PREFACE

It is a far cry from the slim volume of 313 pages which comprised the first edition of the *Extra Pharmacopœia* published by W. Martindale in 1883 to the Twenty-second Edition, of which this volume alone contains 1289 pages. The aim of the original compiler was to provide medical men and pharmacists with practical and up-to-date information concerning drugs and galenicals to supplement that contained in the *British Pharmacopœia* published sixteen years previously. The book met with such an enthusiastic reception that four editions were published in three years. From a kind of unofficial addendum to the *B.P.* there has gradually emerged a work of independent status including in its scope the whole field of therapeutics and the allied sciences. Every effort is made to include within its covers information on all the compounds and preparations which the physician uses, or is recommended to use, including notes on their composition and practical observations on the results of their application. The book also provides the pharmacist with information upon the constitution and properties of the chemical, animal and vegetable drugs necessary to the preparing of medicaments and the dispensing of prescriptions. So far as space permits the book aims at providing for the physician and pharmacist a convenient compendium of information otherwise only obtainable, in many instances, by reference to numerous text-books and by arduous searching through the scientific literature.

Almost from its inception one of the outstanding features of the *Extra Pharmacopœia* has been the breadth of its outlook not only in respect of the drugs and chemicals described in its pages, but also in respect of its sources of information. To those previously unacquainted with the book, a cursory glance through the list of abbreviations will indicate its wide scope. Every new edition of a foreign pharmacopœia is carefully searched for new substances or preparations or for important alterations. The latest developments in medicine and the allied sciences as they appear in the world scientific literature are followed, either at first-hand or through abstract journals. The continual stream of foreign proprietaries flowing into this country from manufacturing houses of established reputation is assiduously watched. It is the presentation of the essential features of this vast accumulation of material which gives the book its unique character and renders it indispensable to all physicians and pharmacists who wish to keep abreast of modern scientific development.

It was fortunate, therefore, that a great part of the material for this new Edition had been collected prior to, or within a short time after, the outbreak of hostilities in September 1939, since it permitted the book to retain its international outlook at a time when this aspect is of especial importance. To those medical men and

scientists from every corner of Europe who are now seeking asylum in this country, the *Extra Pharmacopœia* should prove an invaluable source of information. There is no other book which enables the foreign practitioner to compare the standards and strengths of drugs, chemicals and galenicals with those obtaining in his own country, or to match the proprietary preparation with which he has been familiar with a similar British product. Similarly, the many American doctors who are entering the medical services of Great Britain should find the book valuable, for it contains not only the official standards, strengths and descriptions of the *U.S.P.* and its *Supplements*, correlated with those of the *B.P.* and the *B.P. Addenda*, but in addition details of many American proprietaries which are on the market in this country. Furthermore, some thirty per cent. of the abstracts in the book are derived from American medical and scientific literature.

In spite of the fact that the stream of scientific information in Europe has been dammed at its source, it may be that little of importance to medical progress has been lost; in Germany itself all scientific research, except that having a direct application to war purposes, is probably at a standstill, and in the conquered countries the centres of learning are being closed down or reduced to a uniform level of mediocrity. Many of the leaders of scientific progress are exiles. In England and America, however, the progress of medical research, though inevitably affected by war-time conditions, has continued uninterrupted and the results of that progress up to the spring of 1941 are incorporated in this book.

Thus although this new edition makes its appearance almost two years after the outbreak of hostilities, it is no less comprehensive and up-to-date than any of its predecessors, and every worth-while development in pharmacy or therapeutics evolved during recent years has been included in its pages.

Indeed, the difficulty has been not that of finding new material, but of selecting material sufficiently out-of-date to justify omission, in order to make room for new matter demanding incorporation. In particular, it was necessary to find room for the inclusion of over two thousand new abstracts taken from the world literature during the past four years. In the earlier editions, when the size of the book could conveniently be increased without any interference with its format, this problem did not arise, but since the Seventeenth Edition it has been necessary to restrict any increase in the number of pages if it was to remain a "pocket book." With the rapid and continuous advances of medical science during recent years, and the ever-increasing volume of scientific literature, the problem has become more difficult of solution with each revision. Thus in spite of the drastic revision to which Volume I was subjected for the Twenty-first Edition, nearly sixty per cent. of the matter has been reset for this edition, and of this reset material by far the larger proportion is new to the book. It was clearly impossible to delete as obsolete or unimportant so large a part of a book which was thoroughly revised only four and a half years ago,

and the alternative of increasing the amount of matter in small type was adopted. Even so, the present volume is larger by over one hundred pages than its predecessor. In short, it would seem that the *Extra Pharmacopœia* is outgrowing its format and, with the conclusion of peace, the task of adequately presenting, within the existing limitations of space, the outpouring of medical research which will follow the renaissance of Europe, may become an insoluble problem. Nevertheless, to make any revolutionary change in the style and general appearance of a book which in its present form has served two generations of users is not a step to be undertaken lightly, and is one on which the views of readers would be welcomed.

Classification

The classification, as in previous editions, is based upon the selection of parent substances in common use which serve to form sections of the book, thus enabling readers to review a group of medicinal agents of related composition or medicinal action with the minimum amount of inconvenience. These principal or parent substances are arranged alphabetically, and in each section are included those compounds which are chemically related and those substances which, although not having a close connection by constitution or origin, bear a somewhat similar pharmacological action or are frequently used for the treatment of the same ailment or disease. For example, the several official barbiturates are grouped under the heading "*Barbitonum*," and in this section will be found all the information concerning the many well-known proprietary and non-proprietary barbiturates, together with closely related substances, their more complex derivatives, and the compounded preparations which depend for their action wholly or partly upon the presence of one of these hypnotics. Similarly, under the heading "*Arsenum*," there is a systematic presentation of the information which is necessary to understand the composition, properties and application of the simple inorganic arsenic compounds, and the complex organic arsenicals such as Tryparsamide and Neoarsphenamine.

A few minor changes within this general framework are worthy of note. Thus, certain of the vitamins, after prolonged experimental and clinical research, have now passed into current therapeutic use, so that their continued inclusion in such arbitrary sections as *Aurantium* and *Cerevisiae Fermentum* is no longer justified, especially in the case of those vitamins now prepared synthetically. Ascorbic Acid, Aneurine Hydrochloride and Calciferol have therefore been raised to the status of principal substances and will be found in their respective alphabetical positions in the book. Curiously enough, the first of the vitamins to be discovered, vitamin A, has not yet emerged from the "vitamin" stage, possibly owing to the fact that its therapeutic indications are not yet sufficiently clear-cut, and this therefore remains as a subsidiary substance under *Oleum Morrhuae*.

As in previous editions, the sex hormones have been incorporated in one section, but the generic name *Œstrinum* has been dropped in favour of the more specific name *Œstradiol*. In due course, from the multiplicity of substances described under this heading, there will probably emerge one or two of proved therapeutic superiority, and the introduction of synthetics such as Stilbœstrol, Hexœstrol and Testosterone Propionate will serve to accelerate the process of elimination. Pending such a crystallisation it has been felt preferable to retain all these substances under one heading. The numerous active principles of the pituitary have been dealt with on the same principle.

New Pharmacopœias and Formularies

Originally it was intended to publish this volume of the *Extra Pharmacopœia* after the issue of revised editions of the *British Pharmacopœia* and *British Pharmaceutical Codex*, both of which were due to appear in 1941. The war has, however, caused the Pharmacopœia Commission and Codex Revision Committee to postpone the issue of new editions and to issue, at frequent intervals, Addenda and Supplements to the *B.P.* 1932 and *B.P.C.* 1934 respectively. At the time of going to press two such Addenda (*B.P. Add. II* and *III*) to the *Pharmacopœia* have appeared, and one Codex Supplement, on Standard Dressings, has been published. The matter contained in these books has been incorporated in this edition. In addition, a fourth *B.P. Addendum* and a second Codex Supplement are in course of preparation, and although the work on this volume was too far advanced to await their appearance, it will probably be found that, so far as new substances are concerned, most of the essential information, with the exception of that relating to standards, is already included in our pages. There are also included notes of the more important recommendations taken from the reports of the various Committees of the Pharmacopœia Commission published in 1939, and which have not yet been incorporated in an Addendum.

Two foreign pharmacopœias have been completely revised, the *French Pharmacopœia*, published in 1938, and the *Japanese Pharmacopœia*, in 1935. In addition, two supplements to the *United States Pharmacopœia XI*, and a second supplement to the *Netherlands Pharmacopœia V*, have been issued. All of these have been examined and the references in the *Extra Pharmacopœia* revised so as to bring it into line with the new volumes.

The *National Formulary for N.H.I. Purposes* reached its third edition in 1939, and now forms the basis of the *Drug Tariff Formulary* included in Part VII of the *Drug Tariff*. The preparations from this formulary included in the present edition have been brought up-to-date and a number of new ones added. Other additions include formulæ from the pharmacopœias of the principal London and provincial hospitals, and from the *Pharmacopœia for Use in Military Hospitals*, 1940.

Drugs in War-time

As the war progresses, the need for strict economy in the use of drugs increases. Sources of a number of crude drugs, and of the raw materials for the manufacture of synthetics, are now closed to this country, and this, together with the necessity of conserving foreign exchange and avoiding the waste of shipping space by the importation of non-essential drugs and chemicals, renders the problem of finding adequate alternatives pressing. The Therapeutic Requirements Committee, appointed in September 1939 by the Medical Research Council, in consultation with the Ministry of Health, has submitted our drug requirements to an exhaustive examination, and their report on "*Economy in the Use of Drugs in War-time*" (M.R.C. War Memo., No. 3, H.M.S.O., 1941) provides much of the information necessary for dealing with this problem.

The next step is the authorisation of the use of recommended alternatives. The British Pharmacopœia Commission, by publishing the two war-time addenda (*B.P. Add. II* and *III*) and a number of notices in the *Gazettes*, has already gone a considerable way in this direction. *B.P. Add. II* provides a number of vitamin preparations to supplement the supply of cod-liver oil, permits the use of a number of fixed oils in place of olive oil in some official preparations, and provides alternative formulæ for two ointments previously made with lard. *B.P. Add. III* contains similar alterations and amendments and also modifies the standard for ipecacuanha in order to extend the range of official varieties of this drug (*see p. 655*). More recently a notice in the *Gazettes* has authorised, among other items, the use of Indian squill and Indian valerian in place of squill and valerian, and of a solution of sodium lactate in place of glycerin in kaolin poultice. The fourth Addendum to the Pharmacopœia and the second Codex Supplement, when published, will increase still further the range of permissible alternatives and the number of modified formulæ for *B.P.* and *B.P.C.* preparations containing drugs in short supply. Nevertheless, the authority of the Pharmacopœia Commission and of the Codex Revision Committee is limited to the drugs and preparations contained in their respective publications. Wider authority must come from the Government, which, by means of orders issued under a Defence Regulation, can exercise whatever control is desirable. One such order, relating to the substitution of certain potassium salts by the corresponding sodium salt has already been published (*see p. 1151*). Further similar orders are to be expected and will furnish official guidance as to which drugs should not be used, or should be used sparingly, and what are the more plentiful substitutes. All the alterations, amendments or substitutions, which had been authorised up to the time of going to press, are incorporated in this book, and we stress the desirability in the national interest, that whenever and wherever possible, the alternatives should be used.

Proprietary Names

The inclusion of details concerning proprietary medicines has always been an important feature of the *Extra Pharmacopœia*, which is practically the only concise and comprehensive source of information of this type available. In the majority of cases the notes as to composition, dosage and uses are taken from the literature issued by the manufacturers or agents, upon whom rests the responsibility for the correctness of these statements. Every effort is made to keep the information upon proprietary medicines up-to-date by the deletion of articles no longer on the market and the inclusion of new ones, so that the user of the book is provided with information on nearly every branded product available to medicine and pharmacy.

An innovation made during the course of the last revision of Volume I was the inclusion in brackets, following the name of a proprietary article, of the name of the manufacturer and/or agent, and of his town. This system, which was experimentally tried in an appendix to the *B.P.C.* 1934 has proved to be of great value. Unfortunately, while there are few difficulties in the way of presenting such information in peace time, it is a very different matter under war-time conditions, especially when dealing with foreign medicines. At first sight, it seemed that it would be necessary to omit them. Further consideration, however, suggested that readers would thereby be deprived of the convenience of comparing the composition and uses of a foreign proprietary which they had been using, or had been recommended to use, with those of a suggested British alternative. Further, in the case of a foreign proprietary of complex chemical composition, they might easily have difficulty in tracing the British equivalent disguised under a different trade name. There was the further point that the agents for a foreign manufacturer in this country might still hold stocks of certain of that firm's proprietaries. As a compromise, therefore, it was decided to delete the less well-known proprietaries of continental origin, or those of minor importance, and to retain the remainder, together with the names of the manufacturers and agents, as before. Readers are therefore asked to bear in mind that the inclusion of a foreign proprietary is not an indication that it is obtainable in this country. The information is included merely for reference purposes, and for details as to the availability of the preparation recourse must be had to the agent.

A further complication, from the prescriber's point of view, arises as a result of the licences granted by the Comptroller of Patents to certain British firms to manufacture and market a number of important synthetic proprietaries previously obtained from abroad. A number of these, though described under official names in the *B.P. Addenda*, are also available under various trade names coined by the British manufacturers, and, in addition, under the original trade name of the foreign proprietary which is still on the market in this country, being either manufactured here by a

British-owned company or imported from America. A doctor who has been used in the past to prescribing a well-known foreign proprietary and who has difficulty in connecting it immediately with the official name or with one of the British equivalents, will find the present volume a useful aid to memory. It is unfortunate that in many instances new trade names should have been coined for these substances, thus adding to the confusion. Those firms which have marketed their products under the official titles are at a disadvantage in our pages, since it is impossible to give the names of manufacturers of pharmacopœial substances except when they are issued under trade names.

Finally, there are some instances in which the proprietary medicine is no longer available under its original foreign trade name in this country but is now manufactured by a British firm under another name. In these cases, in order to help the reader, we have followed the British trade name with the note in brackets "A foreign proprietary of similar composition was formerly marketed in this country under the Registered Trade Name —."

Poisons and Dangerous Drugs

As in previous editions, the *Extra Pharmacopœia* provides the doctor and pharmacist with a complete guide to the application of the law relating to the sale and supply of poisonous substances. The system adopted in the Twenty-first Edition for this purpose has proved satisfactory in the readiness with which it enables the reader to ascertain the legal position of any substance, and it has been continued in the present edition. To-day poisons are in one of two parts of the Poisons List of the Pharmacy and Poisons Act, 1933, their position being further qualified by a number of schedules to the Poisons Rules, 1935, which determine the special restrictions, exemptions or other conditions which apply to the various groups.

At the beginning of each section containing a group of poisons, the corresponding item in the Poisons List is quoted and its position marked by [P1] for Part 1 or [P2] for Part 2. Similarly, items from the schedules appended to the Poisons Rules are given to indicate whether the sale or supply of substances in the group are subject to any special restrictions or exemptions. The least complicated system possible has been devised for this purpose, and readers should note that the symbols [S1] and [S4], for example, refer respectively to Schedules I and IV of the Rules. Dangerous drugs are indicated by the symbol [D]. Preceding the names of substances which are poisons, readers will observe symbols or groups of symbols, from which they obtain without effort a concise summary to the conditions which apply. Thus, [P1-S1] tells him that he is concerned with a Part I poison, subject to the special restrictions governing the poisons in Schedule I. Likewise, [P1-S1-S4] indicates that the substance is in Part I of the Poisons List, that it is included in Schedules I and IV and,

consequently, supplied to the public only by authorised sellers on the prescription of a doctor, dentist or veterinary surgeon.

Some Important Therapeutic Agents Described

The following notes give a brief indication of some of the many important substances dealt with and draw attention to a few of the new therapeutic agents described.

Acidum Aceticum. Carbachol and the allied substance, acetyl- β -methylcholine chloride, both of which were briefly described in the Twenty-first Edition under proprietary names, are now more adequately dealt with under these non-proprietary designations (p. 13).

Acidum Ascorbicum. Owing to the importance which this vitamin has assumed during recent years and to its increasing employment as a therapeutic agent, it has been removed from its subsidiary position under *Aurantium* and is now given greater prominence as a principal substance. Under this heading are also described vitamin K, methyl-naphthoquinone, and vitamin P (p. 21).

Acidum Mandelicum. The use of mandelic acid and its salts in the treatment of urinary affections may now be regarded as a procedure of established therapeutic value, and these substances have been made the subject of a separate monograph (p. 81).

Acidum Salicylicum. The various esters of *p*-hydroxybenzoic acid and their use as preservatives in cosmetics and pharmaceutical preparations are dealt with (p. 104).

Acidum Tannicum. Though regarded until quite recently as almost the ideal procedure for the treatment of burns, tannic acid is now shown to possess certain disadvantages, and its use is definitely condemned in burns of the hands and face. Various modifications of the original technique are described (p. 112).

Adrenalinum. The matter under this heading has been revised and details are given of compounds related to adrenaline recently introduced to medicine, including the new circulatory stimulant, pholedrine (p. 132).

A new section has been added under the heading "Suprarenal Cortical Hormones," in which are described corticosterone and desoxycorticosterone acetate. The use of the latter in Addison's disease and in shock is the subject of numerous abstracts (p. 142).

Aneurinæ Hydrochloridum. Here again, as with ascorbic acid, the increasing importance of this vitamin was felt to justify its incorporation as a main monograph. The information under this new heading has been entirely rewritten and greatly extended (p. 188).

As subsidiaries to this section, and new to Volume I, are riboflavin, pyridoxin and nicotinic acid. The use of the latter (and of its amide) in acute pellagra is described (p. 192).

Antimonium. The new *B.P.* substance *Stibophenum*, for use in the treatment of schistosomiasis, undulant fever and oriental sore, is adequately dealt with (p. 198).

Arsenum. The whole of this section, and particularly that dealing with organic arsenic compounds, has been extensively revised (p. 209).

Carbarsonne, a valuable medicament in the treatment of chronic intestinal amœbiasis, is now manufactured in this country under various proprietary names (p. 221).

A new rapid treatment of syphilis, of which doubtless more will be heard, is the intravenous drip therapy, as described under neoarsphenamine and Mapharside (pp. 230 and 235).

Azorubrum. The use of gentian violet, either in the form of an aqueous solution or a jelly, is now widely advocated to replace tannic acid in the treatment of burns, especially as a first-aid procedure. In the form of a 2 per cent. solution this dye is also finding increasing use in the treatment of a wide variety of mycotic skin affections (p. 255).

Barbitonum. The new *B.P.* substances *Hexobarbitonum*, *Hexobarbitonum Solubile*, and *Pemitonum* (hitherto known only under proprietary names) are described, together with a number of other barbiturates which have appeared on the market since our last revision (p. 275).

Sodium diphenylhydantoinate, an anticonvulsant for use in the treatment of epilepsy, is also dealt with in this section (p. 284).

Belladonna. An adequate appreciation, including numerous abstracts, of the so-called "Bulgarian Cure" of post-encephalitic parkinsonism is given (p. 291).

Bismuthum. An interesting new anti-syphilitic introduced from America is sobisminol, which is claimed to be effective by the oral route. Abstracts from the American literature are appended (p. 305).

Bromum. The information on the basal narcotic now known as *Bromethol* has been entirely rewritten in order to bring it into line with the latest clinical reports (p. 316).

Calciferol. This has now been removed from its subsidiary position under *Oleum Morrhuæ* and forms the subject of a separate monograph, in which are included vitamin A and the numerous proprietary preparations containing the two vitamins A and D (p. 326).

Camphora. Among the important substances dealt with in this section are sodium, calcium, and magnesium camphor-sulphonate, leptazol, and nikethamide. The use of leptazol in schizophrenia is the subject of numerous abstracts (p. 346).

Cerevisiæ Fermentum. In the absence of any distinctive name and in view of its still uncertain therapeutic status, vitamin E is retained in this section, though the information has been revised and extended (p. 386).

Penicillin, a substance produced during the growth of certain moulds, is shown to possess an even greater bacteriostatic action than some of the sulphonamides, and its introduction to medicine promises to open up an interesting new field of research (p. 385).

Chlorinum. A British Standards Specification for Bleach Ointment, or Anti-gas Ointment No. 1, is given together with formulæ for other bleach ointments which have appeared in the pharmaceutical literature (p. 398).

In this connection it is of interest to note that, to the best of our knowledge, the late W. H. Martindale was the first to advocate the use of an ointment of chlorinated lime in the treatment of mustard gas burns (see Preface to the *Extra Pharmacopœia*, Seventeenth Edition, Vol. I, 1922).

Chloroformum. Under "Anæsthetic Hydrocarbons" the information on cyclopropane and vinyl ether has been revised. The advantages and limitations of these two anæsthetics are now more clearly appreciated (p. 407).

Chrysarobinum. The properties and uses of dithranol are described. This substance which was previously only available as a foreign proprietary is now manufactured in this country (p. 412).

Cresol. Two new sections have been included in this monograph under the headings "Chloro-phenolic Antiseptics" and "Higher Phenolic Antiseptics"; among others, chlorocresol, parachlorometaxilenol, parachlorophenol and amylmetacresol are described, and a number of abstracts from the scientific literature are appended, together with details of proprietary preparations containing these antiseptics (p. 467).

Ephedra. A great deal of clinical research has been conducted on amphetamine sulphate during the past two or three years, and it has now assumed considerable therapeutic importance (p. 500).

Gelatinum. The small but hitherto separate sections on Capsulæ, Lamellæ and Pastillæ are now incorporated under this heading (p. 542).

A description of pectin and abstracts dealing with its employment as a hæmostatic and in infantile diarrhoea are included in this section. The use of apple powder in the latter condition also forms the subject of several abstracts (p. 544).

Glycerinum. During recent years the glycols have become increasingly used both in pharmaceutical and cosmetic preparations and for various industrial purposes. The glycols in common employment are described, with notes on their uses and their toxicities (p. 554).

Hepar. The information under this heading has been brought up to date, including the list of proprietary preparations containing liver, or the active principles of liver (p. 556). This list, which does not profess to be exhaustive, now contains details of no less than fifty-four proprietaries. The recent memorandum of the Food Rationing Advisory Committee of the Medical Research Council deprecating the use under present conditions of oral preparations of liver in pernicious anæmia, will probably serve to reduce this list considerably in the near future without causing any serious loss to medicine.

The anti-coagulant substance heparin, which is prepared from liver, is dealt with at some length (p. 575).

Insulin. This important monograph has again been carefully revised and a new section added on protamine insulin compounds (p. 634).

Iodum. The information concerning the use of iodised oils for diagnostic purposes has been transferred to this monograph from Volume II. The contrast media diodone and iodoxyl are also described (p. 650).

Ligatures and Sutures. This monograph has been entirely rewritten for this edition (p. 671).

Oestradiol. The rapid advances in knowledge both in respect of the chemistry and the physiology of the sex hormones, which have taken place since our last revision, together with the introduction of synthetic substances, have necessitated a complete rewriting of this section, which now occupies 26 pages as compared with 13 pages in the Twenty-first Edition (p. 714).

In an attempt to clarify the somewhat confusing position, from the therapeutic aspect, due to the availability of numerous oestrogenic substances all possessing similar actions, a short section has been incorporated in which the therapeutic activities of the various oestrogens are compared and, while each of the substances is separately described, their uses are dealt with in one comprehensive section. The androgens have been treated in a similar manner (p. 734).

Another matter which received careful consideration was the method of inclusion of the large number of proprietary preparations, especially in view of the differing methods of presentation and of dosage employed by manufacturers. A list of the proprietaries containing a particular oestrogen (or androgen) is appended at the end of the section dealing with that substance, and wherever possible the strength is given in international units.

Among the new substances described in this section are oestradiol benzoate, stilboestrol, stilboestrol dipropionate, hexoestrol, pregneninolone, and testosterone propionate.

Paraffinum. A new section has been added under the heading "Higher Fatty Alcohols." Cetyl alcohol, stearyl alcohol, and Lanette Wax SX are described (p. 787).

Pituitarium. The information concerning the posterior lobe has been extensively revised (p. 832), while that on the anterior lobe has been rewritten (p. 837). Since our previous revision an enormous amount of research work has been conducted on the active principles of the anterior lobe, as a result of which their functions and therapeutic indications have become more clearly defined, though many of them have not yet been isolated in a pure form. The one which has so far provided the most encouraging clinical results is the gonadotrophic principle, and this is dealt with at some length. The gonadotrophic hormone derived from the pituitary itself, and the gonadotrophic factors obtained from pregnancy urine and from pregnant mares' serum, are described under separate headings, as are the numerous proprietary preparations containing these respective factors (p. 840).

Quinina. The information on the anti-malarials *Pamaquina*, *Mepacrine Hydrochloridum*, and *Mepacrine Methanosulphonas*, all of which were previously described under trade names, has been revised and numerous abstracts added (p. 889).

Sapones. An interesting new section under this heading is that on "Sulphonated Fatty Alcohols." Triethanolamine and triethanolamine stearate, both of which are being increasingly used in pharmacy and in the cosmetic industry, are also described (p. 907).

Sulphanilamidum. That the importance of the sulphonamides has been sufficiently appreciated may be gauged from the fact that this new section occupies no less than 37 pages. It is, in fact, the largest section devoted to any single group of substances in the book (p. 936). It is doubtful whether in the whole history of medicine any therapeutic agent has given rise to such a vast outpouring of literature in such a brief period of time as the sulphonamides, and the task of abstracting only the more important of the thousands of papers which have appeared has been no light one. The collation of the enormous amount of material which finally accumulated, and its presentation in a manner which would cover every important aspect of the subject clearly and concisely, without "overloading," called for very careful consideration. Thus, there were in our files scores of abstracts dealing solely with the toxic effects of sulphanilamide. More than half of these were discarded as merely repetitive, but there still remained a very large number. Instead therefore of adopting the usual method of putting all these abstracts together in chronological order, it was thought better to group them under the heading of the particular toxic effect to which they referred.

The difficulty presented itself in an even more acute form in the preparation of the Uses sections of sulphanilamide and sulphapyridine. It was felt that to attempt to incorporate detailed information on the treatment of the wide variety of diseases for which these substances are used in a general statement, and to follow this in each case with ten or twelve pages of abstracts in unbroken sequence would have been a clumsy and unsatisfactory procedure. It was therefore decided to make only a short general statement and to preface each group of abstracts dealing with the more important indications with a brief summary giving the dosage, method of treatment, etc., applicable to the particular disease. This arrangement it is hoped will make for ease of reference.

The main substances dealt with in this section are sulphanilamide, sulphapyridine and sulphathiazole, and in addition details are given of the numerous sulphonamide derivatives issued under proprietary names. There is more than a likelihood that even more potent and valuable chemotherapeutic agents of the sulphonamide series will be introduced to medicine in the very near future which may supersede those at present employed. Be that as it may, it was felt that this should not deter us from presenting the most adequate

account possible to date of what promises to be one of the most important advances ever made in the treatment of disease.

Vaccines, Sera, Toxins and Antitoxins

The striking advances in the realm of chemotherapy during recent years have to some extent overshadowed the numerous but less spectacular achievements recorded in bacteriotherapy, especially as, by a strange coincidence, the sulphonamides have registered their most outstanding successes in just those diseases in which vaccine and serum therapy have but recently established their value beyond cavil, *e.g.*, pneumonia, cerebrospinal fever and gas gangrene. Nevertheless, that much important work has been done since our last edition is evidenced by the fact that some fifty per cent. of this section of the book has been entirely rewritten and the remainder substantially revised, and that the completed section is 11 pages longer than its predecessor. Among the diseases under which the matter has been rewritten may be mentioned Gas Gangrene, Influenza, Measles, Pneumonia, Rheumatoid Arthritis, Scarlet Fever, Tetanus, and Whooping Cough. Other items of interest which are new to the book, or which have been extensively revised, include the following:

Oral Cold Vaccines—a discussion as to their prophylactic value, together with details of a number of proprietary vaccines.

Diphtheria—an evaluation of the various diphtheria prophylactics and a précis of the instructions issued by the Ministry of Health re Immunisation against Diphtheria, and a description of the Tellurite Test for diagnosis, together with criticisms of the test.

Snake Venoms—the dosage and therapeutic uses in respect of Cobra Venom, Puff-adder Venom, Moccasin Venom and Viper Venom, with numerous abstracts from the medical literature.

Tuberculosis—a description of Tuberculin P.P.D. and of the Vollmer and Copenhagen Patch Tests.

Typhoid—an evaluation of Anti-Typhoid Serum (Felix).

Variola—the present situation in respect of post-vaccinal encephalitis and references to Chick Embryo Vaccine Lymph.

Blood Transfusion

The emergence of blood transfusion from the status of a hazardous procedure, only to be undertaken in rare emergencies by a specialist, to that of a safe and comparatively simple measure employed as a routine even under field conditions, is one of the major therapeutic advances of permanent value which may be almost directly attributed to the exigencies of the war. The various steps which have made possible the more widespread use of this life-saving measure—first the introduction of stored blood, then of citrated plasma, and finally of dried plasma and serum—are described in our pages. Although the transfusion of plasma or serum has now largely superseded whole blood transfusion, especially in the treatment of shock, the latter is still indicated in certain conditions, *e.g.*, in severe anæmia, and the systems of

classification of the blood groups are given, together with the technique of blood grouping and the method of collection of blood from the donor. The technique of transfusion into the patient (applicable to all the solutions), whether by means of single transfusion or continuous drip transfusion, is outlined, and the possible reactions described. Throughout the section (pp. 1096-1105) the most recent recommendations issued by the authorities are incorporated, together with numerous abstracts from the literature.

Summaries of Legal Requirements

The section on Poisons towards the end of the book contains the practical summary of the Poisons Rules, 1935, which was first included in the Twentieth Edition, revised and amended in the light of the Poisons (Amendment) Rules, 1937, 1938 and 1940. It provides the reader with a concise account of the conditions governing the sale or supply of poisons by the doctor, dentist or veterinary surgeon, the pharmacist, the wholesaler and the hospital. This is followed by the Poisons List and the Schedules to the Poisons Rules, brought up-to-date by the inclusion of the alterations made by the Poisons List (Amendment) Orders, 1937, 1938 and 1940, and by the Poisons (Amendment) Rules, 1937, 1938 and 1940 respectively, and these in turn are followed by the Poisons Schedule applicable to Northern Ireland and to Eire, both likewise corrected to 1940. The second part of this section contains a summary of the Dangerous Drugs legislation, including all the recent changes and an outline of the principal points to be remembered by the prescriber and dispenser, together with a summarised version of the Therapeutic Substances Act and Rules, as amended by Statutory Rules and Orders issued in 1935, 1937 and 1939. This section is concluded by the inclusion of a summary of the Shortage of Drugs Order authorising the substitution of a number of potassium salts by the corresponding sodium salt when the former are prescribed or demanded.

Therapeutic Index

During the course of revision it was decided that the usefulness of this Index might be considerably enhanced if each entry relative to a medicinal substance were followed by its appropriate page number in the body of the book, thus making the section self-contained. This necessitated the compiling of an entirely new Therapeutic Index. The text was therefore systematically perused, starting from page 1 and continuing to the end, and an entry made in respect of every reference to the use of a drug or chemical in a particular disease. Proceeding along these lines it became obvious that the existing alphabetical arrangement of drugs and chemicals in each paragraph might conveniently be replaced by a page arrangement, commencing with the lowest page and progressing systematically to the highest. Thus, the physician when confronted with a case which has proved resistant to those therapeutic

measures which he has instituted, is now able by reference to the Therapeutic Index to run quickly through all the medicinal substances mentioned throughout the book in connection with the treatment of the ailment which he has under consideration, without having to refer back to the main index or to dodge backwards and forwards over the pages of the text.

It should be understood that this index does not claim to present an exhaustive list under each disease of the drugs and chemicals employed in its treatment. It contains no entries in respect of therapeutic agents which are not referred to, either specifically or by inference, in the text as having been employed in the treatment of a particular disease, since it was felt that to refer the reader to a page which contained no mention of a therapeutic indication would cause more annoyance than if the reference to the use of the drug in that disease were omitted altogether. However, since the Uses sections throughout the book have been thoroughly revised in the light of the most recent knowledge, and the abstracts are as comprehensive and up to date as it is possible to make them, it is unlikely that the omissions will be found to include many therapeutic agents of major importance.

Acknowledgments

Throughout the revision the fullest use has been made of medical and pharmaceutical literature, and as far as possible care has been taken to select matter which is likely to be of most value to the physician and the pharmacist. In reviewing such a wide range of pharmacopœias, formularies and literature, it is probable that some points of importance may have been overlooked, or that typographical errors may have occurred. The Editor and the Revision Committee will be grateful if readers will draw their attention to any such errors, and they will welcome suggestions regarding the subject matter or arrangement of the work from physicians or pharmacists.

During the latter period of the revision the Committee were deprived by illness of the services of the Editor, and his personal responsibility for the contents is consequently less complete than in previous editions. The Committee desire to record their appreciation of the services of Mr. S. Ward, who assumed the responsibility under their direction for completing the revision. He successfully discharged a formidable task with energy and ability.

London, May 1941.

ABBREVIATIONS

The abbreviated titles of journals are those given in the *World List of Scientific Periodicals* (2nd Edn., 1934). When the reference is to a periodical of which two volumes are published during a year the number placed first indicates the first or second volume of the year followed by the year, and the last number refers to the page, thus, *Brit. med. J.*, i/1932, 250. When only one volume of a periodical is published each year, the reference gives the year and the page, thus, *Quart. J. Pharm.*, 1934, 341. In other cases the volume number is given in italics in addition to the year and page, thus, *J. biol. Chem.*, 1928, 77, 797.

MEASURES. METRIC TO IMPERIAL.

1 ml.	= 15 (nearer 17) minims.
1 litre	= 1 pint 15 fl. oz. approx.

MEASURES OF LENGTH.

1 micromillimetre	= $\frac{1}{1000000}$ millimetre, usually represented by $m\mu$.
1 micron	= $\frac{1}{1000}$ millimetre, or 1 micrometre " " μ .
1 millimetre	= 0.03937 inch.
1 centimetre	= 0.3937 inch.
1 decimetre	= 3.937 inches.
1 metre	= 39.370113 inches or 1 yard 3.37 inches nearly.

MISCELLANEOUS EQUIVALENTS

1 minim = the volume at 16-7°C. of 0.9114583 grain of water.

1 fluid drachm = the volume at 16-7°C. of 54.6875 grains of water.

1 fluid ounce = the volume at 16-7°C. of 437.5 grains of water.

109.7143 minims (taken as 110 minims) = the volume at 16-7°C. of 100 grains of water.

1 grain per gallon = $\frac{100}{7}$ parts per million.

1 part per million = $\frac{7}{100}$ grains per gallon.

1 pound = 7000 grains.

$\frac{1}{100}$ grain per lb. = approx. 1.4 parts per million.

A gallon of water weighs 10 pounds.

A "Corbyn" = 40 ounces fluid (1 quart).

A "Winchester" quart = 80 ounces fluid ($\frac{1}{2}$ gallon).

PROPORTIONAL DOSES ACCORDING TO AGE

The following are some of the methods that have been proposed for calculating the dose for a child from that for an adult.

Gaubius' Method.

Under 1 year	will require	$\frac{1}{12}$	the adult dose
" 2 years	"	$\frac{1}{6}$	" " "
" 3 "	"	$\frac{1}{4}$	" " "
" 4 "	"	$\frac{1}{3}$	" " "
" 7 "	"	$\frac{1}{2}$	" " "
" 14 "	"	$\frac{2}{3}$	" " "
" 20 "	"	$\frac{3}{4}$	" " "
From 21 to 60 years	will require	the full	adult dose.

Young's Formula.

$\frac{\text{Age}}{\text{Age} + 12}$. Thus for 8 years, the dose required is

$\frac{8}{8 + 12} = \frac{2}{5}$ of the adult dose. The formula applies only to children under 12.

Dilling's Formula. This method represents an attempt to correlate dose with body weight. Dilling states that the fraction $\frac{\text{age}}{20}$ approximates closely to the weight curve, between the ages of 4 and 20.

Clark's Formula. $\frac{\text{Body weight in lb.}}{150}$

Fried's Formula.

For infants, $\frac{\text{age in months}}{150}$

Dosage for the Aged. Above the age of 60, an inverse gradation must be observed. The following are the fractions suggested (Dixon's *Manual of Pharmacology*, 8th Edn., revised by W. A. M. Smart, 1936):—

Aged 60 to 70:	$\frac{1}{2}$	the usual adult dose.
" 70 to 80:	$\frac{1}{3}$	" " "
" 80 to 90:	$\frac{1}{4}$	" " "
Over 90:	$\frac{1}{5}$	" " "

CALCULATION OF A DOSE FOR MAN FROM KNOWN DOSE FOR AN ANIMAL

The rate of catabolism of an animal is not proportional to size or weight but approximately to the body surface. Surfaces of solids of the same shape are proportional to the two-thirds power of their volumes (*i.e.*, the cube root of the square of the volumes). Since the specific gravity of animals varies only slightly, their body surface is a function of the two-thirds power of their weight. This relation is expressed by Meeh's Formula, $S = k(W)^{\frac{2}{3}}$, where S is the surface in square centimetres, W is the weight in grammes, and k is a factor which is nearly constant for all animals of the same shape.

(Rubner gives the following values for k : Man, 12.3; Dog, 10.3—11.2; Rabbit, 12.0—12.9; Cat, 9.9; Guinea Pig, 10.5.)

A formula for calculating the dose for man. This assumes that k , the factor, is the same for man and animals, and is approximate only, as the values actually differ somewhat.

If the dose for man and the animal should be proportional to their rates of catabolism, *i.e.*, to their body surface, then:

$$\frac{DM}{DA} = \frac{SM}{SA} = \frac{K(M)^{\frac{2}{3}}}{K(A)^{\frac{2}{3}}}$$

DM = Dose for man in g.

DA = Dose for adult test animal in g.

SM = Body surface of man.

SA = Body surface of animal.

M = Wt. of man in g.

A = Wt. of test animal in g.

$$\text{Hence } DM = \frac{(M)^{\frac{2}{3}}}{(A)^{\frac{2}{3}}} \times DA = \frac{1590 \times DA}{(A)^{\frac{2}{3}}}$$

for a 10-stone (63.5 kilo) man.

Thus, a dose of 1 g. per kilo for an animal is equivalent to 15.9 g., not 63.5 g., for a 10-stone man.

No exact method of calculating the corresponding dose for man from that of an animal is known. The figure obtained by the above formula is useful as a guide, but allowance must still be made for the fact that man may be more sensitive to the drug than the animal.

TRANSPOSITION TABLE OF DOSES STATED FOR MAN IN MG. PER KILO TO MAN'S WEIGHT

Mg. per kilo.

1	=	1 grain (0.065 g.)	for a 10-stone (63.5 kilo) man
5	=	5 " (0.32 g.)	" " " "
10	=	10 " (0.64 g.)	" " " "
50	=	50 " (3.20 g.)	" " " "

As 5 mg. per kilo more nearly = 4.9 grains (0.318 g.) per 10-stone man, the above figures contain a 2% error in excess.

ACACIA

B.P., U.S.P. XI, Fr. Cx., P. Helv. V, P. Jap. V, etc.

Syn. ACACIÆ GUMMI, GOMME ARABIQUE, GOMME DU SÉNÉGAL.

A dried exudation from the stem and branches of *A. senegal* Willd. (*Leguminosæ*), and other species, either colourless or with yellowish tint.

The gum contains arabin which consists of a mixture of Ca, Mg and K arabinates. On hydrolysis it yields arabinose and other sugars.

Soluble almost completely in water; insoluble in alcohol.

Incompatibles. Alcohol, mineral acids, borax, ferric salts, oxalic acid and most lead salts. Bismuth carbonate should not be suspended with acacia mucilage; tragacanth is better.

Uses. For intravenous injection to raise blood pressure after loss of blood, especially that resulting from surgical shock. The solution has the same viscosity as the blood, and a content of colloids with osmotic pressure equal to that of the blood, hence it does not leave the circulation rapidly. It causes an increase in the plasma and blood volumes, but a decrease in the serum proteins, and repeated injections are not advisable. Its use is being largely replaced by blood transfusions or dextrose-saline injections.

Powdered acacia is used as an emulsifying agent for oils, the usual proportion being about 1 of gum to 4 of a fixed oil or 2 of a volatile oil. Less suffices in some cases. For its use as a pill excipient, *vide* *Pilulæ*.

Dangers of 6% gum-saline solution are: injury to the hepatic parenchyma with enlargement of the liver and diminished excretion of bile salts and pigment and diminution in urine volume. Repeated injections are much more apt to cause harm, particularly from depression of serum proteins and damage to the polygonal cells of the liver. In an emergency, however, when it is not possible to give a blood transfusion immediately, the intravenous injection of acacia solution may be regarded as a temporary substitute. Its use is more justifiable in shock than in severe hæmorrhage.—J. D. Stewart, *New Engl. J. Med.*, 1936, 215, 56.

Plasma and blood volumes are increased after acacia is given intravenously to dogs, with a proportionately greater decrease in the total proteins. The plasma volume returns to normal quickly, but the protein regeneration is delayed. The albumin, globulin and fibrinogen factors are all decreased and regenerate relatively slowly. The fibrinogen may become very low and cause considerable delay in clotting and prolongation of bleeding if large amounts of acacia are given. Acacia given intravenously causes lowering of cholesterol to about half the normal value with a slow increase to normal, while hæmoglobin, cell volume, and red blood cell count decrease markedly and regenerate slowly. The intravenous administration of acacia is contraindicated in nephrosis, when one considers that the ultimate recovery of the patient is dependent upon his ability to restore his level of serum protein to normal.—R. L. Jackson and L. Frayser, *J. Pharmacol.*, 1939, 65, 440.

BURNS. The secondary shock of burns is best treated by intravenous injection of 6% gum saline solution—normal saline or dextrose-saline will do more harm than good.—W. C. Wilson, *Practitioner*, i/1936, 398.

DIABETIC COMA. Desperate cases recovered with large quantities of fluid intravenously—hypertonic saline and acacia solution (7%).—R. D. Lawrence, *Brit. med. J.*, i/1930, 690.

OBSTETRIC SHOCK treated with definite benefit. Many lives saved by early use. Should be employed more extensively.—L. M. Randall, *J. Amer. med. Ass.*, ii/1929, 847.

Injectio Sodii Chloridi et Acaciæ (B.P.). Acacia 60 g., sodium chloride 9 g., sterilised water to 1000 ml. The solution is autoclaved at 121° to 122° for one hour, cooled, filtered and again autoclaved.

A four-fold concentrated solution of acacia-saline may be prepared from the following formula and directions. Gum acacia, in tears, 1250 g., sodium chloride 187.5 g., water to 5000 ml. Dissolve the sodium chloride in the water, boil and add the gum acacia. Stir till dissolved. Strain through fine muslin, adjust the pH to 7.0 to 7.2, cover the container with parchment paper and autoclave at 15 lbs. pressure for 90 minutes. Add 200 g. of kiesulguhr to the solution, filter, rinse the flask with a little water and filter this. An accurate dilution figure is calculated from the sodium chloride content of the filtrate, a small quantity of which is diluted and assayed. The filtrate is then filled in suitable volumes into ampoules, sealed, and autoclaved at 10 lbs. pressure for 30 minutes. Or the filtrate may be diluted with water to contain 0.9% of sodium chloride, the pH adjusted to 7.0 to 7.2, filtered, put in suitable containers and autoclaved at 5 lb. pressure for 45 minutes or at 10 lb. for 30 minutes.—H. Gartside, *Quart. J. Pharm.*, 1939, 550.

Replacement of gum arabic in preparation of emulsions may be accomplished by the use of galactose or pectin. Casein also gives good emulsions, but does not keep well.—F. V. Ivenor and G. A. Kleibs, per *Brit. chem. Abstr. (B)*, 1939, 1290.

Ampulla Acaciæ et Sodii Chloridi (L.C.C.). Acacia 6%, sodium chloride 0.9%, in sterilised water to 500 ml. (17½ fl. oz.).

Solutio Salina cum Acacia (U.C.H.). has 0.91% of sodium chloride and 6% of acacia in distilled water.

Mucilago Acaciæ (B.P.).

Dose.—1 to 4 drachms (4 to 16 ml.). Acacia 4, washed to remove any adherent dust, dissolved in chloroform water 6. This quantity measures about 8½. *Fr. Cx.* uses powdered acacia 1, water 1.

Mucilago Acaciæ (U.S.P. XI). *Average dose.*—½ ounce (15 ml.).

Acacia 35% w/v and sodium benzoate 1% in water.

Mucilago Gummi Arabici (P. Jap. V). Acacia 1, water 2.

Pulvis Acaciæ Compositus. Acacia 1, tragacanth 1. A useful pill excipient.

Syrupus Acaciæ (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.). Mucilage of acacia 1, syrup 3. A demulcent for use in cough mixtures. Must be freshly prepared.

Sirop de Gomme (Fr. Cx.). Washed acacia 10, sucrose 56, water 34, all by weight.

Potion Gommeuse (Fr. Cx.). Acacia powder 1, syrup 3, orange flower water 1, by weight, with water to 15 parts by volume.

Gummi Arabicum Desenzymatum (P. Helv. V) is obtained by evaporating the mucilage, drying and powdering the residue; the oxydases are thus destroyed.

Gummi Indici. *Syn.* GHATTI GUM. From *Anogeissus latifolia* (Combretaceæ). Indian gum is used technically for the same purposes as acacia. **Mucilago Gummi Indici**, 1 to 3 of water, is used in place of mucilage of acacia in India and the Eastern Colonies.

Acaciæ Cortex (B.P.C.). The dried bark of *A. arabica* (Babul bark) and *A. decurrens* (Wattle bark) (Leguminosæ). **Decoctum Acaciæ Corticis** 6%, *dose*—½ to 2 fluid ounces; used occasionally as astringent internally or in gargles.

ACETANILIDUM

ACETANILIDUM

B.P.C., Fr. Cx., P. Jap. V, P. Helv. V, U.S.P. XI, P. Dan., etc.
 $C_6H_5NH \cdot CO \cdot CH_3 = 135 \cdot 1$.

Syn. ANTIFEBRIN, PHENYLACETAMIDE.

[P1] "*Acetanilide; alkyl acetanilides.*"

[S3] "*Acetanilide; alkyl acetanilides—in substances not being preparations for the treatment of human ailments.*"

Dose.—2 to 5 grains (0·12 to 0·3 g.). Larger doses are sometimes given, but idiosyncrasy may exist. *P. Helv. V* and *Fr. Cx.* have maximum daily dose of 15 gr. *U.S.P. XI* average dose 3 gr. May be given in cachets or suspended by compound tragacanth powder.

Prepared by the action of glacial acetic acid on aniline. In small white odourless glittering crystals which produce a burning sensation on the tongue. M.p. 113° to 115°.

Soluble 1 in 220 of water, 1 in 22 of boiling water, slightly in glycerin, 1 in 3·5 of alcohol 90%, 1 in 5 of chloroform, 1 in 12 of ether, and readily soluble in benzene.

Incompatible with aspirin, chloral hydrate, menthol and phenazone.

Antidotes. Empty stomach by stomach tube or emetic. Keep patient lying down and warm. Give aromatic spirit of ammonia, 1 dr., in 4 oz. of water. Strychnine, $\frac{1}{4}$ gr., hypodermically. Oxygen inhalations. Saline infusion with dextrose for collapse.

Tolerance to the drug is built up after continued use. For occasional use, for headache or lassitude, acetanilide is a powerful analgesic preparation of great value, but if it is abused there is actually a tendency towards production of headache with the resulting establishment of a vicious circle and the possibility of chronic acetanilide poisoning. A case described.—A. Leslie, *J. Amer. med. Ass.*, ii/1939, 2229.

Chronic acetanilide poisoning (cyanosis) in a woman of 55 who had been taking three powders a day for a year for the relief of headache, the powders consisting of acetanilide and phenazone 4 gr. of each, and caffeine 2 gr.—T. N. Morgan and A. G. Anderson, *Brit. med. J.*, ii/1940, 187.

Pharmacology. The action of acetanilide is due to the formation of *p*-aminophenol in the organism, and the drug is excreted in this form in the urine. Large doses or continued use result in the formation of methæmoglobin, leading to cyanosis. Idiosyncrasy sometimes occurs, cyanosis resulting from small doses. Chronic poisoning is indicated by weakness, dyspnoea, sweating, hot flushes, mental depression and rapid heart; sometimes erythematous rashes occur.

Sodium bromide slightly antagonises the antipyretic action of acetanilide. Caffeine raises the temperature of fevered rats and also antagonises the antipyretic action. Sodium bromide and caffeine together antagonise to a large extent its antipyretic action.—P. K. Smith and W. E. Hambourger, *J. Pharmacol.*, 1935, 55, 205.

Uses. Antipyretic and analgesic. Useful in neuralgia, migraine, sciatica and dysmenorrhœa. Applied externally as a dusting powder it relieves the pain of ulcers, but toxic symptoms may occur owing to absorption. Relieves the darting pains of locomotor ataxy.

[P1] **Pulvis Acetanilidi Compositus (B.P.C.).**

Dose.—3 to 5 grains (0.2 to 0.3 g.).

Acetanilide 7, caffeine 1, sodium bicarbonate 2.

[P1] **Tabellæ Acetanilidi Compositæ (B.P.C.).** Contain acetanilide 2 gr., caffeine $\frac{1}{2}$ gr., and sodium bicarbonate 1 gr.

[P1-81] **Tabellæ Acetanilidi Compositæ cum Codeina (B.P.C.).** As the preceding, with the addition of codeine $\frac{1}{8}$ gr.

[P1] **Phenalgin (Eina Chemical Co., London; Pearson, Mitcham).** *Dose.*—5 to 15 grains (0.3 to 1 g.). A mixture with acetanilide as the active base, as an antipyretic and hypnotic. Tablets and gelatin (hard) capsules, 5 grains.

[P1] **Methylacetanilidum (B.P.C., Fr. Cx.).** *Syn.* EXALGIN.
 $C_6H_5N(CH_3)OC \cdot CH_3 = 149.1$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.) in solution, cachets or pills. In colourless crystals, with a slight saline taste.

An analgesic, anti-neuralgic, antipyretic (only in unsafe doses). Toxic doses cause paralysis of respiratory organs.

Soluble 1 in 60 of water, freely in alcohol, 1 in 10 of ether, 1 in 2 of chloroform.

Incompatible with salicylic acid.

Antidotes. Treat as for poisoning by acetanilide.

Anilinum (B.P.C.). *Syn.* MONOPHENYLAMINE.
 $C_6H_5NH_2 = 93.1$.

A colourless (when freshly distilled) oily liquid, with sp. gr. 1.027. Of burning taste, miscible with alcohol and oils, soluble 1 in 37 of water.

Antidotes. Empty stomach by stomach tube or emetic. Fresh air, artificial respiration, oxygen inhalations. Strychnine, $\frac{1}{4}$ gr., hypodermically. Saline infusion. Venesection followed by blood transfusion.

Aniline has a direct effect on the heart muscle, producing arrhythmia and heart-block. Intoxication may be produced either by absorption *per os* or through the skin, and in its acute stage cardiac and not respiratory treatment is indicated.

Poisoning by a boy drinking less than 2 ml. of a water and aniline mixture. Final recovery under oxygen given through a nitrous oxide bag for 5 minutes at a time with intervals of 15 minutes, instead of constantly through a funnel—far better this way.—J. Inkster, *Lancet*, ii/1926, 752.

It has been shown that cases of acute aniline poisoning arise by absorption through the skin. Its immediate toxic effect is on the blood, and the symptoms are blue-grey discoloration of the lips, ears and cheeks. With concentrations of 1 part of aniline vapour in 10,000 to 1 part in 6000, serious disturbances occur after 1 hour's exposure.—per *Analyst*, 1940, 162.

Paranitroaniline, rubbed on the body of a coolie, caused death due to absorption through the skin.—per *Analyst*, 1939, 679.

Paraphenylenediamine. $C_6H_4(NH_2)_2 = 108.1$.

[P2] "Phenylene diamines; toluene diamines; other alkylated-benzene diamines; their salts."

[S3] "Phenylene diamines; toluene diamines; other alkylated-benzene diamines; their salts—in substances other than preparations for the dyeing of hair."

[S7] Preparations for the dyeing of hair containing phenylene

ACETANILIDUM

diamines or toluene diamines or other alkylated-benzene diamines or their salts must be labelled with the words "Caution. This preparation may cause serious inflammation of the skin in certain persons and should be used only in accordance with expert advice," instead of the word "Poison."

Prepared by nitrating acetanilide and subsequent reduction with tin and hydrochloric acid. In white or reddish crystals soluble in water, alcohol and chloroform. M.p. 140°.

In cases of poisoning by paraphenylenediamine dyes, cedema of head, neck, tongue, eyelids and face is the first stage; skin eruptions, eczema, nausea or nervous symptoms, sleeplessness, dizziness, weakness, etc., or impairment of vision may follow.

Hair Dyes.—Before applying, the sebum must be removed. 1% approx. of ammonia is said to be safe, but 10% injurious. Lead dyes (e.g., lead acetate and sodium thiosulphate) are dangerous, as also are silver, e.g., pyro, amidol and silver nitrate. Pure henna dye is harmless, though penetrating the cortex, as also Henna-reng (henna and indigo). As to the paraphenylenediamine group, toxic effects are both local and general. Sabouraud-Rousseau's Test is used as a sensitisation test. The skin over the mastoid process is cleaned with alcohol and then the dye and its oxidant applied. When dry cover with flexible collodion. After 24 hours remove collodion and wash with soap and water. If patient is sensitive a mild reaction will have formed. If dermatitis is caused in use as hair dye, or from furs, a simple calamine lotion containing 2% of ichthammol should be used. *Do not attempt to remove the dye by hydrogen peroxide or thiosulphate.*—R. M. B. Mackenna, *Brit. med. J.*, i/1930, 899. Some of these remarks are criticised by A. Mahony-Jones, *ibid.*, 879.

A case of systemic poisoning, with death from sub-acute atrophy of the liver, in a girl aged 21, a hairdresser's assistant. There was no skin affection traceable to the dye. Rubber gloves were used when applying the dye, and the gloves removed for the subsequent shampoo. The staining of the hands was removed with hydrogen peroxide, which was possibly a contributory cause, as it has been stated that it is most dangerous to remove the dye from the hair by the use of hydrogen peroxide or sodium thiosulphate, as these measures only intensify the symptoms. It seems possible that the production of aniline is responsible for the toxic symptoms.—M. C. G. Israels and W. Susman, *Lancet*, i/1934, 509.

Paraphenylenediamine and other diamines in hair dyes may be detected by tests described by C. Griebel and F. Weiss (see *Analyst*, 1933, 417).

Dyed Furs. Fur workers and wearers of dyed fur are liable to be affected with dermatitis from this substance. Investigations show that paraphenylenediamine is almost the only dye used, since it has the advantage of being used cold. The fur is dipped in a 0.5% solution and then into hydrogen peroxide, when "Bandrowski's base" is formed. The fur is then washed in revolving drums. Complete removal of all unoxidised amine should be made compulsory.—*Yearb. Pharm.*, 1924, 524.

The result of investigating a large number of cases of fur dermatitis has shown that at least 45% of these cases were due to paraphenylenediamine-dyed furs. Examination of its oxidation products formed during the process of dyeing and of the dyed fur showed that a large amount of Bandrowski base may be formed on the fur, and that the final product of the dyeing is an azine combined with the protein in the fur. Paraphenylenediamine itself, and not any intermediate oxidation products, is stated to be the active irritant in fur dermatitis.—H. E. Cox, *Analyst*, 1934, 3; see also *ibid.*, 1933, 738.

A normal person may fail to react to a 10% solution of Ursol containing p-phenylenediamine, whereas dermatitis cases react to concentrations as low as 0.005%.—W. J. O'Donovan, *Brit. med. J.*, ii/1932, 294.

[P2·83·87] **Metaphenylenediamine Hydrochloride.** *Syn.* METAMINO BENZENE HYDROCHLORIDE. $C_6H_4(NH_2)_2 \cdot HCl = 144.6$.

This compound is considered more poisonous in furs than the

para compound. It is used for the determination of nitrites in water.

Benzidine. White or slightly reddish crystals, m.p. 128°. Slightly soluble in alcohol, ether and boiling water. Used as a reagent for detecting certain oxidising agents, especially the oxidase of blood.

Phenylhydrazinæ Hydrochloridum.

$C_6H_5 \cdot NH \cdot NH_2 \cdot HCl = 144.6$.

Dose.— $1\frac{1}{2}$ to 5 grains (0.1 to 0.3 g.). 2 gr. per day should rarely be exceeded, and frequently 2 gr. per week is sufficient. Dosage must be controlled by blood counts.

Colourless shining scales, readily soluble in water and alcohol. M.p. 240°. *Handle carefully, may produce eczema.*

Phenylhydrazine has a specific effect in destroying erythrocytes and is used therefore in polycythæmia. There is a marked reduction in blood volume directly proportional to destruction of the erythrocytes, and when anæmia has been produced a relative increase in plasma volume is noted. The action is delayed and may continue for two weeks after administration has been stopped. Administration should cease as soon as the effect is noticed until it is known how far the erythrocyte count will fall.

In advanced polycythemia vera should not be given, and only with extreme caution to those over 60, patients with marked arteriosclerosis, or advanced visceral injury. Such patients should be given only small doses, 0.1 or 0.2 g., and subsequent dosage determined by symptoms. Less advanced cases do well on 0.1 to 0.3 g. weekly, and the effect observed over several days. Patients who have had thrombosis should be treated cautiously. Ambulatory treatment best, every effort being made to keep circulation as free as possible. Frequent counts of red and white cells and estimations of serum bilirubin needed. As its action continues after withdrawal, it should be stopped before red cell count is normal. Marked rise in bilirubin means excessive blood destruction, and rising leucocyte count indicates great destruction of liver cells. Results transitory and merely palliative.—H. Z. Giffin and H. M. Connor, *J. Amer. med. Ass.*, i/1929, 1507; Hurwitz and Levitus, *ibid.*, i/1929, 1629.

It is always advisable to omit the drug when the red cell count approaches 6,000,000 per c.mm. Should the red cell fall become alarming, blood transfusion will arrest its progress, followed by liver extract. A case described in which four short courses were given without untoward effect, but a fifth produced a severe hæmolytic crisis.—A. M. Kennedy, *Brit. med. J.*, i/1934, 657.

Acetylphenylhydrazine. $C_6H_5 \cdot HN \cdot NH(C_2H_5O)$. *Syn.* PYRODIN, HYDRACETIN. In colourless crystals slightly soluble in water, has also been used.

Equally effective as phenylhydrazine in polycythæmia vera without producing toxic symptoms so readily in similar doses.—C. T. Stone, T. H. Harris and M. Bodansky, *J. Amer. med. Ass.*, ii/1933, 495.

Superior to phenylhydrazine hydrochloride in the treatment of polycythæmia vera. Of 14 cases treated, 9 were improved, 2 were not improved, and 3 died. The treatment given was 0.1 g. of acetylphenylhydrazine for two or three days in the course of a week; this was repeated for several weeks and the dose then increased gradually to 0.4 or 0.5 g.—M. R. McAlpine and K. E. Smith, *N.Y. St. J. Med.*, 1938, 101.

Acidum Sulphanilicum. $C_6H_4(NH_2)SO_3H \cdot 2H_2O (1 : 4) = 209.2$.

Dose.—10 to 20 grains (0.6 to 1.2 g.).

In small white crystals, slightly soluble in water. Used in Ehrlich's Diazo Test, now superseded by the Widal reaction.

Sodii Sulphanilas. $C_6H_4(NH_2)SO_3Na \cdot 2H_2O = 231.2$.

Dose.—5 to 15 grains (0.3 to 1 g.).

In white shining scales, easily soluble in water. Useful in acute catarrh, laryngitis, and otitis.

Zinci Sulphanilas. *Prop. Name.* NIZIN (*Burroughs Wellcome, London*).

White crystals soluble 1 in 6 of water, 1 in 250 of alcohol. Astringent and antiseptic. Solutions 1 in 500 to 1 in 250 are injected in leucorrhœa and gonorrhœa. In atrophic rhinitis the nasal fossæ may be packed with gauze dipped in 1 to 2% solution.

ACIDUM ACETICUM

$\text{CH}_3\text{-COOH} = 60\cdot03$.

Acidum Aceticum Glaciale (*B.P., U.S.P. XI*). Contains not less than 99% *w/w* of $\text{CH}_3\text{-COOH}$. Sp. gr. 1·055 to 1·058. *P. Belg. IV, P. Jap. V, P. Ital. V* and *F. E. VIII* not less than 96%; *Fr. Cx.* and *P. Helv. V* 98 to 100%; *P. Dan.* 96%.

A colourless liquid or crystals melting at about 14·7° obtained as a product of the destructive distillation of wood, or synthetically. B.p. 118°.

Antidotes. Stomach tube and emetics must *not* be used. Give a pint of water to which has been added 4 tablespoonfuls of magnesium or calcium hydroxide, or 2 teaspoonfuls of soap dissolved in a pint of warm water. (Chalk, sodium bicarbonate or carbonate, well diluted, may be used in absence of magnesium oxide, but it is better to avoid the use of carbonates if possible because the evolution of carbon dioxide may rupture the weakened walls of the stomach.) Milk, white of egg, oil or other demulcents. Morphine, $\frac{1}{4}$ gr. hypodermically, for shock.

Uses. It is applied to corns and warts. Has caustic action, but gives much pain. Psoriasis of a chronic type has been cured in a week or two by glacial acetic acid locally.

Acidum Aceticum Aromaticum (*B.P.C.*). *Syn.* AROMATIC VINEGAR. Glacial acetic acid about 74% *v/v*, with odorants. Used as a restorative.

Acidum Aceticum (*B.P.*). 32·5 to 33·5% *w/w*. *U.S.P. XI* is 36 to 37%; *P. Helv. V* 29·5 to 30·5%; *P. Dan.* 29·5%.

Dose.—5 to 15 minims (0·3 to 1 ml.).

B.P. has sp. gr. 1·044 to 1·045. *P. Austr., P.G. VI* and *P. Belg. IV* (30%) and *F.E. VIII* (30%) designate this acid "Dilutum."

Incompatibles. Alkalis (hydroxides, carbonates, etc.).

Use. Externally for ringworm and in liniments.

Acetum Odoratum (*B.P.C.*). *Syn.* TOILET VINEGAR. Acetic acid 1 in 8 with odorants.

Acetum Officinale (*Fr. Cx.*). White wine vinegar containing about 6% of acetic acid.

Lotio Acidii Acetici (*R.L.O.H.*). Acetic acid 25 m., sterilised water to 1 ounce. Relieves itching and irritation, *e.g.*, in spring catarrh.

Vapor Acidii Acetici (*T.H.*). Acetic acid and glacial acetic acid, equal parts. One teaspoonful to a pint of hot water as a sedative inhalation.

Acidum Aceticum Dilutum (*B.P., U.S.P. XI*). 5·7 to 6·3% *w/w*.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Sp. gr. about 1·008. (*Fr. Cx.* is 10% *w/w*.)

THE EXTRA PHARMACOPŒIA

Uses. May be given as an antidote to poisoning by alkalis, and, largely diluted, is applied as a lotion for inflamed joints, etc., and to bathe the skin as a refrigerant in cases of fever. A 1 in 20 dilution of this dilute acid is used in the form of drops to relieve the conjunctival itching of spring catarrh.

Acetic Anhydride. $(\text{CH}_3\text{CO})_2\text{O}=102.05$.

A colourless liquid with pungent odour, sp. gr. 1.080. B.p. 138° .

Obtained by interaction of anhydrous sodium acetate and acetyl chloride.

Is not employed medicinally, but is extensively used in chemical manufacture.

Acetyl Chloride. $\text{CH}_3\text{COCl}=78.5$. A volatile liquid with intensely penetrating odour, boiling at 51° . Obtained by combining carefully glacial acetic acid 130, with phosphorus pentachloride 137, distilling, and redistilling the fraction passing over below 60° .

Acetamide. $\text{CH}_3\text{CONH}_2=59.05$.

Deliquescent crystals, m.p. 82° , made by interaction of ammonia and acetyl chloride.

Æthylis Acetas (B.P.C., Fr. Cx., P. Helv. V). Syn. **ÆTHER ACETICUS** (P. Jap. V). $\text{CH}_3\text{COOC}_2\text{H}_5=88.06$.

Dose.— $\frac{3}{4}$ to 1 drachm (3 to 4 ml.) for a single administration; $\frac{1}{4}$ to $\frac{1}{2}$ drachm (1 to 2 ml.) for repeated administration.

Contains not less than 90% w/w of ethyl acetate. Boiling-range 73.9° to 77.8° . Sp. gr. 0.900 to 0.907.

Soluble 1 in 15 of water; miscible with alcohol, ether, and chloroform.

Is used as an inhalation in laryngeal catarrh, $\frac{1}{2}$ drachm to 1 pint of warm water (60°). Internally it is carminative, antispasmodic and diaphoretic. Is largely used as a solvent.

Potassii Acetas (B.P., U.S.P. XI, Fr. Cx.).

$\text{CH}_3\text{COOK}=98.12$.

Dose.—15 to 60 grains (1 to 4 g.). U.S.P. XI average dose 15 grains.

Deliquescent white crystals, masses or powder. Diuretic, and uric acid solvent.

Soluble 2 in 1 of water, 1 in 2 of alcohol 90%.

Uses. Is given to render the urine alkaline and as a diuretic. Has mild diaphoretic and febrifuge properties.

Incompatible with acids and silver, mercury and iron salts.

[P1] **Mistura Potassii Acetatis Composita** (B.P.C.).

Syn. **MISTURA DIURETICA**.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains potassium acetate 20 gr., spirit of nitrous ether 30 m., and tincture of hyoscyamus 20 m., with juice of scopolium in infusion of buchu to 1 oz.

Mist. Diuret. (N.I.F.).

Potassium acetate 15 gr., potassium nitrate $7\frac{1}{2}$ gr., vinegar of squill 20 m., decoction of scopolium to $\frac{1}{2}$ oz.

Sodii Acetas (B.P.C., U.S.P. XI, P. Helv. V, P. Jap. V).

$\text{CH}_3\text{COONa}, 3\text{H}_2\text{O}=136.07$.

Dose.—5 to 20 grains (0.3 to 1.2 g.). U.S.P. XI average dose, 25 grains.

Colourless crystals or white powder, efflorescent in warm air. Soluble about 1 in 1 of water, with alkaline reaction, and about 1 in 35 of alcohol 90%.

Uses. To some extent as a diuretic and as rectal injection in uræmia instead of the bicarbonate. It is excreted as carbonate.

[P1-S1] **Thallii Acetas** (*B.P.C.*). *Syn.* THALLOUS ACETATE. $\text{CH}_3\cdot\text{COOTl}=263\cdot4$.

[P1] and [S1] "*Thallium, salts of.*"

Dose.—0·008 g. per kg. body-weight ($\frac{2}{3}$ grain per pound), unless there is marked discrepancy between age and weight, in sweetened aqueous solution.

A white crystalline powder, m.p. about 131°.

Antidotes. Empty stomach by emetic or stomach tube. Give purgative dose of magnesium sulphate. Milk in copious draughts. Keep patient warm. Caffeine sodium benzoate, 2 gr. hypodermically, for shock. Saline intravenously. Intravenous injection of potassium iodide has been suggested. Sodium thiosulphate intravenously in daily doses, 20 ml. of 3% solution slowly (too large doses are to be avoided), promotes gradual elimination of thallium in the urine.

It was much advocated for epilation in ringworm, the direction being to administer it only to children who have not reached the age of puberty in dosage based on weight of the child, but owing to the numerous fatalities due to this treatment, its use has now been largely abandoned (*see* 20th Edn.).

Acetonum (*B.P., U.S.P. XI, Fr. Cx., P. Jap. V, F.E. VIII, P. Helv. V*). *Syn.* DIMETHYLKETONE. $\text{CH}_3\cdot\text{CO}\cdot\text{CH}_3=58\cdot05$.

Dose.—60 to 90 minims (4 to 6 ml.) daily.

A colourless, light, inflammable, neutral liquid, with ethereal odour and camphoraceous taste, obtained by the dry distillation of acetates, also by the destructive distillation of wood and by a fermentation process from maize starch.

It is *miscible* with water, alcohol, ether, chloroform, and oils, and is a ready solvent of fats and resins, pyroxylin, celluloid and many other organic substances. It takes up about 25 times its volume of acetylene. Sp. gr. is 0·796 to 0·801; b.p. 56° to 58°. It is largely employed in the manufacture of chloroform. Acetone has been used in dyspnoea. It has also been given as an anthelmintic, and used for cleansing the skin prior to operation.

It occurs in small quantity as a normal constituent in the urine, also (frequently in large amount) in that of diabetics, *cf.* Vol. II.

Acetophenonum. *Syn.* HYPNONE, PHENYLMETHYLKETONE. $\text{C}_6\text{H}_5\cdot\text{CO}\cdot\text{CH}_3=120\cdot0$.

Dose.—1½ to 5 minims (0·1 to 0·3 ml.) in almond emulsion, or with mucilage or syrup and peppermint water, or in capsules containing ½ minim.

A colourless liquid, with odour of bitter almonds. Insoluble in water, but soluble in alcohol and oils. Used as an hypnotic it requires care.

Benzophenonum. *Syn.* DIPHENYLKETONE. $(\text{C}_6\text{H}_5)_2\text{CO}=182\cdot1$.

Dose.—3 to 8 grains (0·2 to 0·5 g.). White aromatic crystals. Has hypnotic properties.

Acidum Pyrolignosum Crudum. A brown acid liquid, the product of destructive distillation of wood. Contains acetic acid 5 to 13% (*P.G. VI* has minimum 8·4%; *P. Helv. V* 6 to 7%) according to the kind of wood used, also other acids—propionic, butyric, ~~also~~ also small quantities of methyl

alcohol, furfural, pyridine, creosote and resins. Has been employed locally for gangrene and has veterinary uses. It has antiseptic and preservative properties.

Acidum Pyrolignosum Rectificatum. Contains about 5% acetic acid. Of yellowish colour becoming darker on keeping. Occasionally ordered diluted 5 to 10% in mouth-washes and gargles.

Acidum Trichloraceticum (B.P., U.S.P. XI, P. *Helv.* V, P. *Ned.* V, P. *Jap.*, P. *Dan.*, F.E. VIII). $\text{CCl}_3\cdot\text{COOH}=163.4$.

Prepared by chlorination of acetic acid, or by the action of fuming nitric acid on chloral hydrate.

In deliquescent crystals, m.p. 55° (lower if moist), b.p. 195° , very soluble in water, alcohol and ether.

Uses. Applied as a crystal or liquefied by the addition of the minimum amount of water, it is a quick escharotic for venereal and other warts. As a disinfectant lotion or gargle, 1 to 5% aqueous solution may be used. A solution of 1 part in 2 of glycerin has been employed as a caustic in chronic pharyngitis.

LARYNGEAL TUBERCULOSIS treated by trichloracetic acid.—*Brit. med. J. Epit.*, ii/1930, 7.

LEPROTIC LESIONS treated with applications of a solution—1 in 1 for centre of large thick nodules, 1 in 5 for painting on face, and 1 in 3 generally useful. Must not be too strong or brush too wet. When dry, skin should show a white powdery appearance, otherwise repeat second or third time. May be repeated after 10 days.—E. Muir, *Indian med. Gaz.*, May, 1926, 216.

RIGGS'S DISEASE—incipient stages. This acid applied to the gum after cleaning with hydrogen peroxide solution 10 or 20 volume, is a good remedy. Should be tried before sound teeth are sacrificed.

RODENT ULCER. A solution of trichloracetic acid, 3 drachms in 20 minims of water, applied. The acid should be washed off after about 3 minutes, and then for 24 hours no soap or water is allowed on the ulcer. The eschar usually peels off in about 22 days.—H. Leslie-Roberts, *Brit. med. J.*, i/1927, 794.

TONSILS, DISEASES OF. Where operative treatment is not permitted, the use of trichloracetic acid applied on a right-angled wool-carrier and passed deeply into the crypts, has been found of value in reducing the size of the tonsil and adding to the comfort of the patient.

Acidum Monochloraceticum. $\text{CH}_2\text{Cl}\cdot\text{COOH}=94.5$.

Prepared by chlorination of acetic acid in presence of iodine at water-bath temperature, subsequently fractionating and reserving the 180° — 188° fraction. Deliquescent white crystals, m.p. 63° , or liquefied. It blisters the skin, and is a caustic for warts and corns. Soluble with ease in water, alcohol and ether.

Acidum Dichloraceticum. $\text{CHCl}_2\cdot\text{COOH}=128.95$.

A colourless caustic for venereal sores.

Glycine. *Syn.* AMINOACETIC ACID, GLYCOCOLL.

$\text{CH}_2\cdot\text{NH}_2\cdot\text{COOH}=75.05$.

Dose.—150 grains to 1 ounce (10 to 30 g.) per day, in two or three doses.

White crystals with sweet taste, *soluble* in water 1 in $4\frac{1}{2}$, slightly in alcohol, insoluble in ether. M.p. 234° .

Uses. Of value in the treatment of myasthenia gravis. The muscular weakness is connected with a failure to convert creatine into creatinine, for which the presence of an amino-acid is necessary. Glycine produces an increase in the output of creatinine and a drop in the excretion of creatine. Is effective in some cases of myasthenia gravis in which ephedrine fails. Other cases are benefited by the supplementary administration

of ephedrine, $\frac{3}{4}$ to $\frac{1}{2}$ gr., given 20 minutes later (the total daily amount should never exceed $1\frac{1}{2}$ gr.).

MYASTHENIA GRAVIS. Patients responding well to glycine failed to respond to gelatin. In two cases gelatin was tried as a substitute for glycine, a dose of 45 g. daily being administered for 13 and 23 days respectively, but the treatment had to be discontinued because the myasthenic manifestations increased. It was found that patients suffering from myasthenia gravis showed a diminished digestion of gelatin *in vitro* with the juice obtained from the duodenum.—E. J. Maltby, *Canad. med. Ass. J.*, 1937, 272.

Choline. $\text{HO}\cdot\text{N}(\text{CH}_3)_3\text{C}_2\text{H}_4\cdot\text{OH}=121\cdot1$.

A non-poisonous syrupy fluid. A decomposition product of lecithin. It stimulates intestinal movements.

Choline is essential for liver function; lack of it causes fatty degeneration. Dogs with the pancreas removed died in a few months when treated with insulin alone, but survived for years when fed with minced pancreas (which contains choline) in addition. Diabetes is a disorder of the liver rather than of the pancreas, and may be caused by an over-active liver due to disease or to deficiency of insulin; or to over-active pituitary, thyroid or adrenal glands.—C. H. Best, *Science (Suppl.)*, i/1935, 2112.

Choline Chloride. *Syn.* CHOLINE HYDROCHLORIDE.

$\text{Cl}\cdot\text{N}(\text{CH}_3)_3\text{C}_2\text{H}_4\cdot\text{OH}=139\cdot6$.

Dose.—10 grains (0·6 g.) intravenously.

Deliquescent needles soluble in water and alcohol.

Uses. The actions of choline resemble those of acetylcholine (*q.v.*), though its depressant action on the circulation is markedly less. It has been employed intravenously in doses of 10 g. in 180 ml. of normal saline in the treatment of paralytic ileus, the injection being given very slowly. It has also been used to a limited extent in the treatment of pulmonary tuberculosis, subcutaneous injections of $\frac{1}{2}$ grain in 1 ml. of water being given on alternate days for an indefinite period.

Bakolyse (*Anglo-French Drug Co., London*). A sterile solution of amino-acids and creatinine for intramuscular or subcutaneous use in tuberculosis and all states of denutrition. *Dose.*—2 ml. every 3 or 4 days with a minimum of 20 injections.

Biocholine (*Robert & Carrière, Paris; Anglo-French Drug Co., London*). Solution of choline hydrochloride for injection. *Dose.*—1 ml. (=0·01 g.) subcutaneously every two days continuously. In the treatment of all forms of tuberculosis.

Pacyl Tablets (*Coates & Cooper, London*). *Dose.*—1 or 2 tablets twice or thrice daily, commencing with the smaller dosage—to be swallowed whole and followed with water.

A choline preparation, each tablet containing $\frac{1}{12}$ grain (0·005 g.), employed to reduce blood pressure in arteriosclerosis, chronic nephritis and the climacteric.

Sedicyl Tablets (*Coates & Cooper, London*). *Dose.*—1 or 2 tablets three times daily—subsequently 2 tablets a day. A choline derivative used at the climacteric.

Acetylcholine. $(\text{CH}_3)_3\text{N}(\text{OH})\cdot\text{C}_2\text{H}_4\cdot\text{COO}\cdot\text{CH}_3=163\cdot1$.

Usually employed as **acetylcholine chloride** or **hydrochloride**, $(\text{CH}_3)_3\text{N}\cdot\text{Cl}\cdot\text{C}_2\text{H}_4\cdot\text{COO}\cdot\text{CH}_3=181\cdot6$. A white hygroscopic powder forming a stable solution in water.

Dose.— $\frac{1}{2}$ grain (0·05 g.) subcutaneously or intramuscularly, and $1\frac{1}{2}$ grains (0·1 g.) the following day. If inadequate after 10 days, increase to 0·2 g. twice daily. Average course 15 days'

treatment per month for 2 or 3 months. *Dangerous intravenously and ineffective orally.*

Uses. Acetylcholine is a powerful vasodilator and cardiac depressant. Its vasodilator action is exerted mainly on the arteries and arterioles, and is most marked in the peripheral vascular areas. It is a stimulant of the vagus and sympathetic, and has a tonic action on smooth muscle; it also increases the lachrymal, salivary, and other secretions. Acetylcholine has been employed, usually in the form of the hydrochloride, in the treatment of a wide variety of conditions such as Raynaud's disease, intermittent claudication, trophic ulcers, senile and diabetic gangrene, post-operative distension and paralytic ileus, and (by subconjunctival injection) in spasm of the retinal arteries and chronic glaucoma, but, except in the two last-mentioned conditions, the results have been too variable, probably owing to the fact that acetylcholine is rapidly destroyed in the system by choline esterase. It has now been largely replaced by carbachol or acetyl- β -methylcholine chloride, both of which are similar in action to acetylcholine, but are more stable and therefore more reliable.

The results of the administration of acetylcholine to man by intra-arterial, intravenous, intramuscular, or subcutaneous injection, are disappointing from the therapeutic point of view. Given by intravenous injection the effects are too brief, and by intramuscular or subcutaneous injection they are too uncertain.—F. R. Fraser, *Brit. med. J.*, ii/1938, 1249.

EMBOLISM. Subconjunctival injections of acetylcholine solution the best form of treatment for embolism of the retinal artery—4 minims on the lower temporal quadrant and 4 minims in the lower nasal quadrant, as far back as the equator of the globe.—H. C. Orr and J. H. Young, *Brit. med. J.*, i/1935, 1119.

HEADACHE following lumbar puncture can be readily relieved by hypodermic injection of 0.02 g. of acetylcholine. The dose may be repeated if necessary.—Lemaire and Bioy, per *Prescriber*, 1936, 89.

HYPERPIESIS without marked arterial change treated. Semi-permanent fall in blood pressure produced.—A. H. Douthwaite, *Brit. med. J.*, i/1930, 742.

PARALYTIC ILEUS. Most patients with severe post-operative distension, gas pains, and paresis of the bowels are considerably improved by administration of acetylcholine intramuscularly. In paralytic ileus it appears to be almost specific in curing the condition.—A. L. Abel, *Lancet*, ii/1933, 1252. Value confirmed by K. Heritage, *ibid.*, 1258.

PAROXYSMAL TACHYCARDIA. In 5 cases in which the drug was used *intravenously* in doses of 0.1 g. it stopped the paroxysmal tachycardia immediately, with little if any of the terrific side effects resulting from mecholyl.—K. H. Abott, *J. Amer. med. Ass.*, ii/1939, 1243.

TOBACCO AMBLYOPIA. Four cases received marked benefit from intramuscular injections of acetylcholine 0.1 g., given at first daily, and later once a week. It is suggested that the drug counteracts constriction of the arterioles due to nicotine poisoning.—H. C. Orr, *Brit. med. J.*, ii/1936, 69.

Acécoline (Lematte, Paris: Anglo-French Drug Co., London). A stable solution of acetylcholine hydrochloride in 1 ml. ampoules containing 0.02, 0.05, 0.1 and 0.2 g. *Average dose.*—0.1 g. twice daily, for 15 injections.

Acécoplex (Lematte, Paris: Anglo-French Drug Co., London). An ointment containing 2% of Acécoline with the addition of fenchone as an antiseptic. For the treatment of varicose ulcers, atonic wounds and dermatosis.

Tonocholin (Richter, London). Each 1 ml. ampoule contains 1.75 gr. of acetylcholine-bromine. *Dose.*—1 ml. (0.05 g.) subcutaneously or intravenously on alternate days.

Pragmoline (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Acetylcholine bromide. Supplied in 1 ml. ampoules of a 12.5% solution. Given by deep subcutaneous injection, or intramuscularly, in hypertension, Raynaud's disease and tuberculous sweats.

[P1] **Hypotan** (*Lemaitre, Paris; Anglo-French Drug Co., London*). Methylacetylcholine bromide 0.005 g., bromocholine bromide 0.005 g., chloral hydrate 0.05 g. *Dose*.—4 to 6 tablets daily before meals for 15 days each month. In hypertension. Also supplied in 1 ml. ampoules.

Carbacholum (*B.P. Add. III*).

$\text{NH}_2\cdot\text{CO}_2\cdot\text{CH}_2\cdot\text{CH}_2\text{N}(\text{CH}_3)_3\text{Cl}$ = 182.6. *Prop. Name*. MORYL (*Savory & Moore, London*), CHORYL (*Pharmaceutical Products, London*).

(A foreign proprietary of similar composition was formerly marketed in this country under the registered trade name DORYL.)

Dose.—Orally $\frac{1}{8}$ to $\frac{1}{16}$ grain (0.001 to 0.004 g.); subcutaneously or intramuscularly $\frac{1}{16}$ to $\frac{1}{32}$ grain (0.00025 to 0.0005 g.). *It should never be used intravenously.*

Carbachol is carbamylcholine chloride, the urethane of choline, and it occurs as a white, odourless, crystalline powder, hygroscopic in moist air. M.p. 210° to 212° with decomposition.

Soluble 1 in 1 of water, 1 in 50 of alcohol and 1 in 10 of methyl alcohol, but almost insoluble in acetone and ether. The aqueous solution is stable to heat, and may be sterilised by autoclaving.

Antidote. Untoward effects may be relieved by the injection of atropine $\frac{1}{100}$ gr.

Uses. Carbachol exerts effects similar to those of acetylcholine, but it is also active orally and has a more persistent action. It stimulates the parasympathetic nervous system, lowers the blood pressure and dilates the peripheral blood vessels. Carbachol causes contraction of the intestinal and bladder muscle, and is used subcutaneously or intramuscularly to relieve post-operative intestinal atony and to promote micturition due to atony of the bladder wall. The action of carbachol by the mouth is less certain than by injection, but good results are said to have been obtained in paroxysmal tachycardia by the oral administration of from $\frac{1}{8}$ to $\frac{1}{16}$ gr. It is also used as eye-drops in an 0.75% solution for decreasing intra-ocular pressure in glaucoma, and 10 drops of an 0.05% solution applied intranasally three times a day is of value in *ozæna*. The solution may also be applied with a brush or spray.

The results of the administration of carbaminoylcholine to man show that it has in general the same actions as acetylcholine, but because of its increased stability it is effective by intramuscular and subcutaneous injections, and these actions can be maintained for a much longer time than is possible with acetylcholine. By oral administration its effects appear to be less certain, and when given repeatedly malaise and headache result. It can be administered slowly over long periods by ionisation, and local effects in the eye can be obtained by conjunctival instillation. Further, in comparison with acetylcholine the effects on the gastro-intestinal tract and the bladder appear to be greater and those on the cardiovascular system less.—F. R. Fraser, *Brit. med. J.*, i/1938, 1293.

Doryl is useful in the relief of post-operative retention of urine. It has less effect in cases with mechanical obstruction, but is still worthy of trial before resorting to catheterisation. Minor side-effects (salivation, sweating, nausea, shivering, faintness, passage of flatus) make its use inadvisable for very ill or shocked patients. It is also suggested that it should be given an extensive trial

in the treatment of urinary retention associated with spinal cord injuries or tumours or diseases.—R. Officer and J. C. Stewart, *Lancet*, ii/1937, 850.

About a dozen cases of urinary retention which would otherwise have needed catheterisation successfully treated by an intramuscular injection of 0.25 mg. of Doryl.—H. Stalker, *Brit. med. J.*, i/1938, 1393.

Lentin (*Merck, Darmstadt; Savory & Moore, London*). Carbaminoylcholine chloride for veterinary use.

Note.—Formerly the words "LENTIN" and "LENTINE" were applied to *m*-phenylenediamine.

Acetyl- β -methylcholine Chloride.

$(\text{CH}_3)_3\text{NCl} \cdot \text{CH}_2 \cdot \text{CH}(\text{CH}_3) \cdot \text{O} \cdot \text{CO} \cdot \text{CH}_3 = 195.72$. *Prop. Name*. MECHOLYL (*Merck, Darmstadt; Savory & Moore, London*).

Dose.—Orally, 3 to $7\frac{1}{2}$ grains (0.2 to 0.5 g.); subcutaneously, up to 0.025 g. *It should not be given intravenously*.

Acetyl- β -methylcholine chloride is a very deliquescent, white, odourless, crystalline substance melting at 172° .

Very *soluble* in water and alcohol, the aqueous solution having a bitter taste and only limited stability.

Contraindications. It should not be given to patients who are seriously ill or who have asthma, and should be used with caution in elderly patients.

Antidote. Atropine $\frac{1}{1000}$ grain, instantly destroys the action of acetyl- β -methylcholine chloride.

Uses. The action of acetyl- β -methylcholine chloride, whether given by the mouth or by injection, is similar to that of acetylcholine, but it is more stable than the latter and is therefore better suited to clinical use. It is a stimulant of the parasympathetic and antagonises adrenaline. It slows the heart and lowers blood pressure, dilates peripheral blood vessels, increases intestinal tone and peristalsis, and stimulates the activity of the salivary and sweat glands. It has been employed *per os* in a dose of 3 to $7\frac{1}{2}$ gr. two or three times daily in atony of the bladder and intestinal distension. Subcutaneously it has been employed with success in paroxysmal tachycardia, in post-operative abdominal distension, and in various types of peripheral vascular disease. Subcutaneous injections cause a rapid and sharp fall in blood pressure and a rise in the pulse rate, the action lasting for 15 to 20 minutes. For the treatment of conditions such as Raynaud's disease, varicose ulcers, etc., some workers prefer to employ the substance by ionisation, using a 0.1 to 0.5% aqueous solution, which produces the desired local effects without the pronounced systemic effects caused by injections.

A warning as to confusion with acetylcholine. Given subcutaneously, acetyl- β -methylcholine is somewhere between 10 and 20 times as powerful as acetylcholine, and an injection of 75 mg. to a boy of 14 would probably produce enough vagus effect to stop the heart altogether.—I. Starr, *per Lancet*, i/1936, 391.

Like carbaminoylcholine, acetyl- β -methylcholine has actions similar to those of acetylcholine and is more stable, producing typical effects when given by subcutaneous or intramuscular injection, by the mouth, or by ionisation. By injection, a dose of 10 to 25 mg. appears to be comparable to 0.25 to 0.5 mg. of carbaminoylcholine. With both esters the results following injection appear in a few minutes, but while the action on the cardiovascular system passes off in from 30 to 40 minutes the action on the gastro-intestinal tract and bladder may persist for several hours. It is generally accepted that the action of

carbaminoylecholine on the gastro-intestinal tract is relatively greater than on the cardiovascular system, and that the reverse is the case with acetyl- β -methylcholine.—F. R. Fraser, *Brit. med. J.*, i/1938, 1293.

Acetyl- β -methylcholine is rapidly absorbed by the nasal mucous membrane when administered in a glycol or water vehicle. Small doses (25 to 250 mg.) administered by this method produce local and general reactions, the most easily measured of which is a drop in blood pressure.—T. R. Van Dellen, M. Bruger and I. S. Wright, *J. Pharmacol.*, 1937, 59, 379.

In the presence of a very small amount of one of the drugs of the atropine series within the body, acetyl- β -methylcholine fails to cause its characteristic effects of perspiration, salivation, lachrymation and rhinorrhœa. Thus it may be used as a diagnostic test for poisoning created by any one of the atropine series of drugs.—W. Domeshek and O. Feinsilver, *J. Amer. med. Ass.*, ii/1937, 561.

PAROXYSMAL TACHYCARDIA. The dose should be increased in reference to age, the optimum dose being 10 mg. at the age of 20, increasing to 30 mg. at the age of 60. This is probably related to the weight of the patient. Toxic effects with alarming symptoms may follow intravenous injection. Asthmatic attacks in patients subject to this disease may occur and subternal pain on rare occasions, but there is no evidence to show that the drug is dangerous when administered in the proper dosage and in the proper manner. It is only occasionally successful in auricular flutter.—*Amer. J. med. Sci.*, 1936, 191, 210.

ACIDUM ACETYLSALICYLICUM

B.P., U.S.P. XI, *Fr. Cx.*, *P. Jap. V.*, etc.

$\text{CH}_3\text{CO}\cdot\text{O}\cdot\text{C}_6\text{H}_4\cdot\text{COOH} = 180.06.$

Syn. ASPIRIN. This name is public property in Great Britain and Northern Ireland. In other countries it is a registered trade mark. ASPRO (*Aspro Ltd., Slough*), EMPIRIN (*Burroughs Wellcome, London*), GENASPRIN (*Genatosan, Loughborough*), are further names for the substance in tablet form. ASPIRGRAN (*Monsanto Chemicals Ltd., London*) is a granular form.

Dose.—5 to 15 grains (0.3 to 1 g.), in cachets, tablets, or suspended in a good draught of water thrice daily after meals—not on an empty stomach. Children $\frac{1}{2}$ to 5 grains (0.03 to 0.3 g.). *P. Ital. V* has 3 g. as max. dose in 24 hours; *F.E. VIII*, 5 g.; *Fr. Cx.*, 6 g.

A white crystalline powder, m.p. 135° to 138°. It is not completely stable—all samples have an odour of acetic acid. In dry air it is fairly stable, but in contact with moisture it gradually hydrolyses into salicylic and acetic acids. In solution with alkalis this hydrolysis proceeds rapidly, and the clear solutions formed may consist entirely of acetate and salicylate.

Soluble about 1 in 300 of water, 1 in 5 of alcohol 90%, 1 in 17 of chloroform, 1 in 20 of ether.

Incompatible with free acids, acetanilide, phenazone, hexamine, acacia, iron salts and alkalis.

Antidotes. Empty stomach by emetic, or by stomach tube using 5% sodium bicarbonate solution. Keep patient warm. Give milk or water freely, containing a little sodium bicarbonate. Stimulants if necessary. Saline infusion, with dextrose, if required.

The dangerous dose of aspirin probably varies considerably around 400 to 500 gr., but, in the light of more recent observation on the beneficial results of treatment, lethal effect may be avoided

even when more than 500 gr. are ingested. It seems reasonable to believe that even when the symptoms of poisoning have reached an advanced stage, the combined therapeutic effect of the introduction of fluid to the body and the simultaneous aspiration of cerebrospinal fluid will be the means of saving an otherwise hopeless situation.

Reports of poisoning. Notes on four fatal cases and on two cases with recovery following the taking of 500 and 435 gr. respectively.—A. V. Neale, *Brit. med. J.*, i/1936, 110.

Case of woman who took about 435 gr. of acetylsalicylic acid ending in recovery; glucose, 5% in saline, by rectum, and fruit juice with glucose by mouth, were given freely. Strikingly beneficial effect of lumbar puncture.—S. C. Dyke, *Lancet*, ii/1935, 613.

Attempted suicide by taking 600 gr. Recovery without active treatment.—S. Lipetz, *Brit. med. J.*, i/1934, 652.

Attempted suicide from 450 gr. Cyanosis, and later œdema and enlargement of heart. Recovery.—*Lancet*, i/1933, 490.

Two infants of 14 months and 2 years and 8 months developed severe toxic symptoms after ingestion of 30 gr. and 60 gr. respectively. Both recovered following injection of Hartmann's solution intravenously.—S. W. Williams and R. M. Panting, *Brit. med. J.*, i/1937, 550.

Death of a woman, aged 30, after swallowing 100 5-gr. tablets.—E. Biddle, *Brit. med. J.*, i/1938, 1365.

Toxic Effects. May occasionally cause gastric pain, vomiting and giddiness, œdema of face and skin rash, even in relatively small doses. It should be administered on a full stomach.

Dyspnoea is an important symptom of salicylate poisoning, and it is largely because of this hyperpnoea that acidosis of diabetic or renal origin is often suspected unless there is a clear history of the ingestion of salicylate. The finding of the violet colour reaction in the spinal fluid with ferric chloride may be a useful differential diagnostic procedure. The following symptoms are rarely seen in diabetic acidosis but frequently in salicylate poisoning: tinnitus, twitching, convulsion, deafness, dimness of vision, sweating, hallucinations, disorientation, delirium and urticaria.—B. D. Bowen, J. F. Ronfa and O. W. Clinger, *J. Amer. med. Ass.*, ii/1936, 276.

The diagnosis of hypersensitivity for aspirin usually may be made easily by simply questioning the patient. Use of skin tests is not advised in patients with a personal or family history of allergic disease, since they will often be negative even though the patient is hypersensitive to the drug, and if positive they may provoke severe reactions. Aspirin should always be employed with caution in the treatment of asthmatic patients, and should never be given to one who has nasal polyps.—H. F. Buchstein and L. E. Prickman, *Proc. Mayo Clin.*, 1937, 616.

From gastroscopic observation it is concluded that acetylsalicylic acid (in the form of aspirin and certain proprietary preparations) is a gastric irritant, and may thus cause indigestion and hæmorrhage, or, if taken repeatedly, chronic gastritis. If taken after food or with milk it probably has no deleterious effect. Calcium acetylsalicylate is less irritating.—A. H. Douthwaite and G. A. M. Lintott, *Lancet*, ii/1938, 1222.

Uses. Analgesic and antipyretic. It has anti-rheumatic properties, and is useful in influenza (especially with quinine), acute and chronic affections of the joints, headaches and in gout, neuralgia, chorea, and pleurisy. In influenzal complaints a dose taken at bed-time will often induce perspiration; quiet sleep follows, fever is reduced and pulse improves. In some cases, it is useful with caffeine or with phenacetin and Dover's powder. The latter combination is useful also in measles and mumps. Aspirin gargle (10 gr. to 1 oz. of water) is very useful after tonsillectomy and operations on the pharynx.

Appreciable quantities of the calcium of the teeth go into solution when an aspirin gargle is used, and the use of such a gargle over a number of years might well result in permanent damage to the teeth. The fairly alkaline solution of sodium salicylate obtained by dissolving equal weights of aspirin and sodium bicarbonate has no appreciable effect on the teeth.—D. B. Dott, *Edinb. med. J.*, 1940, 700.

ACUTE RHEUMATISM. Aspirin in the same dosage would appear to be equally efficacious, if not more so, than sodium salicylate, in reducing pain and fever, but less frequently produces signs of poisoning, and there would appear to be no need to give alkalis with this drug. Yet it must be remembered that some pharmacologists consider aspirin to be more toxic than sodium salicylate. Clinical experience, however, hardly supports this view, and we have come to regard aspirin as the more useful of the two drugs.—C. Bruce Perry, *Med. Pr.*, 1936, 136.

Mistura Acidi Acetylsalicylici (B.P.C.). *Syn.* ASPIRIN MIXTURE.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Acetylsalicylic acid 15 gr. suspended with compound powder of tragacanth in chloroform water to 1 oz.

Mistura Acidi Acetylsalicylici Composita (B.P.C.). *Syn.* COMPOUND ASPIRIN MIXTURE.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Acetylsalicylic acid 15 gr., dissolved with the aid of potassium citrate 30 gr., in syrup of lemon and chloroform water to 1 oz.

Mist. Acid. Acetylsal. (N.I.F.).

Acetylsalicylic acid $7\frac{1}{2}$ gr., potassium citrate 15 gr., chloroform water to $\frac{1}{2}$ oz.

Hauftus Acid Acetylsalicylici Compositus (Mid. H.).

Acetylsalicylic acid 5 gr., phenacetin 5 gr., caffeine citrate $2\frac{1}{2}$ gr., compound powder of tragacanth 10 gr., chloroform water to 1 oz.

[P1] **Mistura Acidi Acetylsalicylici Composita (W.H.).**

Syn. MORGAN'S MIXTURE.

Acetylsalicylic acid 5 gr., caffeine citrate 2 gr., potassium citrate 20 gr., camphorated tincture of opium 15 m., liquid extract of liquorice 15 m., chloroform water to $\frac{1}{2}$ oz.

Acetylsalicylic acid (3%) dissolved in alcohol 50% loses about 1.5% per day, 6.0 to 6.5% per week and 13.5 to 14.5% per month. A suspension of the same strength, and kept under the same conditions, loses 0.3% per day, 1.6 to 2.0% per week and 7 to 8% per month. Suspensions should be prescribed and dispensed in preference to solutions containing ammonium acetate or similar substances, and where administrations of tablets is not desired.—H. W. Tomski and L. J. Waller, *Pharm. J.*, i/1940, 53.

Tabellæ Acidi Acetylsalicylici (B.P.C.) contain 5 gr. (0.3 g.).

Tabellæ Acidi Acetylsalicylici et Caffeinæ (B.P.C.) contain acetylsalicylic acid 4 gr. and caffeine 1 gr.

Tabellæ Acidi Acetylsalicylici Compositæ (B.P.C.). *Syn.* TAB. ASPIRIN. Co. (N.I.F.), COMPOUND ASPIRIN TABLETS. Contain acetylsalicylic acid $3\frac{1}{2}$ gr., phenacetin $2\frac{1}{2}$ gr. and caffeine $\frac{1}{2}$ gr.

[P1-81] **Tabellæ Acidi Acetylsalicylici et Opii (B.P.C.).** *Syn.* TAB. ASPIRIN. ET DOVER. (N.I.F.), TABLETS OF ASPIRIN AND DOVER'S POWDER.

Contain acetylsalicylic acid $2\frac{1}{2}$ gr. and powder of ipecacuanha and opium $2\frac{1}{2}$ gr. (*Exempt (D).*)

[P1] **Tabellæ Acidi Acetylsalicylici et Opii Compositæ**
(B.P.C.). *Syn.* TAB. ASPIRIN. ET DOVER. Co. (N.I.F.).

Contain acetylsalicylic acid 3 gr., phenacetin $1\frac{1}{2}$ gr., and powder of ipecacuanha and opium 1 gr.

[P1-S1] **Pilula Aspirin et Acidi Arseniosi (Hoedemaker's Pill)** (*Vic. Park*).

Aspirin $2\frac{1}{2}$ gr., arsenic trioxide $\frac{1}{4}$ gr., starch and distilled water sufficient to make into 100 pills. *Dose.*—2 pills thrice daily, increasing carefully by one pill every second day to a maximum, continued for a period, of never more than 25 pills daily, and then reducing at the same rate.

Albyl Tablets (*Bencard, London*). Peppermint-flavoured tablets containing acetylsalicylic acid 5 gr., heavy magnesium oxide 0.8 gr. Stated to be less irritating to the mucous membrane of the stomach.

Anadin (*Anadin, London*). Tablets containing in each: aspirin 3 gr., phenacetin 3 gr., caffeine $\frac{1}{2}$ gr., quinine sulphate $\frac{1}{2}$ gr.

Arifon (*Lilly, London*). Aspirin $2\frac{1}{2}$ gr., sodium citrate 5 gr., caffeine citrate $\frac{1}{2}$ gr., in capsules.

Aspiphelin (*Bayr Products, London*). Tablets containing aspirin 5 gr., phenacetin $2\frac{1}{2}$ gr.

Bromalgin (*Reynolds & Branson, Leeds*). Contains aspirin, caffeine citrate and potassium bromide. *Dose.*—1 or 2 drachms, well diluted. A general analgesic.

Caffacetin (*Duncan, Flockhart, Edinburgh*). Tablets containing $2\frac{1}{2}$ gr. each of phenacetin, aspirin and caffeine citrate.

Collopyrin (*Crookes Laboratories, London*). Acetylsalicylic acid 5 gr. with kaolin. *Dose.*—1 or 2 tablets three or four times daily.

Emocin (*Burroughs Wellcome, London*). Lozenges containing acetylsalicylic acid 2 gr., in a flavoured demulcent base. For sore throats.

[P1] **Fibrosan** (*John Wyeth, London*). Tablets each containing acetylsalicylic acid 2 gr., salol 1 gr., sodium salicylate 2 gr., strychnine sulphate $\frac{1}{100}$ gr., calcium carbonate 1 gr. *Dose.*—2 tablets thrice daily. Advocated for the relief of pain in rheumatic affections, influenza, dysmenorrhœa and migraine.

Calcii Acetylsalicylas (B.P.C., *P. Ned. V Supp II*).

Prop. Names. KALMOPYRIN (*Richter, London*), TYLCALSIN (*Martindale, London*). $(\text{CH}_3\text{CO}\cdot\text{OC}_6\text{H}_4\cdot\text{COO})_2\text{Ca}\cdot 2\text{H}_2\text{O} = 434.2$.

Dose.—5 to 15 grains (0.3 to 1 g.), in cachets or tablets, followed by a draught of water.

White amorphous non-hygroscopic powder, decomposing in moist air. It may be prepared in a stabilised form containing from 5 to 7% of calcium chloride by adding sodium bicarbonate to a suspension of finely powdered acetylsalicylic acid in a solution of calcium chloride, stirring until effervescence ceases, filtering, washing the precipitated product with a solution of calcium chloride and drying *in vacuo*. The increased stability appears to be due to the removal of the water of crystallisation and of absorbed moisture by the calcium chloride, thereby retarding hydrolysis. In aqueous solution, the stabilised salt becomes hydrolysed as rapidly as the unstabilised salt, with the formation of calcium salicylate and acetic acid. Stabilised calcium acetylsalicylate is an odourless, tasteless, white powder.

Soluble 1 in 5 of water; slightly soluble in alcohol.

Uses. In view of its greater solubility, calcium acetylsalicylate forms a useful alternative to aspirin. It is more readily absorbed, is often better tolerated and causes less gastric irritation.

A prompt rheumatic and influenza specific, also in catarrhs and neuralgia and for relief of pain. In lumbago 2 tablets at night in

hot tea (as diaphoretic) valuable. In gonorrhœal rheumatism has given excellent results.

Considerably less toxic than ordinary aspirin and much larger doses can safely be used when required. It is not contraindicated in cases of cardiac weakness and is especially suitable in conditions known to be unfavourably sensitive to ordinary salicylate medication. It is analgesic, antipyretic, diaphoretic, sedative and antirheumatic, and is markedly superior to ordinary aspirin in the treatment of chorea in children; it is also a good source of easily assimilable calcium (10%) and is of value for women during pregnancy and lactation, for growing children, senile cases and in arthritic patients where salicylate therapy is indicated.—M. Coplans, *Med. Pr.*, ii/1939, 199.

CHOREA. Satisfactory clinical results—with an average daily dose *per os* of from 30 to 45 gr. of calcium aspirin for a child of 12. It has a triple action: (1) antirheumatic, (2) correction of Ca deficiency, (3) sedative to brain.—N. Mutch, *Brit. med. J.*, ii/1934, 248. See also N. Hill, *Med. Pr.*, 1936, 415.

Treatment with calcium aspirin gives good clinical results in Sydenham's chorea and considerably shortens the duration of the disease, but it is simply symptomatic. The calcium probably acts as a nerve sedative and the salicylates have a beneficial effect on the rheumatic infection.—G. E. G. Pearson, *Canad. med. Ass. J.*, i/1937, 576.

Calcium Acetylsalicylate Intravenously.

Dose.—The usual dose is 0.5 g. in 10 to 20 ml. of sterile water, but larger doses, even 2 g., have been injected *very slowly*. Solutions must not be heated. The concentration is of importance; it should not exceed 5%.

Uses. Successful in sciatica, acute rheumatism, tabes dorsalis, interstitial keratitis, acute iritis, gonorrhœal synovitis, dysmenorrhœa and severe headaches of doubtful causation. Psoriasis of 15 years standing was treated by the method with marvellous result; the affection cleared up completely. Of considerable value in rheumatic endocarditis. 0.25 g. has been given to children of 14.

In acute and subacute rheumatism and in septicæmia useful intravenously.—H. Pritchard, *Brit. med. J.*, i/1927, 794.

Rapid results in rheumatic infections from Tylcalsin intravenously.—J. Burnford, *Lancet*, i/1931, 351.

Alasil Tablets (Wander, London). **Dose.**—1 or 2 thrice daily in an ample supply of water. Tablets containing calcium acetylsalicylate 7½ gr. and Alocol (colloidal aluminium hydroxide) 6 gr. Antipyretic, analgesic and sedative. In rheumatic affections, influenza, chills, neuralgia and cough.

Caleno (J. C. Eno, London). Calcium acetylsalicylate stabilised by the addition of up to 5% of calcium chloride. Issued in powder form only.

Kafalgol (Richter, London). Calcium acetylsalicylate 0.5 g., caffeine 0.05 g. **Dose.**—2 to 3 tablets daily. In headache, toothache, etc.

Lithii Acetylsalicylas (B.P.C.). $\text{CH}_3\text{CO}\cdot\text{OC}_6\text{H}_4\cdot\text{COOLi}$ = 186.0. **Prop. Names.** HYDROPYRIN (*Richter, London*), LITMOPYRINE (*A. Bishop Ltd., London*), TYLLITHIN (*Martindale, London*).

Dose.—5 to 15 grains (0.3 to 1 g.). Maximum daily dose 75 grains. White powder with a bitter taste.

Soluble 1 in 1 of water, 1 in 4 of alcohol 90%, insoluble in ether. The salt is to be kept in a well-closed bottle as it undergoes decomposition in moist air.

Incompatible with iron salts, mineral acids and alkalis. It is preferably given as cachets or tablets, the latter to be crushed and taken in a little water. It is *not desirable* to give it in mixture form.

Uses. Analogous to those of the calcium salt.

Enema Sedativum (St. G.H.).

Sodium bromide 1 dr., lithium acetylsalicylate 10 gr., water to 5 oz. To be mixed with an equal quantity of warm water and given immediately after operation.

Magnesii Acetylsalicylas. *Prop. Names.* MAGASPIRIN (*Duncan, Flockhart, Edinburgh*), MAGISAL (*Martindale, London*).
 $(\text{CH}_3\text{CO}\cdot\text{O}\cdot\text{C}_6\text{H}_4\cdot\text{COO})_2\text{Mg}=382\cdot3$.

Dose.—5 to 15 grains (0·3 to 1 g.).

Microcrystalline powder, non-hygroscopic, almost tasteless and odourless, soluble 1 in 12 of water, less readily in alcohol.

Incompatibility and Uses are similar to those of the lithium and calcium salts.

Magsyn (*Allen & Hanburys, London*). Tablets containing $7\frac{1}{2}$ gr. of basic magnesium acetylsalicylate. *Dose.*—1 to 3 tablets.

Sodii Acetylsalicylas. $\text{CH}_3\text{CO}\cdot\text{O}\cdot\text{C}_6\text{H}_4\cdot\text{COO}\cdot\text{Na}=202\cdot1$.

Dose.—5 to 15 grains (0·3 to 1 g.).

White amorphous hygroscopic powder, very soluble in water.

Uses. Analogous to those of the calcium salt.

Saligenin. $\text{C}_6\text{H}_4\text{CH}_2\text{OH}\cdot\text{OH}=124\cdot1$. *Dose.*—10 grains (0·6 g.).

This is the alcohol of which salicylic acid is the corresponding acid. It is converted into the acid in the body.

It is formed with glucose on the hydrolysis of salicin. In acute rheumatism it has been well spoken of by R. Stockman.

Aspirodine (*Martindale, London*). Acetyliodosalicylic acid, a stable iodine derivative of acetylsalicylic acid containing about 41% of I. For rheumatic affections and arteriosclerosis. *Dose.*—5 grains (0·3 g.) per day after food, preferably given alone; may be increased if required. Cachets, capsules and tablets are available.

Methyl-Aspirodine (*Martindale, London*). Methyl acetyliodosalicylate, the methyl ester of Aspirodine. It occurs as white crystals agglomerated into granules, m.p. 40° , containing 39·7% of I. Applied by inunction, it is a prompt local analgesic in rheumatism, neuritis, sciatica, lumbago and other painful affections. Should not be rubbed vigorously into extensive areas unless diluted. **Methyl-Aspirodine Balm** contains 50% of Methyl-Aspirodine in a lanolin base. **Methyl-Aspirodine Liniment** contains 25% of Methyl-Aspirodine with camphor, chloroform and menthol.

Phenyl-Aspirodine (*Martindale, London*). Acetyliodosalol, for use as an intestinal and urinary antiseptic. *Dose.*—5 grains (0·3 g.), administered alone as a cachet, capsule or tablet, in water.

Sedasprin (*Martindale, London*). Acetyl bromosalicylic acid, a stable compound containing approximately 31% of Br. It combines the analgesic and antipyretic properties of aspirin with the sedative action of the bromides. For use in headache, dysmenorrhœa, insomnia, tonsillitis, etc. *Dose.*—5 to 10 grains (0·3 to 0·6 g.), preferably given alone as a cachet, capsule or tablet.

Ammonium Ortho-iodoxybenzoate.

Syn. AMIODOXYL BENZOATE. $\text{C}_6\text{H}_4(\text{IO}_2)\cdot\text{COONH}_4=297\cdot0$.

A white crystalline powder containing 42·7% of I, readily soluble in water. To avoid decomposition it should be kept dry and away from sunlight. *Dose.*—11 to 15 grains (0·75 to 1 g.) intravenously, or twice this dose orally.

Uses. Chiefly in arthritis, especially active infection. It is given in 100 ml. of normal saline intravenously within 7 to 12 minutes, but orally and in 2 g. doses by high enema it has been found effective. Following intravenous use, reactions resembling non-specific protein reactions may occur. The salt is quickly reduced in the blood stream, and it is stated to stimulate phagocytosis of streptococci and staphylococci.

Arthrytin (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Calcium o-iodoxybenzoate. Tablets contain 0·5 g. *Dose.*—1 tablet with a glassful of water three daily after meals. Treatment should be continued for a number of months. For the hypertrophic and atrophic types of arthritis.

Good results have also been obtained in leg ulcer. The ammonium salt is also available for intravenous use. Oral administration of the calcium salt is stated not to be followed by the reactions associated with intravenous administration of the ammonium salt.

Calsiod (Smith, Kline & French, Philadelphia; Menley & James, London). Calcium *o*-iodoxybenzoate. Tablets contain 0.5 g. Arthritis and rheumatic conditions.

Acetyl-para-amidosalol. $C_6H_5OH \cdot COO \cdot C_6H_4NH \cdot COCH_3 = 271.16$.
Prop. Name. SALOPHEN (Bayer Products, London). (P. Belg., P. Helv. V, P. Ned. V, Fr. Cx., F.E. VIII, P. Ital. V, P. Svec).

Dose.—5 to 15 grains (0.3 to 1 g.) 3 or 4 times a day in cachets.

White crystalline scales, tasteless; soluble 1 in 160 of alcohol, 1 in 105 of chloroform, ether, and alkalis, almost insoluble in water. It contains about 50% salicylic acid.

Incompatible with alkalis and their carbonates, and with hexamine. It is unaffected by gastric juice, but decomposed by pancreatic ferment.

Uses. Febrifuge and anti-rheumatic. Used in chorea, neuralgia, sciatica, headache and throat affections. Ointment 10% in lanolin for psoriasis and other skin affections.

ACIDUM ASCORBICUM

(with VITAMIN K, etc.)

B.P. Add. I, U.S.P. XI Supp. II, Fr. Cx., etc.

$O \cdot CO \cdot C(OH) : C(OH) \cdot \dot{C}H \cdot CHOH \cdot CH_2OH = 176.1$.

Syn. and Prop. Names, VITAMIN C, CEVITAMIC ACID, REDOXON (Roche Products, Welwyn Garden City), CANTAN (Bayer Products, London), CELIN (Glaxo Laboratories, London), DAVITAMON C (Organon Laboratories, London), PLANAVIT C (Pharmaceutical Specialities (May & Baker) Ltd., London).

Dose.—Prophylactic (daily), $\frac{3}{4}$ to $\frac{1}{2}$ grain (0.025 to 0.05 g.), equivalent to 500 to 1000 units. Therapeutic (daily), $1\frac{1}{2}$ to 4 grains (0.1 to 0.25 g.), equivalent to 2000 to 5000 units. *U.S.P. XI Supp. II* has average daily dose $\frac{3}{4}$ grain (0.05 g.), equivalent to 1000 units.

In colourless, odourless crystals with an acid taste. It is obtained synthetically or may be extracted from the ripe fruit of *Capsicum annuum* or from other vegetable sources. Chemically ascorbic acid is the enolic form of 3-keto-*l*-gulofuranolactone. It contains 20,000 units per g.

Soluble 1 in 3 of water, 1 in about 30 of alcohol 95%; less soluble in methyl alcohol and acetone; insoluble in chloroform, benzene, ether and light petroleum. Ascorbic acid in alkaline solution (pH 8.3) can be sterilised by heating at 100° for one hour.

Human Requirements. The minimum daily requirement of ascorbic acid for an adult is about 25 mg. The requirements of infants and children are proportionately greater than those of adults, and it would appear that infants should receive at least one-third as much ascorbic acid, calculated per unit of body weight, as adults. Thus the minimum level for infants should be not less than 10 mg.

These quantities are normally supplied in the diet, but individuals vary greatly in their requirements, and the higher the

metabolism (as in pregnancy and lactation) the greater is the need, and for prophylactic purposes doses of at least double the minimum requirements are therefore advised, while in cases of known deficiency, or where there is excessive excretion, doses of 100 to 300 mg. are employed.

Uses. Ascorbic acid regulates the oxidation-reduction processes of the living cell. It plays an important part in connection with resistance to bacterial infection and toxins, and acts as a general cell stimulant and detoxicating agent in infections. Clinical scurvy, which is the outcome of severe ascorbic acid deficiency, is seldom seen now in adults but is still a not uncommon disease in infants, and an ample intake of ascorbic acid is therefore a matter of major importance during pregnancy and lactation. It is now generally agreed, moreover, that a minor degree of ascorbic acid deficiency, which has been termed "latent scurvy," is relatively common among adults and is the cause of much ill-health.

In addition to its use as a specific in the prophylaxis and treatment of scurvy, ascorbic acid has been employed with varying success in the treatment of numerous other diseases. These may be classified as (a) those diseases which are due, in greater or less degree, to an initial deficiency of ascorbic acid, and (b) those diseases in which, owing to increased excretion, the normal ascorbic acid requirements are augmented. Among the former may be mentioned (apart from scurvy) anæmia, and especially the anæmias of childhood, increased capillary fragility, hæmophilia, dental caries, gingivitis and cataract, and among the latter the infectious diseases such as influenza, whooping cough, diphtheria, rheumatic fever, and pneumonia.

Ascorbic acid should also be used as a prophylactic measure in gastric and duodenal ulcer when restricted diets are prescribed.

It seems justifiable for the clinician to assume that orange juice contains about 50 mg. of ascorbic acid per 100 ml., tomato juice 17 mg., and pineapple juice 10 mg. In his approximation of prophylactic doses he can consider 50 ml. of orange juice (containing 25 mg. of ascorbic acid) as a nutritional unit, equivalent to 150 ml. of tomato juice and 250 ml. of pineapple juice. The effect of usual home procedures can be ignored although storage for more than two days, even in the refrigerator, has a progressively destructive effect on the vitamin.—T. H. Ingalls, *New Engl. J. Med.*, ii/1939, 685.

ARSENICAL DERMATITIS. Toxic effects after the arsenical anti-syphilitic drugs may be counteracted by ascorbic acid, which appears to have a pronounced detoxicating influence and has a beneficial effect on dermatitis following nearsphenamine. For cases of exfoliative dermatitis the daily subcutaneous injection of 1 ml. of 5% solution, with two tablets of 50 mg. thrice daily, is advised.—R. Lees, *Practitioner*, ii/1937, 418.

CATARACT. A case of bilateral cataract following treatment with dinitrophenol. The right eye was treated surgically, but when the left cataract was ready for extraction vitamin C was administered orally, 40 fl. oz. of orange juice and subsequently 500 mg. of the synthetic vitamin in addition being given daily. Definite improvement occurred.—S. Simkins, *J. Amer. med. Ass.*, i/1937, 2193.

DERMATITIS. Striking effect of L-ascorbic acid (vitamin C) on five cases—three of dermatitis produced by arsenobenzene, a case of intolerance to the drug, and a case of gold dermatitis. The good effects of the injections were almost immediately noticeable, and a cure effected in two or three weeks in cases which might have persisted for months or have had even a fatal issue. 0.05 g. was given intravenously dissolved in distilled water. In one patient whose dermatitis made it impossible

to find a vein, the drug was given orally three times a day with equally good results.—I. Dainow, per *Brit. J. Derm.*, 1936, 48, 167.

HÆMORRHAGE. Five cases of capillary hæmorrhage (essential thrombopenia, purpura infectiosa, essential hæmaturia) satisfactorily treated by intravenous injections of from 100 to 200 mg. daily. Should not attempt treatment in venous or arterial hæmorrhage.—H. Engelkes, *Lancet*, ii/1935, 1285.

A case of hæmorrhage in the right eye recurring at intervals of about 20 days and treated by oral administration of vitamin C as a proprietary preparation, Redoxon, cleared up quickly and there was no further remission during several months.—H. Villard and co-workers, per *Nutr. Abstr. Rev.*, Jan., 1936, 744.

HEART FAILURE. Vitamin C increased the urinary output in each of 8 patients with heart failure and in another with considerable œdema of the lower extremities of unknown origin. In 2 patients the increase was slight, in 4 it was either moderate or considerable, and in 3 cases it was great. These results indicate the need of providing an adequate supply of vitamin C for all patients with heart failure.—W. Evans, *Lancet*, i/1938, 308.

PAROXYSMAL HÆMOGLOBINURIA successfully treated with ascorbic acid, 300 mg. intravenously for several days. The hæmoglobinuria disappeared, and although treatment has now been stopped for 6 weeks paroxysms (due to cold) cannot now be stimulated. Suggested trial in blackwater fever.—L. Armentano, *Nature, Lond.*, i/1936, 910.

PEPTIC ULCER. Diets given to patients with peptic ulcer are generally deficient in vitamin C, and the deficiency may play an important part in the ætiology of hæmorrhagic gastro-duodenal lesions. Ascorbic acid should be administered to ulcer patients, particularly when there is a tendency to hæmorrhage.—A. B. Rivers and L. A. Carlson, *Proc. Mayo Clin.*, 1937, 383.

The amount of ascorbic acid in the blood plasma was determined in 20 patients with gastric or duodenal ulcers, and 18 of them were found to have low values. In most of the cases it could be demonstrated that the patients had actually taken an inadequate amount of vitamin C, and there is evidence that if a sufficient amount of the vitamin is ingested the blood values can be raised to normal. It is important for the physician to make sure that patients with peptic ulcer are receiving an adequate amount of vitamin C.—T. H. Ingalls and H. A. Warren, *New Engl. J. Med.*, ii/1937, 443.

It was found that 5 patients with duodenal ulcer utilised 20% more ascorbic acid than normal individuals. It was found that these patients had been taking diets deficient in vitamin C. The usual Sippy diet contains much less than the normal requirements of vitamin C. This deficiency can be remedied by including in the daily diet juice of one or two good-sized oranges.—H. A. Warren *et al.*, *New Engl. J. Med.*, i/1939, 1062.

PNEUMONIA. Sixteen patients suffering from fibrinous pneumonia were treated with ascorbic acid. During the first few days 400 or 500 mg. was injected three times daily intramuscularly until the temperature had fallen to normal or the appearance of ascorbic acid in the urine showed that the saturation point had been reached. Then, and until recovery, 100 mg. of ascorbic acid was given three times daily by the mouth, employing the sodium salt of *l*-ascorbic acid. Other treatment was limited to expectorants and drugs with an action on the cardiovascular system. Even after the first injection there was often an encouraging response, indicated by an improvement in the respiration and in the patient's symptoms, and it was remarkable that all the 16 cases yielded little or no sputum. The fall of temperature in 8 cases was by crisis.—E. Bohnholtzer, *Dtsch. med. Wschr.*, i/1937, 1001.

RHEUMATISM, JUVENILE. A group of 64 controls excreted more ascorbic acid than the standard amount of 13 mg. per day per 10 st. of body weight, the average being 20 mg. A group of 107 active rheumatic cases, receiving the same institutional diets for periods of up to several months, excreted an average of only 9 mg. per day per 10 st. of body weight. A group of 23 cases of active surgical tuberculosis also showed a low rate of excretion, in common with other infections or pyrexial conditions. Cases of quiescent tuberculosis gave normal rates. It is suggested that in the infection which underlies rheumatic fever there is a greatly increased metabolic use of (and need for) vitamin C. In the absence of generally accepted medical teaching in the matter, further clinical trial of vitamin C therapy in rheumatic fever is suggested.—M. A. Abbasy *et al.*, *Lancet*, ii/1936, 1413.

RHEUMATOID ARTHRITIS. Definite clinical improvement in 5 out of 6 cases on a high vitamin C diet.—D. C. Hare and E. C. P. Williams, *Lancet*, i/1938, 20.

SCURVY. A case of scurvy accompanied by a condition of gastric achylia subsequent to alcoholic gastritis was cured by a daily intravenous injection of 40 mg. of ascorbic acid, the diet being kept the same during the time of the injections as it was before.—Schultzer, *Lancet*, ii/1933, 589.

30 mg. ascorbic acid daily given by mouth completely cured infantile scurvy in 2 children in 1 to 2 weeks.—E. Svensgaard, *Lancet*, i/1934, 22.

A mild case in a child, 9 months old, successfully treated with ascorbic acid. 20 mg. of ascorbic acid dissolved in 2 fl. oz. of water with milk and maltodextrin was given twice daily for 18 days. Dose then reduced to 10 mg. twice daily for 13 days when symptoms cleared up.—L. G. Parsons, *Proc. Roy. Soc. Med.*, 1933, 36, 1534.

A special number (Sir Thomas Barlow Birthday Number) devoted to infantile scurvy—history, ætiology, recognition, effect on tooth structure, treatment, etc.—*Arch. Dis. Childh.*, 1935, 211.

Scurvy and carditis.—S. Taylor, *Lancet*, i/1937, 973.

TUBERCULOSIS. Ascorbic acid is of no value in the treatment of pulmonary tuberculosis and its complications, including hæmoptysis. Saturation with the vitamin neither contributes to recovery nor retards retrogression.—G. S. Erwin, *et al.*, *Brit. med. J.*, i/1940, 688.

WHOOPIING COUGH. Chemical examination of the urine shows varying degrees of hypovitaminosis-C in whooping cough. Saturation of whooping cough patients with ascorbic acid markedly decreases the intensity, number, and duration of the characteristic symptoms. The routine daily dosage given in divided doses throughout the day now adopted irrespective of age or weight of patient is 350, 250, 250, 200, 200, 150, 150, 125, 125, and 100 mg., continuing at the 100 mg. level until the case is complete, or stopping the dose at any stage at which there was complete remission of symptoms for 2 days. The average total dose is 2700 mg. Where whoop develops during the treatment the dosage may be slightly increased for a few days if desired, but the whoop is mild and soon disappears under the routine treatment.—M. J. Ormerod, B. M. Unkauf, and F. D. White, *Canad. med. Ass. J.*, ii/1937, 268.

If relatively large doses are used early in the disease (e.g., from 150 to 500 mg. daily) the paroxysmal stage is shortened from a matter of weeks to a matter of days. The danger of overdosage seems negligible.—J. M. Ormerod and B. M. Unkauf, *Canad. med. Ass. J.*, ii/1937, 134.

From controlled clinical experiments it is considered that the statement that the administration of vitamin C in whooping cough has an effect upon the course of the disease is at present unproven.—D. Gairdner, *Brit. med. J.*, ii/1938, 742.

Monoethanolamine Salt of Ascorbic Acid. In some patients the parenteral administration of ascorbic acid is a necessity and intravenous administration has been widely used but this is associated with considerable loss of vitamin C through the kidneys. On the other hand intramuscular injection of the strong acid causes sloughing of the tissues. The intramuscular injection of the monoethanolamine salt of ascorbic acid presents a simple and effective way of administering vitamin C parenterally. The injections do not give rise to either immediate or delayed local or systemic reactions. The injections are followed by a prompt increase in the vitamin C of the blood. The loss of vitamin C in the urine is not so marked as when ascorbic acid is given intravenously. A patient with marked vitamin C deprivation was saturated in 8 days by the daily intramuscular injection of 100 mg. of the monoethanolamine salt of ascorbic acid.—E. L. Lozner, *New Engl. J. Med.*, i/1939, 987.

Ceetamin Tablets (Bencard, London). Tablets prepared from rose hips and containing in each tablet 10 mg. of l-ascorbic acid, together with vitamin C₁ (J factor) and vitamin P.

Fructamin (Paines & Byrne, London). Vitamins C and P in powder, tablets and ampoules. Tablets contain 15 mg. of vitamin C complex (=300 i.u. vitamin C). Dose.—1 or 2 tablets three times daily. Ampoules contain 40 mg. of vitamin C complex (=800 i.u. vitamin C) in 1 ml. Dose.—1 or 2 ml. daily intramuscularly or intravenously.

For further particulars of the chemistry of ascorbic acid, see Vol. II.

Vitamin K. Vitamin K is widely distributed in nature. In plants its occurrence is almost entirely confined to those structures concerned with photosynthesis. It is present in alfalfa, spinach and sprouting oats. It also occurs in soya-bean oil and some other vegetable oils, but not in fish-liver oils. Vitamin K can be prepared from fish meal, rice bran or casein, if extracts of these materials are allowed to putrefy.

There is evidence that several substances possess Vitamin K activity. That obtained from alfalfa has the empirical formula $C_{31}H_{46}O_2$ and has been given the name Vitamin K_1 or alpha-phyloquinone; it is 2-methyl-3-phytyl-1:4-naphthoquinone. It is a yellow oil and has been synthesised, the biological activity of the product of the synthesis being identical with that of the natural substance obtained from alfalfa. Another compound with vitamin K activity is obtained from sardine meal. It is possibly 2:3-difarnesyl-1:4-naphthoquinone, and has been termed vitamin K_2 .

Vitamin K_2 has been isolated from a light petroleum extract of purified fish meal, by repeated adsorption followed by crystallisation, in the form of light yellow plates, m.p. 52° to 53.5° .—E. A. Doisy *et al.*, *J. Biol. chem.*, 1939, **131**, 327.

In addition to the vitamins K_1 and K_2 , two other substances exhibiting vitamin K activity are known. The first of these is 2-methyl-3-hydroxy-1:4-naphthoquinone, which has been isolated from *Mycobacterium tuberculosis* and is now prepared synthetically. This substance has been termed phthiocol, but has lower activity than vitamin K_1 . The second substance is 2-methyl-1:4-naphthoquinone (*q.v.*), which appears to exert an activity equivalent to that of vitamin K_1 , but since it is more readily obtained, is likely to replace the latter in clinical use.

Uses. Vitamin K was first recognised in 1935 from the fact that chickens fed on a diet deficient in this vitamin developed hæmorrhages, due apparently to a fall in the concentration of prothrombin in the blood resulting in a delayed coagulation time. It is now believed that vitamin K is essential to the normal synthesis of prothrombin in the body and that the liver plays a very important part in this synthesis. Ordinarily most animals obtain sufficient vitamin K from their food or from the products of bacterial metabolism in their intestines, but if there is an inadequate intake of the vitamin in the diet, or if its absorption is impaired owing to an inadequate secretion of bile, or if hepatic damage interferes with the synthesis of prothrombin in spite of an adequate intake of vitamin K, the blood content of prothrombin falls to a low level, resulting in an enormous increase in the clotting time of the blood, so that spontaneous hæmorrhage is likely to occur at the slightest injury. There is at present no method of measuring directly the amount of prothrombin in the blood in order to enable a diagnosis of vitamin K deficiency to be made, or to assess the results of vitamin K therapy, but a fairly accurate determination of the prothrombin level in the blood may be made by Quick's method (*see Vol. II*). Alternatively, a simple bedside test consists in mixing thromboplastin (a saline extract of lung)

with whole blood and observing the clotting time; this is normally from 25 to 30 seconds, but is typically prolonged when the prothrombin level is low.

The chief indications at present for the use of vitamin K are the hæmorrhage associated with obstructive jaundice and hæmorrhagic disease of the newly-born. It is of no value in hæmophilia, purpura and intrinsic diseases of the blood-forming organs or as a non-specific hæmostatic. As a prophylactic its use is indicated in expectant mothers shortly before delivery, in cases of intestinal obstruction, surgical short circuits of the intestines and in the pre-operative and post-operative treatment of cases with obstruction of the common bile duct. Vitamin K may be given orally, in conjunction with bile salts (2 to 4 g.) or, in urgent cases, by duodenal tube; it has also been successfully employed intravenously and intramuscularly.

Vitamin K was employed clinically in 18 cases of obstructive jaundice; in most of the cases there was complete biliary obstruction and subsequent damage to the liver. It was given orally in capsules of 200 mg. daily together with human bile (75 to 150 ml. before each meal) or large doses of bile salts (1000 to 4000 mg.). The results indicated that this treatment reduced elevated prothrombin times to within normal limits and in certain cases probably prevented hæmorrhage or had a definite inhibitory effect on actual bleeding. The results so far obtained encourage the belief that the prevention and control of the hæmorrhagic diathesis of the jaundiced patient may be attained in the not too distant future.—H. R. Butt, A. M. Snell and A. E. Osterberg, *Proc. Mayo Clin.*, 1938, 74.

Apparently vitamin K concentrate will consistently lower the clotting time of the blood in the first few days of life and maintain it at a common lower level.—W. W. Waddell and D. Guerry, *J. Amer. med. Ass.*, i/1939, 2259.

In normal infants a moderate vitamin K lack develops during the first few days after birth and disappears within a week. This results in a hypoprothrombinæmia which is the cause of the commonly seen slight hæmorrhagic diathesis in the newborn. Its cause must be insufficient supply of vitamin K from the intestine. In diseases belonging to the triad of icterus gravis neonatorum, anæmia neonatorum and hydrops congenitus a very considerable hypoprothrombinæmia has been demonstrated. Ingestion of vitamin K (together with bile salt) by one of the patients resulted in a rapid increase in prothrombin.—H. Darn *et al.*, *Lancet*, ii/1939, 1157.

In 4 patients each presenting a history and physical signs of dietary deficiency disease unassociated with jaundice the prothrombin-time was found to be prolonged. Oral administration of vitamin K without bile salts was followed by a prompt return of the prothrombin-time to normal. It appears that there may be a dietary deficiency of vitamin K in man.—R. Kark and E. L. Lozner, *Lancet*, ii/1939, 1162.

Klotogen (Abbott, London). A concentrate rich in vitamin K issued in capsules each containing 1000 Almquist-Stokstad units, and as an oily solution containing 1250 units per ml. *Dose*.—1 capsule three times daily with meals; solution 8 ml. by duodenal tube. It should be used in conjunction with bile salts.

Methylnaphthoquinone. $C_{11}H_8O_2 = 172.2$. *Prop. Names.* KAPILON (Glaxo Laboratories, London); PROKAYVIT (British Drug Houses, London); (1 ml. ampoules containing 5 mg.).

Dose.—5 mg. orally (with 2 or 3 g. of bile salts) or by intramuscular or subcutaneous injection.

1-Methyl-2:4-naphthoquinone is prepared by the oxidation of methyl-naphthalene. It is a lemon-yellow powder with a faint characteristic odour. M.p. 106° . It should be stored in amber coloured bottles.

Uses. Analogous to those of vitamin K.

When employed intramuscularly in 4 cases of obstructive jaundice with low prothrombin indices it raised the index considerably in all of them within two days. Its value in the prevention and treatment of hæmorrhage in jaundice is apparent.—J. M. Macfie, A. L. Bacharach and M. R. A. Chance, *Brit. med. J.*, ii/1939, 1220.

The administration of a vitamin K analogue either to the mother between 12 and 4 hours before delivery or to the newborn infant would appear to be specially indicated (1) in cases of maternal toxæmia; (2) in premature labour; (3) in cases of difficult or instrumental delivery; (4) where breast feeding is not possible; (5) when any cerebral symptoms develop during the first few days of life; (6) in cases of hæmorrhagic diathesis, icterus gravis neonatorum, and anæmia; and (7) where an operation is necessary on the newborn.—A. I. S. Macpherson *et al.*, *Brit. med. J.*, i/1940, 839.

It is probable that for all practical purposes, methyl-naphthoquinone will replace both vitamin K₁ and vitamin K₂. Its stability is about the same as that of vitamin K₁ though it is less photolabile. In clinical use there are three possible routes. First, orally; second, intravenous, in diluted aqueous alkalis solution, where this can be prepared; third, intramuscular or subcutaneous, in an oil solution.—A. L. Bacharach, *Analyst*, 1940, 13.

Synthetic phthiocol has been administered to 10 patients exhibiting hypoprothrombinæmia and in each instance the elevated prothrombin clotting time has been reduced to a near normal level.—H. R. Butt *et al.*, *Proc. Mayo Clin.*, 1939, 497.

Prokayvit Oral (*British Drug Houses, London*). Tablets and capsules containing 10 mg. of diacetyl-2-methyl-1:4-naphthohydroquinone, a substance with therapeutic properties similar to those of vitamin K. The capsules, containing an oily solution of the substance, are intended for administration to infants, the point being cut off and the contents either added undiluted to the feed or mixed with about one teaspoonful of olive oil. *Dose*.—5 to 10 mg.

Vitamin P. Cases of hæmorrhagic purpura of the vascular type were successfully treated with vitapric, an impure concentrate of ascorbic acid obtained from paprika. Similar results were not obtained with ascorbic acid, and search for the active principle led to the isolation of a flavone glucoside called citrin or, since it appeared to exert a specific regulating influence on the permeability of vessels, vitamin P (vitamin of permeability). Citrin was found to consist of a mixture of hesperidin and an eriodictyol glucoside, but the name vitamin P has also been applied to the former. It is also found in hips and lemon juice, always in the presence of ascorbic acid, but although a number of papers have been published on its therapeutic uses, many investigators still deny the existence of a substance with the properties of vitamin P as distinct from ascorbic acid.

Oral administration of hesperidin, in doses of 1 gramme daily, can reduce the number of hæmorrhages in patients with vitamin deficiency.—H. Scarborough and C. P. Stewart, *Lancet*, ii/1938, 610.

Injections of vitamin P, in the form of daily intravenous injections of 50 mg. of citrin, brought about complete disappearance of all symptoms in a woman of 22 who had suffered from Schönlein-Henoch purpura for eight years, after treatment with ascorbic acid had failed to affect the disease. The purpura relapsed when the administration of citrin was stopped.—T. Jersild, *Lancet*, i/1938, 1445.

The evidence upon which the existence of vitamin P is based has been reviewed and it has been shown that a conclusion as to the reality of such a vitamin cannot be maintained on the basis of the published work. Evidence is adduced from experiments on human subjects which establishes the existence of a factor decreasing capillary fragility.—H. Scarborough, *Biochem. J.*, 1939, 33, 1400.

Permidin (*Glaxo Laboratories, London*). Tablets containing 0.25 g. of hesperidin (vitamin P). *Dose*.—1 to 4 tablets daily. Disorders involving increased permeability or fragility of the capillaries. Used in purpuric eruptions following bismuth and arsenical treatment of syphilis.

ACIDUM BENZOICUM*B.P., U.S.P. XI, Fr. Cx., P. Helv. V, etc.* $C_6H_5 \cdot COOH = 122.12.$ *Dose.*—5 to 15 grains (0.3 to 1 g.).

Manufactured either from gum benzoin (natural) or from toluene (synthetic), the former being the more expensive. White feathery crystals; m.p. 121° ; sublimes at 150° .

Soluble 1 in 450 of water, 1 in 3 of alcohol 90%, 1 in 7 of chloroform, 1 in 3 of ether, 1 in 30 of carbon disulphide, and 1 in 30 of glycerin; very soluble in fats and oils.

Incompatible with ferric salts and mercuric chloride.

Uses. Benzoic acid, taken internally, is so irritant to the gastric mucosa that it is seldom employed in this manner except as a constituent of expectorant mixtures. It has been employed as a urinary antiseptic, *e.g.*, in cystitis, but its antiseptic action on the urine is even weaker than that of the salicylates. It acidifies the urine, being mainly excreted as hippuric acid, but it is mostly employed for this purpose in the form of one of its salts. In concentrations of 1 in 1000 it inhibits the growth of most moulds and bacteria and may be used as a preservative in pharmaceutical preparations having an acid or neutral reaction. In the form of compound benzoic acid ointment it is of value in the treatment of ringworm.

Four grains of benzoic acid with 1 grain of Canada balsam, or 1 minim of glycerin, makes a good pill.

A 1 in 20 solution in alcohol relieves urticaria, and, as an antiseptic lotion or gargle, 1 dissolved in 500 of water is employed.

Collutorium Acidi Benzoici (R.D.H.).

Dose.—One tablespoonful in a tumblerful of water.

Benzoic acid 10 gr., tincture of krameria 15 m., saccharin 6 gr., oil of peppermint 2 m., oil of cinnamon 2 m., alcohol 90% to 1 oz.

Miller's Mouth Wash is similar.

Trochisci Acidi Benzoici (B.P.C.).

Contain $\frac{1}{2}$ grain with fruit basis; are also obtainable with simple basis. Those of *T.H.* have a red currant basis. Useful as a voice lozenge.

Unguentum Acidi Benzoici Compositum (B.P.C.). *Syn.* WHITFIELD'S OINTMENT.

Contains benzoic acid 5% and salicylic acid 3% in white soft paraffin and coconut oil. A valuable treatment for ringworm of the scalp, body or nails.

Ung. Acid. Benzoic. Co. (N.I.F.). *Syn.* WHITFIELD'S OINTMENT (*N.I.F.*). Contains benzoic acid 24 gr., salicylic acid 15 gr., hard paraffin 66 gr., simple ointment 66 gr., coconut oil to 480 gr.

Unguentum Acidi Benzoici et Acidi Salicylici Forte (K.C.H.). also with *syn.* WHITFIELD'S OINTMENT, contains benzoic acid 1 dr., salicylic acid 30 gr., soft paraffin 2 dr., coconut oil to 1 oz.

Ammonii Benzoas (B.P.C., U.S.P. XI, P. Helv. V).

$C_6H_5 \cdot COONH_4 = 139.14.$

Dose.—5 to 15 grains (0.3 to 1 g.).

In colourless laminar crystals: **soluble** 1 in 6 of cold water, 1 in 30 of alcohol, and 1 in 8 of glycerin.

Useful expectorant in chronic bronchitis; also used for increasing the acidity of the urine in cystitis, catarrh of the bladder and phosphaturia.

[P1] **Mistura Boro-Benzoatis** (K.C.H.).

Ammonium benzoate 20 gr., boric acid 10 gr., tincture of hyoscyamus 30 m. infusion of buchu to 1 oz. A useful urinary antiseptic mixture.

Magnesii Benzoas. $(C_6H_5 \cdot COO)_2Mg = 266.54$.

Dose.—5 to 15 grains (0.3 to 1 g.).

White crystalline powder. Soluble 1 in 30 of water, hardly soluble in alcohol 90%.

Incompatible with acids, also with sodium bicarbonate.

Antipyretic. Used as an anti-arthritis for rheumatism and as a cathartic in cirrhosis of the liver.

Potassii Benzoas. $C_6H_5 \cdot COOK, 3H_2O = 214.25$.

Dose.—5 to 30 grains (0.3 to 2 g.).

White crystals. Soluble 1 in $1\frac{1}{2}$ of water and 1 in 20 of alcohol 90%. Uric acid solvent.

Sodii Benzoas (B.P., Fr. Cx., P. Ital. V, U.S.P. XI, P. Helv. V., P. Jap. V).

$C_6H_5 \cdot COONa = 144.11$. P. Ned. V has $\frac{1}{2}$ mol. H_2O .

Dose.—5 to 30 grains (0.3 to 2 g.). U.S.P. XI average dose 15 grains.

In white granular crystals or in powder. Soluble 1 in 2 of water and about 1 in 50 of alcohol 90%.

Two varieties are made, one from the acid obtained from benzoin, the other from the synthetic acid.

Incompatible with mineral acids and with ferric salts. It is apt to cause gastric irritation if taken on an empty stomach.

Uses. Urinary antiseptic. Acute lacunar tonsillitis is stated to be cured by it in 12 to 36 hours if given in 5 to 15 grain doses every 2 hours. In pyelitis due to *B. coli* infection, sodium benzoate combined with hexamine has given good results.

Phenylsemicarbazide (Fr. Cx.). Prop. Name. CRYOGÉNINE (*Lumière, Lyons; Anglo-French Drug Co., London*). $C_6H_5NH \cdot NH \cdot CONH_2 = 151.17$.

F.E. VIII includes *m*-benzaminosemicarbazide to which the proprietary name "Crigenina" is attached.

Dose.—3 to 24 grains (0.2 to 1.5 g.), up to 40 grains (2.5 g.) per day.

In white crystals soluble 1 in 100 of water, 1 in 25 of alcohol 90%. Antipyretic and analgesic for rheumatism, neuralgia, etc.

Benzoinum (B.P.).

Dose.—10 to 30 grains (0.6 to 2 g.).

The balsamic resin from *Styrax Benzoin* (Sumatra benzoin), containing 19 to 29% of free balsamic acids and not more than 60% of total balsamic acids, calculated on the dry alcohol-soluble matter. U.S.P. XI and P. Jap. V allow also Siam benzoin, from *S. tonkinense* or other species. Fr. Cx., P. Dan. and P. Helv. V allow Siam benzoin only.

Benzoin acts as a stimulating expectorant, but it is seldom given internally as such.

Vap. Benzoin Co. c. Menthol (N.I.F.).

Menthol 8 gr., benzoin 48 gr., storax 34 gr., balsam of tolu 12 gr., industrial methylated spirit to 1 oz. For use add 1 dr. to a pint of boiling water and inhale the vapour.

Tinctura Benzoini Simplex (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

1 in 10 of alcohol 90%. *P. Ital. V* 1 in 5 of alcohol 80%.
One of the tincture in rose water 40, is useful as a face lotion in urticaria and in irritable conditions of the skin.

Tinctura Benzoini (U.S.P. XI).

Average dose.—15 minims (1 ml.).

Benzoin (Sumatra or Siam) 1 in 5, in alcohol, 95%. *Fr. Cx.* is similar but made with alcohol 80%.

Lotio Benzoini (B.P.C.). Syn. LAIT VIRGINAL.

Tincture of benzoin, 1 in 40, in rose water.

Nebula Benzoini Composita (B.P.C.).

Menthol 1% with oils of eucalyptus, cassia and pumilio pine in glycerin and tincture of benzoin. Useful in nasal and bronchial catarrh.

Tinctura Benzoini Composita (B.P.). Syn. FRIARS' BALSAM, TRAUMATIC BALSAM.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Benzoin 10%, with storax, aloe and balsam of tolu in alcohol 90%.

A drachm to a pint of hot water is valuable as an inhalation in bronchitis and acute laryngitis. Undiluted it is used as a wound dressing. Is useful internally in chronic bronchitis. Mixtures require the addition of 1 dr. per oz. of mucilage of acacia, or of a mixture of equal parts of mucilages of acacia and tragacanth, to suspend the resins.

Tinctura Benzoini Composita (U.S.P. XI).

Average dose.—80 minims (2 ml.).

Benzoin 10, aloe 2, storax 8, tolu 4, in alcohol 95%.

Collunarium Benzoini (T. H.).

Compound tincture of benzoin 5 m., borax 5 gr., water to 1 oz.

Benzyl Alcohol. $C_6H_5 \cdot CH_2OH = 108.13$.

Dose.—5 to 40 minims (0.3 to 2.5 ml.) in water 3 or 4 times a day.

A liquid with a slight aromatic odour. Has been employed as a local anæsthetic, by application or subcutaneous injection, in a 1 to 4% dilution in distilled water or normal saline solution, but is stated to be irritant locally. A few drops on an exposed nerve or cavity is an efficient anodyne for toothache.

Benzylis Benzoas (B.P.C., P. Dan., F.E. VIII).

Syn. and Prop. Name. SPASMODYN (*Bush, London*), ESTER BENZILBENZOICO, PERUSCABINA. $C_6H_5 \cdot COOC_6H_5 = 212.1$.

Dose.—5 to 8 minims (0.3 to 0.5 ml.) as a 1 in 5 alcoholic solution in water, or in capsules, or as an emulsion.

White crystals with faint aromatic odour and burning taste, m.p. 20°, b.p. about 323°.

Insoluble in water and glycerin; miscible with alcohol, chloroform and ether.

Uses. It is practically non-toxic and has been used in excessive intestinal peristalsis, diarrhœas and dysentery, intestinal, biliary and renal colic, spastic constipation, vesical spasm, uterine colic, dysmenorrhœa, persistent hiccough, arterial spasm and bronchial spasm of true asthma. Sometimes of value in whooping-

cough but its action is uncertain. Externally it has proved of value in the treatment of scabies; Kissmeyer's original formula (*Lancet*, i/1937, 21) consisted of equal parts of benzyl benzoate, isopropyl alcohol and soft soap, but this has since been modified by the use of industrial methylated spirit in place of the isopropyl alcohol (*vide infra*).

SCABIES. The following treatment has been used in Denmark for a number of years and has replaced sulphur ointment. The patient takes a hot bath, after which a solution made up of benzyl benzoate 50 g., liniment of soft soap 65 g., alcohol (90%) 30 g., and distilled water 5 g., is applied over the entire body with a small brush and allowed to dry. Another layer is then applied in similar fashion. After the skin is dry the patient dresses. After another bath the next day he changes to fresh clothing. The treatment is preferable to the sulphur treatment in that it is odourless and non-irritating.—L. Goldman, *Arch. Derm. Syph.*, N. Y., 1937, 36, 140.

Anoint the body with soft soap, rubbing it carefully into those parts commonly attacked by the acarus. Then soak for ten minutes in a bath at 100°F., rubbing the affected areas thoroughly during this time. While the body is still wet apply the following lotion vigorously for 5 minutes by means of a pig-bristle shaving brush: Equal parts of benzyl benzoate, industrial spirit and soft soap (B.P.). Allow the lotion and the lather produced to dry on the skin and again apply the lotion vigorously for a further 5 minutes, then dry the body with a towel and resume the clothes worn before treatment. 24 hours later a bath is taken and clean clothes are put on and the discarded clothing and bedclothes used by the patient sterilised by boiling. Other members of the family should be treated on the same day even though they show no signs of the disease. It is a safe, reliable and rapid treatment causing a minimum of inconvenience and discomfort.—R. E. King, *Brit. med. J.*, ii/1940, 626.

Proscabin (Bayer Products, London). Benzyl benzoate emulsion for the local treatment of scabies.

Benzoylis Peroxidum. $C_6H_5 \cdot CO \cdot O_2 \cdot CO \cdot C_6H_5 = 242.1$. A crystalline compound, m.p. 103.5°, prepared by the interaction of 100 of sodium peroxide and 180 of benzoyl chloride, at a low temperature. Soluble slightly in water, more so in alcohol.

Uses. As a dusting powder, as a 2 to 3% solution in oil, or as an ointment in soft paraffin, for burns, ulcers and for dermatitis due to the poison ivy (*Rhus toxicodendron*).

Benzylis Succinas (B.P.C.). Prop. Name. SPASMINE (Bush, London).

$(CH_2 \cdot COOCH_2 \cdot C_6H_5)_2 = 298.1$.

Dose.—5 to 15 grains (0.3 to 1 g.) in tablets or capsules.

This is a tasteless crystalline substance, *soluble* in alcohol, ether, chloroform, and fixed and volatile oils, almost insoluble in water. Not nauseating to the stomach. It is employed for conditions similar to those for which the benzoate has been given.

[P1-81] **Spasticine** (Napp, London). Tablets containing benzyl succinate 0.3 g., papaverine hydrochloride 0.03 g., atropine methylbromide 0.0005 g.

Dose.—From 1 to 3 tablets three times a day. Antispasmodic.

Acidum Hippuricum. *Syn.* BENZAMINO-ACETIC ACID, BENZOYL GLYCOCOLL. $C_6H_5 \cdot CONH \cdot CH_2 \cdot COOH = 179.1$.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

This acid, occurring as white crystals, *soluble* in hot water (very slightly in cold—about 1 in 600), melting at 187°, may be prepared from the urine of herbivora, also synthetically by treating aminoacetic acid with benzoyl chloride or benzoic anhydride.

Ammonii Hippuras (B.P.C.). $C_9H_8O_3N(NH_4) = 196.1$.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

Small white or brownish-white deliquescent crystals. Soluble in water, and 1 in 20 of alcohol 90%. This and other hippurates (sodium, potassium and lithium) have been given in gouty conditions. They are also administered, with other substances, in the treatment of arterial hypertension.

Acidum Cinnamicum (B.P.C.). *Syn.* PHENYLACRYLIC ACID, CINNAMYLIC ACID. $C_6H_5 \cdot CH : CH \cdot COOH = 148.1$.

Dose.—2 to 3 grains (0.12 to 0.2 g.) by mouth; $\frac{1}{30}$ to $\frac{1}{8}$ grain (0.0013 to 0.02 g.) by hypodermic injection, in oily solution.

Transparent micaceous crystals, m.p. 132° to 135° , slightly soluble in water, soluble in alcohol, ether and oils. Has been used to induce leucocytosis. Mostly given as the sodium salt.

Æthylis Cinnamas. $C_6H_5 \cdot CH : CH \cdot COOC_2H_5 = 176.2$. A solution of ethyl cinnamate in benzyl alcohol, corresponding to 5% of benzyl cinnamate, and olive oil, has been used in a dose of 0.25 ml. intramuscularly in the treatment of all forms of tuberculosis. It is contraindicated in nephritis.

Sodii Cinnamas (Fr. Cx.). *Syn.* HETOL.

$C_6H_5 \cdot CH : CH \cdot COONa = 170.1$.

Dose.—2 to 5 grains (0.12 to 0.3 g.).

A white crystalline powder with faint aromatic odour. **Soluble** 1 in 11 of water, 1 in 10 of glycerin, 1 in 160 of alcohol 90%. Has been administered orally or hypodermically in the treatment of tuberculosis.

Glycerinum Sodii Cinnamatis.

Dose.—30 to 60 minims (2 to 4 ml.), by injection. A 10% solution in glycerin, made by heating to not exceeding 180° . Has been used hypodermically and intravenously in tuberculosis and cancer; it causes a general leucocytosis.

Cinnaldehydum. *Syn.* CINNAMAL. $C_6H_5 \cdot CH : CH \cdot CHO = 132.1$.

Dose.—1 minim.

The aldehyde occurring in cinnamon oil. A colourless liquid with cinnamon odour. Sp. gr. 1.054 to 1.056. Soluble in alcohol in all proportions.

Capsules (Gelatin), 1 minim, have been used in malignant disease and in tuberculosis, especially in pulmonary cases.

Acidum Coumaricum. *Syn.* o-HYDROXYCINNAMIC ACID.

$C_6H_4(OH) \cdot CH : CH \cdot COOH = 164.1$.

Brownish crystals, m.p. 200° . The *meta*- acid melts at 191° , and the *para*- at 206° .

Soluble very slightly in water and chloroform, 1 in 12 or less of alcohol, 1 in 36 of ether. The coumarates have action of vasodilators, and they may be taken for prolonged periods without harm.

Injectio Sodii o-Coumaratis. A 22% aqueous solution of sodium o-coumarate, $C_6H_7O_3Na$. Has been used in cancer and tuberculosis.

Dose.—25 minims (1.5 ml.), thrice weekly when possible between the growth and healthy subjacent tissues or in the course of lymphatics proceeding from the region of the growth, or over a large serous sac like the peritoneum. In glandular and early cases of pulmonary tuberculosis Drage reported good results. In cancer he held that few drugs exert more definite action.

Coumarin. *Syn.* COUMARIC ANHYDRIDE. $C_9H_6O_2 = 146.14$.

The lactone of coumaric acid. In colourless crystals with aromatic odour and taste; contained in tonquin beans, also in woodruff. It is made synthetically by boiling salicylic aldehyde with acetic anhydride and sodium acetate. Soluble

in alcohol, ether and oils, but not to any extent in water. Sublimes unchanged. One part will disguise the odour of 50 of iodoform.

Tonco Semen (B.P.C.). *Syn.* TONKA or TONQUIN BEANS.

The seeds of *Dipteryx odorata* and of *D. oppositifolia* (Leguminosæ), dried in the sun or cured by immersion in rum for a few days and drying. Formerly used as a source of coumarin; also used in perfumery.

Vanilla (B.P.C., Fr. Cx.) consists of the cured capsular fruits of *V. planifolia* (Orchidacæ). Contains 2 to 3% of vanillin and other unknown aromatic substances.

Tinctura Vanilla (Fr. Cx.). Macerate vanilla (1 to 10) in alcohol 80% for 10 days.

Vanillinum (B.P.C., U.S.P. XI, Fr. Cx., P. Helv. V).

Syn. VANILLIC ALDEHYDE, METHYLPROTOCATECHUIC ALDEHYDE, HYDROMETHOXYBENZALDEHYDE. $\text{CH}_3\text{O} \cdot \text{C}_6\text{H}_4(\text{OH}) \cdot \text{CHO} = 152 \cdot 1$.

White crystalline needles with intense vanilla odour and taste. Can be extracted from vanilla, but is usually prepared synthetically from eugenol.

Soluble in most organic solvents; slightly soluble in water, more soluble in hot water; readily soluble in alkalis.

Use suggested in atonic dyspepsia as an excito-motor stimulant. For employment in Gunzburg's test, *vide Vol. II. Solutio Vanillini*—Vanillin 80 gr., alcohol 90% to 1 oz. For ordinary purposes $\frac{1}{2}$ dr. will flavour a pint of medicine. **Essence of Vanilla** 1 in 8 by macerating vanilla beans 1 finely ground with sand 1, in a mixture of water 2, and alcohol 90% 6.

Elixir Vanillini Compositum (N.F. VI). *Dose.*— $\frac{1}{2}$ to 1 drachm. Mix compound spirit of vanillin 20, with 95% alcohol 80, add glycerin 25, then syrup 300, caramel 2, and water to 1000. Filter.

Spiritus Vanillini Compositus (N.F. VI). *Dose.*— $\frac{1}{2}$ to 1 drachm. Vanillin 40, oil of orange 10, oil of cardamom 2, oil of cinnamon 1, are dissolved in a sufficiency of alcohol 95% to make 200.

Agaricus (B.P.C.). *Syn.* POLYPORUS OFFICINALIS, BOLETUS LARICIS, FUNGUS LARICIS (P. Austr., P. Ital. V), AGARIC BLANC (Fr. Cx.), POLYPORE DE MÉLÈZE (Fr. Cx.), PURGING AGARIC.

Dose.—3 to 30 grains (0.2 to 2 g.).

The dried fungus *Fomes officinalis*, in light, spongy pieces. Large doses purgative, small ones astringent. For night sweats, diarrhoea and to diminish bronchial secretion. *Tincture, dose.*—20 to 60 minims, 1 in 10 of 60% alcohol. *Extract, dose.*— $\frac{1}{2}$ to 2 grains, prepared by exhaustion with 60% alcohol, about 6%.

Agaricus (B.H.P.). *Syn.* AGARICUS MUSCARIUS, FLY AGARIC. The entire fresh fungus, *Amanita muscaria*. It has a slight, unpleasant odour, a bitter taste and is very poisonous. It contains the poisonous base muscarine, a toxin and a colouring matter muscarufin. Used in homeopathic medicine in the treatment of chorea, skin irritation, neuralgia and chilblains.

Acidum Agaricum (B.P.C., P.G. VI, P. Ital. V, P. Helv. V, P. Jap., P. Dan.). *Syn.* AGARICIN, LARICIC ACID.

$\text{CH}_2\text{C}(\text{OH})\text{CH}(\text{C}_{16}\text{H}_{33}) (\text{COOH})_3, 1\frac{1}{2}\text{H}_2\text{O} = 443 \cdot 3$.

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.005 to 0.03 g.). P.G. VI, P. Helv. V and P. Ital. V have max. single dose $1\frac{1}{2}$ gr.

Obtained from the fungus, *Fomes officinalis*, growing on larch trees. An odourless, tasteless microcrystalline powder, **soluble** 1 in 130 of water. Given to restrain the night sweats of phthisis. Owing to slow absorption should be given some hours before retiring.

Amadou. *Syn.* OAK AGARIC, SURGEON'S AGARIC, TOUCHWOOD. *Polyporus fomentarius* L. A fungus prepared with alkali and nitre, in light brown elastic pieces. Employed as a mechanical hæmostatic. It is included in *P. Austr.* under the name *Fungus ignarius*.

ACIDUM BORICUM

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.
 $H_3BO_3 = 61.84$.

Syn. BORACIC ACID, HYDROGEN BORATE, SAL SEDATIVA DE HOMBERG (*F.E. VIII*).

Dose.—5 to 15 grains (0.3 to 1 g.).

In white laminar crystals, with bitter taste, or as powder (that known as Pulv. Acid. Boric. Subtilis has been passed through a No. 170 sieve). The crystals yield a clearer solution than the powder.

Soluble 1 in about 25 of water, 1 in 3 of boiling water, 1 in 30 of 90% alcohol, 1 in 5 of glycerin at 0°, 7 in 10 at 100°, slightly soluble in volatile oils. Insoluble in ether.

Antidotes. Empty stomach by stomach tube or emetic. Give purgative dose of magnesium sulphate. A teaspoonful taken in error has caused death. Used for lavage, it may prove poisonous owing to idiosyncrasy, producing a rash.

Fifty per cent. of the acid administered is excreted in the urine within 12 hours, the rest remains in the body for 3 to 4 days and hence may accumulate under repeated dosage.

Fatal poisoning of babies each weighing about 7 lbs. with from 0.8 to 3 g. of boric acid given in solution in error for water.—*Pharm. J.*, i/1927, 361.

Recovery of a woman of 42 from an intravenous injection of 600 ml. of a 2.5% solution of boric acid (*i.e.*, approx. 15 g.) in 10% dextrose, given post-operatively after hysterectomy in mistake for 10% dextrose. Immediately following discovery of the error 1000 ml. of 10% dextrose was given intravenously. The patient only vomited once, the pulse remained regular and strong and the respirations were unchanged. At the end of 10 days the patient was discharged. It is concluded that when renal excretion is normal boric acid injected intravenously in large amounts does not produce appreciable symptoms of toxicity.—A. R. McIntyre and C. J. Burke, *J. Pharmacol.*, 1937, 60, 113.

Incompatible with tannin.

Uses. Antiputrefactive and mildly antiseptic. Has been given as antiseptic before and after bladder operations, in typhoid, and also for cystitis. It is used as a dressing to wounds, sores, and the skin generally. When mixed with starch, with or without zinc oxide, it forms a useful "dusting powder" for infants, etc. A little in the socks prevents the odour of perspiring feet.

Vomiting in gastric dilatation or gastric catarrh of infants has been treated by washing out the stomach with weak boric acid

lotion. In otorrhœa an alcoholic solution of boric acid may be used.

Though not actually germicidal it is an excellent cleanser, especially for lavage of cavities in which sterile water or saline solution would be more irritating. The absence of all toxic effect makes it an ideal irrigating fluid where bulk is desirable for cleansing or distension. Though not a disinfectant, even in saturated solution, it checks putrefaction and decomposition in a solution of 0.3%. In urologic practice it is used as a routine by many for cleansing the bladder and urethra before an instillation of some antiseptic substance.—H. W. E. Walker, *J. Amer. med. Ass.*, ii/1938, 1465.

A.B.C. Powder. Boric acid, bismuth subnitrate and calomel, equal parts. A stimulant antiseptic dusting powder.

Carbasus Acidi Borici (B.P.C.). *Syn.* BORIC GAUZE.

Contains 10 to 20% of boric acid.

Cataplasma Acidi Borici (B.P.C.). 20% in linseed poultice.

Cataplasma Acidi Borici et Carbonis (B.P.C.). 4% of each in slippery elm poultice.

Cataplasma Amyli et Acidi Borici (B.P.C.). Boric acid 6% in starch poultice.

Collyrium Acidi Borici (B.P.C.). 2% w/v.

Collyr. Acid. Boric. (N.I.F.). Boric acid 12.5 gr., distilled water to 1 oz.

Collyrium Acidi Borici et Zinci (B.P.C.). Contains 4 gr. of boric acid and 1 gr. of zinc sulphate per oz.

Collyr. Zinci Co. (N.I.F.). Boric acid 5 gr., zinc sulphate 1 gr., distilled water to 1 oz.

Glycerinum Acidi Borici (B.P.).

Syn. GLYCERITE OF BOROGLYCERIN (*U.S.P. XI*).

Dose.—10 to 30 minims (0.6 to 2 ml.).

Consists of glyceryl borate and glycerin, and contains the equivalent of 31% w/w of boric acid.

It is readily miscible with water and alcohol. Of value in otorrhœa.

Boroglycerinum (B.P.C.) is a similar preparation containing the equivalent of 50% w/w of boric acid.

Gossypium Acidi Borici (B.P.C.). *Syn.* BORIC WOOL.

Contains 15 to 30% of boric acid. *P. Jap. V* has about 10%.

Aurist. Boric. (N.I.F.). Glycerin of boric acid 120 m., industrial methylated spirit 100 m., glycerin to 1 oz.

Guttæ Spiritus (T.H.). Rectified spirit 1 dr., boric acid 10 gr., water to $\frac{1}{2}$ oz. The strength of the spirit may be gradually increased until pure spirit is used.

Lintum Acidi Borici (B.P.C.). *Syn.* BORIC (BORACIC) LINT. Contains 35 to 45% of boric acid.

The following simple procedure is equally successful for the treatment of all wounds from a pinprick to a compound fracture. The technique consists in the application of wet boric lint to the surface of the wound. The boric lint must contain equal parts by weight of boric acid and lint. Immediately before being applied it must be saturated with cold water and not wrung out. The entire area of the wound is covered with this wet lint, on top of which is placed oiled silk, which must entirely cover the lint to seal it off hermetically and keep it from becoming dry. The dressing is kept in place with a bandage or towel.—P. Weatherbe, *Lancet*, ii/1939, 1317.

EPIDERMOPHYTOSIS. Trichophyton infection (interdigital) cured by insertion of small strips of boric lint, about 1 inch by $\frac{1}{2}$ inch, well pressed into the affected spaces and renewed night and morning.—*Brit. med. J.*, ii/1934, 889.

Curatio Normalis II (*B.P.C. Supp.*). *Syn.* STANDARD DRESSING No. 2, FOMENTATION DRESSING.

Boric acid lint 12 inches by 12 inches, absorbent cotton-wool 240 gr., oiled cambric 6 inches by 6 inches, open-weave bandage 2 inches by 4 yards.

Curatio Normalis III (*B.P.C. Supp.*). *Syn.* STANDARD DRESSING No. 3, SMALL ELASTIC ADHESIVE WOUND DRESSING.

The dressing consists of a pad, composed of one-ply muslin bandage wrapped round a strip of absorbent lint, fixed to a base of elastic adhesive cotton fabric. The pad measures $\frac{3}{4}$ inch by 1 inch, and is medicated with about 5% of boric acid and tinted pink. The elastic cotton fabric is flesh-coloured and measures $1\frac{1}{2}$ inches by 2 inches, and is spread with a rubber adhesive compound containing not less than 20% of zinc oxide.

Curatio Normalis IV (*B.P.C. Supp.*). *Syn.* STANDARD DRESSING No. 4, MEDIUM ELASTIC ADHESIVE WOUND DRESSING.

Similar to Standard Dressing No. 3, but the pad measures $1\frac{1}{2}$ inches by 2 inches, and the elastic cotton fabric 2 inches by 3 inches.

Curatio Normalis V (*B.P.C. Supp.*). *Syn.* STANDARD DRESSING No. 5, LARGE ELASTIC ADHESIVE WOUND DRESSING.

Similar to Standard Dressing No. 3, but the pad measures $1\frac{1}{2}$ inches by 2 inches, and the elastic cotton fabric $2\frac{1}{2}$ inches by $3\frac{1}{2}$ inches.

Curatio Normalis VI (*B.P.C. Supp.*). *Syn.* STANDARD DRESSING No. 6, EXTRA LARGE ELASTIC ADHESIVE WOUND DRESSING.

Similar to Standard Dressing No. 3, but the pad measures $2\frac{1}{2}$ inches by $3\frac{1}{2}$ inches, and the elastic cotton fabric $3\frac{1}{2}$ inches by $4\frac{1}{2}$ inches.

Curatio Normalis VII (*B.P.C. Supp.*). *Syn.* STANDARD DRESSING No. 7, FINGER DRESSING.

The dressing consists of an open finger-stall, made from two pieces of boric acid lint each 2 inches by $1\frac{1}{2}$ inches, sewn to an open-weave bandage measuring 1 inch by 24 inches.

Curatio Normalis VIII (*B.P.C. Supp.*). *Syn.* STANDARD DRESSING No. 8, MEDIUM MEDICATED WOUND DRESSING.

The dressing consists of a pad sewn to an open-weave bandage measuring $1\frac{1}{2}$ inches by 2 yards. The pad, which measures 3 inches by 4 inches, is composed of a piece of boric acid lint 3 inches by 4 inches, superimposed on about 25 gr. of absorbent cottonwool.

Curatio Normalis IX (*B.P.C. Supp.*). *Syn.* STANDARD DRESSING No. 9, LARGE MEDICATED WOUND DRESSING.

Similar to Standard Dressing No. 8, but the pad measures 4 inches by 6 inches, and is composed of boric acid lint 4 inches by 6 inches, superimposed on about 50 gr. of absorbent cottonwool. The open-weave bandage measures 3 inches by $2\frac{1}{2}$ yards.

Lotio Acidi Borici (*B.P.C.*). 1 in 30. *N.I.F.* is similar.

A useful soothing antiseptic lotion for the eyes, bladder, vagina and mouth.

Lotio Acidi Borici (*R.L.O.H.*). 8 gr. to 1 oz. (2% approx.).

Isotonic Boric Acid Lotion is 3.1% strength—isotonic with the tears.

Lotio Acidi Borici cum Zinci Sulphatis (*R.L.O.H.*).

Boric acid 8 gr., zinc sulphate $\frac{1}{2}$, 1 or 2 gr., water to 1 oz.

Oculentum Acidi Borici (*B.P.C.*). 4% in simple eye ointment.

Oculentum Acid. Boric. (N.I.F.). Boric acid $2\frac{1}{2}$ gr., white soft paraffin to 1 dr.

Pessus Acidi Borici (B.P.C.) contain 10 gr. (0.6 g.).

Convenient for replacing douches after delivery.

Pessus Glycerini Acidi Borici for vaginal use weigh 90 gr. each, and contain 70 gr. of glycerin of boric acid with gelatin 10 gr. and water 10 m.

Pulvis Talci Boricus (B.P.C.). Boric acid and starch, of each 10%, with purified talc, perfumed with oil of geranium.

Solvellæ Acidi Borici (B.P.C.) contain 15 gr. (1 g.).

Suppositorium Acidi Borici contains 3 gr. (0.2 g.) in each.

Unguentum Acidi Borici (B.P.). Boric acid 1, white paraffin ointment 9.

For cleansing the mouth and tongue in typhoid fever, the following ointment (Wyllie's ointment) is best:—Boric acid 60 gr., oil of peppermint 5 m., white soft paraffin to 1 oz. The ointment is applied by means of a soft badger tooth-brush. The mouth should be sprayed with hydrogen peroxide (10 vol.) before the ointment is used, and treatment should be carried out at least twice daily from the commencement of the disease.—S. Watson Smith, *Lancet*, ii/1936, 1453.

Unguentum Acidi Borici (U.S.P. XI).

Boric acid 10, wool fat 5, white wax 5, white petrolatum 80.

Unguentum Acidi Borici Flavum (B.P.C.). 10% in yellow soft paraffin.

Unguentum Lano-Boricum Camphoratum.

Boric acid ointment $\frac{1}{2}$ oz., hydrous wool fat $\frac{1}{2}$ oz., essential oil of camphor 20 m. For earache in children. Applied with a brush to the meatus.

Borax (B.P., P. Helv. V, P. Dan., P. Jap. V). *Syn.* SODII BORAS (U.S.P. XI), SODIUM BORATE (Fr. Cx.), BIBORATE, PYROBORATE or TETRABORATE. $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O} = 381.4$.

Dose.—5 to 15 grains (0.3 to 1 g.).

Soluble 1 in 25 of water, 1 in 1 of glycerin; insoluble in alcohol 90%.

Incompatible with cocaine hydrochloride, mercuric chloride, zinc sulphate, and other metallic salts. In these cases all incompatibility may usually be overcome by the addition of glycerin or by replacing half the borax with boric acid. Also incompatible with gums and mineral acids.

Uses. As gargle in diphtheria, for aphthæ, cancrum oris, and gangrenous stomatitis. As lotion in pruritus ani and vulvæ, in bromidrosis and fetid sweating of the feet. Gouty affections are treated with compresses of saturated solution.

Internally is frequently included in bromide mixtures as a sedative and for epilepsy.

EPILEPSY. Treatment consists essentially of borax 10 gr. and sodium bromide 10 to 15 gr. thrice daily. If the fits do not cease in a fortnight, the borax is increased to 15 gr. After 6 weeks 15 minims of belladonna tincture daily are given in addition if necessary, and after 2 months it is reduced and then omitted. The salt mixture is given for a year at least, when the bromide is gradually reduced. The patient then remains on borax for another year. This almost invariably achieves a cessation of fits in adults, but children do not, as a rule, respond so well.

BILIARY COLIC. Good results obtained in the treatment of pains due to pathological conditions of the biliary tract by intravenous injections of 10 ml. of a 5% aqueous solution of sodium biborate. Of 47 patients suffering from chronic cholecystitis pain disappeared completely in 28 and there was marked

improvement in it; there was also improvement in the general appearance, increase of appetite and gain in weight. A course of 20 daily injections was usually given and, if necessary, repeated after an interval. Strict diet adhered to during treatment and all other drugs eliminated. Care should be taken to avoid extravasation of the solution into the paravenous tissues, since this is followed by intense pain.—G. Macchioro, per *Practitioner*, ii/1939, 347.

Collyrium Boracis (B.P.C.). 1% w/v.

Gargarisma Boracis (B.P.C.). Borax 15 gr. per fl. oz.

Glycerinum Boracis (B.P.).

Borax 12% w/w in glycerin. Has an acid reaction and liberates carbon dioxide from carbonates. Is useful in infantile diarrhoea in 20 m. doses.

Fatal poisoning in two-weeks-old child following ingestion of 1½ drachms of borax and boric acid in the form of honey and borax and glycerin of borax: a dummy teat dipped in the latter may convey 1½ to 2 grains of borax to the child's mouth.—J. Birch, *Brit. med. J.*, i/1928, 177; *Lancet*, i/1928, 287.

Liquor Alkalinus (B.P.C.). *Syn.* COLLUNARIUM ALKALINUM. Borax and sodium bicarbonate 1 in 80 of each, with phenol and sucrose, in water.

Liquor Boracis Compositus (B.P.C.). *Syn.* DOBELL'S SOLUTION, COLLUNARIUM ACIDI CARBOLICI COMPOSITUM. Borax and sodium bicarbonate 1 in 80 of each, with phenol, glycerin and water.

Mel Boracis (B.P.). *Syn.* BORAX HONEY, BORAX AND HONEY. Borax 10% in glycerin 5% and purified honey, all by weight.

Pulvis Boracis Compositus (B.P.C.). *Syn.* PULVIS ALKALINUS COMPOSITUS.

Equal parts of borax, sodium bicarbonate and sodium chloride.

Pulvis Sodii Chloridi Compositus (B.P.C.).

Equal parts of borax, sodium bicarbonate, sodium chloride and sucrose.

Solvellæ Antisepticæ (B.P.C.). *Syn.* EFFERVESCING MOUTH-WASH TABLETS.

Contain 3 gr. of borax with sodium benzoate, menthol, and other aromatics in an effervescing basis.

Solvellæ Boracis Compositæ (B.P.C.).

Contain borax 5 gr., sodium chloride and sodium bicarbonate of each 2½ gr., thymol ⅛ gr.

[P1] **Solvellæ Boracis et Benzaminæ Compositæ (B.P.C.).** *Syn.* TAB. NASO-PHARYNGEAL. CO. (N.I.F.), NASO-PHARYNGEAL SOLUTION-TABLETS.

Contain borax 3 gr., benzamine hydrochloride ¼ gr., with sodium chloride, sodium benzoate, menthol, thymol and oil of sweet birch.

[D-P1-81] **Solvellæ Boracis et Cocainæ Compositæ (B.P.C.).**

Contain sodium chloride 5 gr., borax 3 gr., and cocaine hydrochloride ⅓ gr., with sodium benzoate, boric acid, menthol, thymol and oil of sweet birch.

Sodii Boro-Tartras. *Syn.* TARTARUS BORAXATUS.

Dose.—20 to 40 grains (1.2 to 2.5 g.).

Borax 2, potassium acid tartrate 5, water 15, evaporate until a little of the residue cooled is brittle. Powder and dry at 50°. Antiseptic and diuretic.

Potassii Biboras. *Syn.* POTASSIUM PYROBORATE. $K_2B_4O_7 \cdot 5H_2O = 323.6$.

Prismatic crystals, readily soluble in water.

Varicose and traumatic ulcers have been treated with tri-weekly application consisting of boric acid 63 g., potassium hydroxide 28 g., water 200 ml., starting with half-strength solution.

Sodii Perboras (B.P.C., *Fr. Cx.*, F.E. VIII, U.S.P. XI).

$NaBO_3 \cdot 4H_2O = 153.9$.

Dose.—U.S.P. XI gives average dose 1 grain (0.06 g.).

A white permanent powder. **Soluble** in water, about 1 in 40, with decomposition, giving an alkaline solution containing free hydrogen peroxide. Is more soluble in solutions of boric, tartaric or citric acids, and in glycerin.

Uses. Antiseptic and deodorising. The dry salt may be used as a disinfectant, deodorant dusting powder. It has been used for soil-contaminated wounds. Tonsillitis occurring as complication in typhoid has been treated with sodium perborate gargle, 2 dr. to the pint.

To produce oxygenated water, 1 kilo yields 104 g., or about 72 litres of active oxygen. This quantity will produce 7 to 7.5 litres of "10 volume" oxygenated water. The solution is not acid. It contains hydrogen peroxide and borax. In practice, 170 g. with 60 g. of citric acid makes a litre of about "10 volume" strength. These solutions may be used to prepare antiseptic lotions, vaginal injections (about "5 volume" strength), e.g., in leucorrhœa and metritis, and are useful in minor surgery.

Causes irritation and chemical burns variously ascribed to impurities, to sodium hydroxide formed by hydrolysis, and to flavouring agents. No harmful effects on the oral tissues were caused by a mixture of sodium perborate monohydrate, 30 parts, dehydrated monocalcium phosphate, 45 parts, tricalcium phosphate, 25 parts.—L. L. Manchey and S. Lee, *J. Amer. pharm. Ass.*, 1937, 890.

PARONYCHIA. Make a paste with sodium perborate and water. Gently work this in under the nail-fold with a cotton-tipped toothpick and also pack round the sides and under the nail. Draw on a rubber finger-cot and allow to remain overnight. The infected finger is then soaked three times a day in a warm solution of sodium perborate made by adding two teaspoonfuls to half a glass of water, and continue soaking as long as effervescence takes place. Cases usually cured in 3 to 8 weeks.—E. M. Rockwood, *New Engl. J. Med.*, i/1933, 285.

VINCENT'S ANGINA. Rapid cure in 95% of cases with 2% sodium perborate solution as a mouth wash. Best used as a thick paste and retained in the mouth for 4 or 5 minutes while oxidising froth develops.—*J. Amer. med. Ass.*, ii/1928, 247.

Unguentum Sodii Perboratis. 1% in paraffin ointment basis. Antiseptic and healing.

Sodium Perborate Tooth Powder. Sodium perborate 2%, in precipitated calcium carbonate.

There is no carefully controlled evidence that sodium perborate is beneficial to the gums, that it bleaches the teeth or that its use prevents diseases of the gums. Unless the powder and the alkali resulting from its decomposition be thoroughly removed, inflammation and necrosis of the oral membrane may result.—Rep. of Council on Dental Therapeutics of the American Dental Association, per *Pharm. J.*, ii/1935, 600.

Calcii Perboras. A bulky powder less stable than sodium perborate. Has been used in tooth powders.

Magnesi Perboras is similar.

Magnesii Borocitras (B.P.C.).*Dose.*—15 to 30 grains (1 to 2 g.).

Dissolve light magnesium carbonate 70, in a solution of citric acid 100, in water 400, add boric acid 30, evaporate to dryness on a water bath and powder or scale. *B.P.C.* gives method of preparation from magnesium oxide.

A white powder or colourless scales, readily soluble in water; used as a urinary antiseptic internally for stone, gout, and rheumatism.

Pulvis Magnesii Borocitratis Compositus (B.P.C.). *Syn.* BORACITE.*Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 g.).

Magnesium borocitrate 1, sucrose 2.

ACIDUM CITRICUM*B.P., U.S.P. XI, Fr. Cx., P. Helv. V, etc.* $C_3H_4OH \cdot (COOH)_2, H_2O = 210 \cdot 1.$ *Dose.*—5 to 30 grains (0.3 to 2 g.).

Colourless crystals or white powder, obtained from lemon juice, which contains as much as 7 to 9% (30 to 40 gr. per oz.), or prepared from glucose.

Soluble 2 in 1 of water, 1 in 2 of glycerin, 1 in $1\frac{1}{2}$ of alcohol (90%), 1 in 8 of ether of sp. gr. 0.735, but much less soluble in 0.720 ether.

Incompatible with potassium tartrate and alkali carbonates.

Uses. In dilute solution relieves thirst in fever. For other purposes is usually administered as alkali citrate.

Collutorium Acidi Citrici (R.D.H.).

Citric acid 10 gr., solution of formaldehyde 1 m., water to 1 oz. To be used on the tooth brush with an equal quantity of water.

[P2] Lotio Acidi Citrici et Phenolis.

Citric acid 8 dr., phenol $\frac{1}{2}$ oz., water to 20 oz. For cleansing sockets after removing septic teeth.

Potassii Citras (B.P., U.S.P. XI, P. Dan.). $COOK \cdot C(OH)(CH_2 \cdot COOK)_2, H_2O = 324 \cdot 4.$

Dose.—15 to 60 grains (1 to 4 g.). *U.S.P. XI* average dose 15 grains.

White granular crystals obtained from citric acid and potassium carbonate.

Uses. It has diaphoretic, diuretic, and febrifuge properties. Is excreted as carbonate, rendering the urine alkaline, and is therefore given in cystitis, gout, and enuresis where the urine is over-acid. Large doses are useful for the acidæmia of diabetes. Is expectorant in the early stages of bronchitis and tracheitis with viscid, scanty secretion.

Potassii Citras Effervescens (B.P.C.). About 1 in 6.*Dose.*—1 to 2 drachms (4 to 8 g.).**Potassii Citras Effervescens (U.S.P. XI).**

Average dose.—1 drachm. Contains about 20% of potassium citrate.

Sodii Citras (*B.P., U.S.P. XI, P. Helv. V, P. Dan.*).
 $\text{COONa} \cdot \text{C}(\text{OH})(\text{CH}_2\text{COONa})_2 \cdot 2\text{H}_2\text{O} = 294.1.$

Dose.—15 to 60 grains (1 to 4 g.).

Intravenously, rabbits tolerate up to 0.4 to 1.6 g. per kilo, suitably diluted, or approximately 6.4 to 25.6 g. per 10-stone man (on Meeh's Formula, *q.v.*).

Granular crystals or powder. It is also obtainable with $5\frac{1}{2}$ H_2O (*Fr. Cx.*); 6 of the latter = 5 of the official salt.

Solution of sodium citrate 3.8% may be sterilised by the addition of Nipagin M 0.07 to 0.10% and Nipazol M 0.03% without recourse to heat.—*T. Sabalitschka, Pharm. Zentralh., 1938, 79, 151.*

Soluble. 1 in less than 2 of water; insoluble in alcohol 90%.

Uses. Used for the same purposes as the potassium salt. It has anticoagulant properties and is added for this reason to blood in transfusion. Solutions of strength 3.8% are used for washing out syringes and apparatus in blood transfusion and for mixing with the blood at the time it is drawn from the vein. 40 ml. prevents coagulation of about 650 ml. of blood. Although an anticoagulant *in vitro*, it accelerates coagulation when injected intravenously as a 5 to 30% *w/v* solution, or intramuscularly in doses of 15 ml. of a 30% solution into each buttock. Intravenous injections should be made very slowly, using the finest possible needle.

Is used in feeding infants with cows' milk to prevent the formation of large clots, 1 gr. per oz. being added. Up to 3 gr. per oz. is sometimes used.

Tabellæ Sodii Citratis (*B.P.C.*) contain 2 gr. (0.12 g.).

Liquor Sodii Citratis Fortis (*C.X.H.*).

Sodium citrate 1 g., sterile water to 4 ml., which is sufficient to prevent the coagulation of 15 oz. of human blood.

Wright's Solution.

Sodium chloride 4, sodium citrate 1, water 120. For sinus washing.

Bi-Citrol (*Wilcox, Joseau, London*). Sodium dihydrogen citrate in granular powder. *Dose.*—1 teaspoonful in half a glass of warm water, twice daily. Hepatic and biliary affections, hyperviscosity of the blood, and arthritic affections.

[P1] **Citronin** (*Parke, Davis, London*).

Dose.—1 or 2 drachms at intervals of not less than 3 or 4 hours. A preparation containing in each drachm sodium citrate $2\frac{1}{2}$ gr., citric acid $\frac{1}{2}$ gr., potassium guaiacolsulphonate 1 gr., Cascara Evacuant $\frac{1}{2}$ m., fluid extract of ipecacuanha $\frac{1}{2}$ m., ethylmorphine hydrochloride $\frac{1}{32}$ gr. For treatment of bronchitis and cough following "colds."

ACIDUM FORMICUM

B.P.C., P. Helv. V.

$\text{H} \cdot \text{COOH} = 46.02.$

Syn. AMINIC ACID.

Dose.—2 to 10 minims (0.12 to 0.6 ml.) *per os* freely diluted, e.g., with mineral water. Hypodermically 2 to 15 minims of 1 in 1000 dilution of actual acid. It is better given as sodium salt.

A colourless liquid containing 24 to 26% *w/w* of $\text{H}\cdot\text{COOH}$, sp. gr. about 1.063. Miscible with water.

Note.—Formic acid is obtainable also of sp. gr. $1.12=50\%$, $1.15=65\%$, $1.2=85\%$, $1.22=100\%$ $\text{H}\cdot\text{COOH}$; as a rule the 25% acid is referred to. The stronger acids cause painful burns.

Uses. It is alleged that this acid (acting in a manner similar to cantharides) gives tone to the muscles and restrains muscular tremor, as in cases of paralysis agitans, and in chorea, and that it increases muscular energy and abolishes the sense of fatigue, but there is little scientific evidence in support of this. It is employed, usually as one of the salts, in influenza, gout, rheumatism, tremors, etc.

Intramuscularly a very dilute solution is valuable in rheumatic affections. The injections are much less painful than if given subcutaneously and the pain is transient.

The acid was originally made from the red ant, *Formica rufa*. The stinging nettle, *Urtica dioica*, contains formic acid, and has long been employed as a tonic and diuretic.

Given intramuscularly, gave definite improvement after 6 or 7 injections in rheumatic affections. Sixty cases treated.—*Brit. med. J. Epit.*, 1/1933, 100.

Estoform (Crookes Laboratories, London). Orthoformic ester with extracts of wild cherry and senega in a glycerin-spirit base. *Dose.*—From 2 to 4 teaspoonfuls 3 times daily diluted with water. An antispasmodic in bronchitis, coughs and asthma.

BEE VENOM. Based on the suggestion that bee-keepers do not suffer from rheumatism, bee venom is employed therapeutically in the treatment of various rheumatic affections. The therapeutic action probably consists essentially in a stimulation of the metabolic processes in the tissues, favouring the breakdown of toxic products or their elimination. Injections in increasing dosage are administered intracutaneously at intervals of a few days over a period of some weeks, a preliminary test injection being made to test for idiosyncrasy. There is a temporary local irritation and swelling at the site of injection, accompanied by pyrexia, diuresis and drowsiness. The percutaneous administration of bee venom in ointment form is said to reduce the incidence of unpleasant reactions.

Very satisfactory results with bee venom. The venom collected at the end of the summer is most potent.—Frank Coke, *Brit. med. J.*, 1/1934, 872.

Used at the Royal Devonshire Hospital with excellent results in arthritis, fibrositis and neuritis.—W. Shipton and J. B. Burt, *Brit. med. J.*, 1/1934, 778.

Preparations are available (*Allen & Hanburys, London*, and *Antibody Products, Watford*) in ampoules for intramuscular injection and in ointment form for local use.

Forapin (Coates & Cooper, London). Bee venom available as an ointment in ampoules of various strengths.

Sodii Formas (*B.P.C.*). $\text{H}\cdot\text{COONa}$, $\text{H}_2\text{O}=86.02$.

Dose.—5 to 20 grains (0.3 to 1.2 g.) in solution, increased if desired to as much as 60 grains (4 g.) *per diem*.

A white alkaline powder soluble in water. A strong reducing agent and powerful antiseptic.

Incompatible with acids.

Uses. It is stated to have diuretic powers and to be non-toxic even in doses of 5 or 10 g. The formates were at one time thought to stimulate mental and physical activity, but there is no scientific evidence in support of this. Ocular fatigue has been treated with sodium formate instillation 1 in 50 to 1 in 30. Rheumatism has been improved by 15-grain doses.

[P1] **Elixir Formatum Compositum (B.P.C.).** *Syn.* ELIXIR FORMATUM CUM STRYCHNINA.

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains per drachm approximately 3 gr. each of sodium and potassium formates and $1\frac{1}{2}$ m. of solution of strychnine hydrochloride, in simple elixir.

Calcii Formas (B.P.C.). $(\text{H}\cdot\text{COO})_2\text{Ca} = 130\cdot1$.

Dose.—3 to 10 grains (0·2 to 0·6 g.).

White crystals soluble 1 in 8 of water.

Ferri Formas (B.P.C.). *Syn.* FERRIC FORMATE.

$\text{Fe}_2(\text{OH})_2(\text{HCOO})_4\cdot 4\text{H}_2\text{O} = 588\cdot7$.

Dose.—1 to 5 grains (0·06 to 0·3 g.).

Red crystals or powder soluble 1 in 18 of water forming an unstable solution, and 1 in 20 of dehydrated alcohol.

Lithii Formas. $\text{H}\cdot\text{COOLi}\cdot\text{H}_2\text{O} = 69\cdot96$.

Dose.—1 to 5 grains (0·06 to 0·3 g.). As much as $1\frac{1}{2}$ g. of this salt have been given daily.

White crystalline powder freely soluble in water.

Magnesi Formas. $(\text{H}\cdot\text{COO})_2\text{Mg}\cdot 2\text{H}_2\text{O} = 150\cdot4$.

Dose.—3 to 10 grains (0·2 to 0·6 g.).

Colourless deliquescent crystals soluble in water.

Potassii Formas (B.P.C.). $\text{H}\cdot\text{COOK} = 84\cdot11$.

Dose. and use similar to the sodium salt.

Crystalline hygroscopic powder very soluble in water forming neutral solution.

[P1-31] **Strychninae Formas.**

$\text{C}_{21}\text{H}_{23}\text{O}_2\text{N}_2$, $\text{H}\cdot\text{COOH} = 380\cdot2$.

Dose.— $\frac{1}{64}$ grain (0·001 g.), by hypodermic injection.

White crystalline powder, soluble in water about 1 in 5. A nerve stimulant and muscular tonic.

[P1] **Acidum Oxalicum (B.P.C.).** $(\text{COOH})_2\cdot 2\text{H}_2\text{O} = 126\cdot0$.

[P1] "*Oxalic acid.*"

[P2] "*Metallic oxalates.*"

[S3] "*Oxalic acid; metallic oxalates—in laundry blue; polishes.*"

White crystals soluble in water about 1 in 12; a powerful poison, made by acting on wood, sugar, starch, etc., with sodium hydroxides, or by heating sodium formate.

The toxicity of this acid in dilute solution and of its salts is due to their withdrawal of ionisable calcium from the blood and tissues. Strong solutions of the acid are poisonous by corrosive action. Toxic symptoms and cardiac depression can be relieved by giving soluble calcium salts.

Antidotes. Give immediately 2 dr. of chalk or magnesia mixed with water. Empty stomach, using cautiously a soft stomach tube with 4 oz. of magnesia in 2 gallons of water. Do *not* give hydroxides or carbonates of potassium, sodium or ammonium, as these form soluble oxalates. Give 1 oz. of castor

oil. Keep the patient warm. Saline infusion with dextrose for collapse.

Is used for removing ink stains and iron mould, cleaning leather, etc., and removing the colour from calico printing.

[P2] **Potassii Quadroxalas (B.P.C.)**. *Syn.* SAL ACETOSELLA, POTASSIUM TETROXALATE, SALT OF SORREL, SAL LIMONIS, SALTS OF LEMON. $\text{KHC}_2\text{O}_4 \cdot \text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O} = 254.1$.

Colourless crystals soluble about 1 in 30 of cold water, 1 in 12 of hot water; slightly soluble in alcohol.

Uses. To remove rust and ink spots; in metal polishes.

[P2] **Potassii Binoxalas**. *Syn.* POTASSIUM ACID OXALATE. $\text{KHC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$. Formerly supplied as salts of lemon.

[P2] **Potassii Oxalas**, the neutral salt, $\text{K}_2\text{C}_2\text{O}_4$, is added to blood as an anti-coagulant.

[P2] **Cerii Oxalas (B.P.C., P. Jap. V)**.

Dose.—2 to 10 grains (0.12 to 0.6 g.), in powders or cachets.

A white or pinkish, granular, odourless and tasteless powder, obtained as a by-product in the separation of thorium from monazite, and consisting of about 50% of cerous oxalate, $\text{Ce}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O} = 724.4$, with the oxalates of numerous other rare earths especially lanthanum, praseodymium and neodymium.

Insoluble in water; soluble in warm, dilute acids. Used in chronic vomiting, especially that of pregnancy, also in chronic diarrhoea, hysteria, epilepsy and migraine.

[P2] **Cerocol (Coates & Cooper, London)**. Colloidal cerium oxalate in tablets containing 0.05 g. In vomiting, especially of pregnancy.

Acidum Succinicum (B.P.C.). $(\text{CH}_3 \cdot \text{COOH})_2 = 118.09$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

Obtained on destructive distillation of amber, or by fermentation of tartaric (dihydroxysuccinic) acid or malic acid, or as by-product in fermentation of sugar. Colourless crystals with very acid taste, soluble 1 in 20 of water, 1 in 9 of alcohol.

In 1937 Koranyi and Szent-Györgyi (*Dtsch. med. Wschr.*, 1937, 1029) advocated the use of succinic acid by the mouth in the treatment of diabetic ketosis. They claimed that the administration of 1 g. daily, in divided doses, in a 2% aqueous solution, kept the urine free from acetone bodies in cases where insulin had failed to control the symptoms. Other workers, including Lawrence (*Brit. med. J.*, ii/1937, 214), were unable to substantiate these claims.

Asparagin. *Syn.* ALTHEIN, AMINOSUCCINIC ACID AMIDE.

$\text{HOOC}(\text{NH}_2)\text{HC} \cdot \text{CH}_2 \cdot \text{CONH}_2 \cdot \text{H}_2\text{O} = 150.1$. *Dose.*—5 to 10 grains. White crystals, having a slightly acid reaction. Soluble 1 in 50 of water, also in acid and alkaline solutions. Insoluble in absolute alcohol and ether. An aqueous solution dissolves freshly precipitated mercuric oxide, and this has been used for hypodermic injection in syphilis. Has decided diuretic effect. For cardiac dropsy and chronic gout, 1 grain is given three times a day.

ACIDUM GLYCEROPHOSPHORICUM

B.P.C.

$\text{C}_3\text{H}_5(\text{OH})_2\text{O} \cdot \text{PO}(\text{OH})_2 = 172.1$.

Syn. GLYCERYLPHOSPHORIC ACID, MONOGLYCERYLPHOSPHORIC ACID.

Dose.—5 to 10 minims (0.3 to 0.6 ml.).

A dibasic acid prepared by heating glycerin with phosphoric acid *in vacuo*. Occurs as a colourless, odourless liquid containing the α and β monoglycerides equivalent to about 20% *w/w* of $C_6H_5O_6P$. Sp. gr. 1.095 to 1.105. The chief constituent is the α variety. The acid is readily decomposed into glycerin and phosphoric acid on heating.

Stronger solutions, namely, 25% (sp. gr. about 1.13) and 50% (sp. gr. about 1.30) are also obtainable.

Uses of the Glycerophosphates. Thought to aid metabolism, hence given in emaciation and generally for tonic action. The compound syrup and glycerin of glycerophosphates, the syrup of glycerophosphates with formates, and many of the milk and glycerophosphate preparations are claimed to have tonic properties in devitalised conditions, *e.g.*, during convalescence from illness.

The glycerophosphates were originally introduced into medicine by Robin, on the grounds that lecithin contains its phosphorus in the form of the glycerophosphoric radical.

Calcii Glycerophosphas (*B.P.C.*, *P. Dan.*, *Fr. Cx.*, *P. Belg. IV*, *P. Helv. V*, *P.G. VI*, and *P. Ital. V*). *Syn.* CALCIUM GLYCERINOPHOSPHORICUM (*P. Jap. V*), NEUROSINA (*F.E. VIII*). $CaC_2H_5(OH)_2PO_4 \cdot 2H_2O = 246.2$.

Dose.—3 to 10 grains (0.2 to 0.6 g.) or more *per os* in water, *vide infra*. *Hypodermically* 1 grain (0.06 g.) in 40 minims (2.5 ml.). *Intravenously* 1 grain (0.06 g.) in 100 minims (6 ml.) is suggested by analogy with the lactophosphate.

A white crystalline powder consisting mainly of the α -glycerophosphate. The β -glycerophosphate is less soluble, and usually contains added citric acid to increase the solubility. Calcium glycerophosphate is formed, together with choline, on the breaking up of lecithin in the process of digestion.

Soluble about 1 in 40 of cold water, but different makers' products vary according to whether the compound is mainly the α or the β modification. (The α position is the terminal hydroxyl in glycerin and the β the central in combination with phosphoric acid.) It is only slightly soluble in hot water, soluble also in glycerin, insoluble in alcohol.

Incompatible with mineral acids and with soluble carbonates and phosphates. Solutions decompose when heated.

Caseinum Glycerophosphaticum (*B.P.C.*).

Dose.—1 to 4 drachms (4 to 16 g.).

Soluble casein with 2½% each of sodium and calcium glycerophosphates.

Glycolactophos (*Roberts, London*), **Sanatogen** (*Genatosan, Loughborough*) and **Vitafer** (*Southall Bros. & Barclay, Birmingham*) are casein and glycerophosphate combinations used in neurasthenia, and enfeebled nervous conditions generally.

Ferri Glycerophosphas (*B.P.C.*). *Syn.* FERRIC GLYCEROPHOSPHATE.

Dose.—1 to 5 grains (0.06 to 0.3 g.). In yellow or greenish-yellow scales containing 13 to 16% of Fe, together with alkali citrate. Slowly soluble in water.

Magnesi Glycerophosphas (B.P.C.). $\text{MgC}_2\text{H}_3(\text{OH})_2\text{PO}_4 \cdot 2\text{H}_2\text{O} = 230.4$.

Dose.—5 to 10 grains (0.3 to 0.6 g.). A white amorphous powder, soluble 1 in about 50 of water. May be rendered more soluble by addition of citric acid or alkali citrate.

Mangani Glycerophosphas. $\text{MnC}_2\text{H}_4(\text{OH})_2\text{PO}_4 = 225.0$.

Dose.—1 to 5 grains (0.06 to 0.3 g.). Pinkish amorphous powder, only slightly soluble in water. The relative anaemia which is often associated with cardiac overstrain has been treated by administering manganese glycerophosphate with hæmoglobin.

Potassii Glycerophosphas Liquidus (B.P.C.).*Dose.*—10 to 30 grains (0.6 to 2 g.).

A colourless syrupy liquid containing about 50% *w/w* of the hydrated neutral potassium salts of α - and β -glycerophosphoric acids, calculated as $\text{C}_2\text{H}_7\text{O}_3 \cdot \text{PO}_3\text{K}_2 \cdot 3\text{H}_2\text{O} = 302.3$. A 75% solution is also obtainable.

Quinina Glycerophosphas (B.P.C.). $(\text{C}_{20}\text{H}_{24}\text{O}_5\text{N}_2)_2 \cdot \text{C}_2\text{H}_4\text{O}_3\text{P} \cdot 4\text{H}_2\text{O} = 892.96$.

Dose.—1 to 10 grains (0.06 to 0.6 g.). *Fr. Cx.* has the compound with $5\text{H}_2\text{O}$, termed "basic" quinine glycerophosphate. White crystalline powder, soluble 1 in about 200 of water, and 1 in 40 of alcohol 90%.

Sodii Glycerophosphas (B.P.C., P. Ned. V). Syn. SODIUM GLYCERYLPHOSPHATE. $\text{C}_2\text{H}_7\text{O}_3\text{PNa}_2 \cdot 5\frac{1}{2}\text{H}_2\text{O} = 315.2$. *P. Ital. V, P. Dan., P. Belg. IV and F.E. VIII* have $5\text{H}_2\text{O}$.

Dose.—5 to 10 grains (0.3 to 0.6 g.), *per os*; also given *hypodermically* in 3 to 5 grain doses.

In crystalline masses or as a white powder, consisting of the β -glycerophosphate. *Fr. Cx.* describes it as a variable mixture of α - (with $5\text{H}_2\text{O}$) and β -glycerophosphates (with $6\text{H}_2\text{O}$).

Soluble 1 in 4 of water.

Sodii Glycerophosphas Liquidus (B.P.C.).*Dose.*—10 to 30 grains (0.6 to 2 g.).

A colourless or faintly yellow syrupy liquid consisting of a 50% *w/w* solution of the sodium salts of α - and β -glycerophosphoric acids. A 75% *w/w* solution is also obtainable in commerce.

[P1-S1] Strychnina Glycerophosphas.

Dose.— $\frac{1}{32}$ to $\frac{1}{16}$ grain (0.001 to 0.003 g.). White crystalline powder, soluble in water.

[P1] Metatone (Parke, Davis, London). Glycerophosphates of strychnine ($\frac{1}{160}$ gr. per dr.), calcium, potassium, sodium, manganese with vitamin B extract etc. *Dose.*—1 to 2 drachms before and after meals. Tonic and restorative.

Emulsio Olei Morrhua cum Glycerophosphatibus (B.P.C.).*Dose.*— $\frac{1}{4}$ to 1 ounce (8 to 30 ml.).

Contains 50% *v/v* of cod-liver oil with the glycerophosphates of calcium, magnesium, iron, sodium and potassium.

Emulsio Paraffini Liquidi cum Glycerophosphatibus (B.P.C.). Syn. EMULSIO PETROLEI CUM GLYCEROPHOSPHATIBUS.*Dose.*—1 to 4 drachms (4 to 16 ml.).

Contains 50% *v/v* of liquid paraffin with the glycerophosphates of calcium, magnesium, iron, sodium and potassium.

Extractum Malti Liquidum cum Glycerophosphatibus (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.).

Contains in 1 dr. the equivalent of $\frac{1}{2}$ gr. each of potassium and sodium glycerophosphates, in liquid extract of malt.

Glycerinum Glycerophosphatum Compositum (B.P.C.).

Syn. ELIXIR GLYCEROPHOSPHATUM, GLYCEROL GLYCEROPHOSPHATIS.

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains in 1 dr. calcium glycerophosphate $1\frac{1}{2}$ gr., potassium, sodium, and magnesium glycerophosphates of each about $\frac{1}{2}$ gr., and iron glycerophosphate about $\frac{1}{4}$ gr. It contains no sugar or strychnine.

Glycerinum Glycerophosphatum cum Medulla Rubra (B.P.C.).
Syn. GLYCEROL GLYCEROPHOSPHATIS CUM MEDULLA RUBRA, ELIXIR GLYCEROPHOSPHATUM CUM MEDULLA RUBRA.

Dose.—1 to 2 drachms (4 to 8 ml.).

Equal parts of compound glycerin of glycerophosphates and extract of red bone marrow.

[P1] Syrupus Glycerophosphatum Compositus (B.P.C.).

Syn. SYRUPUS GLYCEROPHOSPHATUM RUBER.

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains the glycerophosphates of calcium, sodium, potassium, magnesium and iron, with about $\frac{1}{10}$ gr. of strychnine and $\frac{1}{4}$ gr. of caffeine per drachm.

Syrupus Glycerophosphatum Compositus cum Medulla Rubra (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Equal parts of compound syrup of glycerophosphates and extract of red bone marrow.

[P1] Syrupus Glycerophosphatum cum Formatibus (B.P.C.). *Syn.* COMPOUND ELIXIR OF GLYCEROPHOSPHATES WITH FORMATES.

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains the glycerophosphates of calcium, sodium, potassium, magnesium and iron, with about $\frac{1}{10}$ gr. of strychnine and 3 gr. each of potassium and sodium formates per drachm.

[P1] Syrupus Glycerophosphatum et Pepsini Compositus (B.P.C.).

Syn. SYRUPUS GLYCEROPHOSPHATUM COMPOSITUS (Robin).

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains the glycerophosphates of calcium, sodium, potassium, magnesium and iron, with about $\frac{1}{2}$ gr. of pepsin and 2 m. of tincture of ignatia per drachm.

Syrupus Glycerophosphatum Flavus (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

It is of the same strength as *Syr. Glycerophosph. Co.*, but contains no strychnine, and is coloured yellow.

ACIDUM HYDRIODICUM DILUTUM

(with METALLIC IODIDES)

B.P.C., U.S.P. XI.

Dose.—5 to 10 minims (0.3 to 0.6 ml.) well diluted, or in syrup.
U.S.P. average dose 15 minims.

This acid is prepared by heating red phosphorus and iodine in presence of water, or by the action of hydrogen sulphide on a solution of iodine.

A colourless, odourless liquid containing 10% *w/w* of HI with 1% *w/w* of H_3PO_3 added to prevent discoloration on keeping. Other strengths available in commerce are 20% with sp. gr. 1.17, 46 to 47% with sp. gr. 1.5, and the constant boiling acid containing 57% *w/w* and boiling at 125°.

Syrupus Acidi Hydriodici (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.), well diluted.

Dilute hydriodic acid 10% *v/v*, with distilled water and syrup.

Syrupus Acidi Hydriodici (U.S.P. XI).

Average dose.—60 minims (4 ml.).

Diluted hydriodic acid (10%) 14 ml., sucrose 45 g., water to 100 ml.

Ammonii Iodidum (B.P.C., P. Helv. V). $NH_4I=145.0$.

Dose.—2 to 6 grains (0.12 to 0.4 g.).

White, deliquescent, crystalline granules becoming yellow on exposure to air, owing to loss of ammonia and liberation of iodine.

Soluble 1 in 1 of water, 1 in 3 of alcohol 90%, 3 in 4 of glycerin.

It causes less depression than potassium iodide, and is preferred by some for syphilis and rheumatism.

Calcii Iodidum (B.P.C.). $CaI_2=293.9$. Prop. Name. CALCIDIN (Abbott Laboratories, London), available in tablets.

Dose.—1 to 5 grains (0.06 to 0.3 g.). Given in dilute aqueous solution.

Deliquescent crystalline powder. On exposure to light or air will liberate iodine; best preserved in amber bottles.

Uses. May be given internally in place of potassium iodide. A 6 to 12% ointment is said to be of value in the treatment of glandular swellings, foul ulcers, and chilblains.

[P1-81-84] **Calcidrine Syrup (Abbott Laboratories, London).** Contains calcium iodide 7 gr., ephedrine hydrochloride $\frac{1}{2}$ gr., codeine sulphate $\frac{1}{2}$ gr., Nembutal $\frac{1}{2}$ gr., syrup of wild cherry and syrup of tolu to 1 oz. Antispasmodic and sedative cough syrup.

[P1] **Foille (Carbisulphoil Co., Dallas; Anglo-French Drug Co., London).** Emulsion of vegetable oil containing potassium iodide 0.14%, calcium iodide 0.25%, calcium thiosulphate 0.02%, calcium soap 0.39%, calcium sulphite 0.086%, oxyquinoline sulphate 0.1%, ethyl alcohol 1.4%, phenol 2.8%, benzocaine 1.3%, water 3.4%, vegetable oil 90.114%, with traces of sulphur and glycerin. Advocated for the treatment of burns, being applied with a brush, and the area then covered with gauze soaked in the preparation. The application is renewed thrice daily at first, the whole area being cleansed after 45 hours. The preparation is also used for indolent ulcers, etc., and for some mycotic infections.

Lithii Iodidum (B.P.C.). $LiI=133.9$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

White crystalline deliquescent powder becoming yellowish when stored. Contains theoretically 94.7% of I.

Soluble in water and alcohol 90%.

An antiarthritic, and has been employed in syphilis.

Potassii Iodidum (B.P., U.S.P. XI, Fr. Cx., P. Dan.).

KI=166.0.

Dose.—5 to 30 grains (0.3 to 2 g.)—often much increased, even up to 4 drachms per day. U.S.P. XI average dose 5 grains; as antiluetic 30 grains.

(**Kalium Jodatum** (P.G. VI, P. Helv. V, P. Jap. V) is potassium iodide. Potassium iodate, KIO_3 , is called **Kalium Jodicum** in Germany.)

In white cubic crystals or granular powder *soluble* 1 in 0.7 of water, 1 in 12 of alcohol 90%, 1 in 75 of acetone, 1 in 5 of methyl alcohol, and 1 in 2 of glycerin.

Solutions become yellowish in colour on standing, especially when exposed to light, owing to the liberation of a trace of free iodine. A slightly alkaline solution keeps better than an acid one.

Incompatible in solution with Spiritus Ætheris Nitrosi (unless made alkaline), salts of iron (except Ferri et Ammonii Citras and Liquor Ferri Acetatis), salts of bismuth; lead and mercury, Liquor Strychninæ Hydrochloridi, quinine sulphate and other alkaloidal salts, and with silver nitrate and potassium chlorate.

Uses. In universal use in the later stages of syphilis, in arteriosclerosis and in certain cases of gout and rheumatism. In rheumatoid arthritis may be given in conjunction with guaiacol carbonate. Small doses are valuable in the early stages of bronchitis, rendering the secretion less viscid. It also assists tuberculous expectoration. Is useful in conjunction with creosote in lobar pneumonia.

For actinomycosis it is specific; very large doses are given. Sporotrichosis and blastomycosis also respond. Acute parotitis is favourably treated with iodine externally and potassium iodide internally. In tinnitus aurium associated especially with vertigo, due to labyrinthine disease, full doses may be given. Is of value also in lymphangitis.

In aneurysm moderate to full doses are given. The addition of ammonium bromide is often useful.

In 5 to 15 grain doses twice or thrice daily, often with tincture of stramonium, is useful in asthma, both during the paroxysms and in the interval.

In arteriosclerosis 3 to 5 grain doses thrice daily with potassium bicarbonate 5 to 10 grains, sal volatile 20 minims, and an ounce of gentian infusion continued for four months at a time with interruptions of 10 or 12 days.

In areas where goitre is endemic, potassium iodide is administered prophylactically, but care must be taken to avoid overdosage and consequent hyperthyroidism. For this purpose it may be taken as *iodised table salt* containing about 1 in 200,000 of potassium or sodium iodide.

An assessment of the expectorant properties of potassium iodide and ipecacuanha, conducted under controlled conditions on 17 consecutive cases of chronic bronchitis, showed that the output of sputum was unchanged by the use of these drugs.—S. Alstead, *Lancet*, ii/1939, 932.

CARDIO-VASCULAR SYPHILIS. Potassium iodide the most efficacious treatment, though explanation of its action is difficult. Iodine by inunction may be substituted. Mercury is not more effective than arsenic, but safer. 0.3 g. of neoparsphenamine at intervals of a week over long periods, till 5 g. have been taken. Iodide and mercury continuous, and a course of organic arsenic added from time to time.—Carey F. Coombs, *Brit. med. J.*, ii/1930, 893.

GOITRE. The Swiss Goitre Commission (1922) after exhaustive investigations fixed the maximum amount as 1 part iodine in 200,000 parts of salt. This is the amount adopted in this country. Marine in the U.S.A. advises 1 in 500 in mildly goitrous districts.—J. A. Goodfellow, *Brit. med. J.*, i/1925, 331.

Iodine stimulates intestinal movements and in excessive doses causes diarrhoea. By the mouth potassium iodide causes a rapid rise in the iodine content of the blood. It is only in exceedingly high dosage that iodine causes injury to the sex glands—no injurious effects occur with small or moderate dosage. In the human subject the minimum amount of iodine required daily for an adult male is calculated at 15 microgrammes (millionths of a gramme). The dosage necessary to prevent goitre is higher, and the lower physiological limit is placed at about 100 microgrammes per day.—*Spec. Rep. Ser. med. Res. Coun., Lond.*, No. 123, 1929.

GUMMA. The action of potassium iodide in promoting the absorption of a gumma is so specific and so rapid that it is sometimes used diagnostically. The usual starting dose is 15 gr. three times a day in a simple mixture which may be increased up to 60 gr. three times daily.—H. K. Goadby, *Practitioner*, ii/1939, 654.

LEPROSY. Extremely useful in the last stages of recovery, but should only be used in patients maintaining a high resistance and tolerating full doses of Hydnocarpus esters.—E. Muir, *Trans. R. Soc. trop. Med. Hyg.*, 1931, 94.

TONSILLITIS. The administration of small doses of potassium iodide over a period of 3 months, 1 to 3 gr. once a day according to the age of the child, is a valuable form of conservative treatment for enlarged tonsils and adenoids. 70% of cases may be successfully treated by this method.—P. W. Leathart, *Brit. med. J.*, ii/1938, 835.

Toxic Effects. Idiosyncrasy to iodides sometimes occurs, comparatively small doses producing nasal catarrh, lachrymation, skin rashes and headache.

Linimentum Potassii Iodidi (B.P.C.).

A fluid liniment containing potassium iodide 1 in 10.

Linimentum Potassii Iodidi cum Sapone (B.P.C.).

A solid liniment containing potassium iodide about 1 in 7 with curd soap, glycerin, oil of lemon and water.

Mist. Pot. Iod. (N.I.F.). Potassium iodide 2½ gr., ammonium carbonate 2½ gr., concentrated compound infusion of gentian 15 m., chloroform water to ½ oz.

[P2] **Mist. Pot. Iod. et Arsen. (N.I.F.).** Potassium iodide 5 gr., arsenical solution 3 m., concentrated infusion of calumba 30 m., water to ½ oz.

Mist. Pot. Iod. c. Ipecac. (N.I.F.). Potassium iodide 5 gr., tincture of ipecacuanha 5 m., glycerin 20 m., water to ½ oz.

Unguentum Potassii Iodidi (B.P.C.).

10% with potassium carbonate in water and benzoated lard.

[P1] **Mixed Treatment Tablets (Parke, Davis, London).** Potassium iodide 2 gr., syrup of ferrous iodide 5 m., mercuric chloride 5 gr., solution of arsenous and mercuric iodides 2 m., tincture of nux vomica 4 m.

Dose.—1 to 3 tablets. Syphilis, tabes, etc.

Sodii Iodidum (B.P., U.S.P. XI, Fr. Cx., P. Dan.). NaI=149.92.

Dose.—5 to 30 grains (0.3 to 2 g.). U.S.P. XI average dose 5 grains.

(**Natrium Jodatum**, *P. Helv. V, P.G., P. Jap. V*, is sodium iodide. Sodium iodate is called **Natrium Jodicum** in Germany.)

A white crystalline deliquescent powder, **soluble** 3 in 2 of water, 1 in 3 of alcohol 90%, and in glycerin and acetone. Must be crystallised at a temperature above 20° otherwise the hydrated salt with 2H₂O is obtained.

Uses and incompatibilities are in general similar to those of the potassium salt, *q.v.*

Intravenous injections of a 10% solution have been employed for their analgesic effect in various painful conditions, *e.g.*, herpes zoster, neuritis, sciatica, etc.

Of ten agents considered to be of value in clinical or experimental hyperthyroidism (sodium fluoride, vitamins A and D, vitamins B and G, sodium iodide, estrogenic hormones, ergotamine tartrate, quinine hydrochloride, vitamin C and sodium thiocyanate) only one, namely, sodium iodide was found to limit the increased metabolic weight induced in guinea-pigs by thyrotrophic extracts. It is doubted therefore whether any of the other agents have any therapeutic value in clinical hyperthyroidism.—W. C. Cutting and G. B. Robson, *J. Pharmacol.*, 1939, 66, 389.

GOITRE well treated by six intravenous injections on alternate days of 6 gr. in 5 ml. water.—Reddi, *Prescriber*, 1928, 159.

HERPES ZOSTER. Intravenous injection of sodium iodide 20 ml. of 10% solution on the 1st, 2nd, 4th and 7th days (some patients less); also a dusting powder of zinc oxide, camphor, starch and morphine. All cases cleared up in less than 17 days.—*Prescriber*, 1931, 352.

The intravenous injection of sodium iodide is a specific for herpes zoster. A dose of 2 g. is given every other day and never more than four doses are necessary.—N. T. Beers, *J. Amer. med. Ass.*, i/1939, 2552.

PARESIS. *Usual dose.*—1 g. in 10 ml. of water. Doses of 100 ml. of 10% solution generally well tolerated at 4 to 7-day intervals. Give preliminary test dose of 20 ml. As much as 30 to 50 g. has been injected in one dose.—*J. Amer. med. Ass.*, ii/1929, 1753.

Sodium Iodide as Pyelographic Medium.

U.C.H. has a sterile solution of sodium iodide 15 g. in distilled water to 50 ml.

PYELOGRAPHY. 13.5% sodium iodide is best. Renal function and pyelography are mutually interdependent.—*Lancet*, i/1929, 1160.

Prolonged anuria in a woman following injection of sodium iodide 15% into pelvis for pyelography. Relieved by venesection.—D. D. Pinnock and I. W. Matthews, *Lancet*, ii/1931, 529.

For further details see Vol. II under X-ray diagnosis.

Naiodine (*Anglo-French Drug Co., London*). A stabilised 1% solution of sodium iodide for injection. *Dose.*—10 ml. intramuscularly. For the relief of pain in all types of neuralgia and neuritis. **Vitamised Naiodine 'A'** contains 2 mg. of crystalline vitamin B₁ in each 10 ml. ampoule, and 'B' contains 1 cg. of vitamin B₁ in each 10 ml. ampoule; these are for the treatment of neuritis by intramuscular injection.

Thionalodine (*Anglo-French Drug Co., London*). A stabilised solution of sodium iodide and magnesium tetrathionate available in two forms suitable for intramuscular and intravenous injection respectively. Advocated as an analgesic and sedative in all painful conditions such as sciatica, rheumatism, etc.

Dose.—Intramuscularly, or intravenously, 5-20 ml. daily.

Strontii Iodidum (B.P.C.). SrI₂·6H₂O = 449.6.

Dose.—5 to 15 grains (0.3 to 1 g.).

In deliquescent crystalline masses, with bitter saline taste.

Soluble 2 in 1 of water, and in alcohol.

Exophthalmic goitre of children has been treated with this and the bromide, also asthma, rheumatism, and chronic endocarditis.

Zinci Iodidum (B.P.C.). $\text{ZnI}_2 = 319.2$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.).

A white deliquescent powder turning brown on exposure. For cerebral, spinal, and nervous diseases in the third stage of syphilis, and in epilepsy, but rarely used.

Talbot's Solution (Canad. Form.). Zinc iodide 110 gr., distilled water 82 m., iodine 183 gr., glycerin to 1 oz.

Acidum Iodicum. $\text{HIO}_3 = 175.9$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

White crystalline powder very soluble in water. It is employed in ozæna, for deodorising offensive urine, as an irrigant in empyema (strength 1 in 500) and for leg ulcers, as a mouth-wash, *e.g.*, in inoperable epithelioma, and as a throat swabbing in diphtheria. Internally a drachm of a 1 in 100 solution, well diluted, has been given in gastro-intestinal sepsis, as in typhoid fever. The calcium salt is principally employed.

Calcii Iodas. *Syn.* CALCINOL. $\text{Ca}(\text{IO}_3)_2, 6\text{H}_2\text{O} = 498.0$.

Dose.—3 to 4 grains 3 times daily in solution.

Tasteless, odourless powder, soluble in 380 parts of water at 11.5°. Acts equally well in an acid or alkaline medium as a deodorant and anti-putrefactive.

Sodii Iodas. $\text{NaIO}_3 = 197.9$. White, crystalline powder, soluble 1 in 10 of water; insoluble in alcohol. Used as a dusting powder with 8 parts of boric acid, or as a saturated aqueous solution as a dressing for ulcers. $1\frac{1}{2}$ grains in 5% solution has been injected for acute and chronic articular rheumatism.

ACIDUM HYDROBROMICUM

(with METALLIC BROMIDES)

B.P.C.

$\text{HBr} = 80.92$.

Hydrobromic acid of sp. gr. 1.303 to 1.314 and containing about 34.5% *w/w* of HBr. Liquid with an acrid smell. Should not be exposed to sunlight. It may be prepared by the action of bromine on amorphous phosphorus in the presence of water and is colourless or straw-coloured. Commercially the acid is also obtainable in the following strengths—25% *w/w* (sp. gr. 1.208), 30% *w/w* (sp. gr. 1.260), and 40% *w/w* (sp. gr. 1.375). *P. Ned.* is 4N (about 32%).

Acidum Hydrobromicum Dilutum (B.P., P. Helv. V).

Dose.—15 to 60 minims (1 to 4 ml.); 60 minims = 10 grains of potassium bromide approximately. Contains 10% *w/w* of HBr. Sp. gr. 1.072 to 1.075. An acid of approximately the same strength is obtained by diluting 290 g. of the concentrated acid with 710 g. of water (approximately 4 fl. oz. 6 fl. dr. to 20 fl. oz.).

Uses. To allay nervous excitability and exhaustion, and as an alternative to potassium bromide; given with morphine to allay after-effects. As a solvent for quinine and to prevent quinism 8 minims will dissolve 5 grains of quinine sulphate in water. Obviates the sense of fulness of the head felt when taking iron. It is useful for tinnitus aurium and tickling hacking cough in

doses of 10 minims, and in headache, with flushing of the face and ringing in the ears. In vertigo it is successful and it relieves toothache. In epilepsy, up to $\frac{1}{2}$ ounce well diluted may be given, even to 3 ounces daily. It is also used with quinine hydrobromide in the treatment of primary Graves' disease.

[P1] **Mistura Chloroformi Composita** (B.P.C.). *Syn.* MISTURA TUSSI SEDATIVA, MISTURA TUSSI RUBRA.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains 15 m. of dilute hydrobromic acid and $\frac{1}{10}$ gr. of morphine hydrochloride per drachm.

Ammonii Bromidum (B.P.C., U.S.P. XI, *Fr. Cx.*, *P. Jap. V*, *P. Helv. V*, *P. Dan.*). $\text{NH}_4\text{Br} = 97.96$.

Dose.—5 to 30 grains (0.3 to 2 g.).

Small colourless crystals. *Soluble* 2 in 3 of water, 1 in 13 of alcohol 90%. *Incompatible* with mineral acids, silver nitrate and spirit of nitrous ether.

Uses. Possesses similar sedative properties to those of the other bromides (*vide* Potassii Bromidum) and is thought to cause less depression.

In sea sickness ammonium bromide, beginning a day or so before the voyage, in doses of 20 gr. in chloroform water with 15 gr. of sodium bicarbonate thrice a day, has been found useful.

In tinnitus a course of ammonium bromide with compound syrup of glycerophosphates is said to be of value, the bromide being taken on retiring.

Pastilli Ammonii Bromidi (B.P.C.) contain 1 gr. (0.06 g.).

Tabellæ Ammonii Bromidi (B.P.C.) contain 5 gr. (0.3 g.).

Ammonii Bromidum Effervescens (B.P.C.).

Dose.—75 grains to 1 ounce (5 to 30 g.). 1 in 12 $\frac{1}{2}$.

Mistura Ammonii Bromidi, Phenazoni et Caffeinæ.

Dose.—1 ounce (30 ml.), repeated in two hours if necessary.

Ammonium bromide 10 gr., phenazone 10 gr., caffeine citrate 5 gr., chloroform water to 1 oz. Ordinary headache is rapidly relieved by this.

Calcii Bromidum (B.P.C., U.S.P. XI, *P. Helv. V*, *P. Dan.*, *P. Ned. V Supp. II*). $\text{CaBr}_2 \cdot 2\text{H}_2\text{O} = 235.9$.

Dose.—8 to 30 grains (0.5 to 2 g.).

A very deliquescent white crystalline powder with saline, bitter taste.

Soluble 1 in 0.3 of water and 1 in 0.6 of alcohol 10%.

When the aqueous solution is recrystallised the salt $\text{CaBr}_2 \cdot 6\text{H}_2\text{O}$ is obtained. It is converted into $\text{CaBr}_2 \cdot 2\text{H}_2\text{O}$ by heating to 180°.

Fr. Cx. obtains by melting $\text{CaBr}_2 \cdot 2\text{H}_2\text{O}$ and allowing to solidify in its own water of crystallisation.

Uses. Is effective in epilepsy and sometimes preferred to potassium bromide.

Syrupus Calcii Bromidi (*Fr. Cx.*). Calcium bromide 25 g., water 15 g., orange-flower syrup 100 g., simple syrup 860 g.

Calcibronat (*Sandoz, London*). Calcium brom-lactobionate. Issued in granules and effervescent tablets, and in 5 and 10 ml. ampoules for intravenous or intramuscular injection.

A stable non-hygroscopic substance first produced by the National Bureau of Standards of the U.S. Department of Commerce. It is stated to have a sedative action almost twice that corresponding to its bromine content and not to cause bromide rashes. It contains 7.5% of Ca and 15% of Br, and is best prepared electrically from calcium carbonate, lactose and bromine.—(See H. S. Isbell, *J. Res. Nat. Bureau of Standards*, 1936, 331.)

Lithii Bromidum (B.P.C.). LiBr = 86.86.

Dose.—5 to 15 grains (0.3 to 1 g.).

White, deliquescent, slightly bitter granules, with neutral reaction. Contains a variable amount of moisture, but less than one molecule.

Soluble 5 in 3 of water; readily soluble in alcohol 90%.

Contains 91% of bromine as against 67% in potassium bromide; hence effect is greater, especially as a hypnotic, and in epilepsy.

Magnesii Bromidum (B.P.C.). $MgBr_2 \cdot 6H_2O$ = 292.2.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

Contains 54.9% of bromine. Given in hysteria and epilepsy as a nervine sedative. Soluble 1 in 0.6 of water and 1 in 2 of alcohol 90%.

Potassii Bromidum (B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Dan.). KBr = 119.0.

Dose.—5 to 30 grains (0.3 to 2 g.). U.S.P. XI average dose 15 grains.

(**Kalium Bromatum (P.G., P. Helv. V, P. Hung.)** is potassium bromide. Potassium bromate, $KBrO_3$, is called **Kalium Bromicum** in Germany.)

Colourless or white crystals with saline taste. **Soluble** 1 in about 2 of water, and 1 in about 200 of alcohol 90%.

Incompatible with mineral acids, mercury and silver salts.

Toxic Effects. Prolonged administration may cause symptoms of bromism, including nausea, dullness and muscular weakness with acneiform or erythematous rashes. To avoid the onset give arsenical solution together with purgatives and salol. Patients saturated with bromides exhibit anaesthesia of the palate—a little known but useful diagnostic. Tickling the palate with a feather is a good means of eliciting the information. The effect of bromides is enhanced by adding potassium bicarbonate in doses equal to about a quarter of the total bromide given.

BROMISM. The early symptoms of bromide intoxication are an exaggeration of the therapeutic sedative effect. Definite retardation of thought, speech, and action appears, with anorexia, constipation, weakness and drowsiness. This stage is seldom dangerous if recognised before the appearance of frank psychosis; and the symptoms clear up gradually when the bromide is discontinued. If the drug continues to accumulate, outspoken psychosis frequently occurs. Drowsiness and lethargy may be replaced by insomnia and irritable restlessness. The patient refuses food and fluids, and may become severely dehydrated. Dry mucous membranes, furred tongue, foul breath, dilated pupils, ataxia and tremulousness are typical symptoms of the more severe states. Symptomatic or delirious psychotic manifestations appear. In some cases, skin lesions appear, but the skin may be normal in the presence of outspoken mental disturbance. Dependence upon the bromide eruption as a diagnostic aid is one of the chief reasons why symptomatic psychosis due to bromide pass unrecognised. A blood bromide level of 250 mg. per cent. or higher will account for a delirious psychosis in a patient who is in fairly good physical condition.—P. W. Preu, J. Romano and W. T. Brown, *New Engl. J. Med.*, 1936, 214, 57.

Levels of blood bromide under 100 mg. per cent. may generally be ignored; symptoms are likely to appear in elderly patients or in those with impaired cardiovascular or renal efficiency when the amount is between 100 and 200 mg. per cent.; levels above 200 mg. produce symptoms in most cases. It is rare for a blood bromide above 300 mg. to be tolerated without ill effect.—R. F. Barbour, F. Pilkington and W. Sargent, *Brit. med. J.*, ii/1936, 957.

There is no uniform threshold at which symptoms appear. Most authors consider that they do not appear until a level of 225 to 250 mg. is reached. This is definitely too high and in certain people a level of 150 mg. is quite sufficient to produce a definite degree of toxicity—cases have been reported when the level was below 125. The average dose of bromide prescribed is 15 to 20 grains thrice daily, and this figure is satisfactory when the patient is taking a normal diet containing 10 to 15 gr. of sodium chloride a day. If, however, the chloride intake diminishes, then the toxic level may be reached very rapidly. In order to *remove the bromide* from the tissues of a patient, the administration of bromide is stopped, sodium chloride 30 gr. thrice daily is given and fluids are given freely. It usually takes from 10 days to two weeks for the acute symptoms to clear up but often considerably longer before all evidence of toxæmia disappears.—R. F. Barbour, *Proc. R. Soc. Med.*, 1936, 29, 1391.

The blood bromides of 32 chronic epileptic psychotic patients were estimated, and although comparatively high levels were found in many cases no obvious instances of true bromide intoxication showing delirious or confusional reactions were discovered, though some of the patients had been taking 90 grains of bromide a day for ten years. Reduction in the bromide level produced no appreciable change in the mental state and no marked increase in the number of fits, which were definitely reduced in eight cases.—L. Minski and J. B. Gillen, *Brit. med. J.*, ii/1937, 850.

Report of a number of cases of bromide intoxication with a description of the physical and mental effects. Bromide intoxication itself can cause impairment of kidney function, the majority of cases showing a raised blood urea nitrogen which fell when the intoxication disappeared.—H. Tod and H. Stalker, *Edinb. med. J.*, 1938, 561.

Whereas the use of sodium chloride in bromide intoxication necessitates from 2 to 6 weeks of treatment, with *gastric aspiration* the bromides are eliminated in from 2 to 7 days. A continuous drainage with negative pressure bottles is simple and efficacious. Twelve cases of bromide psychosis so treated with gratifying results.—F. Lemere, *J. Amer. med. Ass.*, ii/1939, 1243.

Uses. Hypnotic and sedative. Much used in epilepsy, greatly reducing the number of fits. In recent epilepsy it should be given for a long period (not less than two years). If no benefit from 45 to 75 grains *per diem* some other remedy should be tried.

The following mixture has been recommended:—Potassium bromide 1 oz., potassium iodide 2 dr., ammonium bromide 3 dr., ammonium carbonate 1 dr., tincture of calumba 1 oz., water to 6 oz. One teaspoonful before each meal and three teaspoonfuls at bedtime. If petit mal exists alone, or co-exists with complete epilepsy, the dose of ammonium bromide must be increased and that of the other diminished.

Valuable especially in combination with chloral hydrate, in insomnia due to worry or overwork but not to pain. Large doses have been given in tetanus, and it has also been used as an antidote to strychnine poisoning. Sedative in spermatorrhœa and nymphomania. For gonorrhœal erections 15 to 35 gr. may be given 2 to 4 times daily in a cachet with lupulin 1 to 2 gr. and camphor 1 to 2 gr.

Bromide must not be administered over any prolonged period unless an adequate intake of fluids and chloride is maintained; and the physician should be constantly alert for symptoms of bromide intoxication. Bromide should not be employed in states of severe excitement and agitation because it is not effective unless dangerously large doses are given. Bromide should never be

used in cases of delirium due to either toxic or infectious causes. It should be used with caution in cases of arteriosclerosis, since delirium is readily produced if cerebral arteriosclerosis is present. Nephritis is a definite contraindication to the use of the drug. Bromide should not be used in cases of dehydration or severe malnutrition, in which the body fluids and chlorides are low.—P. W. Freu, J. Romano and W. T. Brown, *New Engl. J. Med.*, 1936, 214, 61.

LABOUR. A combination of potassium bromide and chloral hydrate is a safe and useful sedative in the first stage of labour, especially in excitable and nervous patients, and does not appear to lessen uterine contractions. Initial dose, 30 gr. of each drug, repeated in smaller doses at 3 or 4-hourly intervals. Vomiting avoided by sipping the mixture dissolved in at least 6 ounces of water with glucose and lemon juice.—L. McIlroy and H. Rodway, *J. Obstet. Gynec.*, 1933, 1175.

Enema Potassii Bromidi (B.P.C.).

Dose.—5 ounces (150 ml.).

Potassium bromide 1% w/v, acetylsalicylic acid 0.5% w/v and mucilage of tragacanth in normal saline.

[P1] Mistura Bromidi Composita (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

1 oz. contains 10 gr. each of the bromides of ammonium, potassium and sodium, and 10 m. of tincture of nux vomica.

[P1] Mist. Brom. et Chloral. (N.I.F.). Chloral hydrate 5 gr., potassium bromide 10 gr., liquid extract of hyoscyamus 3 m., dill water to $\frac{1}{2}$ oz.

Mist. Pot. Brom. (N.I.F.). Potassium bromide 10 gr., liquid extract of liquorice 5 m., ammonium carbonate 1 gr., chloroform water to $\frac{1}{2}$ oz.

[P1] Mist. Pot. Brom. et Strych. (N.I.F.).

Potassium bromide 10 gr., solution of strychnine hydrochloride 3 m., solution of bordeaux B 2 $\frac{1}{2}$ m., chloroform water to $\frac{1}{2}$ oz.

[P1] Mistura Bromidi et Digitalis (St. M. H.).

Potassium bromide 20 gr., tincture of digitalis 5 m., potassium citrate 15 gr., compound tincture of cardamom $\frac{1}{2}$ dr., peppermint water to 1 oz.

[P1] Mist. Bromidorum (N.I.F.).

Borax 5 gr., potassium bromide 5 gr., sodium bromide 5 gr., ammonium bromide 5 gr., arsenical solution 1 m., liquid extract of liquorice 5 m., chloroform water to $\frac{1}{2}$ oz.

[P1] Mistura Dysmenorrhœica (E.G.A.).

Potassium bromide 15 gr., sal volatile, tincture of hyoscyamus a.a. $\frac{1}{2}$ dr., spirit of chloroform 10 m., water to $\frac{1}{2}$ oz.

Tabellæ Potassii Bromidi (B.P.C.) contain 5 gr. (0.3 g.).

Cerebrom (C. F. Thackray, Leeds). A flavoured bromide preparation. Each fluid drachm contains potassium and sodium bromide 5 gr., ammonium bromide 3 gr., calcium bromide 1 $\frac{1}{2}$ gr., lithium bromide $\frac{1}{2}$ gr. *Dose.*—1 to 2 fluid drachms diluted.

Sedin (Hommel's Hæmatogen Co., London). Tablets contain potassium bromide and sodium bromide of each 0.4 g., ammonium bromide 0.2 g., sodium chloride 0.1 g., with vegetable extractive. To make a sedative bouillon.

[P1-S1] Gelineau Dragées (Mousnier-Delorme, Antony (Seine); Wilcox, Jozseau, London). Dragées contain potassium bromide 1.0 g., antimony arsenate 0.001 g., picrotoxin 0.0005 g. *Dose.*—1st week, 1 twice daily; 2nd and 3rd weeks, 1 thrice daily; 4th week, 1 four times daily, and this dose (or larger if necessary) continued for 6 months or longer. For epilepsy.

Sodii Bromidum (B.P., U.S.P., XI, Fr. Cx.). NaBr=102.9.

Dose.—5 to 30 grains (0.3 to 2 g.). U.S.P. XI average dose 15 grains.

(Natrium Bromatum (P.G., P. Helv. V, P. Jap. V, P. Hung.) is sodium bromide. Sodium bromate, NaBrO₃, is called **Natrium Bromicum** in Germany.)

In white deliquescent granular crystals, with saline taste.

Soluble 1 in 1½ of water, 1 in 16 of alcohol 90%.

Uses. In insomnia, maniacal attacks and hysteria. Full doses combat morphine habit, and may be given as a sedative in alcoholism. A 1% solution has been given by subdural injection, after removal of 50 to 60 ml. of cerebrospinal fluid, for delirium tremens.

It is used in the treatment of epilepsy in a similar manner to potassium bromide. Alternatively it may be used as a substitute for salt in the so-called "saltless" treatment of epilepsy, on the theory that diminishing the chloride increases the readiness with which bromide enters the blood stream (*see also* p. 65).

10 ml. of 10% solution intravenously has been recommended in eczema. 2 to 5 injections usually sufficient but more are sometimes needed.

The addition of 20 drops of sal volatile, or 5 drops of Fowler's Solution to each dose prevents the rash which often disfigures patients taking bromide.

EPILEPSY. The following is a typical hospital mixture for treatment of epilepsy: sodium bromide 5 to 15 gr., borax 5 to 10 gr., tincture of belladonna 5 to 10 m., liquor arsenicalis 1 to 3 m., chloroform water to ½ oz. *Dose.*—½ ounce thrice daily after meals.—D. Brinton, *Practitioner*, i/1936, 521.

Final remissions beginning with the institution of treatment or shortly after occurred in 35 of 96 cases (36%). Final remissions of over a year were brought about in 45.8% of 85 cases treated over a year. Remissions of over one year were brought about in 71.7% of 85 cases treated over one year—in some the remission lasted over ten years. In patients suffering from grand mal attacks only, the attacks were stopped in 43%. Of all cases those presenting focal attacks were most resistant to treatment, it being ineffectual in 55.3%. When remissions are brought about by treatment it must be continued throughout the life of the patient. It is suggested that early treatment and few previous attacks lead to more prompt and continued remissions.—L. J. Pollock, *J. Amer. med. Ass.*, i/1938, 632.

HYPERCHLORHYDRIA. Sodium bromide, 2 to 3 g. a day. Harmless in doses of 6 to 7 g. even when continued for some time.—*Brit. med. J. Epit.*, i/1936, 60.

TRIGEMINAL NEURALGIA. Many patients find considerable temporary relief, at least in the earliest stages, from the following mixture: sodium bromide 10 gr., tincture of gelsemium 10 m., butylchloral hydrate 5 gr., peppermint water to ½ oz. *Dose.*—½ ounce thrice daily, after meals.—D. Brinton, *Practitioner*, i/1936, 526.

Sebrex (*Allen & Hanburys, London*). Sedative broth tablets containing 17 grains of sodium bromide.

Sedobrol Tablets (*Rocha Products, Welwyn Garden City*). Contain 17 gr. of sodium bromide in vegetable extractives and fat. Suggested for salt-free bromide treatment or diet—the tablet being simply covered with 100 to 200 ml. of hot water to produce a bouillon for use in nervous affections, epilepsy and migraine.

Dose.—1 to 6 tablets *per diem*.

Strontii Bromidum (*B.P.C., Fr. Cx.*). $\text{SrBr}_2 \cdot 6\text{H}_2\text{O} = 355.6$.

Dose.—5 to 30 grains (0.3 to 2 g.).

In deliquescent crystals, with bitter saline taste, **soluble** 2 in 1 of water, 1 in 3 of alcohol.

Used in gastric affections, dyspepsia, and vomiting of nervous origin; also in epilepsy instead of the potassium salt, but is more slowly absorbed.

ACIDUM HYDROCHLORICUM

(with METALLIC CHLORIDES)

HCl = 36.46.

[P2] "*Hydrochloric acid.*"

[S3] "*Hydrochloric acid—in substances containing less than 9%, weight in weight, of hydrochloric acid (HCl).*"

B.P. has sp. gr. 1.158 to 1.168, containing 32% *w/w* of HCl. P. Ned. V and P. Helv. V 25%. Fr. Cx. 35.5%. F.E. VIII 33.65%. P.G. VI 24.8 to 25.2%. P. Ital. V 35.39%. P. Belg. IV 36.47%. U.S.P. XI 35 to 37%. P. Jap. V 30%.

Incompatible with alkalis, alkaline carbonates, metallic oxides, silver, mercury and lead salts.

Antidotes. Treat as for poisoning by glacial acetic acid, see p. 7.

Uses. Escharotic, but less corrosive than sulphuric or nitric acid. Neuritis is sometimes treated by applying strong hydrochloric acid to the skin along the line of the inflamed and painful nerve on a wad of cotton wool; results are striking and appreciated. The freshly diluted acid, 5 to 10 m. with 6 to 8 oz. of water (Bouchard's remedy), taken with every meal, is of value in alimentary toxæmia.

Acidum Hydrochloricum Dilutum (B.P.).

Dose.—5 to 60 minims (0.3 to 4 ml.).

Is prepared by diluting 31.3 g. of the strong acid with water to 100 g. An acid of approximately the same strength is obtained by diluting 5 fl. oz. 310 m. of the strong acid with water to 1 pint. Sp. gr. 1.045 to 1.052. Contains (B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V, F.E. VIII and F. Norsk.) 10% *w/w* of HCl. P. Ital. V 8.07%, P. Ned. V is 4N (14.5%), P.G. VI 12.4 to 12.6%, P. Belg. IV 7.29%, P. Dan. 7.05%.

Uses. In conditions of achlorhydria (*e.g.*, in pernicious anæmia, chronic gastritis, cancer of the stomach, etc.) and hypochlorhydria (*e.g.*, in sprue). $\frac{1}{2}$ to 1 dr. with meals has been recommended for tuberculous diarrhoea. In dilatation of the stomach 10 to 15 minims after each meal may be given with or without 6 to 8 grains of pepsin.

PRURITUS VULVÆ. A common factor present in pruritus vulvæ, leukoplakia, kraurosis vulvæ and leukoplakic vulvitis is achlorhydria, which causes a deficiency of absorption of vitamin A from the diet. The addition of diluted hydrochloric acid to the diet of 42 women suffering from intractable pruritus vulvæ with achlorhydria relieved the pruritus in the majority of cases, with great improvement of the local vulval condition. The diluted hydrochloric acid is given by mouth, a teaspoonful in a glass of water. Half of this solution is sipped during the meal and the other half drunk after the meal. The acid is taken with each meal and continued for several weeks. A teaspoonful of cod-liver oil is also taken three times a day.—B. H. Swift, *per J. Amer. med. Ass.*, 1/1937, 1754.

Betainæ Hydrochloridum. $C_5H_{11}NO_2 \cdot HCl = 153.6$.

(Betaine (*Syn.* TRIMETHYL-GLYCOCOLL. $C_5H_{11}NO_2 = 117.1$) occurs in beets and mangolds (especially *unripe* roots) and has been found in a number of vegetable and animal substances. It

is formed on oxidation of choline and is chemically related to muscarine and neurine.)

Dose.—1 to 8 grains (0.06 to 0.5 g.).

White crystalline substance soluble in water 1 in 2; in alcohol about 1 in 20.

Uses. Liberates hydrochloric acid (almost 25% of its weight), and is given with pepsin or diluted with water in gastric affections.

Acidol (*Bayer Products, London*). Betaine hydrochloride in 7½ gr. tablets.

Acidol-Pepsin (*Bayer Products, London*).

Dose.—1 to 2 tablets (7½ grains in each) in water after meals.

Contains betaine hydrochloride equivalent to 8 m. of dilute hydrochloric acid, and pepsin 1½ gr. In anorexia, hypochlorhydria, gastritis, etc.

Acidulin (*Eli Lilly, London*). Glutamic acid hydrochloride. Liberates free HCl in presence of moisture. Capsules contain the equivalent of 10 drops of dilute HCl. For use in the treatment of conditions exhibiting deficiency of gastric HCl.

Betacid (*Richter, London*). Betaine hydrochloride and pepsin. Available in two strengths:—"Mite" containing betaine hydrochloride ½ gr., pepsin 3½ gr. and "Forte" containing betaine hydrochloride 6½ gr., pepsin 1½ gr.

Paractol (*Camden Chemical Co., London*). Betaine hydrochloride and glutamine hydrochloride in powder form for the treatment of gastric disturbances due to insufficiency of HCl. 3 g. is equivalent to 37 drops of dilute hydrochloric acid. *Dose*.—45 grains (3 g.) in water.

Ammonii Chloridum (*B.P., U.S.P. XI, Fr. Cx., P. Helv. V*). NH_4Cl = 53.50.

Dose.—5 to 60 grains (0.3 to 4 g.).

White crystals soluble 1 in 3 of water, 1 in 60 alcohol (90%), and 1 in 5 of glycerin.

Incompatible with alkalis and carbonates of alkaline earths.

Uses. Mildly expectorant, diaphoretic and diuretic. Is administered to render the urine acid in the treatment of urinary infections, e.g., with mandelic acid; change of pH alone has no effect on bacilluria.

In cases of chronic lead poisoning, ammonium chloride, in a dose of 1 or 2 g. daily in divided doses, produces a condition of acidosis which hastens the elimination of the lead; too rapid elimination should be avoided, however.

URINARY AFFECTIONS. In cases of infection with the proteus bacillus, ammonium chloride would seem to be unsuitable as a urinary acidifier for biochemical and bacteriological reasons. In treating infections of the kidneys with the proteus bacillus, systemic acidification may be dangerous and lead to the formation of new stones, unless one is successful in obtaining a strongly acid urine. This may be due to the rapid manufacture of ammonia by the proteus bacilli.—R. Chute, *New Engl. J. Med.*, i/1936, 869. See also D. M. Lyon and D. M. Dunlop, *Brit. med. J.*, ii/1935, 1096.

Collyrium Ammonii Chloridi (*B.P.C.*). 0.5% w/v.

Lot. Evap. Meth. (*N.I.F.*).

Industrial methylated spirit 1 oz., ammonium chloride 2 dr., water to 8 oz.

Mist. Ammon. Chlorid. (*N.I.F.*). Ammonium chloride 15 gr., aromatic solution of ammonia 5 m., liquid extract of liquorice 15 m., water to ½ oz.

[P1] *Mist. Ammon. Chlorid. Co.* (*N.I.F.*)

Ammonium carbonate 3 gr., ammonium chloride 5 gr., tincture of chloroform and morphine 5 m., liquid extract of liquorice 5 m., water to ½ oz.

Pastilli Ammonii Chloridi (*B.P.C.*) contain 2 gr. (0.13 g.).

Pastilli Ammonii Chloridi Compositi (*B.P.C.*) contain 2 gr. of ammonium chloride and 2 m. of liquid extract of liquorice.

Trochisci Ammonii Chloridi Compositi (B.P.C.) *Syn.* TROCHISCI AMMONII CHLORIDI ET GLYCYRRHIZÆ.

Contain 3 gr. of ammonium chloride and 3 gr. of extract of liquorice. Tablets are also made same strength.

Trochisci Ammonii Chloridi (T.H.). 2 grains, marked "M.A." One every 3 hours useful in congestion of the pharynx and larynx, loss of voice arising from cold and bronchial cough.

Trochisci Ammonii Chloridi Compositi (T.H.). Contain ammonium chloride 1 gr., potassium chlorate 2 gr., and $\frac{1}{2}$ gr. approximately of cubeb. Marked "C.M.A."

Calcii Chloridum (B.P., F.E. VIII). $\text{CaCl}_2 = 111.0$.

Dose.—*Per os*, 10 to 30 grains (0.6 to 2 g.). *B.P. Add. I* states that when calcium chloride is prescribed for injection hydrated calcium chloride shall be dispensed.

This is the anhydrous salt, the *B.P.* requiring not more than 10% of water. In fused white agglutinated very deliquescent masses.

Soluble 1 in $\frac{1}{2}$ of water, 1 in 3 of alcohol 90%.

Calcii Chloridum Hydratum (B.P. Add. I, Fr. Cx., P. Helv. V, P. Belg. IV, P. Ital. V, P. Jap. V). $\text{CaCl}_2 \cdot 6\text{H}_2\text{O} = 219.1$.

Dose.—By intramuscular injection, 1 to 3 grains (0.06 to 0.2 g.); by intravenous injection, 10 to 30 grains (0.6 to 2 g.). It should never be given hypodermically, owing to its destructive action on the subcutaneous tissues, and intravenously it should be employed with caution owing to possible formation of blood clot.

In colourless deliquescent crystals with slightly bitter taste, containing about 50% of CaCl_2 .

Soluble 4 in 1 of water, 1 in 1 of alcohol 90%.

Incompatible with carbonates, phosphates, sulphates and tartrates.

Uses. Calcium chloride increases the coagulability of the blood and has thus been employed in a wide variety of hæmorrhagic conditions, though there is little convincing evidence of its value.

It is employed in itching skin affections, *e.g.*, pruritus, prurigo, urticaria. It is useful in chilblains (full dose frequently), in certain forms of headache, in tubercular disease, chorea, glandular affections and in all conditions in which there is calcium deficiency.

The use of calcium chloride should be restricted to those conditions in which it is desired (1) to raise the serum calcium and more especially to increase the proportion of ionised calcium, and (2) to increase the acidity (pH) of the urine. It may be given in doses of 15 to 30 grains four-hourly, but prolonged administration is inadvisable in view of the possibility of acidosis. Given by injection it is irritating and its use should be avoided if possible, even for intravenous injections, since a small amount leaking into the perivascular tissues may cause considerable pain and sloughing. Subcutaneous injections of calcium preparations are of little value, since a reasonable amount cannot be given by this route.—N. Morris, *Practitioner*, ii/1939, 343.

ACNE. A 10% solution of calcium chloride intravenously, 5 ml. every third day, increased to 10 ml. every second day, of value. Inject slowly, taking care not to infiltrate the skin or the hypoderm. When patient complains of heat in the face, stop till this feeling disappears.—*Per Prescriber*, 1929, 332.

ANGIONEUROTIC ŒDEMA treated with 10 grain doses thrice daily, increasing to 20 grains. The swellings which appeared continuously in different parts of the body disappeared completely.

CANCER OF THE BUCCAL CAVITY. For the prevention of pneumonia after operations on the tongue and mouth for cancer. For about a week before operation give 15 gr. calcium chloride thrice daily (practically all cases of cancer are deficient in calcium).—James Barr, *Brit. med. J.*, i/1934, 452.

CHOREA. There is a rather low total serum calcium content. The calcium content of the cerebrospinal fluid is consistently low.—E. C. Warner, *Lancet*, i/1930, 339.

ECLAMPSIA. Calcium therapy is the prophylactic. Continuous administration during pregnancy of 15 gr. calcium phosphate in $\frac{1}{2}$ oz. of water thrice daily as prophylactic in midwifery, combined with a 1 in 1000 solution of acriflavine in glycerin (q.v.) for vaginal injection.—J. L. Moir, *Brit. med. J.*, i/1931, 118.

Calcium therapy in eclampsia disappointing. The fits are not influenced by the calcium content of the serum.—W. C. W. Nixon, *Lancet*, ii/1931, 292.

EPIDIDYMITIS well treated by intravenous injection of 0.5 to 1 g. in dilute solution—4 or 5 injections, one daily.—Per *J. Amer. med. Ass.*, ii/1928, 1136.

HÆMORRHAGE (uterine) may be controlled by intramuscular injection of calcium chloride. 1 gr. in 100 m. injected deeply into the gluteal muscles is generally painless. A second injection at end of 24 hours and a third, 24 hours later, may be given.

HAY FEVER. A low body content of calcium is favourable to hay fever, the administration of calcium chloride acting beneficially. A retention of potassium and a greater output of sodium results from increased calcium in the diet. 10 grain doses t.d. have been advised.

NEPHRITIS and ŒDEMA successfully treated with calcium chloride, $2\frac{1}{2}$ to $4\frac{1}{2}$ dr. daily, free diuresis occurring.

In chronic parenchymatous nephritis the calcium is at a low level.—Dan T. Davies, *Lancet*, i/1930, 203.

TETANY. Intravenous injection of 10 ml. of a 10% solution of calcium chloride is an excellent emergency measure for the relief of symptoms of parathyroid tetany. A good method of treatment is to give orally a large amount of calcium chloride (150 grains daily); where this is not effective, and where achlorhydria is present, give 50 to 100 ml. of N/3 hydrochloric acid in milk (1 of acid to 20 of milk) to increase absorption of the calcium.—D. Campbell, *Lancet*, i/1935, 372.

In acute cases of spasmodophilia the calcium content of the serum ranges between 4 and 8 mg. per 100 ml. Give calcium chloride 2 g. every 2 hours. As much as 6 g. can be given in 24 hours in milk to an infant without any apparent intolerance. Improvement in $\frac{1}{2}$ hour. Hydrochloric acid (e.g., 260 ml. of N/10 acid with 750 ml. of milk) and ammonium chloride, 5 g. a day, also efficacious but they are only transient in effect.—Dan T. Davies, *Lancet*, i/1930, 202.

Mistura Calcii Chloridi (N.I.F.).

Calcium chloride 10 gr., syrup of ginger $\frac{1}{2}$ dr., water to $\frac{1}{2}$ ounce.

Mist. Calc. Chlorid. c. Ferro (N.I.F.). Calcium chloride 10 gr., solution of ferric chloride 10 m., water to $\frac{1}{2}$ oz.

Mistura Calcii Chloridi Albuminata (B.V.H.).

Calcium chloride 15 gr., solution of pectin 2 dr., syrup 30 m., water to 1 oz. (Solution of pectin contains pectin (100 grade) 87.5 gr., glycerin of chlorbutol (1 in 12) $\frac{1}{2}$ oz., water to 20 oz.).

A calcium mixture for oral administration over long periods to asthmatic and arthritic patients; it does not cause derangement of the stomach.—*Pharm. J.*, ii/1934, 620.

Syrupus Calcii Chloridi (B.P.C.). Syn. ELIXIR CALCII CHLORIDI.

Dose.—1 to 2 drachms (2 to 4 ml.).

Calcium chloride 1 in 8 in distilled water and syrup of lemon.

Transcutan (Transcutan Ltd., Leeds). A concentrated solution of mineral salts from the Kreuznach springs, containing calcium chloride, iodine, bromine, strontium and lithium salts, with aromatic oils, for adding to baths. In rheumatoid arthritis, fibrositis, etc.

Magnesii Chloridum (B.P.C., *Fr. Cx.*, *P. Helv. V*).
 $\text{MgCl}_2 \cdot 6\text{H}_2\text{O} = 203.3$.

Dose.— $\frac{1}{4}$ to 1 ounce (8 to 30 g.).

Deliquescent crystals, **soluble** about 2 in 1 of water and 1 in 6 of alcohol 90%. Mild purgative, a dose in $\frac{1}{2}$ pint of hot water useful for constipation and in dyspepsia and stomach disorders.

Potassii Chloridum (B.P.C., *P. Helv. V*, *P. Dan.*).
 $\text{KCl} = 74.55$.

Dose.—15 to 60 grains (1 to 4 g.). A 25% aqueous solution is usually better tolerated than capsules or tablets; a teaspoonful of this solution (equivalent to 1 g. of the salt) added to a wineglassful of water or milk seldom gives rise to gastric distress. It is well to test the patient's tolerance with an initial dose of 15 gr.

(Kalium Chloratum (*P. Jap. V*, *P. Helv. V*) is potassium chloride. Potassium chlorate (*P. Jap. V*, *P. Helv. V*, *P. G. VI*) is **Kalium Chloricum**.)

Potassium chloride is obtained from natural sources or by neutralising hydrochloric acid by potassium carbonate, and occurs as a colourless, crystalline solid, with a saline taste.

Soluble 1 in 3 of water; insoluble in alcohol and ether.

Uses. Potassium chloride has been advocated for use in place of table salt in gouty and rheumatic individuals as a means of preventing the formation of uric acid calculi. It has also been found of value as a diuretic in the treatment of nephritis with oedema, the main objection to its use in this connection being that if its elimination is delayed it may give rise to toxic symptoms, such as chilliness, fatigue and headache.

In common with most of the potassium salts the toxicity of potassium chloride by the mouth in healthy individuals is very slight, and the ill effects arising from the ingestion of excessive amounts are few, since gastric upset usually occurs before a toxic amount has been taken, and this retards assimilation. In the presence of renal insufficiency, however, even the amount of potassium contained in an ordinary diet may be dangerous, and potassium salts should only be administered with caution. Their use should also be avoided in the presence of cardiovascular disease, owing to their depressant effect on the heart, and they should be employed with care when given simultaneously with digitalis, since the two drugs may act synergically on the heart.

Although in the treatment of Addison's disease a low potassium intake is recommended in order to favour the retention of sodium, over-treatment, when due to excessive administration of desoxycorticosterone acetate (*q.v.*), may result in a decrease in the concentration of serum potassium resulting in an exacerbation of certain of the symptoms, and to the occurrence of oedema and hypertension, and in this case an increased potassium intake is advised.

During recent years a considerable amount of work has been done on the biochemistry of potassium salts and the indications

for their use (and in particular for the use of potassium chloride) are now more precise and less empirical. In the light of present knowledge it would appear that the action of potassium depends on its effects (1) as an electrolyte, (2) as a substance concerned with carbohydrate metabolism, (3) as a mediator of the nerve impulse, and (4) as a participant in muscle contraction. On the basis of this knowledge potassium salts have been employed with varying success in a wide variety of conditions, *e.g.*, in hay fever and other allergic diseases, in familial periodic paralysis, in myasthenia gravis, and in Ménière's disease.

ADDISON'S DISEASE. The potassium content of the diet of patients with Addison's disease affects the course of the disease and the development of the symptoms of crisis. An intake of potassium not greater than 4 g. a day, an amount comparable to that contained in a normal diet, may promote the excretion of sodium and chloride whereby significant losses of sodium and chloride occur and symptoms of crisis are precipitated. If the intake of potassium is restricted to about 1.6 g. per day, the requirement of sodium and chloride is materially diminished and it becomes possible (though not necessarily desirable) to maintain patients with smaller doses of sodium salts than are otherwise needed and without injections of extract of adrenal cortex. Optimal therapeutic results demand not only restriction of potassium but optimal rather than minimal doses of sodium salts, and when possible injection of an active extract of adrenal cortex. The arrangement of a diet to contain not more than 1.6 g. of potassium requires careful planning, and the diet should be suitably supplemented by the addition of calcium phosphate, some iron salt, and a concentrate of vitamins B and G.—R. M. Wilder *et al.*, *Arch. intern. Med.*, 1937, 69, 367.

Directions for the planning and preparation of diets low in content of potassium, including tables showing the potassium content of a wide variety of fruits, vegetables, and other foods.—M. Victor, *Proc. Mayo Clin.*, 1937, 424.

FAMILIAL PERIODIC PARALYSIS. Administration of potassium caused rapid disappearance of paralysis. Potassium chloride, from 5 to 10 g. in watery solution by mouth, brought about return of movement within thirty minutes to one hour and the ability to walk unaided within two hours. Recovery was associated with a progressive rise of serum potassium. Intravenous injections (50 ml. of 2% solution in 10 minutes) caused much more rapid and dramatic recovery but with intense burning pain.—R. H. Pudenz, *J. Amer. med. Ass.*, ii/1938, 2254.

It is well known that periodical attacks of paralysis are always accompanied by a fall in the potassium figure, and the administration of 5 to 10 g. by the mouth restores the power of movement within half to one hour. Complete cures have been reported in 8 to 10 days of infantile paralysis. Treatment should be started as early as possible, the daily dose for an adult being 5 to 6 g. and for an infant 0.75 to 1 g., the drug being given in 250 g. of syrup for an adult and 125 g. for an infant.—A. Ravina, *Pr. méd.*, 1939, 789.

HÆMORRHAGE. Dental hæmorrhage may be rapidly suppressed by insertion in the socket of a cotton plug soaked in 5% solution of potassium chloride. No irritation results.—J. A. Higgins, *J. Amer. dent. Ass.*, 1937, June, 1047.

HAY FEVER. Striking benefit was obtained from the use of potassium salts in 29 cases of hay fever. Most of the patients responded quickly to 5 grains (a dose of 10 grains caused acute epigastric pain) of potassium chloride, dissolved in water, three times a day, some experiencing relief in a few minutes and some in about half an hour. The treatment was also found of value in urticaria, eczema and other allergic diseases. It is suggested that allergy is predominantly a disturbance of electrolyte metabolism and associated with some endocrine (possibly adrenal) dysfunction.—B. Bloom, *J. Amer. med. Ass.*, ii/1938, 2281. Results not confirmed in 40 cases.—G. F. Harsh and P. B. Donovan, *ibid.*, i/1940, 1859; or in 153 cases.—S. S. Rubin *et al.*, *ibid.*, i/1940, 2359.

MÉNIÈRE'S SYNDROME. In forty patients treated by a high potassium intake with an otherwise normal diet, the therapeutic results were encouraging. It cannot be considered a cure for all the symptoms, but clinical improvement has been impressive, and surgical treatment was not carried out in any of the cases. A daily dose of 6 to 10 g. of potassium chloride in aqueous solution was given

and no dietary modifications were advised.—J. H. Talbott and M. R. Brown, *J. Amer. med. Ass.*, i/1940, 125.

MYASTHENIA GRAVIS. Potassium chloride given in large doses, 10 to 12 g., by the mouth, gives a demonstrable improvement in myasthenia. Six patients have taken the salt daily for two months in doses of from 4 to 6 g. six times a day—the largest total in one day being 40 g., and this treatment has proved a valuable adjunct to Prostigmin (*q.v.*). The only unpleasant symptom has been a mild diarrhoea and some nausea following the larger doses.—L. P. E. Laurent and W. W. Walther, *Lancet*, i/1935, 1434.

OBESITY. The use of potassium salts in the treatment of obesity has been recommended, a high protein intake supplemented by 4 g. or more of potassium chloride daily constituting an effective anti-obesity regimen.—*Per New Engl. J. Med.*, i/1940, 587.

Sodii Chloridum (*B.P., U.S.P. XI, Fr. Cx.*). NaCl = 58.45.
Dose.—10 to 60 grains (0.6 to 4 g.). White cubical crystals.

(**Natrium Chloratum** (*P.G. VI, P. Helv. V, P. Jap. V.*) is sodium chloride. Sodium chlorate, NaClO₃, is called **Natrium Chloricum** in Germany.)

Soluble 1 in about 3 of water (not more in boiling water), about 1 in 200 of alcohol 90%, about 1 in 10 of glycerin.

Uses. Although in common use, sodium chloride is not requisite to those having ordinary mixed diet, but is necessary to vegetarians. Insufficient sodium chloride leads to anæmia, debility and œdema of face and ankles. Large doses are emetic.

As a purgative it may be given in dose of 120 to 240 grains. As a laxative, 75 grains in a tumbler of cold water, it is stated, acts efficiently and without pain. Rectal injections are used to kill threadworms. Hypodermically or intravenously as normal saline solution, *q.v.*

In large doses, 10 to 15 g. daily, sodium chloride is frequently of considerable value in the treatment of Addison's disease and may substantially reduce the dose of suprarenal cortex extract required. In some cases its administration may replace treatment with cortical extract, especially if the potassium intake is kept low (*cf.* Potassium Chloride).

ADDISON'S DISEASE. Striking results in a case from a dosage of 15 g. a day. The sodium in the blood is reduced in cases of Addison's disease.—G. Graham, *Lancet*, ii/1933, 1446.

Dramatic effect in a case put on 10 g. daily (in milk), relapse following reduction of dose to 5 g. daily. Treatment with sodium chloride is not in any way curative, but by supplying an excess of sodium makes good the wastage.—C. M. H. Howell, *Lancet*, i/1934, 1116. *See also* R. F. Loeb, *Proc. Soc. exp. Biol. Med.*, N.Y., 1933, 30, 808; W. G. Sears, *Lancet*, i/1934, 950.

Sodium chloride by mouth may be of real value in the acute, subacute and chronic phases of Addison's disease. On the other hand the benefit may be so slight as not to be appreciated by the patient. The emetic action of sodium chloride may prevent its administration by the mouth. Sometimes salts of sodium other than the chloride may be satisfactorily substituted to overcome the difficulty. 10 g. of the salt daily is as much as most patients can possibly take, but sometimes 20 g. or more is necessary.—S. L. Simpson, *Proc. R. Soc. Med.*, 1936, 29, 1143.

Most patients object to taking more than 10 g. of sodium chloride in the day except for a short while, and this will only supply 4 g. of sodium. It may be that some mixture of salts which will supply about 10 g. of sodium, will give better results. A trial should be made of a mixture of sodium chloride, sodium bicarbonate and sodium citrate, but a careful watch should be kept on the patient's alkali reserve.—G. Graham, *Proc. R. Soc. Med.*, 1936, 29, 1138.

DIABETIC PAIN. Complete or marked relief of neuritic pain in all of 13 diabetic patients following oral administration of sodium chloride in amounts ranging from 15 to 90 g. daily over periods of two to four weeks with interruptions of 10 to 14 days. The relief is thought to be due to a vasodilating effect, since observations indicate that ischaemia, the result of vascular disease, primarily arteriosclerosis, is responsible for the neuritic symptoms.—H. R. Sandstead and A. J. Beams, *Arch. intern. Med.*, 1938, 61, 372.

Dechlorination or Salt-free Diet.

NEPHRITIS has been treated by this (in many forms of nephritis the kidneys fail to eliminate salt). Copious diuresis sets in, oedema disappears and remains more or less absent so long as the treatment is kept up. Food should be cooked without it. The salt-free diet is, however, often disappointing. It should be tried where heart and lungs are hampered by excessive oedema, and in migraine and chlorosis. It is important to remember that it is the sodium ion that is important, and not the chlorine; thus, sodium bromide and sodium bicarbonate should also be avoided in these cases.

EPILEPSY has been treated by sodium chloride reduction. Reduce the salt in the diet and the absorption of bromide will increase. The combined treatment, e.g., with bromide tablets containing 2 gr. of salt and 18 gr. of bromide to be used to salt broth, is satisfactory.

MÉNÈRE'S SYNDROME. Severe attacks of vertigo and vomiting in 12 patients suffering from deafness and tinnitus ceased on the institution of a low sodium diet (water intake unrestricted) and administration of ammonium chloride 3 g. (in capsules) with each meal, the medication being given three days on and two days off. The addition of ammonium chloride prevents the storage of sodium. All medicaments containing sodium should be avoided, e.g., sodium salicylate, sodium bicarbonate, sodium bromide, etc.—M. R. Brown, *J. Amer. med. Ass.*, 1/1937, 1158.

Selarom (Bayer Products, London). Mixture of calcium, magnesium, and sodium salts of organic acids. For salt-free dietary.

Balneum Sodii Chloridi (B.P.C.). Contains 7 lbs. of sodium chloride per 30 gallons. A tonic and stimulant, e.g., in chronic rheumatism.

Collunarium Plasma (B.V.H.).

Sodium chloride 6 dr., sodium sulphate 2 dr., sodium phosphate 2 dr., sucrose 3 oz. (Apoth.) or tragacanth 20 gr., thymol 3 gr., menthol 3 gr., alcohol 90% 1 dr., distilled water to 6 oz.

Hauftus Sodii Chloridi Compositus (Mid. H.).

Sodium chloride 5 gr., sodium bicarbonate 5 gr., spirit of chloroform 5 m., caraway water to 1 oz. For the dry cough of the early stages of acute bronchitis.

Liquor Sodii Chloridi Physiologicus (B.P.). *Syn.* PHYSIOLOGICAL SALINE SOLUTION, NORMAL SALINE SOLUTION.

A sterile 0.9% w/v aqueous solution of sodium chloride. *U.S.P. XI* and *P. Jap. V* have 0.85%, and *Fr. Cx.* 0.8%.

This is isotonic with the liquid of the blood corpuscles and possesses the same osmotic pressure as the *liquor sanguinis*; it has a freezing point of approximately -0.56° . The injection should be made at least at 105°F . (*this is important*), into any convenient vein. The rate of injection varies; it may be as rapid as a pint in 10 minutes, or as slow as 8 ounces per hour (see refs. *infra*).

Fortunately only an approximation to an isotonic solution is necessary, as mucous membranes are practically insusceptible to changes in osmotic pressure within fairly wide limits. The solution should be slightly alkalisied. 0.1% sodium bicarbonate is sufficient.

ISOTONIC SODIUM CHLORIDE for ophthalmic use is 1.4%. The lachrymal secretion is stated to contain 1.3% of sodium chloride and 0.5% of albumin. Eye lotions are often made isotonic.

Uses. Normal saline solution, usually given by intravenous or rectal injection, is an easy and effective means of increasing the

blood volume and blood pressure, and is of great value in severe hæmorrhage, surgical shock, acute diarrhœa, and the recurrent vomiting of infants. By hastening excretion of poisons by the kidneys, intravenous injections are also of value in morphine poisoning, uræmia, and diabetic coma.

Continuous intravenous saline preferable to putting into the circulation a pint or more of fluid comparatively suddenly. The cannula (preferably gold-plated) is tied into a vein a little larger than itself, either in the back of the hand or the saphena or one of its branches, just below the knee, or the vein just in front of the internal malleolus, the vein being exposed by a transverse incision after infiltration anæsthesia. The cannula and wound should be moist with citrate solution at time of introduction. A splint is used to keep the limb at rest. The fluids generally used are normal saline or 5% glucose in normal saline, kept warm by placing an electric heating pad on the limb over the cannula. The average rate of flow for an adult is 50 drops per minute ($\frac{1}{2}$ pint an hour), increased to 100 drops in the first hour if necessary (œdema the signal for reducing flow). May be continued for 3 to 7 days.—V. Bailey and J. M. Carnow, *Brit. med. J.*, i/1934, 11. Value confirmed by E. R. Flint, *ibid.*, 75; W. Morris, *ibid.*, 75. In almost constant use at the Northampton General Hospital since June, 1931.—E. L. Laver, *ibid.*, 123.

ACNE. Intravenous injections of 100 ml. increased by 50 ml. until a maximum of 250 ml. was reached (unless the patient had only one or two pus pockets, when the solution was injected locally into the pus and around the inflammatory base); most serviceable in pustular acne and furunculosis.—H. Goodman, *Arch. Derm. Syph.*, June, 1935, 828.

GONORRHEA. 1% saline solution has many advantages over a 1 in 10,000 potassium permanganate solution for posterior irrigation.—*Brit. med. J. Epit.*, ii/1929, 43.

ILEUS. As in cholera, there is dehydration. Give $2\frac{1}{2}$ to $3\frac{1}{2}$ pints of normal saline intravenously.—D. C. Corry, *Brit. med. J.*, i/1931, 219.

RETAINED PLACENTA.—The rapid injection of 350 to 400 ml. of saline into the umbilical vein in cases of retained placenta is a successful and much less dangerous undertaking than the manual removal of this organ.—David Levi, *Practitioner*, i/1936, 508.

SCIATICA. Injection of normal saline into and around the sciatic sheath is of value in the later stages of trunk sciatica (sometimes known as low sciatica or true sciatica). On entering the nerve sheath, employing a lumbar puncture needle of 10 cm., inject 20 ml. of the solution very slowly and leave the needle in position; then refill the syringe. Having fixed the syringe in position, slightly withdraw the needle and push upwards into the piriformis muscle and inject a further 50 ml. It is a good plan to include 10 ml. of 1% Novocain in the normal saline mixtures made up to 100 ml. It is only in trunk sciatica that these injections are of any use.—J. B. Burt, *Practitioner*, ii/1939, 275.

SURGICAL SHOCK. Instead of saline injections, gum saline—Bayliss (sodium chloride 2 g., potassium chloride 0.05 g., calcium chloride 0.05 g., acacia 5 g., distilled water 100 ml.) is advocated for loss of blood if actual blood transfusion is impossible.—H. Pritchard, *Brit. med. J.*, i/1927, 793. (See *Acacia*.)

Solvellæ Sodii Chloridi (B.P.C.) contain 20 gr. (1.3 g.).

Ringer's Solution (B.P.C.). Sodium chloride 0.7, potassium chloride 0.014, calcium chloride 0.012, sodium bicarbonate 0.02, water to 100. Is isotonic with the serum of frog's blood.

The Committee on Pharmacy and Pharmacognosy of the Pharmacopœia Commission (*Report 13*) have recommended the inclusion in the B.P. of the following formula for Ringer's Solution:—sodium chloride 9 g., potassium chloride 0.42 g., hydrated calcium chloride 0.48 g., sodium bicarbonate 0.5 g., water to 1000 ml.

Liquor Ringeri (P. Jap. V) contains sodium chloride 0.8%, potassium chloride 0.075%, calcium chloride 0.02%, sodium bicarbonate 0.01%.

Ringer-Locke Solution (B.P.C.). Sodium chloride 0.9, potassium chloride 0.042, calcium chloride 0.024, dextrose 0.1, sodium bicarbonate 0.05, water to 100. Is isotonic with the serum of mammalian blood.

Liquor Lockei (P. Jap. V) contains sodium chloride 0.9%, potassium chloride 0.025%, calcium chloride 0.046%, dextrose 0.1%, and sodium bicarbonate 0.02%.

AURICULAR FIBRILLATION. There is always calcium deficiency. Ringer's solution containing about double the usual amount of calcium chloride and 2 ounces of syrup of glucose to the pint is a good drink which should be drunk freely.—Sir J. Barr, *Brit. med. J.*, i/1930, 774.

Ringer-Tyrode Solution (B.P.C.). Sodium chloride 0.8, potassium chloride 0.02, calcium chloride 0.02, magnesium chloride 0.001, dextrose 0.1, sodium acid phosphate 0.005, sodium bicarbonate 0.1, water to 100. Is isotonic with the serum of mammalian blood.

Fischer's Modified Ringer's Solution.

Sodium chloride 0.5, calcium chloride 0.04, potassium chloride 0.02, distilled water to 100. This is employed in surgical practice instead of normal saline, e.g., for dissolving procaine. Has advantages over Ringer's or Tyrode's solution. This solution possesses constant pH value of 7.52 at 37°, is isotonic with blood, is sterilisable and contains calcium and potassium in a ratio approximating to that in arterial blood. Similar relation exists between total uni- and bivalent positive ions.

STOCK SOLUTION contains sodium chloride 10.5 g., potassium chloride 0.5 g., magnesium chloride 0.1 g., calcium chloride 0.8 g., N/1 phosphoric acid 5 ml., and 50 ml. of water.

For use filter 50 ml. and add 1 litre of water, heat and when cool saturate with oxygen, and add 5 ml. of sterile N/1 sodium carbonate solution.

Hypertonic Saline Solution. Intravenous injections of hypertonic saline solutions, varying in strength from 5 to 30%, are of value in conditions in which it is desired to replace loss of body fluids and chlorides, e.g., in cholera (120 grains of sodium chloride and 4 grains of calcium chloride in a pint of distilled water). They also lower the pressure of the cerebrospinal fluid and give relief in post-concussional headache, cerebral tumour, and cerebral hernia. The injection in divided amounts of from 100 to 200 ml. of a 5 to 10% solution is of value after operation in acute intestinal obstruction. A 20% solution has been employed as a sclerosing agent for varicose veins, but is said to be more painful and less certain than quinine urethane.

40 ml. of a 30% saline solution intravenously is an effective means of raising the blood pressure immediately after the fall which follows the administration of a spinal anæsthetic—it also reduces the number of post-operative headaches.—H. Dodd, *Lancet*, i/1940, 360.

ACUTE INTESTINAL OBSTRUCTION well treated immediately after operation by 20 g. of sodium chloride intravenously in 10% solution 30 ml. at a time during 48 hours (maximum 70 g. for a man of average weight) with 1 litre physiological serum subcutaneously during the same period.—*Brit. med. J. Ept.*, i/1928, 32.

Discussion at B.M.A. Centen. Meeting, 1932. *Sir W. I. de C. Wheeler.*—Hypertonic saline intravenously reduced mortality rate from 50 to 11.1%. *D. P. D. Wilkie.*—Fluids and chlorides must be given liberally before operation. *R. Graham* (Toronto).—Thousands of ml. of saline necessary in these cases.—*Brit. med. J.*, ii/1932, 364.

ANGINA PECTORIS due to coronary artery disease. Injections used with good results in patients not improved by rest or the usual therapy. Initial dose 100 ml. of 5% sodium chloride solution, and subsequent doses increased by 50 ml. weekly up to a maximum of 250 ml., injections being given three times weekly. Contraindications are nephritis, cardiac decompensation and arterial hypertension of over 180 mm. of mercury. Injection discontinued if precordial pain occurs during or immediately following.—S. C. Feinberg, *Amer. J. med. Sci.*, 1936, 191, 210.

CARBUNCLES. The local application employed is a fomentation or compress of fluffed-up white gauze well wrung out of a hot solution of hypertonic salt—one ounce to the pint—renewed two-hourly during the day and four-hourly at night. In a few days the slough comes away entirely, when dry fluffed gauze dressings are substituted. The method is equally applicable to boils. In infections of the face, nose and lip the part is bathed in the hypertonic salt solution for a quarter of an hour at a time at two or three-hourly intervals, a compress being applied as near as possible during the intervals.—C. Donald, *Brit. med. J.*, i/1935, 963.

POST-CONCUSSIONAL STATES. One of the effects of injecting hypertonic saline into the circulation is a diminution in the volume of the brain—hence of use in post-concussional or post-concussional states—for relief of headache—even 100 ml. of 30% solution can be given, but usually 50 ml. of 15% effective.—A. Feiling, *Brit. med. J.*, ii/1930, 907.

TRICHOMONAS VAGINITIS. Vaginal douching with 25% salt solution gives prompt relief and in most cases prevents recurrence. The effect is due to osmotic action, and is non-irritating and inexpensive.—L. Rosenthal and co-workers, *J. Amer. med. Ass.*, ii/1935, 105.

VARICOSE VEINS. Large amounts may be injected, 10 ml. for one injection, up to 20 or 30 ml. at one time; or with 5 or 10 ml., 3 or 4 injections at one sitting. A more adherent and exclusive thrombosis and a better end-result than with other agents.

Sodium chloride 20% the "safest as far as systemic reaction is concerned." Retards clotting of the blood, and incapable of giving rise in the ordinary way to any thrombosis, either at time of injection or subsequently. Probably the most efficient and safest to use and will remain so until the ideal solution is discovered.—T. H. T. Barber, *Brit. med. J.*, i/1930, 219; *ibid.*, ii/1930, 60.

4 to 10 ml. of 20% solution gives good results, but is not certain in its effects and causes cramp-like pains.—A. H. Douthwaite, "Injection Treatment of Varicose Veins" (H. K. Lewis).

Strong solutions of dextrose (50%) and salt (30%) have gone out of favour, and are only occasionally used in allergic cases.—A. Dickson Wright, *Brit. med. J.*, i/1940, 665.

Hypotonic Saline Solution (St. G. H.) is 0.3%.

[P2] **Cheron's Serum.**—Sodium chloride 2, phenol 1, sodium phosphate (Na_2HPO_4 , called neutral phosphate in France) 4, sodium sulphate 8, distilled water to 100.

Enema Sodii Chloridi (B.P.C.). Dose.—20 ounces (600 ml.). 2.5 to 5% w/v in mucilage of starch or in 5% w/v aqueous soft soap. Hypertonic enema.—4% w/v in water.

Pulv. Hypertonic (N.I.F.).

Sodium chloride 4, sodium citrate 1. Two heaped teaspoonfuls to be dissolved in $\frac{1}{2}$ pt. of warm water.

Trunecek's Serum for nervous ailments and high arterial tension.

Dose.—Subcutaneously 1 ml. to commence with, increasing by 0.2 ml. May also be given by rectum and mouth.

Sodium chloride 492, sodium sulphate 44, sodium phosphate 15, sodium carbonate 21, potassium sulphate 40, water to 10,000.

Tablets of Trunecek's Serum are prepared 5 grains each, i.e., equivalent approximately to 5 ml. of the serum. Daily dose 3 to 6 with meals. Administration per os is equally effective.

For atheroma and sclerosis of arterial coats.

Trunecek's Serum has a freezing point of 3.29° , and an osmotic pressure 5.875 times greater than blood serum—i.e., it is, strongly hypertonic.

[P2] **Acidum Hydrofluoricum.** HF = 20.0. *Syn.* FLUORIC ACID.

[P1] "*Alkali fluorides other than those specified in Part II of this list.*"

[P2] "*Hydrofluoric acid; potassium fluoride; sodium fluoride; sodium silicofluoride.*"

[S3] "*Sodium fluoride—in substances containing less than 3% of sodium fluoride as a preservative.*"

[S3] "*Sodium silicofluoride—in substances containing less than 3% of sodium silicofluoride as a preservative.*"

Manufactured by the action of sulphuric acid on fluor spar (CaF_2) in lead or platinum vessels, and redistilled for medicinal use. It contains about 40% *w/w* of the gas and emits suffocating fumes. It attacks glass and must be kept in gutta-percha bottles, or bottles coated internally with ceresin or hard paraffin.

HYDROFLUORIC ACID BURNS.

Relief from use of copious quantities of dilute ammonia solution followed by ice bath; also, in severe and extensive burns, subcutaneous injection of 10% ammonium chloride solution relieves pain and prevents extension. In from 24 to 48 hours, the areas that have come in contact with acid appear white and lifeless. These areas should be extensively debrided and the white surface tissue removed (this causes no pain). Wet magnesium sulphate dressings are then applied for a few days and subsequently bland ointment dressings. This procedure relieves pain, hastens healing and reduces scarification.—E. E. Evans, *J. Amer. med. Ass.*, ii/1932, 1194.

[P2] **Acidum Hydrofluoricum Dilutum.**

Dose.—5 to 15 minims (0.3 to 1 ml.). Contains about 0.5% of the strong acid. Even thus diluted should not be kept in glass bottles. Has been given for goitre.

[P2] **Sodii Fluoridum (B.P.C.).** NaF = 42.00.

Dose.— $\frac{1}{12}$ to $\frac{1}{2}$ grain (0.005 to 0.03 g.), in very dilute solution.

Lustrous cubes or crystalline powder.

Soluble 1 in 25 of water, insoluble in alcohol.

Antidotes. Wash out the stomach, using lime water or a dilute solution of calcium chloride freely; or give 20 to 30 gr. of calcium chloride or lactate dissolved in water, and then an emetic. The dose of calcium salt should be repeated, or calcium chloride may be given intravenously. Keep patient lying down and warm. Give a purgative dose of castor oil. Demulcent drinks freely. Morphine, $\frac{1}{4}$ gr. hypodermically, if necessary.

Calcium compounds effective in treatment of fluoride poisoning.—Sharkey and Simpson, *J. Amer. med. Ass.*, i/1933, 100.

Recovery after taking 5½ gr. in the form of an insect powder, mistaken for flowers of sulphur. Sickness, vomiting, diarrhoea, pains in legs and arms, dysphagia, and ocular paralysis with diplopia supervened. Oxygen and stimulants were administered, and later Coramine, strychnine, atropine and radiant heat.—R. D. Bell, *Brit. med. J.*, i/1936, 886.

For references to fluorine in water, see Vol. II.

Uses. Given in toxic goitre in doses of 1 dr. of 2% *w/v* solution three times a day with potassium iodide. Given hypodermically as 0.5% *w/v* solution. Mixed with meal is a specific for killing beetles and cockroaches. The aqueous solution attacks glass slowly.

GRAVES' DISEASE. 5 ml. of a 2% solution *intravenously* on alternate days. Orally 0.025 g. in pill form. Malaise disappears, pulse rate reduced, weight increases, and B.M.R. lowered. Both exophthalmos and thyroid enlargement

are ultimately much reduced or become unnoticeable. No contraindications and no danger.—L. Goldemberg, per *Brit. med. J. Epit.*, i/1934, 55.

Sodium fluoride does not inactivate thyroxine *in vivo*, but its therapeutic use in hyperthyroidism is not condemned by this finding, since it may have an inhibitory action on the thyroid gland itself.—M. H. Seevers and H. A. Braun, *Proc. Soc. exp. Biol.*, N.Y., 1935, 33, 228.

[P1] **Mistura Sodii Fluoridi (B.V.H.)**. Dose.—1 dr. of A with 1 dr. of B.
A.—Solution of sodium fluoride (2%) 30 m., aqueous solution of iodine (Lugol's solution) 10 m., water to 1 dr.

B.—Tincture of chloroform and morphine 5 m., tincture of catechu 15 m., syrup 20 m., mucilage of acacia 8½ m., water to 1 dr.

[P1] **Ammonii Fluoridum**. In white deliquescent crystals which attack glass slowly. Has been used in enlargement of the spleen in doses up to ½ gr.

[P2] **Potassii Fluoridum** occurs in deliquescent cubic crystals or as a crystalline powder. It attacks glass slowly.

Quininae Hydrofluoridum. $C_{20}H_{24}O_2N_2.HF = 344.2$.

Dose.—1 to 2 grains (0.06 to 0.12 g.). Has been recommended for use in exophthalmic goitre.

[P2] **Sodii Silicofluoridum (B.P.C.)**. Syn. SODIUM FLUOSILICATE. $Na_2SiF_6 = 188.1$.

Fine white granular or crystalline powder, becoming gelatinous when moist. Soluble about 1 in 200 of water, giving a turbid acid solution. The 1 in 500 solution is non-caustic and has been used as an external antiseptic. Concentrated solutions attack metal and porcelain enamel.

Useful as an insecticide, being both a contact and stomachic poison. It has the advantages over arsenicals of cheapness, more rapid killing, and of effectiveness against a wide range of insects. Mixed with 9 parts of hydrated lime, it has been successfully used as a field dust against many pests.

For insects and lower organisms, e.g., worms and protozoa, sodium fluosilicate is more toxic than sodium arsenite. To man and the higher animals the arsenicals are 9 times more toxic than sodium silicofluoride and 30 times more toxic than sodium fluoride.

Two fatal cases of poisoning. Sodium silicofluoride is commonly sold as an insect powder. Half a spoonful, taken in mistake for carbonate, caused death in 10 hours.—*Chem. Zet.*, 1925, 805, per *Analyst*, 1926, 313.

ACIDUM HYDROCYANICUM

HCN = 27.02.

[P1] "Hydrocyanic acid; cyanides; double cyanides of mercury and zinc."

[S1] "Hydrocyanic acid except substances containing less than 0.15%, weight in weight, of hydrocyanic acid (HCN); cyanides except substances containing less than the equivalent of 0.1%, weight in weight, of hydrocyanic acid (HCN); double cyanides of mercury and zinc."

[S6] "Hydrocyanic acid; cyanides; double cyanides of mercury and zinc"—specify proportion in a preparation as the proportion of hydrocyanic acid (HCN) that the preparation would be calculated to contain on the assumption that the cyanides in the poison had been wholly converted into hydrocyanic acid."

Rule 20 (2). "It shall not be lawful to sell or supply any compressed hydrocyanic acid unless the container is labelled with the words 'Warning. This container holds poisonous gas and should

only be opened and used by persons having expert knowledge of the precautions to be taken in its use.''' (Note: this rule is additional to other rules which apply to hydrocyanic acid and other poisons generally.)

[P1-S1] **Acidum Hydrocyanicum Fortius** (B.P.C.). *Syn.* SCHEELE'S HYDROCYANIC (or PRUSSIC) ACID.

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Manufactured by distillation of potassium ferrocyanide with dilute sulphuric acid.

A colourless liquid with powerful odour. Sp. gr. about 0.994. Contains approximately 4% HCN.

Antidotes. Give emetic immediately (may not be effective). Empty stomach by stomach tube, using 60 gr. of potassium permanganate in 2 gallons of water. Give, as chemical antidote, 15 gr. of ferrous sulphate, 20 m. of solution of ferric chloride and 1 to 2 dr. of magnesium carbonate mixed with a wineglassful of water; repeat this dose as required. Hydrogen peroxide, diluted about 1 in 16, may also be used. Artificial respiration, kept up steadily (20 per minute); oxygen, or oxygen and carbon dioxide (7%) inhalations. Ammonia inhalations. Stimulants, e.g., strychnine, $\frac{1}{2}$ gr., or caffeine sodium benzoate, 2 gr., hypodermically. Intravenous injection of sodium thiosulphate, 10 to 50 ml. of 20% solution, or methylene blue, 50 ml. of 1% solution.

Review of cases of cyanide poisoning; antidotes most satisfactory seem to be sodium nitrite and sodium thiosulphate intravenously, and amyl nitrite by inhalation.—Chen, Rose and Clowes, *J. Amer. pharm. Ass.*, 1935, 625.

Hydrocyanic acid used in industry, gilding, dyeing, fumigation, etc.; it has been stated that no man should be without protection unless concentration of gas is less than 0.01%, and for long exposures concentration should be much lower than this.

In ridding a house of bed-bugs it cannot be too strongly emphasised that fumigation by hydrogen cyanide is a dangerous process and should be undertaken only by responsible persons with full knowledge of the nature and properties of the gas, and who are skilled in the use of gas masks and oxygen breathing apparatus. In order to minimise risk, a lachrymating gas may be mixed with hydrogen cyanide to act as an indicator. Failure to detect the lachrymating gas, however, can of itself be accepted neither as indicating the absence of hydrogen cyanide nor that ventilation is complete.—*Rep. med. Offr. Minist. Hlth, Lond.*, 1934, 161.

Recovery from two cases of cyanide poisoning is reported after treatment with sodium nitrite and sodium thiosulphate intravenously.—A. P. Ingegno and S. Franco, per *J. Amer. pharm. Ass.*, 1938, 335.

[P1-S1] **Acidum Hydrocyanicum Dilutum** (B.P., P. Ned. V, P. Belg. IV). *Syn.* DILUTE PRUSSIC ACID.

Dose.—2 to 5 minims (0.12 to 0.3 ml.). *Fr. Cx.*—Max. single dose $1\frac{1}{2}$ minims, max. during 24 hours 8 minims.

Contains 2% w/w of HCN, sp. gr. about 0.997. Keep in inverted stoppered bottles in the dark.

Incompatible with soluble salts of silver, mercury and iron.

Uses. In dyspepsia with pain, combined with bismuth or sodium bicarbonate. It is very useful as a sedative in an effervescent mixture. Dilute hydrocyanic acid 5 minims in 2 drachms of water is useful to allay vomiting and cough.

[P1] **Lotio Acidi Hydrocyanici et Bicarbonatis** (*L.H., R.L.O.H.*).

Dilute hydrocyanic acid 5 m., borax 4 gr., sodium bicarbonate 4 gr., sterilised water to 1 oz. A soothing eye lotion.

[P1-S1] **Potassii Cyanidum** (*B.P.C.*). *Syn.* POTASSIUM CYANURET (an old name), KALIUM CYANATUM, CYANKALI, CYANURE DE POTASSE. KCN = 65.10.

Dose.— $\frac{1}{15}$ to $\frac{1}{4}$ grain (0.005 to 0.016 g.).

A crystallised salt or in fused masses, deliquescent and decomposed on exposure to air.

Soluble 1 in $2\frac{1}{2}$ of water, 1 in 10 of alcohol 90%.

Antidotes. See under Acidum Hydrocyanicum Fortius, p. 71.

TRADE VARIETIES. Commercial fused potassium cyanide is obtainable in various strengths, equivalent to 30, 40, and 90 to 95% of KCN; is also obtainable as a mixture with sodium cyanide containing the equivalent of 98 to 100% of KCN; "gold cyanide," for gold extraction. 30% pure is supplied in sticks; this is "silver cyanide," for silver extraction. Sodium cyanide is equivalent to 130% of KCN.

Potassium Cyanate, KCNO, is made by oxidising potassium cyanide with red lead. Colourless crystals readily soluble in water.

Potassii Ferricyanidum. $K_3Fe(CN)_6$ = 329.2. Red crystals. Used as a reagent and in photography.

A fatal case of poisoning by potassium ferricyanide, the first recorded for many years.—H. W. Greenwood, per *Chem. & Drugg.*, ii/1940, 139.

Potassii Ferrocyanidum. $K_4Fe(CN)_6 \cdot 3H_2O$ = 422.3. In lemon-yellow crystals.

Dose.—8 grains (0.5 g.). Said to be physiologically almost without action.

Potassii Thiocyanas. *Syn.* POTASSIUM SULPHOCYANIDE, POTASSIUM RHODANIDE. KSCN = 97.17.

Dose.— $\frac{1}{4}$ to 3 grains (0.05 to 0.2 g.).

Made by fusing potassium cyanide with sulphur.

Uses. There is a similarity between the actions of the thiocyanates and the iodides and the toxic symptoms are similar to those of iodism. Mainly used in hypertension, but in view of the toxic effects the justification of this therapy is doubtful. Treatment may begin with $1\frac{1}{2}$ gr. three times a day, and the dose decreased or increased (up to 15 gr. per day) as required.

In the treatment of uncomplicated vascular hypertension in patients under 60 years of age it has decided value, but patients must be closely watched, and if a patient fails to respond at blood-cyanate levels of 12 to 14 mg. per 100 ml., maintained for 2 to 4 weeks (higher concentrations may be very dangerous), the treatment should be stopped. In 75 patients treated minor toxic symptoms occurred in 23 and serious complications in 6.—R. W. Robinson and J. P. O'Hare, *New Engl. J. Med.*, ii/1939, 964.

There is no clear evidence as to its clinical value in essential hypertension, and its hypotensive effect is almost always accompanied by distressing side reactions (weakness, fatigue, drowsiness, and gastro-intestinal symptoms) whether given in large doses for short periods or small doses for long periods. Arteriosclerosis a contraindication.—D. Ayman, *J. Amer. med. Ass.*, i/1931, 1857. Both sodium and potassium thiocyanates produced very disagreeable side-effects.—W. C. Egloff and co-workers, *ibid.*, 1942.

Exfoliative dermatitis following use of $1\frac{1}{2}$ grains three times daily for a week.—C. R. Weis, *J. Amer. med. Ass.*, ii/1929, 988. Acute diffused erythematous dermatitis caused.—*Brit. med. J. Epit.*, ii/1929, 96.

Sodii Thiocyanas. *Syn.* SODIUM RHODANIDE, SODIUM SULPHOCYANIDE. NaCNS = 81.1.

Dose.—1 to 5 grains (0.06 to 0.3 g.), up to 15 grains (1 g.) daily.

A crystalline colourless salt, soluble in water 1 in 0.3 and 1 in 0.6 of alcohol 90%. Has been employed in hypertension in a similar manner to the potassium salt. The dose usually recommended is 2½ gr. twice or thrice daily after meals in an aromatic mixture. Up to 15 gr. daily tolerated over a period of 3 weeks.

The toxic and therapeutic effects of thiocyanates are often very close together and there are few indications that they are in any way superior, or even equal, to the older vasodilators.—*Lancet*, ii/1932, 1169.

Forty-five patients with hypertension were given sodium or potassium thiocyanate and the concentration of the cyanates in their blood followed. The reduction of blood pressure and the relief of symptoms obtained in thirty-five roughly corresponded to the level of the cyanates in the blood. The optimum therapeutic level would seem to range between 8 and 12 mg. per 100 ml., and significant toxicity begins to appear at from 15 to 30 mg. The individual tolerance varies greatly, the different levels being obtained with widely varying doses. The cyanates may reach hazardous concentrations very quickly in some individuals, so that the administration of the thiocyanates is believed to be dangerous unless controlled by close observation and blood cyanate determinations.—M. H. Barker, *J. Amer. med. Ass.*, i/1936, 766.

Toxic manifestations of the thiocyanates.—M. H. Wald *et al.*, *J. Amer. med. Ass.*, i/1939, 1120. Fatalities.—C. F. Jarvin, *ibid.*, 1125.

Elixir Sodium Sulphocyanate (*Duncan, Flockhart, Edinburgh*). Each fl. dr. contains 2½ gr. of sodium sulphocyanate. *Dose.*—1 to 2 teaspoonfuls. In arterial hypertension.

Rhodopurin (*Camden Chemical Co., London*). Caffeine-thiocyanammonia in 5-grain tablets. Arterial hypertension.

[P1-S1] **Laurocerasus** (*B.P.C.*). *Syn.* CHERRY-LAUREL. The fresh leaves of *Prunus Laurocerasus* (*Rosaceæ*).

[P1] **Aqua Laurocerasi** (*B.P.C., Fr. Cx., P.G. V, P. Helv. V*).

Dose.—½ to 2 drachms (2 to 8 ml.). Standardised to 0.1% of HCN. *P. Helv. V* requires this to be dispensed when Aqua Amygdalæ is prescribed.

ACIDUM HYPOPHOSPHOROSUM .

B.P.C., U.S.P. XI.

$H_3PO_2 = 66.0$.

Dose.—2 to 5 minims (0.12 to 0.3 ml.). *U.S.P. XI* average dose 3 minims.

A monobasic acid occurring as a colourless liquid containing 30 to 32% w/w of H_3PO_2 . Sp. gr. about 1.14.

Antidotes. Give copper sulphate as emetic, or use the stomach tube with dilute solution of potassium permanganate.

Acidum Hypophosphorosum Dilutum (*B.P.*).

Syn. ACIDUM HYPOPHOSPHOROSUM (*F.E. VIII*).

Dose.—5 to 15 minims (0.3 to 1 ml.).

Contains 10% w/w of H_3PO_2 . It may be prepared by diluting 323 g. of the *B.P.C.* concentrated acid with 677 g. of water (approximately 5 fl. oz. 440 m. to 1 pint).

Uses of Hypophosphites. There is no reliable evidence that the hypophosphites exert any physiological effect. They are stated to be excreted unchanged in the urine, and any benefit may be

ascribed to the base with which the acid is combined. Hypophosphites are prescribed as a nerve tonic in anæmia and neurasthenia and also in disturbed nutrition and wasting diseases.

Calcii Hypophosphis (*B.P.C.*, *P. Helv. V*, *Fr. Cx.*).

$\text{Ca}(\text{H}_2\text{PO}_3)_2 = 170.07$.

Dose.—3 to 10 grains (0.2 to 0.6 g.).

White crystalline salt, with nauseous taste, soluble 1 in 8 of water, insoluble in alcohol 90%. Prepared by heating phosphorus with milk of lime until phosphoretted hydrogen ceases to be given off, filtering and evaporating or precipitating with alcohol to crystallise.

Incompatible with oxidising agents.

Syrupus Calcii Hypophosphitis (*B.P.C.*).

Dose.—1 to 4 drachms (4 to 16 ml.). Contains 1 grain per drachm.

Ferri Hypophosphis (*B.P.C.*). $\text{Fe}(\text{H}_2\text{PO}_3)_3 = 250.9$.

Syn. FERRIC HYPOPHOSPHITE.

Dose.—1 to 3 grains (0.06 to 0.2 g.) in a pill or cachet.

Whitish amorphous powder with a chalybeate taste, and containing about 22% of Fe. Slightly **soluble** in water, but more so in presence of potassium citrate, or of hypophosphorous acid.

Liquor Ferri Hypophosphitis (*B.P.C.*).

Syn. LIQUOR FERRI HYPOPHOSPHITIS FORTIS.

Dose.—10 to 30 minims (0.6 to 2 ml.).

[P1-81] **Pilula Ferri Hypophosphitis cum Strychnina.** Strychnine, $\frac{1}{10}$ gr., ferric hypophosphite 2 gr. To make one pill (or in grammes to make 15).

Dose.—1 twice or thrice daily.

Syrupus Ferri Hypophosphitis (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Solution of iron hypophosphite 1, syrup to 5.

Magnesii Hypophosphis (*B.P.C.*).

$\text{Mg}(\text{H}_2\text{PO}_3)_2 \cdot 6\text{H}_2\text{O} = 262.5$.

Dose.—3 to 10 grains (0.2 to 0.6 g.). White crystalline salt **soluble** about 1 in 5 of water.

Potassii Hypophosphis (*B.P.C.*). $\text{KH}_2\text{PO}_3 = 104.1$.

Dose.—3 to 10 grains (0.2 to 0.6 g.).

A deliquescent granular white powder, having a nauseous, bitter taste. **Soluble** 1 in 0.6 of water, 1 in $7\frac{1}{2}$ of alcohol 90%.

Incompatible with oxidising agents.

Sodii Hypophosphis (*B.P.C.*, *Fr. Cx.*). $\text{NaH}_2\text{PO}_3 = 88.03$ (+ H_2O *P. Ned. V*; about 1 H_2O *P. Helv. V* and *P. Dan.*).

Dose.—3 to 10 grains (0.2 to 0.6 g.).

A white granular deliquescent salt, with a bitter, nauseous taste. **Soluble** 1 in 1 of water, and 1 in 30 of alcohol. Explosive when mixed with nitrates or other oxidising agents.

Fosfoxyyl (*Anglo-French Drug Co., London*). Sodium salt of hypophosphomonoterebinic acid, obtained by the combination of phosphorus and turpentine. Supplied as syrup or pills. *Dose.*—One teaspoonful of syrup, or 2 pills, three or four times daily. In neurasthenia, anæmia, etc.

Extractum Malti cum Hypophosphitibus (*B.P.C.*).

Liquid extract of malt with $\frac{1}{2}$ gr. each of sodium and calcium hypophosphites per dr.

[P1] **Glycerinum Hypophosphitum Compositum (B.P.C.).**

Syn. GLYCEROL HYPOPHOSPHITIS.

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains the hypophosphites of calcium, potassium, manganese and quinine with about $\frac{1}{80}$ gr. of strychnine per dr. It is free from sugar.

[P1] **Syrupus Hypophosphitum Compositus (B.P.C.).**

Syn. SYRUPUS FERRI HYPOPHOSPHITIS COMPOSITUS.

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains the hypophosphites of calcium, potassium, manganese, and quinine with about $\frac{1}{80}$ gr. of strychnine per dr.

[P1] *Tabellæ Hypophosphitum Compositæ (B.P.C.)* are each equivalent to 1 drachm of the compound syrup.

ACIDUM LACTICUM

B.P., U.S.P. XI, Fr. Cx., P. Helv. V, etc.

Dose.—5 to 20 minims (0.3 to 1.2 ml.), well diluted.

A colourless, odourless, syrupy, sour liquid, obtained by the fermentation of milk sugar by the action of *Bacillus acidi lactici*. Lime or zinc oxide is used to neutralise the acid as formed. The respective lactates are then decomposed. It has sp. gr. about 1.21 and consists of a mixture of hydrogen lactate and lactide ($\text{C}_6\text{H}_8\text{O}_4$) containing the equivalent of not less than 87.5% of $\text{C}_3\text{H}_5\text{O}_3$.

Fr. Cx. has sp. gr. 1.23 at 15°.

Solubility. Is miscible with water, alcohol and ether; it coagulates milk and albumin.

Antidotes. Empty stomach by stomach tube, using lime water. Give doses of magnesia stirred up in water (or chalk or magnesium carbonate, if magnesia is not available). Demulcent drinks.

Uses. It has been used locally in tuberculous ulceration of the pharynx and larynx (50% solution), in diphtheria, etc., and internally for infantile and tropical diarrhoea, dyspepsia, as a stomachic tonic in combination with iron and calcium, and in vesical catarrh. Chronic enteritis has been treated by lactic acid $7\frac{1}{2}$ minims thrice daily after meals. A 1 in 10 solution is used as a douche in leucorrhoea. A 1 in 3 dilution has been recommended as an application in alopecia. As a paint, or paste with kaolin, or as a 50% injection, it has been used in lupus, but is painful. It is a constituent of some contraceptive pessaries and jellies.

ARTHRITIS. In cases of traumatic arthritis injection of lactic acid restores functional activity. The formula of the injection is as follows: procaine hydrochloride 2 g., sodium chloride 0.5 g., lactic acid N/5 0.2 ml., water to 100 ml. This solution has an acidity of pH 5. The amount injected is 2 ml. for elbow and ankle-joint cases and 4 ml. for shoulder-joint cases. The treatment should be reserved for cases showing severe disorganisation of joints.—W. G. Waugh, *Lancet*, i/1938, 487.

Lactic Acid Milk consists of fresh milk to which lactic acid 1 dr. has been added drop by drop to each pint of milk. It is used for infant feeding and in gastro-enteritis.

Hydrochloric Acid Milk is made similarly, using 40 m. of dilute hydrochloric acid. It is used in lactalbumin sensitisation, especially for the eczema and asthma of children. In cases of malnutrition or infection the gastric juice tends to contain less acid; acid milk is therefore particularly useful in such cases.

Acidum Lacticum Dilutum (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Lactic acid 174.5 g., distilled water to 1000 g. (approximately 3 fl. oz. to 1 pint). Contains about 16% w/w of $C_2H_3O_2$. Sp. gr. about 1.04.

Limonade Lactique (Fr. Cx.). Dilute lactic acid 4, water 86, simple syrup 10, all by weight.

Pessus Acidi Lactici (B.P.C.) contain $2\frac{1}{2}$ m. of acid in 30 gr. of oil of theobroma.

[P2] **Pigmentum Acidi Lactici cum Phenole (Mid. H.).**

Liquefied phenol 120 m., lactic acid to 1 oz. For lupus erythematosus.

Koromex (Holland-Rantos Co., New York; Prentif Ltd., London). Contractive jelly stated to contain boric, lactic and stearic acids and a stabiliser.

Syrupus Acidi Lactici (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Lactic acid $2\frac{1}{2}\%$ v/v in syrup.

Calcii Lactas (B.P., U.S.P. XI, Fr. Cx., etc.).

$(CH_3 \cdot CHOH \cdot COO)_2Ca \cdot 5H_2O = 308.2$.

Dose.—15 to 60 grains (1 to 4 g.). *Intravenously*, 5 to 10 grains (0.3 to 0.6 g.) well diluted has been suggested. *Subcutaneously* too irritating. U.S.P. XI average dose is 15 grains.

Solubility. Samples vary in solubility, two kinds being obtainable. One has a solubility of 1 in 20 at 23° , and the other 1 in 16.—N. Glass, *Quart. J. Pharm.*, 1933, 522.

The B.P. gives 1 in 18.5 (at 15°). The solubility does not decrease with age. Slightly soluble in cold alcohol; soluble in boiling alcohol; insoluble in ether.

An opaque white crystalline powder.

Uses. Urticaria and chilblains have been treated with it. Chilblains are stated to be caused by a slow coagulation rate of the blood, which permits of effusion into the tissues and consequent swelling and inflammation. May be given in 15 gr. doses in chloroform water 1 oz., three times a day one hour before meals, to be continued over 6 weeks. Has been found of value in metrorrhagia. Is given during pregnancy (in conjunction with vitamin D) to replace calcium taken by the fœtus and to improve tone of involuntary muscle. Migraine is stated to be aborted by the taking of 30 grains at the first warning of onset.

Children in a nursing school in South India were given 0.5 g. of calcium lactate daily, and showed greater increases in height and weight during a 4 to 5 month period than children not receiving the supplement. The acceleration in growth was accompanied by an improvement in general condition. Supplements of calcium salts are recommended as a milk substitute when milk cannot be supplied.—W. R. Aykroyd and R. S. B. Krishnan, *Lancet*, ii/1938, 153.

Liquor Calcii Lactatis (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.) or more. Contains the equivalent of about 10 gr. of calcium lactate in 4 dr.

Mist. Calc. Lact. (N.I.F.). Calcium lactate 10 gr., syrup 30 m., chloroform water to $\frac{1}{2}$ oz.

Mistura Calcii Lactatis (W.H.).

Calcium lactate 15 gr., sodium lactate 5 gr., spirit of chloroform 5 m., water to $\frac{1}{2}$ oz.

Tabellæ Calcii Lactatis (B.P.C.) contain 5 gr. (0.3 g.).

Tabellæ Parathyroidei et Calcii Lactatis (B.P.C.).

Dose.—1 to 4 tablets. Contain 5 gr. of calcium lactate and $\frac{1}{10}$ gr. of parathyroid.

Calcii Lactas Recens. The lactide does not interact unless the reactants are heated. A solution containing 100 gr. of calcium lactate is obtained by boiling for 20 minutes calcium carbonate 40 gr. with lactic acid 1 dr. diluted with 10 dr. of water, the diluted acid being added slowly to the carbonate. The product is filtered, the residue washed and the filtrate and washings diluted to volume.—*Pharm. J.*, ii/1930, 515.

Calcii et Sodii Lactas (B.P.C.).

$\text{Ca}(\text{C}_3\text{H}_5\text{O}_3)_2, 2\text{NaC}_3\text{H}_5\text{O}_3, 4\text{H}_2\text{O} = 514.3.$

Dose.—5 to 30 grains (0.3 to 2 g.).

White powder or granules containing 8.5 to 9.5% of Ca, 10 to 11% of Na calculated on the dried substance, and not more than 16% of moisture.

Used for the same purposes as calcium lactate. The presence of sodium lactate is stated to increase the solubility and ease of absorption.

Tabellæ Calcii et Sodii Lactatis (B.P.C.) contain $7\frac{1}{2}$ gr. (0.5 g.).

Tabellæ Parathyroidei et Calcii et Sodii Lactatis (B.P.C.).

Dose.—1 to 4 tablets.

Contain $7\frac{1}{2}$ gr. of calcium sodium lactate and $\frac{1}{10}$ gr. of parathyroid.

Calsolact (Allen & Hanburys, London). Tablets contain $7\frac{1}{2}$ gr. of calcium sodium lactate.

Kalsolac (Evans, Sons, Lescher & Webb, Liverpool). Capsules containing calcium lactate 78.05%, iron lactate 19.51%, and magnesium lactate 2.44% with 500 i.u. of vitamin D for the prevention and treatment of chilblains.

Kalzana Tablets (Wulff, Berlin; Therapeutic Products, London) are stated to contain $3\frac{1}{2}$ gr. each of calcium lactate and sodium lactate.

Nutritive Salts (Parke, Davis, London). A combination of salts of calcium, magnesium, sodium, potassium, manganese, iron, etc., in 15 gr. tablets. For supplementing the diet in respect of mineral constituents, and preventing acidosis.

Calcii Lactophosphas.

Dose.—3 to 8 grains (0.2 to 0.5 g.).

Hygroscopic, crystalline powder. Some samples have consisted of a mixture of equal parts of calcium lactate and (dibasic) calcium phosphate. **Soluble** in water. A stomachic tonic especially useful for children.

Liquor Calcis Lactophosphatis. Rub dibasic calcium phosphate 17, smoothly with water 964, add lactic acid 19—all by weight. Shake to dissolve; filter.

Calcium Lactophosphoricum Solutum (*Fr. Cx.*). Calcium lactate 33 g. is shaken with phosphoric acid 19 g., in a little water and made up to 1000 g. after filtration.

Syrupus Calcii Lactophosphatis (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains the equivalent of 4 gr. calcium lactate per drachm.

Dusart's Syrup. *Dose.*—2 drachms to $\frac{1}{2}$ ounce (8 to 15 ml.).

Calcium carbonate 9, lactic acid 75% 22, phosphoric acid 10% 88, water *q.s.* Dissolve the calcium carbonate in the lactic acid diluted to 108 with water with the aid of heat. Cool and add the phosphoric acid, and make up to 370. Dissolve in this sugar 623, and add spirit of limes 7. Mix and adjust to 1000. *All parts by weight.*

Syrupus Calcii Lactophosphatis cum Ferro (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains $\frac{1}{2}$ gr. of ferrous lactate with potassium citrate and water in syrup of calcium lactophosphate to 1 dr.

Ferri Lactas (*B.P.C., Fr. Cx., P. Belg. IV, P. Ital. V, P. Jap., P. Dan., P. Helv. V, Ph. Ned. V, F.E. VIII.*) *Syn.* FERROUS LACTATE. $(C_3H_5O_3)_2Fe, 3H_2O = 288.0$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

In greenish white crystals with characteristic odour. *Soluble* 1 in 40 of water; readily soluble in alkali citrate solutions; when taken internally is easily assimilated by the system.

Potassii Lactas. $C_3H_5O_3K = 128.0$.

Dose.—5 to 15 grains (0.3 to 1 g.). Occurs as a syrupy liquid or as a very deliquescent amorphous mass soluble in water and alcohol 90%.

Sodii Lactas. $C_3H_5O_3Na = 112.0$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

Usually in form of colourless or yellowish syrupy liquid miscible with water, containing 70% of the salt.

Uses. Is given intravenously as an isotonic ($\frac{1}{2}$ molar) solution in all types of severe acidosis other than that associated with congenital heart disease with persistent cyanosis, and for rapid alkalinisation of the urine in the treatment of urinary infections. Its use has been recommended, in 40-grain doses thrice daily, in diabetes mellitus when there is a tendency to acidosis.

The administration of sodium lactate prior to the use of chloroform has been suggested to prevent possible acidæmia. In other forms of acidosis the chief indication is when the CO_2 content of the blood is below 25 vols. per cent., when the dose should be 60 ml. per kg. body weight. For alkalinisation of urine, 30 ml. per kg. body weight.

A concentrated (molar) stock may be made by neutralising 100 ml. of lactic acid with concentrated (about 40%) carbonate-free sodium hydroxide using phenol red as indicator, diluting to 800 ml. and boiling for 30 to 40 minutes, more alkali being added as necessary to neutralise the lactic acid produced by hydrolysis of lactide. The solution is diluted to 1000 ml., filtered and autoclaved at 15 to 20 lb. pressure for 30 minutes. For use this solution is diluted with five times its volume of sterile water.

Sodium lactate is suggested as a substitute for glycerin, which it may replace in Kaolin poultice.

Lactate-Ringer Solution. Syn. HARTMANN'S SOLUTION.

Add 10 ml. of concentrated (molar) sodium lactate solution to from 400 to 450 ml. of modified hypotonic Ringer's Solution (containing sodium chloride 6 g., potassium chloride 0.4 g., calcium chloride 0.2 g., magnesium chloride 0.2 g., water to 1000 ml.).

For all types of dehydration. Indicated especially for counteracting acidosis when sufficient sodium bicarbonate cannot be added to Ringer's Solution because of precipitation of calcium bicarbonate. *Dose*.—80 to 100 ml. per kg. body weight. In gastro-enteritis in infants the solution rapidly checks the vomiting, but not the diarrhoea.

With 10% dextrose it is the fluid of choice for the continuous intravenous drip method.—A. F. Hartmann, *J. Amer. med. Ass.*, ii/1934, 1349.

Physiological Buffer Solution (Hartmann Solution) (Lilly, London).

Dose.—For children up to one year 250 ml. of diluted solution; for children from 1 to 8, up to 1000 ml.; subcutaneously, intraperitoneally or intravenously, in amounts sufficient to maintain elasticity of skin. Before using, the solution is diluted 25 times with freshly distilled water or glucose solution.

Not more than 30 ml. per kilo bodyweight is given. Indicated in dehydration with alkalosis or acidosis.

Strontii Lactas (Fr. Cx.). $(C_2H_5O_3)_2Sr, 3H_2O = 319.8$.

Dose.—5 to 30 grains (0.3 to 2 g.).

A white crystalline powder, very soluble in water, of service in albuminuria and Bright's disease. May be combined with iron in the albuminuria of pregnancy. To increase coagulability of the blood 15 to 30 grain doses useful.

Tetany can be prevented or relieved by the continuous oral administration of strontium lactate. It acts by decreasing the permeability of the gut to calcium excretion and by reducing the excitability of the motor nerves.

Tabletæ Strontii Lactatis Compositæ (G.H.). Each tablet contains strontium lactate $\frac{1}{2}$ gr., lithium citrate $\frac{1}{2}$ gr., caffeine citrate $\frac{1}{2}$ gr., quinine sulphate $\frac{1}{2}$ gr., sodium benzoate 1 gr., exciccated magnesium sulphate 2 gr., exciccated sodium sulphate 8 gr.

Zinci Lactas. $(C_2H_5O_3)_2Zn, 3H_2O = 297.5$.

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.). Max. *pro die* 10 grains. (Has been used in France up to 3 g. for a dose.—Dorvault.)

White crystals soluble 1 in 60 of water. In epilepsy.

ACIDI LACTICI BACILLI

To arrest the growth of putrefactive organisms in the intestines and to stimulate intestinal digestion and diminish toxic absorption from the bowel, Metchnikoff proposed the acclimatisation of the lactic acid bacillus. He concluded that, as organisms of putrefaction only increase with difficulty in neutral or acid media, the most feasible procedure would be to introduce a lactic acid organism (growing in a sugar medium) into the human being to arrest the proliferation of harmful bacteria. For this purpose he chose the bacillus known as the Bulgarian Bacillus (*B. Caucasicum*), which occurs in natural soured milk, as being the best acid producer.

B. Caucasicum is not, however, a normal inhabitant of the intestinal tract, and in spite of Metchnikoff's claims to the contrary, later workers found it very difficult to produce a growth of this organism in the intestines. Various other acid-forming bacteria have therefore been employed, of which the one most favoured is *B. acidophilus*. This is a normal inhabitant of the human intestine, and is the organism best adapted to the purpose of maintaining the intestinal flora in a healthy condition, since it survives and multiplies with ease.

The taking of cultures of this organism, usually in the form of *B. acidophilus* milk, combined with the liberal consumption of lactose or dextrin, the carbohydrates most favourable to its growth, is the best procedure for supplanting the putrefactive organisms of the intestine with fermentative ones. The patient should first go on an exclusive diet of *B. acidophilus* milk (1 to 2 quarts daily) for a week, with 2 to 3 ounces daily of lactose, after which cereals, fruits and vegetables in liberal amounts should be added to the diet and protein-rich foods omitted for several weeks.

Although this form of therapy has been advocated in a wide variety of conditions, including skin disorders such as eczema and psoriasis, intestinal tuberculosis and cancer of the stomach, it is most successfully employed in the summer diarrhoea of children, in infective conditions of the intestinal tract, and in enteritis and colitis generally; obstinate constipation in adults is also said to be relieved by daily doses of *B. acidophilus* milk, which are also stated to be of value in sprue.

Lactic acid bacilli are supplied commercially in three forms: (1) as living cultures in broth, whey or whole milk, but the bacteria in these cultures only remain viable for a few days, and the cultures require to be kept in a refrigerator; (2) as tablets, but the bacteria do not retain their viability for any length of time in the dry state, and most tablets of this type contain no living organisms; (3) as chocolate-coated agar-jelly blocks, but these are unstable and must bear an expiry date.

Lac Coactum (B.P.C.).

Curdled milk is prepared by sterilising cows' milk by heating it in an autoclave at 125° for 30 minutes and cooling to 40°. A culture of *B. Caucasicum* or *B. acidophilus* is then added, and the temperature maintained at 38° to 40° for 8 to 12 hours. The milk, when ready for consumption, is in the form of a junket.

Koumiss (Artificial). Dissolve dextrose $\frac{1}{2}$ ounce in water 4 ounces, and add 20 grains of yeast and cows' milk 4 ounces. Place in a quart bottle and fill up with milk; cork and wire. Keep it cool and shake it frequently during 4 days. Koumiss thus prepared contains some alcohol (1 to 2%) and lactic acid (about 1 to 2%). The original koumiss of the Tartars was made from mares' milk by using the Kephir ferment, which swells up on soaking in milk. This consisted in reality of yeast cells with certain bacteria (*B. Caucasicum*, Kern). It is a food used in the Caucasus as a stimulant.

Yoghurt. *Preparation*—Raise the milk to boiling point. Remove from the heat and cool enough for a skin to form on top. While still too hot to be held conveniently inoculate by allowing some previous Yoghurt—thinned with sterile water, if necessary—to slip down the edge of the container all round the rim. Cover, and, without shaking, place in a closely fitting hay-box until the next day. Do not allow to cool before placing in hay-box.

In Greece Yoghurt is much in use both as a food and for treatment. It is prepared there by adding a little lemon-juice to fresh milk, which is kept warm for 8 hours, forming a curd. From the curd a tablespoonful is mixed with boiled milk, and this procedure is repeated several times, with fresh milk on each occasion, until a Yoghurt of suitable consistency is obtained. Small spoonfuls of this latter product are added to wooden or earthenware pans containing milk which has been boiled and is still slightly warm. This forms the commercial Yoghurt, which curdles in 4 hours at 35°. In order to keep it, and this one may do for as long as from 5 to 8 days, it is poured into little bags of cotton from

which the whey filters, the products thereby becoming thicker and of better keeping qualities.

Lactobacilline (*Darrasse, Nanterre; Wilcox, Jozeau, London*), **Sauerin** (*Allen & Hanburys, London*), and **Trilactine** (*Martindale, London*) are commercial preparations of lactic acid bacilli.

Buttermilk contains protein 3, fat 0.5, sugar 4.8, water 91 per cent. The ordinary lactic acid bacilli found in this are not so active or resistant as those contained in Bulgarian sour milk. Milk in any form, however, in sufficiently large quantity tends to lessen internal putrefaction. Erysipelas has been treated by buttermilk internally and locally.

Buttermilk Powder (G.L.) (*Glaxo Laboratories, London*) is milk from which greater part of fat is removed and some lactose has fermented. Contains lactose 42%, protein 33.5%, fat 3.5%, lactic acid 6.5%, water 3.5%, etc. When reconstituted it gives a solution of pH 5 and acts as a buffered "acid-sparer," for use in the diarrhoeal diseases of infants.

ACIDUM MANDELICUM

U.S.P. XI Supp. II, P. Ned. V Supp. II.

Syn. α -HYDROXYPHENYLACETIC ACID, PHENYLGLYCOLLIC ACID.

Dose.—45 grains (3 g.) in 1 oz. of water, neutralised with sodium bicarbonate, four times a day.

Mandelic acid is obtained by the hydrolysis of the mandelonitrile produced by the action of sodium cyanide on the sodium bisulphite addition-compound of benzaldehyde. It occurs as white crystals or as a white, crystalline, odourless powder. M.p. 118° to 120° . On exposure to light mandelic acid gradually darkens and decomposes.

Soluble 1 in about 7 of water; freely soluble in alcohol and ether.

Contraindications. Mandelic acid should not be given when there is impairment of renal function.

Uses. Introduced to replace the ketogenic diet. (*see Vol. II*) in the treatment of urinary infections. The bacteriostatic substance in urine of patients on ketogenic diet is β -hydroxybutyric acid. If the acid is given orally it has been found to be almost completely oxidised in the body. Mandelic acid was selected, after trial of other hydroxy acids, as being least toxic, most effective, and at the same time easily obtained. Its bacteriostatic action is only exerted when the urine is not less acid than pH 5.5, and the acidity of the urine is maintained by the simultaneous administration of ammonium chloride. During treatment the urinary pH must be controlled by tests with methyl red (the colour produced should be reddish-orange but not yellow; the test is best carried out on the early morning urine).

The original technique of administration was as follows (*Rosenheim's Routine*): 12 g. of mandelic acid is given daily in divided doses, the fluid intake being limited to 2 pints daily. The standard mixture contains 45 gr. (3 g.) of acid per oz. of water, just neutralised with sodium bicarbonate 24 gr. (1.6 g.), and flavoured with lemon; 1 oz. is given four times a day; 8 cachets, each containing 15 gr. (1 g.) of ammonium chloride, are given during the day.

The acid is now usually administered in the form of its ammonium, calcium or sodium salt. More recently it has been to some extent superseded by sulphanilamide especially in the treatment of the *B. proteus* type of urinary infection.

The effect of mandelic acid on bacteria in the urine depends upon the nature of the infecting organisms, the concentration of mandelic acid and the acidity of the urine. As the acidity of the urine increases, the concentration of mandelic acid required decreases. *Escherichia coli* is killed by 0.25% of mandelic acid at pH 5, but requires 1% at pH 5.7. *Proteus Ammoniae* is also destroyed by 1% at pH 5.7, but with 0.25% a pH of 5.3 is necessary. *Aerobacter sp.* and *Pseudomonas sp.* are more resistant, requiring 0.5% at pH 5 and 1% at pH 5.3.—H. F. Helmholtz and A. E. Osterberg, *Proc. Mayo Clin.*, 1936, 373.

The relative merits of mandelate and sulphonamide therapy may be summarised as follows:—Both are efficient and may be relied on to cure 70 to 80% of cases of urinary tract infection after 8 to 14 days' treatment. Mandelate is irritant to the stomach, but the toxic effects of sulphanilamide are likely to be more serious. Mandelate is more expensive. A patient whose renal function is so impaired as to interfere with concentration of mandelate and acid will be more likely to improve on sulphanilamide, which acts at a lower concentration. The presence of prostatic enlargement and infection are indications for sulphanilamide. Infections with *B. coli* and its variants, *B. lactis aerogenes*, and most streptococci, are amenable to either drug. Sulphanilamide is ineffective in enterococcal infections, but these respond well to mandelate treatment. *B. pyocyaneus* and *B. proteus* infections require sulphanilamide. Staphylococcal infections do not yield satisfactorily to mandelate, and many cases are disappointing with sulphanilamide, but Uleron or sulphapyridine may be substituted. In cases of mixed infection the complementary action of sulphanilamide and mandelate may be utilised.—T. H. Crozier, *Practitioner*, 1/1940, 516.

For earlier references see previous editions.

Acigen (*Pharmaceutical Specialities (May & Baker), Ltd., London*). Flavoured granules containing mandelic acid, sodium bicarbonate and ammonium biphosphate. Dose.—2 teaspoonfuls (= 3 g. of mandelic acid).

Neoket (*Boots, Nottingham*). Compound effervescent granules of mandelic acid. Contains in 2 teaspoonfuls (90 gr.) mandelic acid 45 gr., sodium bicarbonate 25 gr., sodium acid phosphate 30 gr., soluble saccharin $\frac{1}{2}$ gr., flavouring oils q.s.

Dose.—Two teaspoonfuls in water four times daily immediately after each meal.

In some cases the optimum urinary pH can only be attained with the supplementary administration of ammonium chloride.

Ammonii Mandelas. $C_6H_5 \cdot \text{CHOH} \cdot \text{COONH}_4 = 169.18$.

Dose.—50 grains (3.4 g.) four times daily in aqueous solution.

Ammonium mandelate occurs in white, very hygroscopic needles. Very easily *soluble* in water and alcohol.

It has been suggested to replace sodium mandelate and ammonium chloride, the ammonium radicle being converted by the body to urea and the mandelic acid radicle serving to acidify the urine. The nausea and vomiting sometimes caused by ammonium chloride are thus avoided. Occasionally, however, ammonium chloride must also be given to obtain the necessary acidity. More rarely an excessively acid urine is obtained, and in these cases sodium bicarbonate must be given.

Ammonium mandelate found as effective as the sodium salt in the treatment of urinary infections and usually obviated the necessity of giving the unpleasant ammonium chloride.—H. E. Holling and R. Platt, *Lancet*, 1/1936, 771.

The following is a much-used formula readily made in the dispensary:—Mandelic acid 36 g., strong solution of ammonia 264 m., liquid extract of liquorice 240 m., tincture of ginger 20 m., tincture of capsicum 20 m., syrup 1 oz., mucilage of ceratonia 3 oz., chloroform water to 12 oz. 1 oz. of this mixture

contains 3 g. of mandelic acid as ammonium mandelate, and, taken with an equal amount of water, is the usual adult dose. When the solution of ammonia is added to the acid in a bottle, a syrupy solution of ammonium mandelate is formed almost immediately. It is convenient to keep this solution ready as a "stock" solution, each 55 m. representing 3 g. of acid. The colloid gum, by retarding absorption in the mouth, makes the mixture less unpalatable. The concentrated "stock" solution may be put up in capsules, which are rendered insoluble by exposing them, separated bottom from cap, in a bottle overnight with a paraform tablet. The dose can be contained in four of these capsules. The capsules keep at least a week, but probably not indefinitely.—W. A. Knight, *Pharm. J.*, ii/1936, 250.

GASTRO-INTESTINAL INFECTIONS. Three cases of colitis and 9 of acute gastritis were treated with ammonium mandelate. Doses of 5 ml. twice daily by mouth, until consistency of the stools became normal, were used in acute cases; three times daily for a week at a time in chronic cases. The results were good and rapid, cure being achieved in 1 to 3 days.—G. Sternberg, per *Trop. dis. Bull.*, 1940, 371.

PYELITIS. The following mixture is recommended for the treatment of pyelitis in children; ammonium mandelate 26 gr., liquid extract of liquorice 5 m., elixir of gluside $\frac{1}{2}$ m., water to 1 dr. This prescription can be made up with a 50% aqueous solution of ammonium mandelate, and costs very much less than any of the proprietary preparations. It is given three or four times a day, the dosage being: up to 6 months 1 dr., from 6 months to 2 years, 1 to 2 $\frac{1}{2}$ dr.; from 2 to 5 years, 2 $\frac{1}{2}$ to 4 dr.; from 5 to 12 years, 4 to 6 dr. The following mixture is given in addition in a total daily dose of 3 to 8 dr.; ammonium phosphate 7 $\frac{1}{2}$ gr., liquid extract of liquorice 5 m., acid syrup 15 m., water to 1 dr. The pH of the urine should be reduced, if possible, to 5.3. If the urine is acid enough it can in most cases be rendered sterile within several days of onset of treatment. Mandelic acid therapy should be continued for at least a week after the urine has become sterile. *E. coli* is the infecting organism in most cases of pyelitis in children, and these respond well to mandelic acid therapy; *B. proteus* pyelitis does not respond to this drug.—G. H. Newns, *Med. Pr.*, ii/1936, 516; see also W. W. Payne, *Brit. med. J.*, ii/1936, 1046.

Effervescing Mixture. *A.* Mandelic acid 36 g., water to 12 oz. *B.* Ammonium bicarbonate 18 g., elixir of saccharin 1 dr., water to 12 oz. Two tablespoonfuls of each mixed and taken during effervescence provides the usual 3 g. dose of mandelic acid.—W. A. Knight, *Pharm. J.*, ii/1936, 408.

Mist. Ammon. Mandelat. (N.I.F.). Mandelic acid 45 gr., strong solution of ammonia 20 m., liquid extract of liquorice 10 m., strong tincture of ginger 2 $\frac{1}{2}$ m., syrup 2 dr., chloroform water to $\frac{1}{2}$ oz.

Ammoket (Boots, Nottingham). Elixir of ammonium mandelate containing ammonium mandelate 52 gr., elixir of saccharin 5 m., liquid extract of liquorice 5 m., sucrose 110 gr., spirit of chloroform 7 $\frac{1}{2}$ m., essential oils *q.s.*, water to $\frac{1}{2}$ oz.

Keturex (Evans, Sons, Lescher & Webb, Liverpool). Elixir of ammonium mandelate containing the equivalent of 45 gr. of mandelic acid per tablespoonful.

Mandelix (British Drug Houses, London). Elixir of ammonium mandelate containing the equivalent of 45 gr. (3 g.) of mandelic acid in 2 dr. Complete outfits are available containing the elixir, cachets of ammonium chloride and a testing outfit for determining the urinary pH.

Mist. Ammon. Mandelat. Co. (Martindale, London) is a lemon-flavoured preparation containing ammonium mandelate equivalent to 45 gr. of mandelic acid and 25 gr. of sodium acid phosphate in $\frac{1}{2}$ oz.

Calcii Mandelas. $(C_6H_5 \cdot CHOH \cdot COO)_2Ca = 342.35$.

Dose.—50 grains (3.4 g.) four times daily in water.

A white crystalline, odourless powder with a slightly saline taste, prepared by double decomposition between sodium mandelate and a calcium salt.

Very slightly **soluble** in water; insoluble in alcohol 90%.

Unlike the sodium and ammonium salts, the calcium salt of mandelic acid is quite tasteless and does not give rise to dyspepsia. Treatment of 8 patients with urinary infections with calcium mandelate gave the same good results as

treatment with other preparations of mandelic acid.—E. Schnor, *Lancet*, i/1937 1104.

Calcium mandelate is recommended because the acidity produced is equivalent to that produced by ammonium mandelate, coupled with comparative palatability and non-production of nausea or gastric symptoms. It is, however, hydrophobic; overcome by damping with ethyl alcohol prior to suspending.—W. A. Woodard, *Pharm. J.*, i/1938, 436.

Further methods for rendering miscible with water: (i) granulate with syrup; (ii) add sodium tauroglycocholate ($\frac{1}{2}$ to 1%); cover bitterness with a suitable agent.—W. A. Woodard, *Pharm. J.*, i/1938, 530.

Pulvis Calcii Mandelatis (I.H.). Calcium mandelate 50 gr., cocoa 5 gr., sugar to 75 gr. Prepare as granules. For a child of 1 year.

Calcium Mandelate Compound (Burroughs Wellcome, London). A flavoured powder, readily miscible with water, containing calcium mandelate equivalent to 3 g. of mandelic acid in 4.4 g. (one measureful). *Dose*.—One measureful, suspended in 4 tablespoonfuls of water four times a day. An additional acidifying substance, e.g., ammonium chloride, may be administered if required.

Camelate (Abbott Laboratories, London). Calcium mandelate tablets containing 8.45 gr. (representing $7\frac{1}{2}$ gr. of mandelic acid).

Mandecal (British Drug Houses, London). A flavoured powder containing 75% of calcium mandelate, readily miscible with water. For the treatment of urinary infections, the compound being decomposed by gastric juices with liberation of mandelic acid which itself renders the urine acid. *Dose*.—One level dessertspoonful (4.5 g. equivalent to 3 g. of acid) stirred in 2 fl. oz. of water, four times a day.

Sodii Mandelas. $C_6H_5 \cdot CHOH \cdot COONa = 174.13$.

Dose.—50 grains (3.4 g.) four times daily, with supplementary treatment as with mandelic acid.

In white crystals with a faintly aromatic odour.

Soluble 1 in about $1\frac{1}{2}$ of water; almost insoluble in cold alcohol 90%.

Successful clinical results with sodium mandelate given in a mixture containing sodium mandelate 50 gr., syrup of orange 1 dr., water to 1 oz. To be taken 4 times a day in water, each dose to be preceded by the requisite dose of a mixture containing ammonium chloride 30 gr., liquid extract of liquorice 15 m., water to 1 oz. The dose of ammonium chloride must be adjusted to give a urinary pH of 5.3 or less (pink with methyl red). No deleterious effects in nephritis or nephrosis.—H. E. Holling and R. Platt, *Lancet*, i/1936, 769.

The administration of sodium and ammonium mandelates is contraindicated:—(1) in the presence of raised blood urea due to renal failure, since the acidifying salts have a cumulative effect; (2) in acute febrile urinary infections; (3) in infections due to organisms capable of splitting urea and thus maintaining a constantly alkaline urine.—M. L. Rosenheim, *Brit. med. J.*, ii/1936, 1045.

By oral administration of sodium mandelate, concentrations of the acid varying from 0.25 to 1% can be obtained readily in the urine. In this range of concentration the acid will act bactericidally on most organisms at a pH ranging from 5.0 to 5.7.—H. F. Helmholtz and A. E. Osterberg, *J. Amer. med. Ass.*, ii/1938, 1794.

ACIDUM NITRICUM

B.P.

$HNO_3 = 63.02$.

[P2] “Nitric acid.”

[S3] “Nitric acid—in substances containing less than 9%, weight in weight, of nitric acid (HNO_3).”

Dose.—1 to 4 minims (0.06 to 0.25 ml.).

B.P. has sp. gr. about 1.42, contains 70% *w/w* of HNO_3 . *U.S.P. XI*, 67 to 70%; *P. Helv. V*, 64 to 66%; *P. Ned. V*, 50%; *P.G. VI* and *P. Jap. V*, 25%; *F. E. VIII*, 63.64%; *P. Belg. IV*, 63.02%; *Fr. Cx.*, 63.05%; *P. Ital. V*, 65.3%; *P. Dan.*, 22 to 25%.

A colourless liquid emitting corrosive fumes. It forms a constant-boiling mixture with water at 120.5°, containing 68% HNO_3 .

Antidotes. Treat as for poisoning by glacial acetic acid, *see* p. 7. Chloroform in 5-drop doses every 10 minutes will prevent the convulsions following the inhalation of nitrous fumes, as in the accidental breaking of a bottle of nitric acid.

Uses. A caustic for warts and condylomata.

[P2] **Acidum Nitricum Dilutum** (*B.P.C.*, *F. E. VIII*).

Dose.—5 to 20 minims (0.3 to 1.2 ml.).

Contains 10% *w/w* of HNO_3 . *P. Belg. IV* has 12.6%.

Tonic and biliary stimulant.

Incompatible with alkalis, sulphides, thiosulphates, ferrous salts, and alcohol.

[P2] **Acidum Nitricum Fumans.** Sp. gr. 1.5. (*P. Jap. 1.48*; *P. G. VI* has 36%, sp. gr. at least 1.476; *P. Dan.* has sp. gr. 1.48 to 1.5.)

A reddish-brown liquid, giving off yellowish-red fumes. Used as a caustic.

[P2] **Aqua Regia** is nitric acid 3, hydrochloric acid 4.

[P2] **Acidum Nitro-Hydrochloricum Dilutum** (*B.P.C.*).

Dose.—5 to 20 minims (0.3 to 1.2 ml.).

Contains nitric acid, hydrochloric acid and their reaction products equivalent to about 12.5% *w/w* of nitric acid and about 13.5% *w/w* of hydrochloric acid.

Balneum Acidum (*B.P.C.*). Contains 15 oz. of dilute nitro-hydrochloric acid per 30 gallons.

Potassii Nitrates (*B.P.*, *U.S.P. XI*, *Fr. Cx.*, *P. Helv. V*, *P. Dan.*).

Syn. NITRE, SALTPETRE. $\text{KNO}_3 = 101.1$.

Dose.—5 to 15 grains (0.3 to 1 g.). Should be given well diluted. *U.S.P. XI* average dose 5 grains.

A white odourless crystalline powder; taste, cool and saline.

Soluble 1 in 4 of cold water, 1 in 0.4 of boiling water, 1 in 300 of alcohol 90%.

Antidotes. Empty stomach by emetic or stomach tube. Keep patient lying down and warm. Demulcent drinks freely. Stimulants, *e.g.*, brandy, $\frac{1}{2}$ oz. in water, or hot coffee by mouth or by rectum.

Uses. Diuretic, to be given in dilute solution with caution. Its chief use is in the preparation of powders for burning in asthma. It has been found of value in chronic pericarditis in conjunction with other diuretics, and also in pneumonia.

Diuresis from potassium nitrate may be initiated more slowly and be of longer duration than that of other diuretics but it is less likely to cause untoward effects. It does not increase urinary acidity. It is best used in the form of enteric-coated pills of 0.5 g., of which 16 to 24 are given daily after meals. Patients are put on a salt-free, low-fluid diet and usually 50 g. of protein daily, unless the serum protein is low, when it is increased to 75 or 100 g. daily.—N. M. Keith and M. W. Binger, *J. Amer. med. Ass.*, ii/1935, 1584.

Potassium nitrate in moderate dosage can be given for long periods of time without injury. A thirteen year old boy, weighing 110 pounds (49.9 kg.), with

glomerulonephritis took 6 g. a day for a whole year, and thereby his œdema was kept under control. Intermittent administration is, however, to be preferred.—S. Amberg, *Proc. Mayo Clin.*, 1935, 739.

MÉNIERE'S SYNDROME. Many patients improved with potassium nitrate in a dosage of 9 g. daily, taken for three days and discontinued for two days, in conjunction with a low sodium diet.—M. N. Walsh and A. W. Adson, *J. Amer. med. Ass.*, i/1940, 130.

Charta Nitrata (*B.P.C.*, *P. Dan.*). *Syn.* NITRATED PAPER.

White blotting-paper, impregnated with 20% potassium nitrate solution and dried. To relieve asthma these are burnt and the fumes inhaled. Asthmatic pastilles are prepared in cones containing a mixture of chlorate and nitrate of potassium.

Sodii Nitras (*Fr. Cx.*, *P. Helv. V*). $\text{NaNO}_3 = 85.01$.

Dose.—5 to 15 grains (0.3 to 1 g.).

Occurs as colourless, odourless crystals with a cool and saline taste.

Soluble 1 in 1 of water, 1 in 0.6 of boiling water and 1 in 100 of alcohol 90%.

Has saline, refrigerant and diuretic properties, but is seldom used in medicine. Crude sodium nitrate is known as Chile salt-petre and is used as an artificial manure.

Uranii Nitras (*B.P.C.*). *Syn.* URANYL NITRATE, URANIC NITRATE. $\text{UO}_2(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O} = 502.2$.

Dose.—1 to 5 grains (0.06 to 0.3 g.). Lemon yellow radioactive crystals with bitter styptic taste, efflorescent in dry air.

Soluble 2 in 1 of water, also in alcohol and ether. Has been used in diabetes and cancer, but is without evidence of value.

ACIDUM OLEICUM

B.P., *U.S.P. XI*, *P. Jap.*, *P. Helv. V*.

$\text{CH}_3(\text{CH}_2)_7\text{CH} : \text{CH}(\text{CH}_2)_7\text{COOH} = 282.3$.

Dose.—5 to 15 minims (0.3 to 1 ml.).

A pale sherry-coloured, faintly acid, oily liquid (at ordinary temperatures) with a slight odour.

Soluble readily in alcohol 90%, ether, chloroform, benzene and fixed oils; insoluble in water. It dissolves most metallic oxides, thus forming indefinite solutions of oleates in an excess of oleic acid; such combinations of bismuth, copper, lead, mercury and zinc are used medicinally; they are soluble in fats. Oleic acid also dissolves alkaloids, but not their salts, e.g., oleinates of aconitine, atropine, morphine and veratrine are used medicinally. Oleic acid is much more readily absorbed by the skin than oils.

Capsules of oleic acid ($7\frac{1}{2}$ m.), one or two daily, taken in the morning on an empty stomach, have been employed in the treatment of biliary colic and to hinder the formation of gall-stones.

Bismuthi Oleas (*B.P.C.*).

Dose.—5 to 10 grains (0.3 to 0.6 g.).

A greyish-white unctuous substance or white powder containing the equivalent of 20 to 22% of Bi_2O_3 , and used with zinc oxide or starch as a dusting powder in hyperæmic conditions of the skin.

Unguentum Bismuthi Oleatis (B.P.C.). 12½% in white soft paraffin. For chapped hands and similar conditions.

Cupri Oleas (B.P.C.). $(C_{17}H_{33}COO)_2Cu = 626.46$. (Theoretical formula for pure oleate).

Add a hot solution of copper sulphate 1 in 50 of water to a hot solution of castile soap 2.5 in 50, and wash and dry the precipitate. When cold it is in solid dark-green masses. It is an oleo-palmitate of copper, containing copper equivalent to about 12% of cupric oxide. Soluble in ether.

Unguentum Cupri Oleatis (B.P.C.).

Copper oleate 12½% in yellow soft paraffin. For some purposes it may be employed half strength. Ringworm is well treated with it—lightly rubbed in night and morning, also indolent ulcers, warts and corns, and it has been used to remove freckles.

Bougies of Copper Oleate are prepared 4 inches long containing each 5 grains (0.3 g.) of copper oleate with theobroma basis.

[P2-81] **Hydrargyrum Oleatum (B.P.).**

Yellow mercuric oxide 20% w/w, triturated with liquid paraffin and warmed with oleic acid. **Oleatum Hydrargyri (U.S.P. XI)** is made with 25% of HgO.

[P2-81] **Unguentum Hydrargyri Oleati (B.P.).** *Syn.* MERCURIC OLEATE OINTMENT.

Oleated mercury, 25%, in simple ointment.

[D-P1-81] **Oleatum Hydrargyri (10%) cum Morphina.**

Morphine (base) 1 is dissolved in 60 of the 10% oleate.

Uses. For use where the plain oleate causes pain; in syphilis in secondary and tertiary stages, excessive use to be avoided. In persistent inflammation, especially of glands and joints (such as synovitis), and in non-ulcerated syphiloderma, these oleates are more active and cleanly than mercurial ointment. They are very effective parasitocides for pediculi and ringworm.

In rheumatoid arthritis the joints thickened by fibrous adhesions and fibroid thickenings of the synovial and periarticular tissues are treated with mercuric oleate.

[P2-81] **Oleatum Hydrargyri cum Sulphure.**

Mercuric oleate 5% 4, precipitated sulphur 1, ether 3. For pediculi pubis.

[P2-81] **Unguentum Hydrargyri Oleatis Compositum.**—BROOKE'S OINTMENT.—Mercuric oleate ointment (5%) and Lassar's paste of each 41, salicylic acid 6, ichthammol 12.

In (septic) oedema of the face has been applied covered with cotton wool in thick layer and pressed down by cotton elastic bandage.

[P1-81] **Plumbi Oleas (B.P.C.).**

An unctuous granular powder obtained by interaction of solutions of lead acetate and sodium oleate.

[P1-81-83] **Emplastrum Plumbi (B.P.).** *Syn.* DIACHYLON PLASTER, DIACHYLON.

Lead plaster is a crude oleate of lead, made by the combination of olive oil (oleate and palmitate of glyceryl) and oxide of lead heated together in the presence of water. Thus made, the oleate is more adhesive than when prepared by the oleic acid solution of the oxide.

B.P. Add. III allows the use of arachis oil, in place of olive oil, in making lead plaster.

Is used as a "supporting" plaster in lumbago and similar conditions, and as a protective agent. Internally, it has been employed as an abortifacient.

The Inter-Departmental Committee on Abortion recommended that machine-spread plasters containing more than a defined proportion of lead oleate should be brought within the restrictions imposed upon substances in Part I of the Poisons List and the First Schedule. In some parts of the country the lead contained in machine-spread diachylon plasters is removed by scraping, and is made into pills which are sold as abortifacients.—*Report of the Inter-Departmental Committee on Abortion (H.M.S.O.)*, 1939.

Antidotes. Treat as for poisoning by lead compounds, see p. 855.

[P1-81-83] **Emplastrum Colophonii (B.P.).** *Syn.* EMPLASTRUM RESINÆ, ADHESIVE PLASTER.

Colophony 10, plaster of lead 85, hard soap 5. The machine-spread plaster is usually supplied with about 3 or 4 ounces of mass per yard of bleached glazed calico or brown flax holland.

Spread Adhesive Plaster of the Drug Tariff for *N.H.I.* purposes consists of three forms. No. 1.—A plain rubber adhesive compound spread on cotton cloth (*Emplastrum Adhesivum, B.P.C.*). No. 2.—A rubber adhesive compound containing zinc oxide spread on cotton cloth (*Emplastrum Zinci Oxidi, B.P.C.*, prepared with a flesh-coloured cloth). No. 3.—*Emplastrum Colophonii, B.P.*, spread on brown holland. When a prescription for "Adhesive Plaster" indicates a ribbon plaster, No. 1 should be supplied.

Emplastrum Adhæsivum (U.S.P. XI).

A rubber adhesive plaster prepared with 1.5 g. of a plaster mass, consisting of rubber, resins and waxes with a filler such as zinc oxide, orris root, or starch, on 100 sq. cm. of cotton cloth.

Taffeta Adesivo (P. Ital. V). Dissolve fish glue 100 g. in small pieces in warm water 2000 ml., and add alcohol 95% 81½ ml. and honey 10 g. Keep warm on a water-bath and apply 4 or 5 layers to fine silk tissue (allowing each layer to dry separately). Then apply balsam of Peru 1 g. mixed with tincture of benzoin 4 g., and a final coating of glue. Dry, and keep away from air and light.

P. Helv. V has lead plaster 80, elemi 5, yellow beeswax 5, colophony 5, Venice turpentine (from *Larix decidua*) 5.

Local reaction to adhesive plasters occurs with considerable frequency. The following enter into the composition of adhesive plaster:—(1) Rubber, one or more of four varieties. South American Para; Plantation Smoked Sheet; Balata; Gutta siac. (2) Rosin, Grade I. (3) "Burgundy" pitch. (4) Olibanum. (5) Beeswax. (6) Zinc Oxide. (7) Anhydrous lanolin. (8) Starch. (9) Orris root. In patch tests carried out with 11 substances on 120 employees in a plaster factory, 21 showed degrees of reaction varying from slight erythema to erythema with oedema, papules and vesicle formation.—L. Schwartz and S. M. Peck, *Publ. Hlth Rep., Wash.*, 1935, 811.

[P1-81] **Unguentum Plumbi Oleatis (B.P.C.).** *Syn.* UNGUENTUM DIACHYLON, HEBRA'S OINTMENT. Plaster of lead 50% and olive oil, with 1% of oil of lavender.

[P1-81] **Unguentum Diachyli Carbolisatum (Lassar)** is the same with 2% of phenol. To be rubbed in 1 to 3 times a day, or spread on linen and applied as a plaster.

These ointments are prescribed for eczema, excessive perspiration of the feet, etc.

Zinci Oleas.

Zinc sulphate 30 is dissolved in 60 of water, the solution is added to a solution of hard soap 90 in water 600, the mixture boiled and the zinc oleate washed, dried and powdered.

Unguentum Zinci Oleatis (B.P.).

Freshly-precipitated zinc oleate 1, white soft paraffin 1. Melt together and stir till cold. For some cases further dilution with soft paraffin is advisable. This ointment will cure chronic eczema.

Zinci Oleostearas (B.P.C.).

A white amorphous powder with faint fatty odour.

To a solution of hard soap 2, and curd soap 1 in water 15, add zinc sulphate 1 in boiling water 2; wash free from sulphate, dry and powder.

Useful for dusting on eczematous surfaces and for excessive perspiration. It may be perfumed by the addition of $\frac{1}{100}$ of thymol, and diluted with kaolin or starch.

Pulvis Zinci Oleostearatis Compositus (B.P.C.). Zinc oleostearate 25, boric acid 25, starch to 100, perfumed with oil of geranium.

Acidum Stearicum (B.P.C., U.S.P. XI, Fr. Cx., P. Jap. V, P. Dan., P. Helv. V). *Syn.* STEARINUM (*P. Austr.*). *Commercial Syn.* "STEARINE," wrongly so called. $C_{17}H_{35}COOH = 284.3$.

This monobasic acid occurs as a hard white solid substance, and is not entirely pure. It is prepared by decomposition with superheated steam of stearin (the triglyceride of stearic acid contained with those of palmitic and oleic acids in tallow), and consists chiefly of stearic and palmitic acid. **Soluble** about 1 in 18 of alcohol 90%, readily soluble in ether and chloroform.

M.p. not below 54°. It is obtainable commercially with m.p. 50° (122°F.), 52.5° (126°F.), and 56° (132.8°F.). The pure acid melts at 69.2°.

Pasta Acidi Stearici (B.P.C.). *Syn.* UNSCENTED VANISHING CREAM.

A non-greasy preparation containing partially saponified stearic acid. Suitable for the application of substances such as quinine for the prevention of sunburn in artificial sunlight therapy.

[P1-81] **Emplastrum Hydrargyri Stearatis.**

Lead plaster 6, melt and add mercuric stearate 2, made by direct combination of mercuric oxide 10, with stearic acid 26 or *q.s.*—melt the acid and gradually stir in the oxide until all dissolved—a sand bath may be necessary. Is a substitute for mercurial plaster.

Zinci Stearas (B.P., U.S.P. XI).

A white powder, yielding 13 to 15.5% of ZnO. Contains a small proportion of palmitate. Manufactured by precipitating a curd soap solution with zinc sulphate.

Insoluble in water, alcohol and ether.

Oleum Cocois (B.P.C., Fr. Cx.). *Syn.* COCONUT OIL or BUTTER, OLEUM COCOS RAFFINATUM (*P. Dan.*). Is obtained by expression from the kernels of the coconut, the fruit of *Cocos nucifera* and *C. butyracea*. Becomes rancid on exposure to the air. Forms a readily-absorbed ointment base. Is used commercially in the preparation of "marine" soaps.

Coconut Stearine.—A solid fat separated from oil of coconut by cold pressure, m.p. about 29°. Has been suggested for use as a suppository basis.

Copra is the dried pulp of the coconut.

Sapo Olei Cocosis (*Fr. Cx.*) is made from coconut oil 500, potassium hydroxide 125, and water 250 parts, all by weight.

Sapo Liquidus (*Fr. Cx.*). Coconut oil soap 450, glycerin 25, water 525 parts, all by weight.

Liquor Saponis Olei Cocois (*B.P.C.*). A solution of the sodium and potassium soaps of coconut oil, used as a shampoo and in dermatological practice.

Unguentum Olei Cocois (*B.P.C.*). 70% of coconut oil with white soft paraffin.

ACIDUM PHOSPHORICUM

B.P.

Syn. ACIDUM PHOSPHORICUM CONCENTRATUM; CONCENTRATED PHOSPHORIC ACID.

Contains 89% *w/w* of H_3PO_4 ; sp. gr. about 1.75. This acid is considerably stronger than the concentrated phosphoric acid of the *B.P.* '14, which contained 66.3% *w/w* of H_3PO_4 , the sp. gr. being 1.5. *U.S.P. XI* has 85 to 88% of H_3PO_4 ; *Fr. Cx.* 49.7 to 50%, sp. gr. 1.342; *P. Ital.* 50%, sp. gr. 1.35; *P.G. VI* and *P. Ned. V* 25%.

Dose.—1 to 4 minims (0.06 to 0.25 ml.).

Antidotes. Treat as for poisoning by glacial acetic acid, *see* p. 7.

Acidum Phosphoricum Dilutum (*B.P., U.S.P. XI, Fr. Cx., P. Helv. V, P. Belg. IV*).

Dose.—5 to 20 minims (0.3 to 1.2 ml.).

Contains 10% of H_3PO_4 , sp. gr. 1.054 to 1.060. *P. Dan.* has 12.2%, sp. gr. 1.067 to 1.07.

Dilute concentrated phosphoric acid (89%) 112 g. with distilled water *q.s.* to 1000 g. An acid of approximately the same strength is obtained by diluting 1 fl. oz. 170 m. of the concentrated acid with distilled water *q.s.* to 1 pint.

Incompatible with alkalis, ferric chloride, lime salts.

Uses. It has been employed as a nerve tonic, but actually it has none of the therapeutic properties of free phosphorus. Well diluted, is a pleasant cooling drink in fevers, and relieves thirst in diabetes. It renders iron preparations compatible with astringent vegetable infusions.

Mistura Acidi Phosphorici (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Dilute phosphoric acid 15 m., with spirit of chloroform, syrup of orange and compound infusion of gentian to 1 oz.

[*P*] **Mist. Phosph. c. Strych.** (*N.I.F.*).

Dilute phosphoric acid 10 m., solution of strychnine hydrochloride 4 m., concentrated infusion of quassia $7\frac{1}{2}$ m., chloroform water to $\frac{1}{2}$ oz.

Calcium Magnesium Inositol-Hexaphosphorica Mitigata (*Fr. Cx.*). A salt of the hexaphosphoric ester of inositol containing variable amounts of calcium and magnesium, and obtained from the seeds, tubers and rhizomes of various plants. It should contain not less than 19% of phosphorus.

Ferrophytin (*Ciba, Horsham*). Neutral colloidal iron salt of inositol hexaphosphoric acid, containing about 7.5% Fe and 6% P. Pills contain 2 $\frac{1}{2}$ gr.

Dose.—1 or 2, 3 or 4 times a day. Also supplied in granules.

Fortossan (*Ciba, Horsham*). A combination of Phytin with lactose, specially suitable for infants and young children.

Phytin (*Ciba, Horsham*). Calcium magnesium salt of inositol hexaphosphoric acid with a phosphoric content of 22.8%. *Dose*.—One tablet 4 times daily. Neurasthenia, tuberculosis, anæmia, etc.

Tonophosphan (*Bayer Products, London*). Sodium salt of dimethylamino-methylphenylphosphinic acid, containing about 11% of phosphorus. Available in 1 ml. ampoules of 1 or 2% solution for subcutaneous injection and in $\frac{1}{2}$ gr. tablets for oral administration in neurasthenia, etc. *Dose*.—1 ampoule per day or 1 tablet thrice daily.

Ammonii Phosphas (B.P.C.).

Dose.—5 to 20 grains (0.3 to 1.2 g.).

A mixture of di-ammonium hydrogen phosphate, $(\text{NH}_4)_2\text{HPO}_4 = 132.1$, and ammonium dihydrogen phosphate, $\text{NH}_4\text{H}_2\text{PO}_4 = 116.2$, occurring in colourless crystals liberating ammonia on exposure to air. The salt now supplied usually consists of di-ammonium hydrogen phosphate.

Soluble 1 in 2 of water. A diuretic; increases the acidity of the urine.

Calcii Phosphas (B.P., U.S.P. XI Supp. II). *Syn.* CALCIUM PHOSPHORICUM TRIBASICUM (*P. Helv. V, Fr. Cx.*), "NEUTRAL" or "TRIBASIC" CALCIUM PHOSPHATE, TRI-CALCIUM PHOSPHATE, CALCIUM ORTHO-PHOSPHATE. $\text{Ca}_3(\text{PO}_4)_2 = 310.25$.

Dose.—10 to 30 grains (0.6 to 2 g.), but larger amounts (up to 75 gr.) are given as antacid.

It consists mainly of the tribasic and dibasic phosphates with some monobasic compound. The pure tribasic compound is not obtainable.

White powder made by interaction of calcium chloride with sodium phosphate and excess of ammonia at a boiling temperature. It contains about 39% of calcium and about 20% of phosphorus.

Insoluble in water and alcohol; soluble in dilute hydrochloric and nitric acids.

Uses. To supply calcium to growing bones and to assist in general nutrition. It is also given to pregnant women for the same purpose. Is a useful antacid, and has the advantage of not producing systemic alkalisation.

GASTRIC ULCER. Best method of avoidance of free acid and mechanical irritation is by giving hourly feeds of 5 ounces of milk, or its equivalent, through a tube, and neutralising acid by giving doses of atropine $\frac{3}{8}$ gr. increased to tolerance: sodium citrate prevents milk clotting: manganese oxide, dose regulated to keep bowels open: and tribasic calcium or magnesium phosphate (chiefly the former) *effectually prevents acidosis*. Stomach emptied last thing at night.—A. F. Hurst, *Lancet*, i/1930, 242.

The neutral tribasic phosphates of calcium and magnesium are moderately effective antacids but are inclined to be irritating. They do not prevent alkalosis, and further experience has shown that they are not satisfactory substitutes for the other alkalis, and their use has been generally abandoned.—T. L. Hardy, *Practitioner*, i/1937, 437.

Calcii Phosphas Di-acidus (Fr. Cx., F.E. VIII, P. Belg. IV, P. Helv. V). *Syn.* MONOBASIC CALCIUM PHOSPHATE, ACID CALCIUM PHOSPHATE, MONO-CALCIUM PHOSPHATE. $\text{Ca}(\text{H}_2\text{PO}_4)_2 \cdot \text{H}_2\text{O} = 252.09$.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

Deliquescent crystals, *insoluble* in alcohol. Contains about 16% of calcium and about 24.5% of phosphorus. It is used in the flour-milling trade and in baking.

Calcii Phosphas Mono-acidus (*P. Ned. V, F.E. VIII, P. Belg. IV, P. Ital. V, P. Helv. V, P. Dan.*). *Syn.* DIBASIC CALCIUM PHOSPHATE, CALCIUM MONO-HYDROGEN PHOSPHATE, DI-CALCIUM PHOSPHATE (*Fr. Cx.*). $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O} = 172.1$.

Dose.—10 to 30 grains (0.6 to 2 g.). Prepared by decomposing calcium chloride with dibasic sodium phosphate.

Colourless crystalline powder with slight acid reaction, almost *insoluble* in water. Contains about 23% of calcium and about 18% of phosphorus. Used in making *Liquor Calcis Lactophosphatis*, *q.v.*

Caldeferrum (*Glaxo Laboratories, London*). Chocolate-coated tablets, each containing exsiccated ferrous sulphate equivalent to about 6 mg. of iron, calcium phosphate equivalent to 0.5 g. of calcium and 500 units of vitamin D. Advocated as a nutritional supplement in pregnancy and lactation and in debility and convalescence. *Dose*.—4 tablets per day.

Calfo-Rayol (*Squibb, New York; Savory & Moore, London*). Capsules each containing dicalcium phosphate $4\frac{1}{2}$ gr., calcium gluconate 3 gr., vitamin D 330 i.u., or tablets each equivalent to 2 capsules. Advocated for use during pregnancy, lactation, and generally where supplementary calcium is indicated. *Dose*.—1 to 2 capsules thrice daily or 2 to 6 tablets daily.

Calfos Brand Tablets (*Calfos Ltd., London*). Calcium phosphato-carbonate $4\frac{1}{2}$ gr., sacch. alb. 5 gr., oil of lemon $\frac{1}{8}$ m., excipient to 12 gr. Stated to be an assimilable and physiologically balanced form of calcium and phosphorus from natural sources. *Dose*.—1 to 2 tablets thrice daily.

Dicalcium Phosphate Dulcet (*Abbott Laboratories, London*). A candy preparation of dicalcium phosphate, containing 24% calcium and 20% phosphorus. Each Dulcet contains 1 g. In calcium deficiency diseases.

Potassii Phosphas (*B.P.C.*). *Syn.* DI-POTASSIUM HYDROGEN PHOSPHATE. $\text{K}_2\text{HPO}_4 = 174.2$.

Dose.—10 to 30 grains (0.6 to 2 g.).

A deliquescent granular powder; is given as a saline purge.

Potassii Phosphas Acidus. *Syn.* POTASSIUM DI-HYDROGEN PHOSPHATE, MONO-POTASSIUM PHOSPHATE. $\text{KH}_2\text{PO}_4 = 136.1$.

Dose.— $\frac{1}{4}$ to 1 drachm (1 to 4 g.).

Colourless crystals, readily soluble in water with acid reaction. Resembles the sodium compound, but is more diuretic.

Sodii Phosphas (*B.P., P. Ital. V, F.E. VIII, P. Jap. V*). *Syn.* DI-SODIUM HYDROGEN PHOSPHATE, MONO-ACID SODIUM PHOSPHATE (*Fr. Cx.*), TASTELESS PURGING SALT.

$\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O} = 358.2$. *P. Ned. V, P. Belg. IV and P. Helv. V* have $2\text{H}_2\text{O}$. *U.S.P. XI* and *P. Dan.* have $7\text{H}_2\text{O}$.

Dose.— $\frac{1}{2}$ to 4 drachms (2 to 16 g.). *U.S.P. XI* average dose 1 drachm. Colourless crystals, efflorescent in dry air.

Soluble 1 in 7 of water, almost insoluble in alcohol 90%.

Incompatible with salts of metals and alkaloidal salts, particularly those of strychnine.

A mild aperient, well suited for a delicate stomach; small doses are antacid and diuretic; useful in bilious sick-headache and jaundice.

Sodii Phosphas Exsicc (U.S.P. XI, P. *Helv.* V). *Syn.* ANHYDROUS MONO-ACID SODIUM PHOSPHATE (*Fr.* Cx.).
 $\text{Na}_2\text{HPO}_4 = 142.0$.

Dose.—10 to 75 grains (0.6 to 5 g.). A white powder, readily absorbing moisture.

Soluble 1 in 15 of water.

Sodii Phosphas Effervescens (B.P.).

Dose.—1 to 4 drachms (4 to 16 g.).

Contains 50% of sodium phosphate. A convenient and pleasant mode of taking this useful purgative.

Sodii Phosphas Effervescens (U.S.P. XI).

Average dose.—150 grains (10 g.). Contains about 20% of exsiccated sodium phosphate with sodium bicarbonate, tartaric acid and citric acid.

Alka-Zane (*Warner, London*).

Dose.—1 teaspoonful in a glass of cold water 3 or 4 times daily after meals. An effervescing preparation of sodium, potassium, calcium and magnesium citrates, carbonates and phosphates. An antacid-diuretic, maintaining "alkali reserve."

Calsoma (*Abbott Laboratories, London*). Granular effervescent preparation of calcium and magnesium tribasic phosphates, for acid indigestion.

Heptos (*Sharp & Dohme, London*). A granular effervescent preparation containing the equivalent of 50% sodium phosphate with 3 grains of phenolphthalein and 2 grains of lithium citrate in each ounce. *Dose.*—1 to 2 teaspoonfuls as a purgative and hepatic stimulant.

Sodii Phosphas Acidus (B.P., U.S.P. XI).

Syn. SODIUM DIHYDROGEN PHOSPHATE, SODIUM BIPHOSPHATE.
 $\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O} = 156.1$.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 g.). U.S.P. XI average dose 10 grains.

In colourless crystals or crystalline powder. *Soluble* about 1 in 1 of water, and 1 in 300 of alcohol 90%. Is given in alkalinity of urine with good results. Particularly useful in cystitis, and after operations on the bladder to keep the urine acid. If diarrhoea occurs, stop its use for a time. Passage of a calcium oxalate stone may be assisted by employing this salt owing to its solvent action on calcium oxalate.

Mistura Sodii Phosphatis Acid (L.H.).

Sodium acid phosphate 30 gr., red mixture to $\frac{1}{2}$ oz. (Mistura Rubra L. H. fuchsin $\frac{1}{1000}$ grain, water $\frac{1}{2}$ oz.).

Mistura Sodii Acid-Phosphatis Composita (L.H.).

With each dose of the previous mixture, patient to take hexamine 5 gr.

Mist. Sod. Phosph. Acid. (N.I.F.).

Sodium acid phosphate 20 gr., liquid extract of hyoscyamus 4 m., concentrated infusion of buchu 7 $\frac{1}{2}$ m., chloroform water to $\frac{1}{2}$ oz.

Phospho-Soda (Fleet) (C. B. Fleet Co., Lynchburg, Va.; Anglo-French Drug Co., London). Monosodium phosphate in a non-toxic, highly concentrated aqueous solution. *Dose.*—As a laxative and liver stimulant, one teaspoonful before meals; as a purgative, 3 or 4 teaspoonfuls before breakfast; for hyperacidity due to constipation, 1 teaspoonful an hour after meals. Dilute with a third of a glass of water, and follow by a full glass.

Recresal (*Coates & Cooper, London*). Tablets of sodium acid phosphate.

Dose.—2 to 5 daily. Muscular and nerve tonic.

ACIDUM SALICYLICUM

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.

Syn. o-HYDROXYBENZOIC ACID.

Dose.—5 to 10 grains (0·3 to 0·6 g.).*Fr. Cx.* gives max. single dose 1 g.; max. during 24 hours 4 g.

Salicylic acid (artificial acid) of commerce is made by Kolbe's method devised in 1874, by heating sodium phenate in a current of carbon dioxide, or by a modification of it. The basic sodium salicylate so formed is decomposed with hydrochloric acid. A modification consists in heating the phenate and gas under pressure; this is more economical.

It may also be prepared from salicin and from oils of wintergreen (*Gaultheria procumbens*—Ericaceæ) and sweet birch (*Betula lenta*—Betulaceæ). This natural acid was formerly preferred for internal use.

In colourless prismatic crystals with sweetish taste. It is odourless, but its dust irritates the nostrils. M.p. 158° to 159°.

Soluble 1 in 500 of cold water, 1 in 3·5 of 90% alcohol, 1 in 40 of 45%, 1 in 2 of ether, about 1 in 80 of olive or almond oil, 1 in 100 of castor oil, 1 in 200 of glycerin, and 1 in 55 of chloroform; soluble also in melted fats and soft paraffin. Borax, ammonium citrate and sodium phosphate increase its solubility in water.

Incompatibility. Spirit of nitrous ether, quinine salts, alkalis such as sal volatile. An aqueous solution of the acid gives a deep violet colour with a trace of a ferric salt.

Uses. Anti-fermentative and anti-putrefactive. Internally, it is too irritating to the gastric mucosa for therapeutic use. Externally it is employed in concentrated solutions to destroy warts or corns, and in the form of a dusting powder or ointment in the treatment of skin diseases.

A solution of 1 dr. of acid in 1½ oz. of methylated spirit has been used as a paint for ringworm of nails, the applications being continued for 3 months or longer.

For scarlatinal sore throats and tonsillitis, compresses of 2% alcoholic solution have been found of value.

Amylum Salicylatum (B.P.C.). Salicylic acid 1, starch 9.

Collodium Salicylicum (B.P.C.). About 1 in 8 in acetone and acetone collodion.

[P1-51] **Collodium Salicylicum Compositum (B.P.C.).** Syn. COLLODIUM CALLOSUM.

Salicylic acid about 1 in 8, and extract of cannabis, in acetone and acetone collodion.

Collodium Acidum Compositum (Fr. Cx.). Salicylic acid 2, lactic acid 2, ether 5, malachite green 0·1, in elastic collodion.

Collodium cum Acido Salicylico (Fr. Cx.). Salicylic acid 10%, in elastic collodion.

Collodium Callosum (St. B. H.). Salicylic acid 25, creosote 5, flexible collodion to 100.

Collyrium Acidi Salicylici (B.P.C.). 0·1% w/v.

[P1-81] Emplastrum Salicylicum Compositum (B.P.C.).

Salicylic acid 20% and extract of cannabis 10% in rubber adhesive plaster. The machine-spread plaster is usually prepared with about 3½ ounces of mass per square yard of bleached cotton cloth of plain weave.

[P1-81] Emplastrum Salicylicum Compositum Fortius (B.P.C.).

Salicylic acid 40% and extract of cannabis 20% in rubber adhesive plaster.

Emplastrum Salicylicum Elasticum (B.P.C.). 10% in rubber adhesive plaster. Plasters are also prepared with other proportions (from 5 to 40%) of salicylic acid.

WARTS often yield to prolonged maceration by a strong salicylic acid plaster—up to 60% strength—cut exactly to the pattern and outline of the lesion. The use of fuming nitric and other strong acids should be banished.—H. C. Semon, *Practitioner*, ii/1933, 479.

Parogenum Salicylatum (B.P.C.). Syn. SALICYLATED VASOLIMENT.

Salicylic acid 10% w/v in parogen.

Pulvis Acidi Salicylici Compositus (B.P.C.). Syn. PULVIS PRO PEDIBUS.

Salicylic acid 3% with boric acid and purified talc. For application to sweating feet.

RINGWORM. The most suitable powder for routine use in the prevention and treatment of mycotic infections of the glabrous skin is as follows:—Salicylic acid 5 g., menthol 2 g., camphor 8 g., boric acid 50 g., starch 35 g., applied three times daily. This is the routine treatment in the U.S. Navy; it is extremely effective and is popular with the men.—D. T. Frehn, *J. Amer. med. Ass.*, ii/1938, 685.

Pulvis Zinci et Acidi Salicylici (B.P.C.).

Zinc oxide 20% and salicylic acid 5% in starch.

[P2] Salicylic Cream or Paste.

Salicylic acid, in powder, 2, phenol 1, glycerin 10; mix.

Used as pigment when the skin is irritated by the discharge from wounds, etc., under antiseptic dressings.

Salicylic Gauze, Lint and Wool, each 4%.

Dissolve the salicylic acid in alcohol, q.s. (about 1 = 1 of dressing) and impregnate under pressure: dry.

Unguentum Acidi Salicylici (B.P.).

Salicylic acid, in powder, 1, white paraffin ointment 49. Useful in eczema, acne and ringworm. A 50% ointment has been used in lupus vulgaris, scabies, acute eczematous dermatitis and ringworm.

In seborrhœa, the following is useful: salicylic acid 1, precipitated sulphur 2.5, cold cream 25.

Death of a child of 7 suffering from psoriasis following application of 5% salicylic acid ointment to the psoriatic areas. Death occurred forty hours after application of the ointment.—Per *J. Amer. med. Ass.*, ii/1937, 1160.

Adsorption through the Skin. Salicylic acid can be transported through the epidermis into the connective tissues and thence into the blood stream. The colloids of the connective tissues retain the drug by adsorption and from these surfaces it is liberated gradually, passes into the blood and is mainly excreted

by the kidney. Adsorption may take place from soft paraffin, alcohol and water, but the first is probably the best.

[P2-81] **Mycozol** (*Parke, Davis, London*). Chlorethone 5%, salicylic acid 4%, and mercury salicylate 4%, in a suitable ointment base. For the treatment of fungus infections of the skin. Also **Liquid Mycozol**, a paint containing chlorethone, malachite green, salicylic acid, etc.

Salicyl Vasogen (previously marketed as **SALICYLOSOL**) (*Pearson, Mitcham*). A solution of salicylic acid in a partly oxygenated mineral oil. Used by massage into the skin.

Ammonii Salicylas (*B.P.C., U.S.P. XI*).

$C_6H_4(OH) \cdot COONH_4 = 155.15$. *P. Ned. V* with $\frac{1}{2} H_2O$.

Dose.—5 to 15 grains (0.3 to 1 g.); up to 30 grains (2 g.) is sometimes given. *U.S.P. XI* average dose 15 grains.

In crystalline powder, **soluble** 1 in 1 of water, 1 in $2\frac{1}{2}$ of alcohol 90%.

Ferri Salicylas. *Syn.* FERRIC SALICYLATE.

Dose.—3 to 10 grains (0.2 to 0.6 g.).

Brownish powder of variable composition, sparingly soluble in water, but readily in solution of potassium bicarbonate. In tonsillitis, as an antiarthritic, and as a dusting powder for foul wounds.

Mist. Ferri Salicyl. (*N.I.F.*). Sodium salicylate 10 gr., solution of ferric chloride $7\frac{1}{2}$ m., dilute solution of ammonia 5 m., chloroform water to $\frac{1}{2}$ oz.

Mistura Ferri Salicylatis (*B.V.H.*).

Potassium bicarbonate 10 gr., sodium salicylate 10 gr., solution of ferric chloride 5 m., water to 1 oz. Useful in erysipelas and acute tonsillitis.

Mistura Ferri Salicylata. COHEN'S SALICYLATED IRON MIXTURE.

Dose.—1 to 2 drachms (4 to 8 ml.) increased.

Dissolve citric acid 14 in distilled water 200, add ammonium carbonate 6.5, then dissolve sodium salicylate 125 in this solution; add tincture of ferric chloride 125, glycerin 175, and oil of betula 4, and then add sufficient distilled water to make 1000, and filter.

Lithii Salicylas (*B.P.C., Fr. Cx.*).

$C_6H_4(OH) \cdot COOLi = 144.0$.

Dose.—10 to 30 grains (0.6 to 2 g.).

A deliquescent white powder, **soluble** more than 1 in 1 of water, forming a colourless, slightly acid solution, 1 in 2 of alcohol 90%, and in ether.

Incompatible with acids and with sodium bicarbonate.

Used in rheumatism and gout. Varicose veins have been treated with lithium salicylate 30%, and Tutocaine 1%. (*For references see Vol. I, 21st Edn.*)

Effervescent Lithium Salicylate contains 1 in 30.

Dose.—1 or 2 drachms.

Magnesii Salicylas (*B.P.C.*).

$(C_6H_4(OH) \cdot COO)_2Mg, 4H_2O = 370.5$.

Dose.—8 to 30 grains (0.5 to 2 g.).

In crystals or as a white or pinkish crystalline powder. **Soluble** 1 in 6 of water. Incompatible with acids and sodium bicarbonate.

In flatulence 15 to 45 grains thrice daily has been found useful.

Potassii Salicylas (*B.P.C.*). $C_6H_4(OH) \cdot COOK = 176.1$.

Dose.—10 to 30 grains (0.6 to 2 g.).

A white crystalline powder, very soluble in water.

Has given relief in rheumatic affections of the eyes.

RHEUMATIC ENDOCARDITIS. In some cases in which sodium salicylate gives poor results there is a good response to potassium salicylate in large doses, as shown by a fall in temperature, disappearance of intestinal disturbances, and improved general condition, with increased appetite. The treatment is preceded by four or five days' rest in bed on a diet poor in sodium and rich in potassium.—A. Tillich, *Dtsch. med. Wschr.*, 1/1937, 928.

Sodii Salicylas (*B.P.*, *U.S.P. XI*, *Fr. Cx.*, *P. Jap. V*, *P. Helv. V*, *P. Dan.*). $C_6H_4(OH)COONa = 160.04$.

Dose.—10 to 30 grains (0.6 to 2 g.) in a mixture or in cachets. *F.E. VIII* has max. dose in 24 hours 120 gr.

Dangerous poisoning by sodium salicylate is rare, but toxic symptoms resembling cinchonism usually appear when a total dose of 150 to 200 grains has been given.

Intravenously doses as large as 15 grains (1 g.) have been given, also in combination with the same amount of sodium iodide (*see Injunctio Sodii Salicylatis*).

It may also be administered *per rectum* since it is rapidly absorbed by the rectal mucosa.

In white scales or shining tabular crystals with sweetish taste.

Soluble 1 in 1 of water, 1 in 6 of alcohol 90%, 1 in 4 of glycerin; insoluble in ether. Natural and synthetic varieties are available in commerce, the former being obtained from the natural acid. Concentrated aqueous solutions should be made with hot water and filtered; they are liable to deposit crystals of the hexahydrate on standing.

Storage. *P. Belg. IV* and *P. Helv. V* direct to be kept in the dark.

DISCOLORATION OF SOLUTIONS. Darkening of alkaline solutions of sodium salicylate may be prevented by the addition of 0.5% of sodium citrate.—A. Capellati, *per J. Amer. pharm. Ass.*, 1937, 199.

The discoloration of salicylate solutions is due to a brown oxidation product formed by the action of atmospheric oxygen. This product, "sodium salicylate-brown," the tri-sodium salt of an organic compound with the empirical formula $C_{11}H_5O_6$, and containing three hydroxyl groups, is an intermediate product, further oxidation giving colourless compounds.—E. A. Brecht and C. H. Rogers, *J. Amer. pharm. Ass., Sci. Edn.*, 1940, 178.

Incompatible with free ammonia, ammonium carbonate, and aromatic spirit of ammonia (turns brown). Gives a violet colour with iron salts. Mineral and many organic acids and acid salts cause separation of salicylic acid, *e.g.*, to dispense sodium salicylate with tincture of ferric chloride, dissolve 1 dr. of the salt in 2 oz. of water, add 30 to 40 m. of the tincture and $1\frac{1}{2}$ oz. of a solution of potassium bicarbonate 1 dr. in 1 oz., then chloroform water to 8 oz. The result is a clear, palatable, claret-coloured mixture useful in rheumatic sore throats.

Uses. Sodium salicylate has a marked antipyretic and anti-rheumatic action. This combined action is employed with benefit in acute rheumatic fever, for which sodium salicylate is almost a specific. From 15 to 30 gr. is given every two hours for 3, 4 or 6 doses or until toxic symptoms, such as nausea and tinnitus, develop; then stop for 12 hours and resume with a dose of 10 to 15 gr. three times daily for several weeks. Gastric irritation is

lessened by giving at the same time an equal or double quantity of sodium bicarbonate. Children tolerate large doses well.

Sodium salicylate has also been used in chronic rheumatic diseases, but the effects are far less satisfactory than in acute rheumatic fever. Similarly, it has been used for antipyretic action in typhoid, malaria and other pyrexial diseases, but in this respect it is inferior to quinine.

It also possesses cholagogue properties, increasing the amount and fluidity of the bile, and has been employed in doses of from 5 to 10 grains four to six times daily in catarrhal jaundice and in the treatment of gall-stones.

In tonsillitis and other forms of sore throat, especially where there is a rheumatic history, doses of 10 to 15 gr. every four hours are useful, and in neuralgia, sciatica, lumbago and acute neuritis it may be given for the relief of pain.

The itching of pruritus ani may be instantly relieved by the application of a very minute quantity.

In encephalitis lethargica good results are said to have been obtained by daily intravenous injections of 15 gr. in an ounce of normal saline, increased gradually to 45 gr.

During recent years it has been widely employed as a sclerosing agent for varicose veins (*vide infra*).

The use of sodium salicylate is contraindicated in the presence of renal impairment.

ACUTE RHEUMATISM. Relapses found to be common when the dose was reduced too rapidly or the treatment stopped. It might be considered reasonable to keep all cases of rheumatic fever, except the most trivial, on a daily dosage of 120 gr. for a month after admission to hospital. The initial dose to be aimed at in an adult should be 200 to 240 gr. daily, with double the quantity of sodium bicarbonate, continued until toxic signs develop or the temperature has been below 99°F. for 24 hours. Thereafter a reduction to 180 to 150 gr. might be allowed for 10 days, and after that 120 gr. until the end of the fourth week, continuing with daily doses of 60 gr. until the patient is ready to be allowed out of bed, when 30 to 45 gr. of acetylsalicylic acid might be substituted for a time.—R. M. Murray-Lyon, *Edinb. med. J.*, Feb., 1936, 84.

In acute and subacute rheumatism in children, sodium salicylate intramuscularly is of advantage, 1 gr. for each year in 1 ml. water once a day for 4 days. Temperature normal in 24 hours and pains gone—but does not control rheumatic cardiac disease.—E. C. Warner, *Lancet*, ii/1930, 719.

It is possible to give a child of ten years 240 gr. of sodium salicylate every day for months, without any great difficulty or any disadvantage; indeed, the child and the carditis improve on such a dosage. But the child must be kept at rest, fed on a low protein diet, given adequate quantities of fluid, have a daily action of the bowel, and must take twice as much sodium bicarbonate—480 gr. The best way to prescribe the salicylate is in doses of 20 gr. two-hourly with 40 gr. of bicarbonate and some syrup and a flavouring agent. By these means the effects of acute rheumatic carditis can be minimised and cardiac effects rendered less severe and less common.—K. D. Wilkinson, *Practitioner*, i/1937, 378.

Fatal Intoxication in a child of 10 years treated for rheumatic endocarditis. After 5 days' salicylate treatment (2 g. intravenously and 5 g. rectally) symptoms of intoxication due to an acidoketosis of salicylate origin, together with renal insufficiency, developed, and despite intensive alkalisation death occurred three days later. Post-mortem revealed discrete renal lesions and massive fatty degeneration of the liver.—G. Paiseau, per *Brit. med. J. Epit.*, ii/1934, 61.

RHEUMATIC POLYARTHRITIS well treated by *large doses*, giving 10 times daily at 2-hourly intervals 50 ml. of a solution containing sodium salicylate 30 g., sodium bicarbonate 60 g., syrup of orange 300 g., and distilled water to 1000 ml. When fever and pains have disappeared, reduce to 4-hourly intervals. Quick

cure in acute cases, and the accompanying endocarditis is improved or cured.—J. T. Peters, *J. Amer. med. Ass.*, ii/1929, 958.

SCIATICA. Intravenous injections consisting of 20 ml. of an aqueous solution containing 15 gr. of sodium salicylate and 15 gr. of sodium iodide rapidly cured 20 cases of primary sciatica, but produced no permanent result in 12 cases of secondary sciatica (due to some extraneous pathological condition). The injection should be given slowly and care taken to avoid inadvertent injection into the tissues. In primary sciatica pain usually ceases within 10 minutes.—H. B. Sutton, *Lancet*, ii/1939, 1169.

Sodium Salicylate as a Sclerosing Agent.

Sodium salicylate in 20, 30 or 40% solution may be used as the sclerosing agent in the injection treatment of varicose veins, the dose being 6 to 10 ml. of the 20% at the first sitting, then 4 to 5 ml. of the 30% and finally 2 to 4 ml. of the 40%. The veins rapidly acquire a toleration for the drug if obliteration does not occur rapidly. The injection, especially of the 40% solution, may cause intense pain, commencing some seconds after injection and lasting for 2 to 3 minutes. Immediate pain on injection is an indication of extravascular escape of the sclerosing solution. Addition of $\frac{1}{2}$ % of procaine hydrochloride has been advised, but may prevent recognition of extravasation of the solution.

There are several disadvantages, including possible loss of time in testing sensitivity of the patient, acquirement of tolerance by veins if they are not quickly obliterated, cramp during administration, ulceration if leakage occurs, uncontrollable effect.—A. H. Douthwaite, "The Injection Treatment of Varicose Veins." H. K. Lewis, 1927.

V. Meisen recommends sodium salicylate 25% and sodium chloride 10%, which is practically painless. *Max. dose.*—10 ml. Cannula (not too sharp) is inserted with patient standing; rotate once or twice when blood flows from it to see that it has not caught in the opposite wall. The patient then lies down with leg on a special stand. When varices are empty commence injection very slowly, stopping if flow is resisted or if patient feels pain. For injections in the neighbourhood of the malleoli inject $\frac{1}{2}$ % Novocaine direct into the varix. Massage lightly after injection. Repeat the treatment every other day and if both legs are affected treat one every day.—*Lancet*, i/1927, 1355.

The standard injection for a medium-sized vein is 5 ml. 30% solution in 10% saline, and for a large vein 7 ml. of 40% solution in 10% saline. Inject with limb emptied of blood and from below upwards. The effect can be judged after a fortnight. Local analgesics added to allay the pain found entirely negative.—G. H. Colt, *Brit. med. J.*, ii/1929, 850.

25% saline with 5% salicylate is a good average "guidable" solution for those who prefer saline to salicylate.—G. H. Colt, *Brit. med. J.*, i/1930, 760.

VARICOSE ULCERS. As the result of a questionnaire to 550 medical men, A. P. Luff concludes that the treatment is best limited to two procedures: (1) Injection of veins (preferably with sodium salicylate) in combination with Unna's zinc gelatin for local treatment; (2) Unna's zinc gelatin alone if injection is refused or cannot be done. Ultra-violet light treatment appears very reliable in the hands of experts. The rational method of prevention of varicose ulcers is the obliteration of varicose veins.—*Brit. med. J.*, ii/1928, 1146.

See also *Dextrose, Lithium Salicylate, Quinine-Urethane, Sodium Morrhuate, and Sodium Chloride.*

Scleroveine (Bengal, London). Sodium salicylate solution in ampoules for varicose vein injection.

Effervescent Sodium Salicylate. This is made in two strengths—5 and 10 grains in a drachm. *Dose.*—1 drachm (4 g.) or more.

Mist. Sod. Sal. (N.I.F.).

Sodium salicylate 10 gr., sodium bicarbonate $12\frac{1}{2}$ gr., concentrated compound infusion of gentian 15 m., water to $\frac{1}{2}$ oz.

Mist. Sod. Salicyl. (P.M.H.). Sodium salicylate 20 gr., sodium bicarbonate 20 gr., sodium thiosulphate 1 gr., peppermint water to 1 oz.

D*

Mist. Sod. Sal. Co. (N.I.F.). Sodium salicylate 10 gr., sodium bicarbonate 10 gr., potassium citrate 10 gr., concentrated compound infusion of gentian 15 m., water to $\frac{1}{2}$ oz.

[P1] **Mistura Coryzæ (B.V.H.).**

Tincture of catechu 15 m., sodium salicylate 6 gr., ammonium chloride 5 gr., compound tincture of cinchona 1 dr., compound tincture of chloroform and morphine 5 m., syrup of tolu 30 m., syrup of lemon 30 m., glycerin 15 m., mucilage of acacia 15 m., liquid extract of nux vomica $\frac{1}{2}$ m., water to 1 oz.

Apparently a bad example of polypharmacy but if any ingredient be omitted it disagrees with some patients. As it stands it can be taken by everybody.—A. T. Todd, *Practitioner*, 1934, 731.

Strontii Salicylas. $(C_6H_4(OH) \cdot COO)_2Sr, 2H_2O = 397.9$.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

A white crystalline powder, slightly soluble in water and in alcohol. Used for chronic gout, and is a good intestinal antiseptic. In chronic sciatica 10 to 15 grain doses are stated to act better than other salicylates.

Intravenously 10 ml. of 5% solution, has proved useful in chronic affections of the joints. The lactate may be given orally, and, in severe pain, the bromide intravenously in place of the salicylate.

Methylis Salicylas (B.P., U.S.P. XI, Fr. Cx., P. Helv. V).
Syn. ARTIFICIAL (OR SYNTHETIC) OIL OF WINTERGREEN.

$C_6H_4(OH) \cdot COOCH_3 = 152.1$.

Dose.—5 to 15 minims (0.3 to 1 ml.). *U.S.P. XI* average dose 12 minims.

U.S.P. XI gives *Oleum Gaultheriæ* and *Oleum Betulæ* from the bark of *B. lenta* (Sweet Birch) as synonymous with methyl salicylate.

P. Belg. IV directs methyl salicylate to be given when *Essence de Wintergreen* is prescribed. *F.E. VIII*—May be either synthetic or natural. *P. Ital. V*—Synthetic only.

A colourless liquid, with wintergreen odour.

May be prepared by carefully distilling a mixture of salicylic acid 2, methyl alcohol 2 and sulphuric acid 1. **Miscible** with alcohol 90%, ether, chloroform or glacial acetic acid.

Antidotes. Empty stomach by emetic, or by using stomach tube with 4 oz. of sodium bicarbonate in 2 gallons of water. Give water freely, with sodium bicarbonate or magnesia, then milk and demulcent drinks. Keep patient lying down and warm.

Poisoning due to swallowing 1 oz. of methyl salicylate. Recovery after forcing liquids by the mouth, 2% solution of sodium bicarbonate by proctoclysis and wrapping patient with blankets.—*J. Amer. med. Ass.*, ii/1925, 306.

Less than 15 ml. per os has caused more than one fatality in infants. 13 cases of poisoning have been recorded, with 6 deaths.—*Brit. med. J. Epit.*, i/1928, 57.

Uses. Is readily absorbed when applied to the skin, and is an efficient application in lumbago, sciatica and rheumatic pain, either alone or as a paint, liniment or ointment. Also used for furunculoid ulcers, orchitis and mumps.

Emplastrum Methylis Salicylatis. A rubber base machine-spread plaster containing in the mass about 2% of methyl salicylate, and spread with about 4 ounces per yard on bleached cotton cloth.

Linimentum Methylis Salicylatis (B.P.C.).

Syn. LINIMENTUM BETULÆ COMPOSITUM.

Rectified oil of camphor 1 in 4, with menthol, oil of eucalyptus and methyl salicylate.

[P.] **Linimentum Methylis Salicylatis Compositum** (B.P.C.).

Rectified oil of camphor 1 in 4, with menthol, chloral hydrate, methylsalicylate and chlorophyll.

Linimentum Methylis Salicylatis Oleosum (B.P.C.).

Syn. **LINIMENTUM METHYLIS SALICYLATIS SIMPLEX** (N.I.F.).

Methyl salicylate 25% v/v in rape oil.

Unguentum Methylis Salicylatis (B.P.C.). Syn. **UNGUENTUM METHYLIS SALICYLATIS FORTE**.

Contains 50% w/w of methyl salicylate.

Unguentum Methylis Salicylatis Dilutum (B.P.C.).

Contains 25% of the strong ointment in hydrous wool fat ointment.

Unguentum Methylis Salicylatis Compositum (B.P.C.).
Syn. **UNGUENTUM METHYLIS SALICYLATIS COMPOSITUM FORTE**,
UNGUENTUM BETULÆ COMPOSITUM, **UNGUENTUM ANALGESICUM**.
ANALGESIC BALM.

Contains methyl salicylate 50% w/w, menthol 10% w/w, oil of cajuput and eucalyptol in a beeswax and wool fat basis.

Unguentum Methylis Salicylatis Compositum Dilutum (B.P.C.).

Contains 25% of the strong compound ointment in hydrous wool fat ointment.

Analgesic Balm (Parke, Davis, London). Menthol, methyl salicylate and lanolin. Muscular pain, rheumatism, etc.

Balmosa (Oppenheimer, Son & Co., London). A non-greasy, analgesic cream containing methyl salicylate and rubefacients.

Lodynic Unguentum Rubefaciens (Research Products, London). Methyl salicylate 20, oil of turpentine 10, menthol 7.5, sodium ricinoleate 1 in 500, oleoresin of capsicum 2, lanolin 2 parts and beeswax 1 part to 100. As a counter-irritant in rheumatism, sciatica, etc.

Menthofax (Burroughs, Wellcome, London). Contains methyl salicylate 50%, menthol 10%, eucalyptol 2.5%, oil of cajuput 2.5%, white beeswax 20% and hydrous wool fat 15%.

Mesotan (Bayer Products, London). Methoxymethyl salicylate. Used in the form of a paint, diluted with 1 to 4 parts of olive or other oil as a counter-irritant.

Methylsal Balm (Martindale, London). Contains methyl salicylate 7, in combination with menthol 5%. Also prepared containing 25% and 33% of methyl salicylate (with menthol 5%). For analgesic effect in rheumatism.

Oleum Betulæ (B.P.C.). Syn. **OIL OF SWEET BIRCH**, **OIL OF WINTERGREEN**, **OLEUM GAULTHERIÆ**.

Dose.—5 to 15 minims (0.3 to 1 ml.).

Formerly obtained from *Gaultheria procumbens*, now exclusively from *Betula lenta*. Contains not less than 98% w/w of esters, calculated as methyl salicylate.

The oil has similar properties to salicylic acid. 10 to 20 minims are given every 3 or 4 hours in rheumatism and sciatica. With olive oil externally for rheumatism.

Reipar Ampoules (Anglo-French Drug Co., London). Natural salicylic acid in distilled *Betula lenta* water. **Dose**.—8 to 10 ml. daily subcutaneously, but not more than 1 ml. at one locality. Rheumatism, sciatica, gout, etc.

Ethylis Phthalas. Syn. **DIETHYL PHTHALATE**. $C_6H_4(COOC_2H_5)_2$. A colourless, odourless, somewhat syrupy liquid with acrid taste. B.p. 290° to 300°. Insoluble in water, soluble in alcohol 90% and in oils and aromatic hydrocarbons. Used as a denaturant in surgical spirits and perfumes.

Salicinum (B.P., U.S.P. XI, Fr. Cx.).

$C_6H_{11}O_5 \cdot O \cdot C_6H_4 \cdot CH_2OH = 286.1$.

Dose.—5 to 15 grains (0.3 to 1 g.) in cachets, tablets or in aqueous solution—the taste being covered with liquid extract of

liquorice, or small doses may be given in a pill with glycerin of tragacanth.

A glucoside in colourless shining trimetric tabular crystals, without odour, taste moderately bitter. Obtained from various species of *Salix* and *Populus* especially *S. fragilis*.

Soluble 1 in 28 parts of cold water, and 1 in 80 of alcohol, but insoluble in ether or chloroform.

Uses. Given for influenza and as a prophylactic. In rheumatic fever it acts similarly to sodium salicylate. 20-grain doses hourly, or 30 grains every 2 or 3 hours. 60 grains have been given, repeated in 2 hours without ill effect. It is given to reduce fevers, e.g., of malaria or phthisis. Is of value in psoriasis when given in a dose of 10 to 15 grains three times a day. It is not adapted for use as an external antiseptic.

Effervescent Salicin. *Dose.*—1 drachm. Contains 5 grains in 1 drachm.

Tabellæ Salicini (*B.P.C.*) contain 5 gr. (0.3 g.).

Salol (*B.P.C.*, *P. Belg.* IV, *F.E.* VIII, *U.S.P.* XI, *P. Helv.* V). *Syn.* PHENYL SALICYLATE (*Fr. Cx.*, *P. Jap.* V).

$C_6H_5(OH) \cdot COOC_6H_5 = 214.1$.

Dose.—5 to 20 grains (0.3 to 1.2 g.) in cachets, suspended in milk, or in mixtures suspended with tragacanth. *Fr. Cx.* and *P. Belg.*: *Max. single dose*, 15 gr.; *max. during 24 hours*, 90 gr. *P. Helv. V* has *max. single dose* of 30 grains.

Small crystals, with a slight wintergreen odour. *M.p.* 42° to 43.5°.

Soluble 1 in 15 of alcohol 90%, 1 in 10 of liquid paraffin, in fixed oils, and a trace in glycerin. Almost insoluble in water.

Dispensing Note. Taken internally as such it is liable to form intestinal calculi and should be triturated and prescribed with some inert powder or as an emulsion. When prescribed in an emulsion with an oil, e.g., castor oil, dissolve it in the oil before proceeding. Melt the salol in the oil in a warmed mortar; emulsify with acacia, using hot water to complete.

Uses. Antiseptic and antipyretic. In the small intestine it splits up into its component parts, both being found in the urine which becomes very dark. It has been used as an intestinal antiseptic, but effective doses would be toxic owing to liberation of phenol. It is mainly employed as a coating for enteric pills.

SALOL COATING OF PILLS is conducted by employing salol melted. This renders the pill insoluble in the acid gastric juice, but soluble in the alkaline fluid of the intestine; hence suitable for purgatives to act on the bowels, and for administering antiseptics in eczema and urticaria.

Liquor Salolis Compositus (*B.P.C.*). *Syn.* SALOL MOUTH WASH. Salol 2.5% with thymol, oil of peppermint, oil of anise, elixir of saccharin and alcohol 90%. For use, add $\frac{1}{2}$ to 1 teaspoonful to a tumbler of water.

Pigmentum Salolis (*B.P.C.*). Salol 1 in 300 in glycerin and alcohol 90%. For septic tonsils.

Salol Catheter Oil. Salol 1, castor oil and almond oil, of each 15. Does not dissolve the varnish of catheters.

Salol cum Camphora. *Syn.* SALOL CAMPHOR.

Salol 3, camphor 2, heated together, combine to form a viscid liquid, which has been used as an antiseptic in place of iodoform. Prepared with 10% only of camphor, quickly crystallises, and when powdered is suitable for application where liquid is not practicable.

Useful in suppuration of the middle ear; non-irritating.

Tabellæ Salolis (B.P.C.) contain 5 gr. (0.3 g.).

Unguentum Salol cum Menthol.

Salol 4, menthol 2, olive oil 4, wool fat to 100. For fissures of the skin, *e.g.*, in chapped hands.

SUNBURN. A 10% cream made by dissolving the salol in a minimum amount of liquid paraffin and mixing this solution with a base of cold cream, makes an effective application for the absorption of ultra-violet rays and prevention of sunburn.—H. Sharlit, *Arch. Derm. Syph., N.Y.*, Aug., 1935, 291.

Salbide (Gabbil) (*Anglo-French Drug Co., London*). Ampoules of 5 ml. contain 1 g. of salol and 0.1 g. of iodine, with 0.02 g. of camphor, in ether-purified olive oil. *Dose*.—5 ml. intramuscularly every 2 days. Chronic rheumatism.

Ethylis Salicylas. $C_6H_4(OH) \cdot COOC_2H_5 = 166.17$.

A colourless liquid of aromatic odour, with b.p. 225° to 234° , and properties similar to those of the methyl compound. Soluble in alcohol.

Amylis Salicylas. $C_6H_4(OH) \cdot COOC_5H_{11} = 208.1$.

Colourless liquid with carnation odour, used principally in perfumery. Has been used for painting on rheumatic joints.

BURNS, especially from acids, are treated with a pad soaked in it, the part being first dried and then flooded with water and neutralised with dilute ammonia.

Borneol Salicylate. In muscular rheumatism and acute neuralgia, by inunction or by painting over affected part. Apply $\frac{1}{2}$ to 1 drachm with equal quantity of olive oil.

Butylis Salicylas. $C_6H_4(OH) \cdot COOC_4H_9 = 194.2$.

A colourless liquid with a powerful fragrant odour. B.p. 267° . It is used in perfumery.

Salicyl Salicylate. *Prop. Name.* DIPLOSAL (*Boehringer, Mannheim; Coates & Cooper, London*). $OH \cdot C_6H_4 \cdot COO \cdot C_6H_4 \cdot COOH = 258.1$.

Tablets contain $7\frac{1}{2}$ gr. *Dose*.—1 or 2 tablets, 4 to 6 times daily.

Salol in which the phenyl group is replaced by salicylic acid. White odourless needles melting at 147° . Insoluble in water and dilute acids, soluble in alcohol. Used for rheumatism, neuralgia, and cystitis.

Pharmacological experiments showed that the compound remained unchanged for 6 hours in the gastric juice, but was decomposed in 2 or 3 minutes in the duodenal secretion. Hence it does not cause gastric disturbances.

Estersil (Johnson & Sons, London). Ethyl and propyl esters of salicylglycollic acid, 49% of each, with oil of lavender 2%. Liquid, for external application in rheumatism.

Mycoceten (Leo, Copenhagen; Bencard, London). Preparations (powder, spirit, ointment) containing oxybenzoic acid ester and salicylic acid. Mycotic eczema.

Salen (Ciba, Horsham). Methyl and ethyl glycollic acid esters of salicylic acid. An oily liquid readily soluble in alcohol, ether and castor oil. It is odourless and non-irritating, and is used for local application in rheumatic affections, etc. **Salenal.** An ointment containing $33\frac{1}{3}$ % of Salen.

Sal-Ethyl Carbonate (Parke, Davis, London). Salicylic ethyl ester carbonate in 5 gr. tablets. *Dose*.—1 to 3 tablets with water. For the relief of acute rheumatism, etc.

Spirosal (*Bayer Products, London*). Monoglycol salicylate. Applied externally, diluted with alcohol or olive oil, or in an ointment, as an antirheumatic.

T.C.P. (*British Alkaloids Ltd., London*) is stated to be a 1% aqueous solution of "trichlorophenylmethyliodosalicyl" with a R.W. coefficient of 10 calculated on the pure salt. It is a non-toxic antiseptic advocated for local application to wounds, ulcers, boils, burns, chilblains, skin affections, insect bites and stings, nasal catarrh (diluted 1 in 2 or 3 of water) and conjunctivitis (1 in 10), etc.

T.C.P. B3 Colloidal Emulsion contains trichlorophenylmethyliodosalicyl 1%, tribromoacetylidoorthoxybenzoic acid 2%, T.C.P. bismuthate 1.5%, colloidal aluminium silicate 2%, glycerin 3%, distilled water 90.5%. For the treatment of bacillary infections of the alimentary tract such as dysentery, colitis, gastro-enteritis, etc. *Dose*.— $\frac{1}{2}$ oz. in water twice a day.

T.C.P. Ointment No. 33 contains trichlorophenylmethyliodosalicyl 15, iodine (as tincture) 0.42, methyl salicylate 4, sulphur 3.5, and colloidal kaolin 22.65 with camphor, tannic acid, salicylic acid, borax, boric acid, creosote and glycerin in a paraffin base. For eczema, hæmorrhoids, chilblains and rheumatic conditions.

Esters of *p*-Hydroxybenzoic Acid. Various esters of *p*-hydroxybenzoic acid, the *para* isomeride of salicylic acid, and its salts are used as preservatives in cosmetic, pharmaceutical and other preparations, especially on the Continent. They have the advantages of being tasteless, odourless, inert, stable and non-toxic substances.

Esters of *p*-hydroxybenzoic acid usually possess excellent preservative action in most cosmetic creams, but they cannot be recommended for the preparation of *sterile solutions*, or in the preservation of neutral jellies for therapeutic use, or in the formulation of antiseptic mouth washes and similar products.—R. G. Harry, *Mfg. Chem.*, 1940, 45.

Butoben (*Merck, Rahway, N.J.*). *n*-Butyl-*p*-hydroxybenzoate occurring as a white crystalline powder, almost insoluble in water but soluble in organic solvents.

It is non-irritant and is perfectly satisfactory in the preservation of cosmetic creams and in eye lotions.—R. G. Harry, *Mfg. Chem.*, 1940, 46.

Nipagin M (*Nipa Laboratories, Cardiff; P. Samuelson, London*).

$C_6H_4(OH) \cdot COOCH_3 = 152.1$.

Nipagin M is the methyl ester of *p*-hydroxybenzoic acid, occurring as a white crystalline powder, m.p. 126° to 127° . Soluble 1 in 400 of water at room temperature if the solution is prepared by boiling; soluble in alcohol as follows: 1 in 2 $\frac{1}{2}$ (95%), 1 in 5 (70%), 1 in 17 (50%), 1 in 143 (20%); also soluble in warm oils (1 in 40), and in glycerin (1 in 80 at 70°). It is used as a preservative in a strength of from 0.05 to 0.25% against moulds and yeasts.

Quantitative tests on methyl *p*-hydroxybenzoate confirm that it is poor in germicidal power in comparison with *p*-chlor-*m*-cresol. A 0.2% solution is not an efficient preservative for hypodermic injections; it is less germicidal than 5 p.p.m. of copper sulphate.—H. Davis, *Quart. J. Pharm.*, 1940, 32.

Sodium-Nipagin M is the sodium salt, soluble 1 in 5 of water. It is used in a strength of 0.1 to 0.25% as a preservative in aqueous preparations, preferably in conjunction with other related esters.

Nipagin A. $C_6H_4(OH) \cdot COOC_2H_5 = 166.7$. Ethyl *p*-hydroxybenzoate. Used for the preservation of fatty emulsions, creams, etc., in the proportions of 0.05 to 0.15%.

Nipabenzyl (*Nipa Laboratories, Cardiff; P. Samuelson, London*).

$C_6H_4(OH) \cdot COOCH_2C_6H_5 = 228.2$. Benzyl *p*-hydroxybenzoate. Soluble 1 in about 500 of water; readily soluble in oils and glycerin. It is used similarly.

Nipasol M (*Nipa Laboratories, Cardiff; P. Samuelson, London*).

$C_6H_4(OH) \cdot COOC_3H_7 = 180.2$. The propyl ester of *p*-hydroxybenzoic acid. Slightly soluble in water (1 in 2000, prepared by boiling); also soluble 1 in 40 of warm oils, 1 in 143 of glycerin; soluble in alcohol as follows: 1 in 2 (95%), 1 in 2 $\frac{1}{2}$ (70%), 1 in 6 $\frac{1}{2}$ (50%), 1 in 700 (20%). It is used as a preservative for emulsions, oily preparations and albuminous solutions in the proportion 0.05 to

0.075%. Up to 0.5% is used for preventing the development of rancidity in oils. **Sodium-Nipasol M** is the sodium salt, readily soluble in water.

Nipa 49 (*Nipa Laboratories, Cardiff; P. Samuelson, London*). A stable ester of *p*-hydroxybenzoic acid with anti-oxidant properties. It is stated to prevent the oxidation of ascorbic acid and oils, and the formation of peroxides in ether, etc.

ACIDUM SULPHURICUM

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Dan., P. Helv. V.

$H_2SO_4 = 98.08$.

Syn. OIL OF VITRIOL.

[P2] "*Sulphuric acid.*"

[83] "*Sulphuric acid—in substances containing less than 9%, weight in weight, of sulphuric acid (H_2SO_4); accumulators; batteries; fire extinguishers.*"

Dose.—1 to 2 minims (0.06 to 0.12 ml.).

A colourless, corrosive liquid of oily consistence. When diluted with water it evolves much heat. *B.P.* requires sp. gr. about 1.84, the acid containing not less than 95% *w/w* of H_2SO_4 .

Antidotes. Treat as for poisoning by glacial acetic acid. Burns should be treated by the application of magnesium oxide or carbonate in powder form or as a thick paste. Sodium bicarbonate or chalk may also be used well diluted with water. The raw surface, if free from sepsis, may subsequently be protected by tannic acid solution or jelly.

Uses. Very occasionally as a caustic (mixed with sufficient charcoal to form a paste).

[P2] **Acidum Sulphuricum Fumans.** *Syn. NORDHAUSEN SULPHURIC ACID* or "**Oleum**," sp. gr. about 1.9. Contains some sulphuric anhydride dissolved in sulphuric acid. When made by distillation of ferrous sulphate, ferric oxide or colcothar or polishing rouge remains behind.

"C.O.V." and "R.O.V." are impure commercial sulphuric acids, known as commercial oil of vitriol and brown oil of vitriol respectively.

[P2] **Acidum Sulphuricum Aromaticum (B.P.C.).**

Syn. ELIXIR OF VITRIOL.

Dose.—5 to 20 minims (0.3 to 1.2 ml.).

Contains the equivalent of about 13% *w/w* of free and combined sulphuric acid with tincture of ginger, spirit of chloroform and alcohol 90%.

[P2] **Acidum Sulfuricum Aromaticum (U.S.P. XI).**

Average dose.—8 minims (0.5 ml.).

Contains about 20% of free and combined sulphuric acid with fluid extract of ginger, oil of cinnamon and 80 to 85% by volume of alcohol.

Spiritus Sulfuricus (Fr. Cx.). *Syn. EAU DE RABEL.* Prepared by macerating red poppy petals 4 g., with a mixture of 95% alcohol 300 g., and sulphuric acid 100 g., for 4 days.

[P2] **Acidum Sulphuricum Dilutum (B.P.).**

Dose.—5 to 60 minims (0.3 to 4 ml.); *U.S.P. average dose* 15 minims. When given internally it is best administered through a glass tube to avoid injury to the teeth.

Is prepared by diluting 104 g. of the strong acid with water to 1000 g. An acid of approximately the same strength is obtained by diluting 1 oz. 100 m. with water to 1 pint.

Contains 10% w/w of H_2SO_4 and has sp. gr. 1.064 to 1.073; *U.S.P. XI*, *Fr. Cx.*, *F. Norsk.*, *F.E. VIII*, *P. Jap. V* and *P. Helv. V* are similar; *P. Ned. V* is 4N., i.e., 19.6%; *P.G. VI* 15.6 to 16.3%, *P. Ital. V* approx. 19%; *P. Belg.* approx. 9.8%; *P. Dan.* 9.2%.

Incompatible with alkalis and carbonates. It precipitates barium and calcium from solutions of their salts, also soluble lead and silver salts.

Uses. Similar to those of other mineral acids. Antiseptic and astringent in diarrhoea. In cholera epidemics "sulphuric acid lemonade," containing 5 to 10 m. of dilute acid per pint of sweetened water, has been taken as preventive; it is also taken by lead workers as preventive of plumbism. Dilute sulphuric acid in 20 to 30 m. doses, well diluted, every 4 hours is of value in carbuncles, boils and staphylococcal infections.

Linctus Acidus (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Oxymel 1 in 3 with dilute sulphuric acid, emulsion of chloroform and treacle.

[P1] **Mistura Acidi Sulphurici cum Opio** (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains dilute sulphuric acid 20 m. and tincture of opium 7 $\frac{1}{2}$ m. with tincture of capsicum and camphor water to 1 oz.

[P1] **Mist. Acid. Sulph. c. Opio** (*P.M.H.*). Dilute sulphuric acid 15 m., tincture of opium 20 m., strong tincture of ginger 5 m., water to 1 oz.

Ammonii Sulphas. $(NH_4)_2SO_4 = 132.1$.

Colourless crystals soluble about 3 in 4 of water. It is made by distilling gas liquor with lime into sulphuric acid and is a source of ammonia for refrigeration and similar purposes. Its chief use is as a fertiliser and for fire proofing. It is also used for precipitating proteins from solution.

Potassii Sulphas (*B.P.C.*, *Fr. Cx.*, *P. Jap. V*, *P. Helv. V* *P. Dan.*).

Syn. SAL POLYCHRESTUM. $K_2SO_4 = 174.3$.

Dose.—15 to 45 grains (1 to 3 g.).

Colourless crystals with saline, slightly bitter taste. **Soluble** 1 in 10 of water. A saline purgative.

0.25 to 0.5% added to local anaesthetics, whether by spinal injection or peripheral blocking of nerves, enhances anaesthesia.

Sodii Sulphas (*B.P.*, *U.S.P. XI*, *Fr. Cx.*, *P. Jap. V*, *P. Dan.*).

Syn. GLAUBER'S SALT. $Na_2SO_4 \cdot 10H_2O = 322.2$.

Dose.— $\frac{1}{2}$ to 4 drachms (2 to 16 g.). *U.S.P. XI* average dose 4 drachms.

The form known as "feathery crystals" is handy for dispensing.

Soluble about 1 in 3 of water, also in glycerin; insoluble in alcohol.

Uses. Sodium sulphate is a powerful purgative, producing a copious watery evacuation without griping. Large doses are of value for removing fluid from the tissues in dropsy or ascites. Two-hourly doses of 120 grains are excellent for bacillary dysentery, and in infantile diarrhoea small doses (from 6 to 10 grains in dill water) have been advised. Externally the use of compresses

of a saturated solution of sodium sulphate is said to reduce œdema and pain in infected wounds.

WOUNDS. Plain lint soaked in a 12% solution of sodium sulphate and applied to the surface of any ordinary, fairly open septic wound is astonishingly effective and is preferable to the use of antiseptics. The lint is covered with oiled silk or elastic adhesive plaster and bandaged. The lint must be kept soaked with the solution and changed twice a day or more often if necessary. One of the first and almost immediate symptoms is the relief of pain.—J. C. Lyth, *Brit. med. J.*, ii/1935, 905.

Recovery of every one of 1096 infected wounds of all types by the sole use of soaks of a saturated solution of sodium sulphate. Septic œdema disappears with startling rapidity when hypertonic solution of sodium sulphate is applied at the point of entry of infection. For the purpose of hypertonic saline dressings sodium sulphate is much more effective than either magnesium sulphate or sodium chloride.—J. C. Lyth, *Lancet*, i/1940, 216; *see also Brit. med. J.*, ii/1940, 53.

Lyth's findings confirmed, but, by the addition of 0.1% acriflavine to the 10% sodium sulphate solution, spreading infections are promptly localised, sloughs separate more rapidly, and granulation and epithelization are stimulated to a far greater extent than by sodium sulphate alone.—C. J. Cellan-Jones, *Brit. med. J.*, ii/1940, 152.

Mist. Sod. et Mag. Sulph. (N.I.F.). Sodium sulphate 30 gr., magnesium sulphate 15 gr., syrup of ginger 20 m., water $\frac{1}{2}$ oz.

Sodii Sulphas Effervescens (B.P.).

Dose.—1 to 4 drachms (4 to 16 g.).

Contains 50% of sodium sulphate.

A teaspoonful or more in half a tumbler of water, taken half an hour before breakfast, is an efficient evacuant.

Sodii Sulphas Exsiccatus (B.P.C., Fr. Cx., P. Helv. V).

$\text{Na}_2\text{SO}_4 = 142.1$.

Dose.— $\frac{1}{2}$ to 2 drachms (1 to 8 g.).

A white powder readily absorbing moisture. On drying, crystalline sodium sulphate loses about half its weight.

Soluble 1 in 8 of water.

The Committee on General Chemistry of the Pharmacopœia Commission (*Report* 14) have recommended the inclusion in the B.P. of exsiccated sodium sulphate (*syn.* ANHYDROUS SODIUM SULPHATE, EXSICCATED GLAUBER'S SALT) prepared by drying sodium sulphate at 100° to constant weight.

Sal Carolinum Factitium (B.P.C.). Syn. ARTIFICIAL CARLSBAD SALT.

Dose.—1 to 2 drachms (4 to 8 g.).

A crystallised preparation containing sodium sulphate about 55% with potassium sulphate, sodium chloride and sodium carbonate. $1\frac{1}{2}$ drachms is approximately equivalent to 1 pint of the natural water.

Sal Carolinum Factitium (P.G. VI, P. Ned. V, P. Belg. IV, P. Jap. V).

Dose.—20 to 60 grains (1.3 to 4 g.).

A powdered preparation containing exsiccated sodium sulphate 22, potassium sulphate 1, sodium chloride 9, sodium bicarbonate 18. 53 gr. is approximately equivalent to 1 pint of the natural water.

Sal Carolinum Factitium Effervescens (B.P.C.).

Syn. EFFERVESCENT CARLSBAD POWDER.

Dose.—1 to 2 drachms (4 to 8 g.).

Contains about 10% of exsiccated sodium sulphate and 40% of sodium potassium tartrate.

Marienbad salt is similar to powdered artificial Carlsbad salt. **Marienbad salt tablets** may be prepared containing 60 grains of the mixture.

Marienbad Antiobesity Tablets. *Dose.*—One or two at bedtime. Aloes $\frac{1}{2}$ gr., rhubarb 1 gr., cascara extract $\frac{1}{2}$ gr., Marienbad salt $\frac{1}{2}$ gr., fucus extract $\frac{1}{2}$ gr.—*Pharm. J. Formulary.*

Sal Emsanum Facticum (*P. Ned. V*). Exsiccated sodium sulphate 10, potassium sulphate 10, sodium chloride 265, sodium bicarbonate 715.

Sal Hunyadi Janos Facticum (*P. Ned. IV*). Magnesium sulphate 950 exsiccated to 500, sodium chloride 50, exsiccated sodium sulphate 450.

Sal Vichy Facticum (*P. Ned. V; P. Helv. V*). Sodium phosphate (cryst.) 20, potassium sulphate 50, sodium chloride 80, sodium bicarbonate 850.

Sal Wildungense Facticum (*P. Ned. V*). Potassium sulphate 5, calcium carbonate 190, magnesium carbonate 190, sodium chloride 240, sodium bicarbonate 375. To make artificial Wildungen water use 4.6 g. per litre.

Dose of each.—20 to 60 grains (1.3 to 4 g.), increased as required.

Sodii Sulphas Acidus, *syn.* **SODIUMBISULPHATE**, $\text{NaHSO}_4 \cdot \text{H}_2\text{O}$, occurs in crystals or fused masses. Is used for preparing effervescing baths.

Nauheim Bath Salts are prepared with this salt and sodium bicarbonate. The Nauheim water contains in addition sodium and calcium chlorides.

Ammonii Persulphas (*B.P.C.*). $(\text{NH}_4)_2\text{S}_2\text{O}_8 = 228.2$.

White crystals obtained by the electrolysis of ammonium sulphate solution. Soluble 1 in 2 of water. Is used in the preparation of the persulphates.

Potassii Persulphas (*B.P.C.*). $\text{K}_2\text{S}_2\text{O}_8 = 270.3$.

White crystals soluble 1 in 3 of water. A bleaching agent; used also in photography as a reducer. Its use as a flour "improver" is liable to cause "baker's itch."

Sodii Persulphas. $\text{Na}_2\text{S}_2\text{O}_8 = 238.1$.

Dose.—1 to 3 grains in water before meals.

In small white granular crystals, soluble in water. Has been recommended as an aperitive stimulant to digestion and is said to bring about an improvement in nutrition and gain in weight. It should not be used continuously for more than 3 weeks. It is best given in water in a single daily dose of 3 grains. It is a strong oxidising and bleaching agent. Liberates about 13% active oxygen. If it is desired to avoid production of free sulphuric acid, the persulphate may be mixed with $1\frac{1}{2}$ times its weight of sodium carbonate. 3 to 10% solutions as gargle and dressing. Suitable for wounds requiring moist dressing and where disinfection necessary. For small ulcers may be used as dusting powder, with equal quantity of powdered talc.

ACIDUM SULPHUROSUM

B.P.C.

$\text{H}_2\text{SO}_3 = 82.08$; $\text{SO}_2 = 64.06$.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

A colourless liquid, with strong sulphurous odour, and containing 5% of SO_2 . Sp. gr. about 1.025.

Preparation. By roasting sulphur or by heating copper and sulphuric acid, or carbon and sulphuric acid, and dissolving the gas in water. Sulphur dioxide is also available compressed in cylinders.

Antidotes. Keep patient warm; mustard plaster on chest. Give narcotics if necessary. Artificial respiration.

Uses. This solution of sulphurous acid is applied externally as a lotion—one part to two or more of water and sometimes a

little glycerin added for affections such as chloasma, ringworm, pruritus, thrush and chapped hands, with very good results. It is sprayed into the throat for tonsillitis, diphtheria (better diluted) and asthma, or used as an inhalation, a teaspoonful to a pint of cold water. It is strongly antiseptic, and has been used in whooping cough by fumigating the room. Also diluted, for fœtor of the teeth, *e.g.* in syphilis.

Internally it has been used in cholera (freely diluted). As a rectal injection, a 1 or 2% solution of the gas. Also for gastric fermentation accompanied by *sarcinæ*, and in typhoid (20 to 30 minim doses, diluted) every 2 or 3 hours.

Lotio Acidi Sulphurosi (B.P.C.).

Sulphurous acid and glycerin of tannic acid, of each 1 in 4 in distilled water. Useful as a paint or spray in tonsillitis and septic sore throat.

Magnesium Thiosulphas. *Syn.* MAGNESII HYPOSULPHIS.

$\text{MgS}_2\text{O}_3 \cdot 6\text{H}_2\text{O} = 244.5$.

Dose.—8 to 15 grains (0.5 to 1 g.) orally, or by intramuscular injection of a 10% solution.

Colourless crystals *soluble* 1 in $1\frac{1}{2}$ of water. Used in the treatment of allergic diseases.

Spasmodic coryza and asthma, resistant cases successfully treated by magnesium thiosulphate tablets 0.5 g., 4 to 6 daily, or the intramuscular injection every fourth day for 2 weeks of 10 ml. of a 10% solution. Injections stated to be painless and amelioration of symptoms to follow almost immediately.—G. Boissel, *Fr. med.*, May 17, 1930.

Asthma of 2 to 25 years' standing treated *per os*. Results satisfactory, no contraindications.—M. J. Fenton, *Brit. med. J.*, ii/1930, 940.

Potassii Metabisulphitis. $\text{K}_2\text{S}_2\text{O}_5 = 222.3$. *Syn.* POTASSIUM PYROSULPHITE, POTASSIUM BISULPHITE.

Prepared by saturating a solution of potassium carbonate or caustic potash with sulphur dioxide.

It is used as a reducing agent in photography and, in small quantities, to preserve the colour of ointments containing resorcinol. Also used in the *Campden Process* for preserving fruit, which consists of bottling the fruit in a cold solution of potassium metabisulphite and sealing the containers. The covers must be non-metallic, and cork bungs sealed with wax are recommended. The fruit will keep indefinitely when stored in this manner, and even when unsealed, provided the solution still covers the fruit, will remain good for a week or two. The fruit is boiled before use to remove the preservative. The process can be used for most soft fruits, but is of no use for vegetables.

Sodii Sulphis (B.P.C.). $\text{Na}_2\text{SO}_3 \cdot 7\text{H}_2\text{O} = 252.2$.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

Colourless efflorescent crystals slowly oxidising in air to sulphate (keep in stoppered bottles).

Soluble 1 in 2 of water, 1 in 25 of glycerin; slightly in alcohol 90%. Incompatible with acids.

Uses. Antiseptic and antizymotic. Has been used internally for fermentative dyspepsia and for *sarcinæ* in the stomach. In dilatation of the stomach, sodium sulphite in 5 to 10 gr. doses, with sodium bicarbonate and nux vomica between meals, is said to be of value.

Externally it is employed as a lotion in parasitic skin diseases and a 1 in 8 solution is a useful mouth-wash in stomatitis.

Sodii Sulphis Exsiccatus. *Syn.* NEUTRAL SODIUM SULPHITE (*Fr. Cx.*). $\text{Na}_2\text{SO}_3 = 126.1$.

A white powder, **soluble** 1 in 3.2 of water; slightly soluble in alcohol. It is used in photography. Being a dry powder it is convenient for transit.

Sodii Metabisulphis. *Syn.* SODIUM PYROSULPHITE, SODIUM BISULPHITE. $\text{Na}_2\text{S}_2\text{O}_5 = 190.1$.

Made by passing sulphur dioxide into a hot concentrated aqueous solution of sodium sulphite, or sodium hydroxide.

Prismatic crystals or white powder readily **soluble** in water.

The true bisulphite or acid sulphite, NaHSO_3 , does not exist as a solid.

Uses. Antiseptic and antifermentative. Has been used as a mouth-wash in thrush and as a 10% lotion in ringworm and other skin diseases.

A solution of sodium metabisulphite 20 gr., in alcohol 90% 1 oz., peppermint oil 5 m., and glycerin 2 oz., has been used as an antiseptic throat pigment. In photographic use sodium metabisulphite is similar to the potassium salt. Is largely used as a food preservative.

Sodii Thiosulphas (*B.P. Add. I, U.S.P. XI, P. Helv. V, P. Jap. V, P. Dan., P. Ital. V, and F.E. VIII*). *Syn.* SODII HYPOSULPHIS (*Fr. Cx.*). $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O} = 248.2$.

Dose.—5 to 20 grains (0.3 to 1.2 g.), or more, *per os*. *B.P. Add. I* gives dose by subcutaneous, intramuscular or intravenous injection, 5 to 15 grains (0.3 to 1 g.). Is usually injected as a 10% solution.

Crystals **soluble** 5 in 3 of water; insoluble in alcohol.

Sterilisation of a solution of sodium thiosulphate requires special precautions, since the thiosulphate ion appears to cause a high survival-rate of bacteria. Of a number of solutions of medicaments, 12% sodium thiosulphate solution was the only one not sterilised by steaming for 30 minutes, and in tyndallisation experiments, a solution of sodium thiosulphate showed little germicidal action on spores of *B. subtilis* and *Cl. Welchii*.—H. Davis, *Quart. J. Pharm.*, 1940, 42.

Uses. As a lotion, 1 in 10 for chloasma, ringworm, etc. A 40% solution is employed in the treatment of scabies, followed by the subsequent application of 4% hydrochloric acid. Intravenously it is used for the prevention and treatment of stomatitis due to injections of mercury, bismuth or arsenic compounds, and also for the dermatitis sometimes caused by injections of gold compounds. For these purposes oral administration is less effective, but gold dermatitis may yield to a short course of 10 gr. doses thrice daily. Tissue reactions due to extravenous leakage of organic arsenicals may be treated by infiltrations of a 10% sterile solution. Intravenous injection of 10 to 50 ml. of a 20% solution is of value in the treatment of cyanide poisoning.

Sodium thiosulphate is extensively employed in photography.

ECZEMA. 0.45 to 0.75 g. intravenously repeated daily without danger for weeks at a time.—*Lancet*, i/1931, 649.

PELLAGRA. Even advanced cases cured by intravenous injections of 10 ml. 10% solution, 20 to 60 injections necessary. No complications.—I. Sabry, *Lancet*, ii/1931, 1022; *J. trop. Med. (Hyg.)*, Sept., 1931, 303.

SCABIES. The patient takes a soap and water bath, and, after drying, a 40% aqueous solution of sodium thiosulphate is applied to the areas between the fingers, the flexural surfaces of the wrists, breasts, abdomen, buttocks, thighs and external genitalia. 15 minutes later 4% hydrochloric acid is applied in the same way, and 1 hour later the applications are repeated in the same order. The procedure is repeated the next day. On the following day the patient bathes and changes to fresh clothing. All bed linen, sleeping garments, and clothing previously used are sterilised by boiling for 5 minutes. 4 ounces of each solution is sufficient to carry out the treatment. Better results than with the Danish treatment. 10 patients out of 50 developed sulphur dermatitis.—G. V. Kulcher and W. M. Meininger, *Arch. Derm. Syph., N.Y.*, 1936, 218. Good results using 25% and 5% solutions respectively.—W. S. Parker, *Lancet*, i/1939, 987.

Calcii Thiosulphas. $\text{CaS}_2\text{O}_3 \cdot 6\text{H}_2\text{O} = 260.3$.

Dose.—10 grains (0.6 g.) daily.

A white, crystalline substance, efflorescing at 40°.

Readily *soluble* in water, but insoluble in alcohol.

Uses. Has been used internally in excessive gastro-intestinal fermentation and in skin diseases, and intravenously in arsenical or bismuth dermatitis similarly to sodium thiosulphate.

Arsenical or bismuth dermatitis treated by 0.6 g. daily intravenously of a 10% solution for 3 days and then bi-weekly injections. Exerted definite curative influence in 6 cases.—A. E. W. McLachlan, *Brit. med. J.*, i/1933, 916.

Ametox (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Preparations of sodium thiosulphate, calcium thiosulphate or magnesium thiosulphate. The sodium thiosulphate preparation is available in ampoules of solution or of the exsiccated salt. The calcium and the magnesium preparations are in ampoules of solution, the latter also in tablets for gastric fermentation.

Calciostab (*Boots, Nottingham*). 10% aqueous solution of calcium thiosulphate; for the prevention and treatment of metallic poisoning from anti-syphilitic treatment. *Dose.*—6 ml. intravenously daily up to the seventh or eighth day and then every second or third day.

Thiostab (*Boots, Nottingham*). Sterile 10% solution of sodium thiosulphate in ampoules containing 0.3 to 0.9 g. of exsiccated salt (equivalent to 0.45 to 1.35 g. of the crystalline compound).

ACIDUM TANNICUM

U.S.P. XI, Fr. Cx., P. Belg. IV, P. Ital. V, P. Helv. V, etc.

$\text{C}_{14}\text{H}_{10}\text{O}_9 = 322.1$.

Syn. TANNIN.

Dose.—5 to 10 grains (0.3 to 0.6 g.). *U.S.P. average dose* 15 grains.

Extracted from specially fermented galls with ether containing a little alcohol and water.

Soluble in water 1 in 1 slowly, in glycerin 1 in 1, and in alcohol 90% 1 in 1. Almost insoluble in ether, chloroform, benzene and light petroleum. Aqueous solutions of tannic acid tend to decompose on storage.

Incompatible with ferric salts, acids, alkalis, silver and other metals and with gelatin. Furthermore, tannin solution precipitates the majority of alkaloids from solution, hence is occasionally employed as an antidote to these.

Uses. A powerful astringent but somewhat irritating. It is seldom given internally as such, since it may interfere with gastric

digestion. Externally it is valuable in overcoming tissue relaxation such as is seen in chronic inflammation of the throat and in hæmorrhoids, and its coagulant properties may be employed to arrest superficial bleeding, though it is of no value in any form of remote hæmorrhage. A 20% solution in alcohol is a useful astringent for application to spongy gums. For the tannic acid treatment of burns, employing aqueous solutions varying from 2 to 20% *vide infra*.

ECZEMA. For the treatment of weeping eczema it is recommended to start with a 10% solution to give quick relief, followed by a weaker solution down to 2.5%; discontinued when the weeping surface has dried; it is unnecessary to carry the treatment to the tanning stage. A bland ointment containing zinc oxide, tar, starch, and soft paraffin is then applied.—P. S. Tennant, *Canad. med. Ass. J.*, Oct., 1934, 414.

Also of value in impetigo neonatorum, the vesicles being ruptured with a swab dipped in 10% solution, followed by swabbing the areas with a 2.5% solution several times daily for 2 days.—*ibid*.

Tannic Acid Treatment of Burns.

First advocated by E. C. Davidson in 1925. A 2% solution of tannic acid (originally 2½% was used) with 1-2000 of mercuric chloride is applied warm on lint wrung lightly out of the solution, the dressing being completed by covering with wool and bandaging in position. For hospital treatment the burned area should be sprayed with the solution and dried—by electric lamps in bed cases or by an electric drier—the application being repeated every hour until a thin brown layer of coagulated tissue is formed (7 to 10 applications). Tannic acid must never be used for burns of the hands or face; in the former it may produce gross crippling of the hands, and in the latter, by immobilising or deforming the eyelids, it endangers the eyes. No part of burnt area should touch bed-clothes or bed. The solution should be freshly prepared since the coagulating power decreases on keeping. Stronger solutions, *e.g.*, 5, 10 and even 20%, have been advocated, but the 2% solution is still widely employed. For burns of minor degree the application of tannic acid jelly (5%) is a valuable first-aid procedure. (*N.B.* The tannic acid treatment is now being largely replaced by the use of gentian violet jelly or spray (*see p. 256*) which produces a more supple coagulum.)

At St. Thomas's up to 1900, mortality from burns and scalds was 23 to 24% of the cases occurring annually; this was reduced to 14% with the introduction of the picric acid method, and with the introduction of the tannic acid treatment in 1928 was further reduced to 4% in 1929, 3% in 1930, 2½% in 1931, and nil in 1932 (up to October). A moderately large dose of morphine should be given at the earliest possible moment to minimise primary shock.—N. Lock, *Brit. med. J.*, i/1933, 272. *See also* P. H. Mitchiner, *ibid.*, 447, and *Lancet*, i/1933, 233.

There is no time limit after which tannic acid treatment should be abandoned and good results may be obtained by its use where sepsis is fully established. When applied to a septic surface tannic acid will form a coagulum more readily than on a surgically clean area and a crust soon dries, which, if it stays in place and can be kept hard, will supply the essential rest and protection for the inflamed tissues. Pus formation is not an indication for removal of the coagulum and incisions are seldom if ever necessary. Neither should fever be considered an indication for removal of the coagulum; in most cases it will subside in 2 or 3 days. Treatment of 18 cases of second degree cordite burns (naval men) all septic.—B. C. Murless, *Brit. med. J.*, i/1940, 51.

A 20% solution, which produces immediate coagulation, has many practical advantages over a 2.5 or 5% solution. An antiseptic—1 in 1000 acriflavine or 1% aqueous solution of gentian violet—should be incorporated in the coagulating solution or applied immediately afterwards.—W. C. Wilson, *Practitioner*, i/1936, 398.

A 20% solution in 1-1000 acriflavine is advocated, applied by means of a camel-hair brush. The solution keeps indefinitely.—L. J. Panting, *Brit. med. J.*, i/1936, 446. The solution can also be applied as a spray.—J. A. Ross, *ibid.*, ii/1936, 312.

The application of powdered tannic acid directly to the burn has given excellent results. The serous exudate is relied upon to dissolve the powder, and the resultant scars are supple, non-cheloid and often invisible.—P. Joly and A. Vadder, per *Amer. J. Pharm.*, 1940, 231.

The following antiseptic analgesic tannic acid jelly has been prepared for use in H.M. ships:—tannic acid 20%, proflavine sulphate 0.1%, procaine 2%, in a glycerin-tragacanth base (powdered tragacanth 2%, glycerin 10%, water to 100).—J. F. Heggie and R. M. Heggie, *Lancet*, ii/1940, 391.

The Bettman Technique. An improvement on the usual spray of 5% tannic acid solution is to follow this by the application of 10% silver nitrate solution. Minimises shock and toxæmia and promotes more rapid healing.—A. G. Bettman, per *Prescriber*, 1935, 304.

Especially valuable in treating young children and infants with severe burns. The resulting eschar is much softer, thinner and more rubbery than that produced by tannic acid, but the most important advantage is the dramatic speed with which it is formed; it is possible even in cases of severe shock to cover the burned area immediately with dressings and clothes and to prop the child up in bed on soft pillows. The dressings do not stick, the danger of upper respiratory infections is markedly lessened and the "heat-bed" and continued spraying are not necessary. The eschar comes off in one to three weeks. The danger of argyria is discounted. The after-care of small children is most important. At least 1 litre of fluid per 10 kg. of body weight per day should be given, and in the most severe cases continuous intravenous drip is advisable.—M. B. Low, *New Engl. J. Med.*, i/1937, 553.

The weaker solutions, e.g., 2½%, have been abandoned owing to the length of time required to produce a satisfactory coagulum (an extremely important factor in infants and children) and the 20% solution has also been discarded in favour of the Bettman technique, since the eschar formed is too thick and tends to crack.—W. M. Dennison, *Lancet*, ii/1939, 1107.

The silver nitrate and tannic acid method is strongly recommended in the treatment of war burns.—S. M. Cohen, *Brit. med. J.*, ii/1940, 251.

Collodium Stypticum (B.P.C.) contains 15% w/v of tannic acid with benzoin and alcohol in simple collodium.

Gargarisma Acidi Tannici (B.P.C., N.I.F.) contains 12½% of glycerin of tannin in water.

Pasta Acidi Tannici (B.P. Add. III). *Syn.* TANNIC ACID JELLY.

Tannic acid 5%, powdered tragacanth 2%, chlorocresol 0.1%, alcohol (95%) 6%, in water.

The following formula has also been recommended:—Tannic acid 5 g., powdered tragacanth 2.1 g., *p*-chloro-*m*-cresol 0.1 g., potassium chloride 0.042 g., sodium chloride 1.05 g., calcium chloride 0.084 g., industrial methylated spirit 6 ml., water to 100 ml. Boil the water for 15 minutes, add the *p*-chloro-*m*-cresol, plug the flask and shake until dissolved. Cool, dissolve the tannic acid and the salts and strain through wool. Place the industrial methylated spirit in a dry wide-mouthed bottle, add the tragacanth and shake occasionally during 20 minutes. Finally add the whole of the aqueous solution to the gum-spirit suspension and shake vigorously. Store in well-closed containers in the dark.—W. A. Woodard, *Pharm. J.*, i/1938, 435.

INFANTILE STOMATITIS. Tannic acid jelly is a valuable treatment in infantile stomatitis (*i.e.*, those non-specific infections of the mouth in infants up to the completion of the first dentition). The mother is instructed to scrub her hands

with soap and water and then to apply a little of the jelly to the child's gums and cheeks with her finger. The soothing effect is rapid and gratifying. Applications at 2 or 3 hourly intervals are recommended.—I. Mirvish, *Lancet*, ii/1938, 1292.

Amertan (*Lilly, London*). A non-greasy jelly containing 5% tannic acid and Merthiolate (q.v.) 1 in 5000.

Candatan (*Clay & Abraham, Liverpool*). Tannic acid 10%, acriflavine 0.1%, in a water-emulsifying base.

Dettol Burn Cream No. 4 (*Reckitt & Sons, Hull*), containing tannic acid, tragacanth and Dettol, is now constantly used at the Royal Hospital for Sick Children, Glasgow, for burns of the face. Owing to its flexibility this cream is useful when the injury is situated at flexures and it is used routinely for "patching up" cracks which appear in the coagulum formed by the tannic acid and silver nitrate.—W. M. Dennison, *Lancet*, ii/1939, 1107.

Flavotan (*Boots, Nottingham*). Tannic acid jelly with acriflavine and amyl-m-cresol.

Hexyltan Jelly (*Sharpe & Dohme, London*). Jelly containing hexyl-resorcinol 1 in 2000 and tannic acid 5% in a water-soluble base.

Tanjac (*Evans, Sons, Lescher & Webb, Liverpool*). Tannic acid jelly with acriflavine.

Tannafax (*Burroughs Wellcome, London*). Tannic acid with 0.5% phenol in a water-soluble base. For burns and scalds, apply lightly, allow to dry and bandage loosely.

Tanna-flavine Jelly (*British Drug Houses, London*). A non-oily, water-soluble preparation containing 5% of tannic acid and a suitable proportion of acriflavine.

Tanna-flavine Powder (*British Drug Houses, London*). A combination of tannic acid and acriflavine in powder form issued in tubes, each containing sufficient to prepare $\frac{1}{2}$ pint of a 2½% solution of tannic acid with a suitable quantity of acriflavine.

Tannex (*Allen & Hanburys, London*). Tannic acid jelly containing 5% of tannic acid and 0.1% of acriflavine in a water-soluble base.

Tannol (*Clay & Abraham, Liverpool*). Emulsion of acriflavine with 10% of tannic acid.

Glycerinum Acidi Tannici (B.P.).

Dose.—10 to 30 minims (0.6 to 2 ml.).

Tannic acid 15% w/w in glycerin.

For follicular tonsillitis the B.P. glycerin of tannic acid or of alum has a most satisfactory action and causes the ejection of secretion from the follicles.—F. C. Ormerod, *Practitioner*, i/1937, 527.

Glyceritum Acidi Tannici (U.S.P. XI).

Tannic acid in glycerin 1 in 5 by weight, with 1% of sodium citrate.

[P2] **Lotio Acidi Tannici (B.P.C.).**

Tannic acid 2% w/v and mercuric chloride 1 in 2000 in distilled water. For the treatment of burns.

Lotio Acidi Tannici (Mid. H.).

Tannic acid 10 gr., resorcinol 4 gr., spirit of rosemary 1 dr., water to 1 oz. For oily seborrhœa.

Pessus Acidi Tannici (B.P.C.) contains 10 gr. (0.6 gr.).

Pulvis Acidi Tannici et Acriflavinae (C.X.H.).

Tannic acid 30 gr., acriflavine 1½ gr., warm sterile water to 3½ fl. oz. To be dissolved immediately before use and applied with a sterile brush, or on gauze, or as a spray.

[P2-S1] **Solvellæ Acidi Tannici Compositæ (B.P.C.).**

One solution-tablet dissolved in 1 fl. oz. of water gives a solution of about the same strength as the B.P.C. lotion.

Suppositorium Acidi Tannici (B.P.).

3 grains (unless otherwise stated), with theobroma oil *q.s.* to 15 grains.

[D-P1-S1] **Suppositories of Tannic Acid with Opium**, 1 grain in addition, or [D-P1-S1] morphine $\frac{1}{2}$ gr.

Trochiscus Acidi Tannici (B.P.). Each contains $\frac{1}{2}$ grain (0.03 g.).

Unguentum Acidi Tannici (B.P.).

Tannic acid 20, in glycerin, yellow beeswax and benzoinated lard to 100.

B.P. Add. II allows the following alternative formula:—tannic acid 20 g., glycerin 20 g., simple ointment, prepared with yellow soft paraffin, 60 g.

Unguentum Acidi Tannici (U.S.P. XI).

Tannic acid 20, glycerin 20, wool fat 3, yellow wax 3, petrolatum 54.

Eldoform (Bayer Products, London). A yeast compound of tannic acid in $7\frac{1}{2}$ gr. tablets. *Dose.*—1 or 2 tablets 3 to 4 times daily; children, $\frac{1}{2}$ tablet 3 or 4 times daily. Anti-diarrhoeic in diarrhoea and dysentery.

[P1] **Tanichthol Suppositories (Sharp & Dohme, London).** Contain tannic acid $2\frac{1}{2}$ gr., phenol $\frac{1}{2}$ gr., ichthyol 1 gr., extracts of stramonium, belladonna and witch hazel of each $\frac{1}{2}$ gr. in a glycerin base. Haemorrhoids, anal fissure and fistula, and chronic inflammatory conditions of the rectum, anus and vagina.

Aluminii Tannas. Syn. TANNAL INSOLUBLE.

$\text{Al}_2(\text{OH})_3(\text{C}_{12}\text{H}_9\text{O}_6)_3 \cdot 10\text{H}_2\text{O}$. Is made by precipitating a solution of aluminium trisulphate with sodium tannate, or better by treating freshly made aluminium hydroxide with tannin solution. As astringent for chronic catarrh of the respiratory organs.

Albuminum Tannicum (U.S.P. XI, P. Belg. IV, P. Jap., F.E. VIII, P. Austr., P. Ned. V with method of making). Prop. Name. TANNALBIN (*Knoll, London; Savory & Moore, London*).

Dose.—8 to 15 grains (0.5 to 1 g.). *U.S.P. XI* average dose 30 grains.

A compound of tannin with albumen. A pale brown, insoluble, tasteless powder.

Uses. A disinfectant soluble in the intestines but unaffected by the stomach, given for diarrhoea.

Tannocarbon (Richter, London). Tablets containing tannin albuminate 2 gr., charcoal 2 gr. *Dose.*—1 or 2 tablets thrice daily. Flatulence, dysentery, mucous colitis.

Zinci Tannas. Syn. "SEL DE BARNIT."

Is obtained by treating zinc oxide 10 in water 15 with tannin 50 in alcohol (45%) 100. Dry at gentle heat. Used as ophthalmic application and for bed sores and other skin lesions.

Acetannin (B.P.C., Fr. Cx., P.G. VI, etc.). Syn. and Prop. Name. DIACETYL-TANNIN, ACIDUM ACETYLTANNICUM, TANNYL ACETATE, TANNIGIN (Bayer Products, London), TANNINUM ACETYLICUM (P. Jap. V).

$\text{C}_{14}\text{H}_8(\text{COCH}_3)_2\text{O}_6 = 406.1$.

Dose.—5 to 10 grains (0.3 to 0.6 g.) in cachet.

A yellowish or greyish white tasteless powder. Almost *insoluble* in water, alcohol or ether; soluble in ethyl acetate, and in alkalis

with decomposition. *P.G. VI* defines it as mainly a mixture of diacetyl and triacetyltannin.

In diarrhœa. Dissolves in the intestine, appearing in the urine as gallic acid. Should not be prescribed with alkali, or combined with hot fluids.

Methyleneditannin (*P.G. VI*). *Syn. and Prop. Name.* METHYLDITANNIN, TANNIFORM (*Merck, Darmstadt; Savory & Moore, London*).

A compound of tannin with formaldehyde in reddish-white powder, insoluble in water, soluble in alcohol and alkalis. Used as an antiseptic in ointment (1 in 10) or dusting powder, alone or with 1 to 4 parts of starch, for bedsores, hyperhidrosis, pruritus, eczema (particularly in interdigital eczema), piles and tender feet. Internally in diarrhœa and enteritis, in doses of 8 to 15 gr.

Acidum Gallicum (*B.P.C., P. Helv. V, P. Jap. V*). *Syn.* ACIDO AGALICO (*F.E. VIII*). $C_6H_2(OH)_3 \cdot COOH, H_2O = 188.1$.

Dose.—5 to 15 grains (0.3 to 1 g.).

Crystals or crystalline powder of brownish colour.

Soluble about 1 in 100 of water, 1 in 3 of boiling water, 1 in 40 of ether, 1 in 6 of warm glycerin, 1 in 3 of alcohol 90%; insoluble in benzene and chloroform. Properties and uses similar to those of tannic acid, *q.v.*

Glycerinum Acidi Gallici (*B.P.C.*).

Dose.—10 to 60 minims (0.6 to 4 ml.).

About 1 in $6\frac{1}{2}$ w/w. Used in the same way as Glycerinum Acidi Tannici.

Galla (*B.P.C., U.S.P. XI, Fr. Cx., P. Helv. V, P. Dan.*).

Dose.—10 to 20 grains (0.6 to 1.2 g.). *U.S.P. XI* average dose 8 grains.

Excrescences on *Quercus infectoria* (Fagacæ) caused by deposition of eggs of *Cynips gallæ tinctoriæ* (Cynipidæ). Astringent. Contains 50 to 70% of gallotannic acid.

Tinctura Gallæ (*B.P.C.*). *Dose.*— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). 1 in 8 of alcohol 60%.

Unguentum Gallæ (*B.P.C.*). 20%.

Unguentum Gallæ (*U.S.P. XI*).

Nutgall 20, wool fat 5, yellow wax 5, petrolatum 70.

[P1-81] **Unguentum Gallæ cum Opio** (*B.P.C.*). Unguentum Gallæ (*B.P.C.*) with addition of $7\frac{1}{2}\%$ of powdered opium. (*Exempt [D]*).

Skol (*Skol Products, London*). Extract of galls 5, menthol 0.25, phenol 0.5, glycerin 3, salicylic acid 1, alcohol and water to 100. A healing antiseptic for use in burns, bed-sores, cuts, stings, etc.

Æsculus Hippocastanum. *Syn.* HORSE CHESTNUT, MARRON D'INDE (*Fr. Cx.*). Tincture of seeds 1 in 10 of proof spirit has been given for painful hæmorrhoids. *Dose.*—10 minims night and morning. A liquid extract has been used, painted on or rubbed in, in rheumatism and neuralgia.

Alcoolature de Marron d'Inde Stabilisé (*Fr. Cx.*). Horse chestnuts (1-1) and alcohol 75% are refluxed for two periods of 20 minutes, filtered, and any lost weight adjusted.

Æsculin, $C_{14}H_{17}O_6, 1\frac{1}{2}H_2O = 367.1$, a glycoside, soluble in water to which 2 to 3% sodium carbonate is added, also soluble in alcohol. Solutions have a blue fluorescence, and have been used similarly to quinine in X-ray and Finsen light treatment (*q.v.*).

An ointment containing æsculin 2% in soft paraffin or other base may be used for prevention of sunburn.

Hæmatoxylin (B.P.C.). *Syn.* LOGWOOD. The unfermented heart-wood of *Hæmatoxylon campechianum* (Leguminosæ). Contains 10% of hæmatoxylin, and tannin. Is used as an astringent, and the decoction is also used for some forms of urinary hæmorrhage.

Preparations of logwood colour the fæces and urine red, and stain linen. The fermented chips used by dyers are deep red in colour, have lost the sweet taste and the hæmatoxylin is oxidised to hæmatein, $C_{14}H_{12}O_6$.

Decoctum Hæmatoxyli (B.P.C.). *Dose.*— $\frac{1}{2}$ to 2 ounces (15 to 60 ml.). 1 in 20 with 1% of cinnamon.

Extractum Hæmatoxyli Liquidum (B.P.C.). *Dose.*— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). 1 in 1.

Hæmatoxylin. $C_{16}H_{14}O_4 \cdot 3H_2O = 356.2$. Usually in yellowish granular crystals, slowly soluble in water, easily in alcohol. Alcoholic solution 0.2% is used as indicator—yellow in acid and purple in alkaline solution.

Decoctum Sappan. 1 in 20 of sappan wood, *Cæs-alpinia Sappan* (Leguminosæ), is similar to decoction of logwood.

Myrobalanum (B.P.C.). *Syn.* BLACK OR CHEBULIC MYROBALANS. The dried immature fruits of *Terminalia Chebula* (Combretacæ). Contain 20 to 40% of tannin. Used as an equivalent of gall in India and the East.

It is a valuable styptic. Is purgative in large doses ($\frac{1}{2}$ to 2 dr.), but may constipate after purging. The natives employ it in perineal injuries caused during childbirth, also in eczematous sores and prolapsus ani.

Unguentum Myrobalani and Unguentum Myrobalani cum Opio are similar to the corresponding preparations of gall.

Quercus (B.P.C.). *Syn.* OAK BARK. The dried bark of the British oak, *Quercus Robur* and *Q. sessiliflora* (*Q. sessiliflora* and *Q. pedunculata*, P. Helv. V) (Fagacæ). Contains 15 to 20% of quercitannic acid.

Decoctum Quercus (B.P.C.). About 1 in 15. Has been used as a rectal injection for hæmorrhoids and as an astringent gargle.

ACIDUM TARTARICUM

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.

$(\text{CHOH} \cdot \text{COOH})_2 = 150.05$.

Dose.—5 to 30 grains (0.3 to 2 g.).

Colourless crystals or a white powder obtained from potassium acid tartrate. It is odourless and has a strongly acid taste.

Soluble 10 in 8 of water, 1 in $2\frac{1}{2}$ of alcohol 90%, 1 in $4\frac{1}{2}$ of glycerin, 1 in 120 of ether 0.720, 1 in 5 of dehydrated alcohol. Nearly insoluble in benzene and chloroform.

Incompatible with carbonates, and with potassium, calcium and mercury salts.

Antidotes. Give calcium hydroxide or magnesium hydroxide, stirred up in water, freely. Empty stomach by stomach tube, using lime water. Purgative dose of castor oil.

Uses. For making effervescent preparations, effervescing tablets, and cooling drinks. If not neutralised, it must be taken well diluted.

Ammonii Tartras. $(\text{CHOH} \cdot \text{COONH}_4)_2 = 184.1$.

White efflorescent crystals soluble in water.

Liquor Ammonii Tartratis (R.L.O.H.).

Contains 20 or 40 gr. of neutral ammonium tartrate per oz. of sterilised water. For treatment of lime burns of the eye by irrigation.

LIME BURNS OF THE EYE. Daily irrigation for a period of 15 minutes with a 10% solution of neutral ammonium tartrate recommended. Stated to dissolve the calcium carbonate formed in the tissue.

Potassii Tartras (*B.P.C., P.G. VI, P. Jap. V*). *Syn.* NORMAL OR NEUTRAL POTASSIUM TARTRATE.

$(\text{CHOH} \cdot \text{COOK})_2 \cdot \frac{1}{2} \text{H}_2\text{O} = 235.3$.

Dose.— $\frac{1}{2}$ to 4 drachms (2 to 16 g.).

Crystalline powder with bitter taste made by neutralising acid potassium tartrate with potassium carbonate. Has purgative and diuretic properties.

Soluble about 5 in 3 of water.

Potassii Tartras Acidus (*B.P., Fr. Cx., P. Helv. V*). *Syn.* POTASSIUM BITARTRAS (*U.S.P. XI*), PURIFIED CREAM OF TARTAR. $\text{COOH} \cdot (\text{CHOH})_2 \cdot \text{COOK} = 188.1$.

Dose.—15 to 60 grains (1 to 4 g.). *U.S.P. XI* average dose 30 grains.

Obtained by recrystallising the crude tartar (argol) deposited during the fermentation of grape-juice. A white powder with acid taste *soluble* 1 in 220 of water, 1 in 16 of boiling water, insoluble in alcohol 90%.

Uses. A saline purgative producing a watery motion in $\frac{1}{2}$ to 2 hours. It is also a diuretic and is especially useful in renal dropsy and in ascites from hepatic disease; for this purpose it is usually employed in the form of Imperial Drink (*vide infra*). In large and repeated doses it renders the urine alkaline and is of value in *B. coli* infections of the urinary tract.

Collutorium Acidi Tartarati (*R.D.H.*).

Potassium acid tartrate 2 gr., tartaric acid 1 gr., syrup of lemon 3 m., saccharin $\frac{1}{2}$ gr., water to 1 oz. Use 1 tablespoonful in half a tumblerful of water.

Potus Imperialis (*B.P.C.*). *Syn.* HAUSTUS IMPERIALIS.

Contains 2 grains of potassium acid tartrate per fl. ounce, with citric acid, oil of lemon, tincture of lemon and water.

U.C.H. has potassium acid tartrate 1 dr., sugar 4 dr., boiling water 1 pint. *Mid. H.*—Potassium acid tartrate 1 dr., tartaric acid 10 gr., soluble saccharin 1 gr., oil of lemon 3 m., water to 20 oz. *L.H.*—Potassium acid tartrate 40 gr., lemon juice $\frac{1}{2}$ oz., syrup $\frac{1}{2}$ oz. (omit for diabetic patients), water to 20 oz. *K.C.H.*—Potassium acid tartrate 1 dr., tartaric acid 1 dr., oil of lemon 1 $\frac{1}{2}$ m., sugar 2 oz., boiling water 20 oz.

Potassii Borotartras (*Fr. Cx.*). *Syn.* SOLUBLE CREAM OF TARTAR.

Dose.—20 to 40 grains (1.2 to 2.5 g.).

An amorphous white powder prepared by dissolving potassium bicarbonate in boiling water, adding tartaric acid and boric acid, filtering, evaporating and drying off at 40°.

Soluble 1 in 1 of water.

Epilepsy has been treated with it—as much as 3 g. daily, sometimes combined with bromide. It is said to give better results when combined with phenobarbitone than either separately, commencing with 1.5 g. borotartrate and 0.15 g. phenobarbitone daily in 3 doses, continued for 3 years.

Sodii et Potassii Tartras (B.P., U.S.P. XI, P. Helv. V, P. Dan.). *Syn.* ROCHELLE SALT, SEIGNETTE SALT, SODA TARTARATA. $\text{COONa} \cdot (\text{CHOH})_2 \cdot \text{COOK} \cdot 4\text{H}_2\text{O} = 282.2$.

Dose.—2 to 4 drachms (8 to 16 g.).

Colourless crystals. *Soluble* 1 in $1\frac{1}{2}$ of water; almost insoluble in alcohol 90%.

Uses. A saline cathartic and diuretic with an alkalinising action on the urine. It is employed in dropsy and rheumatism, and as a mild purgative, and is the chief constituent of Seidlitz Powder.

Pulvis Effervescens Compositus (B.P.). *Syn.* SEIDLITZ POWDER, PULVIS SODÆ TARTARATÆ EFFERVESCENS.

Sodium potassium tartrate, in dry powder, 7.5 g., sodium bicarbonate, in dry powder, 2.5 g., in the blue paper. Tartaric acid, in dry powder, 2.5 g., in the white paper.

Pulvis Effervescens Compositus Duplex (B.P.C.). *Syn.* DOUBLE-STRENGTH SEIDLITZ POWDER.

Contains $231\frac{1}{2}$ grains (15 g.) of sodium potassium tartrate, double the amount in the B.P. Seidlitz Powder.

Pulvis Effervescens Compositus Fortis (B.P.C.). *Syn.* EXTRA-STRONG SEIDLITZ POWDER.

Contains $173\frac{1}{2}$ grains (11.25 g.) of sodium potassium tartrate, 50% more than the amount in the B.P. Seidlitz Powder.

Pulveres Effervescentes Compositi (U.S.P. XI).

Each blue paper contains 150 gr. of a mixture of 1 part of sodium bicarbonate and 4 parts of Rochelle salt, and each white paper contains $32\frac{1}{2}$ gr. of tartaric acid.

Citralka (Parke, Davis, London). Combination of the citrates and tartrates of sodium and potassium together with salts of magnesium, calcium and lithium. *Dose.*—1 or 2 discs dissolved in a glassful of cold water, every 3 hours.

Salvitæ (American Apothecaries Co., New York; Coates & Cooper, London). Strontium lactate 0.3, lithium carbonate 0.15, caffeine and quinine citrate 0.8, "sodii-forma-benzoas" 1.6, calcium lactophosphate 0.15, sodium and potassium citrotartrate 59.0, magnesium sulphate 8.0, sodium sulphate 30.0. *Dose.*—A teaspoonful in a glass of water every 4 hours. Colds and influenza.

Sodii Tartras (Neutrale). $(\text{CHOH} \cdot \text{COONa})_2 \cdot 2\text{H}_2\text{O} = 230.06$.

Dose.—As aperient $\frac{1}{2}$ to 1 ounce. Diuretic, 15 to 60 grains repeated. White crystalline powder comparatively tasteless. Soluble in water 1 in 2. Relaxes the bowels and increases the flow of urine.

Limonade Tartro-sodique (Fr. Cx.). A solution of sodium tartrate, saturated with carbon dioxide and sweetened.

Acidum Malicum. *Syn.* HYDROXYSUCCINIC ACID.

$\text{C}_2\text{H}_3(\text{OH})(\text{COOH})_2 = 134.0$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

White deliquescent crystals *soluble* in water 1 in 1, and in alcohol 1 in $1\frac{1}{2}$. Has been used as throat spray in diphtheria and other throat affections. Possesses properties similar to those of tartaric acid. In phthisis much larger doses—up to 2 drachms—have been given.

Extractum Ferri Pomati (P. Jap. V) is made from sour ripe apples and iron powder, and contains 5% of Fe.

ACONITUM

B.P., Fr. Cx., U.S.P. XI, P. Helv. V, F.E. VIII, etc.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Aconite, alkaloids of.*"

[81] "*Alkaloids, the following; their salts, simple or complex:—Aconite, alkaloids of, except substances containing less than 0.02 per cent. of the alkaloids of aconite.*"

[86] "*Alkaloids—Aconite, alkaloids of—specify proportion in a preparation as the proportion of any one alkaloid of aconite that the preparation would be calculated to contain on the assumption that all the alkaloids of aconite in the preparation were that alkaloid.*"

Dose.—No dose is given in *B.P.* *Fr. Cx.* has max. single dose 0.1 g., max. in 24 hours 0.3 g.; *F.E. VIII* has 0.01 g. and 0.05 g. respectively. *U.S.P. XI* average dose 1 grain.

The dried root of *Aconitum Napellus* (Ranunculaceæ). *B.P.* '32 gives no standard for alkaloidal content. *B.P.* '14 required not less than 0.4% of ether-soluble alkaloids.

Antidotes. Empty stomach by emetic, or by using stomach tube with 180 gr. of tannic acid in 2 gallons of water. Give 20 gr. tannic acid in 6 oz. of lukewarm water, followed by medicinal charcoal, stirred up in water. Keep patient warm, and lying down with the head rather low. Give 1 dr. of aromatic spirit of ammonia, well diluted, every 15 minutes. Strychnine, $\frac{1}{4}$ gr., hypodermically. Atropine sulphate, $\frac{1}{100}$ gr., and digitalin, $\frac{1}{100}$ gr., hypodermically, have been recommended. Artificial respiration may be necessary over a long period. Oxygen inhalations.

Uses. Anodyne, diaphoretic, diuretic.

Externally the liniment, as such, or mixed with chloroform or belladonna liniment in neuralgia and rheumatism (causes tingling and numbness). Equal parts of strong tincture of aconite and of weak solution of iodine make a useful application in dental periostitis.

Internally the tincture diminishes the force and rate of the pulse, especially in the early stages of fevers and mild local inflammations, such as feverish cold, laryngitis, and first stages of pneumonia and erysipelas. It also relieves the pain of neuralgia, pleurisy and aneurism. Acute tonsillitis in children is well treated by aconite; for a child 5 to 10 years old, 1 to 2 minims of tincture.

Aconite in small but frequent doses will often abort a quinsy. A useful prescription is:—Tincture of aconite 1 m., phenazone 1 gr., caffeine citrate 5 gr., water to 1 oz. To be taken every hour for eight hours.—D. McKenzie, *Practitioner*, 1935, 656.

[P1-S1] **Aconitum Folium** (*B.P.C.*), *syn.* MONKSHOOD OR WOLFSPANE, consists of the dried leaves and flowering tops. It contains 0.1 to 1% of alkaloids.

Fr. Cx. employs fresh leaves for making Alcoolature d'Aconit, 1 = 1, using 95% alcohol for macerating 8 days. To contain 0.1% alkaloids. Max. single dose 1 g., max. daily dose 5 g.

[P1-S1] **Chloroformum Aconiti** (*B.P.C.*). 1 = 1, prepared by percolating aconite moistened with ammonia with chloroform and alcohol.

[P1-S1] **Collodium Anodynum (B.P.C.)**.

Aconite about 0.1% w/v and veratrine about 0.7% w/v in acetone and acetone collodion.

[P1-S1] **Extractum Aconiti Siccum (P. Belg. IV)**.

Prepared from the root with 70% alcohol and standardised to 1% of alkaloids. *Max. single dose*.— $\frac{1}{2}$ grain. *Max. during 24 hours* $1\frac{1}{2}$ grains approx. *F.E. VIII* is assayed biologically. *P. Ital. V* contains 0.5% of alkaloids.

[P1-S1] **Linimentum Aconiti (B.P.)**. 1 in 2.

Prepared by percolating the root with alcohol 90% and dissolving 3% w/v of camphor in the percolate. Useful in neuralgia. *It is not suitable for painting on the gums.*

[P1-S1] **Linimentum Aconiti Oleosum (B.P.C.)**. *Syn.* A.B.C. LINIMENT.

Liniment of aconite, liniment of belladonna, liniment of chloroform equal parts. To be well shaken before use, as the olive oil in the chloroform liniment is not soluble in the other ingredients. *See also* **Pigmentum Aconiti Compositum**.

The oil in the "A.B.C." formula seems to be essential—otherwise the preparation proves too irritant for sensitive skins.

Antidotes. Treat as for poisoning by aconite, *see* p. 120.

POISONING. Acute aconite poisoning due to accidental swallowing of an ounce of A.B.C. liniment successfully treated by intravenous injection of 3 pints of hypertonic saline after all the usual measures had failed. All the symptoms abated and recovery was complete in 72 hours.—M. Talukder, *Indian med. Gaz.*, 1935, 628.

[P1] **Mist. Aconiti (N.I.F.)**.

Tincture of aconite 1 m., tincture of belladonna 3 m., dilute hydrochloric acid 5 m., solution of mercuric chloride 10 m., water to $\frac{1}{2}$ oz.

[P1-S1] **Pigmentum Aconiti Compositum (B.P.C.)**.

Liniment of aconite and liniment of belladonna, of each $37\frac{1}{2}\%$ with chloroform and distilled water. A non-oily form of A.B.C. liniment. The water is necessary to produce a non-separable preparation.

[P1-S1] **Pigmentum Iodi et Aconiti (B.P.C.)**. *Syn.* TINCTURA IODI ET ACONITI.

Equal parts of weak solution of iodine and strong tincture of aconite. Used in dental periostitis. Strong solution of iodine is sometimes used instead of the weak.

[P1-S1] **Tinctura Aconiti (B.P.C.)**.

Dose.—2 to 5 minims (0.12 to 0.3 ml.). As a febrifuge 2 minims every 10 minutes or quarter of an hour for an hour, then repeat dose every hour till skin acts well and temperature is reduced.

Strength about 1 in 6, by percolation with alcohol 70%. It is not standardised as to alkaloidal content. *B.P.* '14 standardised to 0.04% w/v of ether-soluble alkaloids.

[P1-S1] **Tinctura Aconiti (U.S.P. XI)**.

Average dose.—10 minims (0.6 ml.).

A 10% tincture is prepared, adjusted to pH 3 with hydrochloric acid, and assayed biologically, using guinea-pigs and a reference sample of aconitine. It is then diluted with the menstruum and sufficient hydrochloric acid to maintain a pH of 3, so that the finished tincture has a potency per ml. equivalent to 0.14 to 0.16 mg. of the aconitine.

[P1-81] *Tinctura Aconiti Fortis* (B.P.C.), *syn.* FLEMING'S TINCTURE OF ACONITE, is about five times the strength of the ordinary tincture. Turnbull's tincture of aconite is similar. They are not used internally.

[P1-81] *Aconitina* (B.P.C., *Fr. Cx.*). *Syn.* ACETYL BENZOYLACONINE. $C_{34}H_{47}O_{11}N = 645.4$.

Dose.— $\frac{1}{8}$ to $\frac{1}{10}$ grain (0.0001 g.). Larger doses, up to $\frac{1}{300}$ grain (0.0003 g.), are sometimes given and may be increased, if desired, with extreme caution, the maximum single dose being 0.001 g.

Fr. Cx. gives 0.0005 g. as maximum during 24 hours; *F.E. VIII*, 0.001 g.; *P. Helv. V*, 0.0003 g.

An alkaloid obtained from aconite—content about 0.3 to 0.6% of ether-soluble alkaloids, chiefly aconitine. In colourless crystals or crystalline powder, m.p. 196° to 200° when heated rapidly. A drop of dilute solution placed on the tongue produces a characteristic tingling sensation.

Soluble 1 in 30 of alcohol 90%, 1 in 65 of ether, 1 in 7 of benzene, and 1 in 1 of chloroform; sparingly soluble in water.

Antidotes, vide Aconite.

Uses. Employed externally (*vide* Unguentum Aconitinæ and Oleinatum Aconitinæ) in neuralgia, *avoiding mucous membranes and raw skin*. Internally in the form of a pill is a depressant, calmative and diaphoretic, but rarely administered owing to extremely powerful cardiac action.

[P1-81] *Unguentum Aconitinæ* (B.P.C.).

Aconitine 2% in oleic acid and lard. Best freshly prepared. A piece of the size of a bean is gently rubbed in for facial neuralgia, avoiding broken skin and mucous membranes.

[P1-81] *Aconitinæ Nitras*. $C_{34}H_{47}O_{11}N.HNO_3 = 708.4$. *Dose.*— $\frac{1}{10}$ grain (0.0001 g.), hypodermically. *Fr. Cx.* gives 0.0005 g. as max. in 24 hours. A crystalline stable salt, soluble 1 in 10 of water and in alcohol. M.p. 200° .

[P1-81] *Granules of Aconitine* *Fr. Cx.* and of *Aconitine Nitrate* *Fr. Cx.* contain $\frac{1}{10}$ mgr. in each, and are coloured pink.

[P1-81] *Aconitinæ Hydrobromidum*, $C_{34}H_{47}O_{11}N.HBr.2\frac{1}{2}H_2O = 771.3$, and [P1-81] *Aconitinæ Hydrochloridum*, $C_{34}H_{47}O_{11}N.HCl.3\frac{1}{2}H_2O = 735.9$, are crystalline salts with dose as for the nitrate.

[P1-81] *Oleinatum Aconitinæ*.

Aconitine 2, oleic acid by weight 98. Dissolve; may be perfumed. Is painted on the skin (not when broken) for neuralgia.

[P1-81] *Poudre d'Aconitine au Centième* (*Fr. Cx.*). Aconitine 1%, carmine 2.5%, in lactose.

[P1-81] *Poudre d'Azotate d'Aconitine au Centième* (*Fr. Cx.*). Aconitine nitrate 1%, carmine 2.5%, in lactose.

Bryonia (B.P.C.). *Syn.* VITIS ALBA, WHITE BRYONY, ENGLISH MANDRAKE.

The dried root of *B. dioica* (Cucurbitaceæ), the only species commonly found in this country—hence called English Bryony. Contains an amorphous glucosidic bitter substance and an amorphous alkaloidal principle.

Tinctura Bryoniæ (B.P.C.).

Dose.—1 to 10 minims (0.06 to 0.6 ml.), or more. 1 in 10. Useful in pleurisy. Relieves the pain and allays the cough. In large doses it is an active cathartic, used for dropsy. The fresh plant applied to the skin will cause vesication.

Mandragora. Syn. MANDRAKE. *M. Autumnalis* (Solanaceæ).

The root is often forked and is sometimes similar to the human body in shape. It is poisonous, with effects allied to those of belladonna. Contains an alkaloid. Much confusion exists over the name mandrake. The Mandrake, as pharmacists understand the Museum specimens, is to be associated with *M. officinarum* L. (this includes two varieties, α *vernalis*, β *autumnalis* = "European" Mandrake). English, or false, "Mandrake" is *Bryonia dioica*. American Mandrake is *Podophyllum peltatum*.

Corydalis (B.P.C.).

Dose.—5 to 15 grains (0.3 to 1 g.).

The dried tubers of *Dicentra canadensis* (Squirrel Corn, Turkey Corn) and of *D. Cucullaria* (Dutchman's Breeches) (Papaveraceæ). Reputed to have tonic and diuretic properties. Administered as a decoction.

Bulbocapnine. $C_{19}H_{19}O_4N$.

Dose.— $1\frac{1}{2}$ grains (0.1 g.) either *per os* or subcutaneously once or twice daily.

An alkaloid from *Corydalis tuberosa* and from *Dicentra canadensis*. Insoluble in water but soluble in alkalis, and precipitated from them by CO_2 or ammonium chloride. Solutions oxidise slowly to a green colour.

Of value as a sedative in post-encephalitic conditions and in tremor of various origins—paralysis agitans, choreic disorders, multiple sclerosis, and hemiplegia.

Ménière's disease well treated. One tablet of 0.1 g. *per os* daily is sufficient to prevent vertigo, while the acute attack is treated by 0.1 g. hypodermically, which at once relieves.—W. S. Thacker Neville, *Brit. med. J.*, ii/1931, 54.

ACRIFLAVINA

B.P. Add. I.

Syn. FLAVINE, ACRIFLAVINÆ HYDROCHLORIDUM (U.S.P. XI).

Acriflavina (U.S.P. XI) is identical with euflavine.

Dose.—5 grains have been given, but euflavine is more used *per os*.

Acriflavine is an orange-red to red, crystalline, odourless powder. It consists of a mixture of the hydrochloride of 2:8-diamino-10-methylacridinium chloride and diaminoacridine dihydrochloride, the latter being present to the extent of approximately one-third.

Solubility. 1 in about 3 of water (commercial samples vary considerably owing to variations in the proportions of the two constituents present), 1 in 40 of alcohol, 1 in 4 or less of glycerin. Insoluble in liquid or soft paraffin, oleic acid, and eucalyptol. The solubility of 2:8-diamino-10-methylacridinium chloride hydrochloride is 0.4% and of diaminoacridine dihydrochloride 0.6%. Mixtures of the two are more soluble. Concentrated aqueous solutions are brown, dilute ones lemon-yellow with green fluorescence.

For details of the solubility in water of acriflavine and its constituents, see M. Gailliot, *Quart. J. Pharm.*, 1934, 63; also G. F. Hall and A. D. Powell, *Quart. J. Pharm.*, 1936, 510.

Compatible with normal saline if required for immediate use, but deposits after about 24 hours. Concentrations of saline higher

than 5% give a precipitate almost at once. Compatible with 0.5% sodium citrate.

Incompatible with Dakin's solution, eusol and other chlorine antiseptics. Also with mercuric chloride solution (e.g., 1 in 1000 as used), also with phenol (e.g., 1 in 20 solution).

Solutions may be boiled or heated in an autoclave to 130°.

To remove acriflavine stains from the hands, etc.—Rub with a little dilute hydrochloric acid or with a little dilute sulphurous acid, or with sulphurous acid followed by hydrochloric acid, and then wash with water.

Antiseptic Powers. It is markedly antiseptic. It does not affect phagocytosis, is non-irritant, and its activity is not altered by the presence of serum or urine, though it is diminished in the presence of whole blood. Acriflavine is 20 times more powerful against *S. aureus* than mercuric chloride, and 800 times more so than phenol or chloramine.

Uses. The dye is advised for prompt application to wounds soon after infliction, to prevent sepsis by destruction of virulent organisms before they have time to multiply, and thus to facilitate healing by first intention. Liquor Acriflavinæ (equal in bactericidal effect on staphylococci to an 80% phenol solution) is a non-irritant and painless application to the surface of wounds.

A contaminated wound, within the first few hours of infliction, if thoroughly cleaned with 1 in 1000 solution—as much as possible being left in the cavity—may be sewn up and will heal by first intention. The same result may be expected in war wounds if similar facilities are permitted, but on the whole this is not favoured. It is better to pack the wound with the soaked gauze for 3 or 4 days after requisite surgical procedure. Suppuration may thus be aborted in many cases. Inject the solution into the surrounding tissues and muscle planes with a syringe and fine needle if there is extensive damage to the tissues.

Acriflavine is also advocated at the time of secondary operations to prevent the recrudescence of sepsis when operating in an area already affected.

For suppurating wounds the solution is used to swab out the open wound once or twice a day *after free drainage has been secured*. All the crevices of the wound are to be reached and sloughs, etc., removed. Then lightly pack with gauze steeped in the solution and cover with a "protective." Several ounces of the solution may be safely left in the tissues or peritoneal cavity. In cases showing spreading inflammatory conditions, it is well to inject the antiseptic into the part, and especially around the edges, with a hypodermic serum syringe.

When the infection has been practically overcome, weaker solutions, e.g., 1 : 5000, may be used, or the treatment may be intermitted for a day every few days, dry dressing being substituted in the intervals, or "stimulating" applications, e.g., brilliant green solution 1 in 1000, may be employed.

Inlet tubes may be used, but frequent periodic flushing, e.g., every 2 hours, with an aqueous solution (Carrel's method) is to be *avoided*.

Gauze steeped in the solution is specially favoured, as the dressing need only be changed once or twice in 24 hours.

The emulsion is extensively used as an antiseptic dressing for plugging suppurating wounds.

The muscles round the site of an infected wound may be injected with several ounces of 1 : 1000 solution without ill effect.

General Local Use. Strengths ranging from 0.1 to 1% are used for treatment of local conditions of the ear, such as otorrhoea, and of the mouth and throat (sycosis, folliculitis, etc.). 1 in 4000 may be used in conjunctivitis and gonorrhoeal ophthalmia, and in ophthalmic surgery to prevent septic sutures, and 1 in 1000 is used as a urethral injection in gonorrhoea, injections being made twice daily, but for this purpose euflavine, being neutral, is preferred. A 0.5 to 1% solution in alcohol is of value in various skin diseases such as crusty eczema, pyoderma and impetigo. Four-hourly compresses of 1 in 1000 solution may be applied in pemphigus neonatorum and impetigo contagiosa. It is also used alone or in conjunction with tannic acid in the treatment of burns.

Intravenous Injection. The preparation has been tried even to the amount of 300 ml. of 1 in 1000 solution. The injection is given slowly—at the rate of 50 ml. per minute. The method has not been largely practised. *Euflavine is preferable.*

Owing to the frequent occurrence of jaundice following intravenous acriflavine therapy, Imperial Chemical Industries Ltd., Dyestuffs Group, were asked to investigate the matter, and they have now succeeded in supplying an acriflavine (Acriflavine Intravenous) which is apparently non-toxic. Patients receiving acriflavine should always be tested for the presence of urobilinogen in the urine and the use of the drug discontinued if it is found.—E. W. Assinder, *Lancet*, i/1936, 305.

For references in the literature to toxic effects see 20th Edn., Vol. I.

Subcutaneous and Intramuscular injections of 5 to 10 ml. of 1 in 1000 solution have been given. It has been used hypodermically in lymphangitis.

References to Clinical Use of Acriflavine.

BURNS. A 1 in 1000 emulsion in pure sterile medicinal paraffin, applied as a dressing, preferable to tannic acid. Painless and quite harmless to the conjunctiva or any mucous surface. Burns remain clean, free of septic infection and with no tendency to scarring and contraction, and no hard scab is formed as with tannic acid.—N. H. Mummery, *Lancet*, i/1933, 662.

Daily anointing with the solution produces a film, which increases in thickness and falls off in about 10 days, leaving a marvel of healing.—W. Robertson, *ibid.*, 830.

GANGRENE, MOIST, of arm and leg, and hernia of spleen, well treated with flavine.—W. J. Sheehan, *Brit. Med. J.*, i/1930, 822.

GONORRHOEA. From the treatment of over 100 patients with acute gonorrhoea it was concluded that acriflavine given by deep subcutaneous injection will cause urethral discharge to disappear quickly, but relapses are common and local pain at site of injection makes it unsuitable for use in an out-patient clinic. Its use is not without danger. Jaundice is apt to appear after a long latent period, and deep subcutaneous injection may lead to local pain and abscess formation. It appears to lessen the incidence of complications, but has no beneficial effect when these are established.—E. Hughes and C. A. Birch, *Lancet*, ii/1933, 634.

In 4985 cases of acute gonorrhoea treated by intravenous injections of 2% acriflavine, the most noticeable feature has been the short duration of the urethral discharge, which ceases as a rule in 7 to 10 days; the duration of the actual infection is also much shortened.—E. W. Assinder, *Lancet*, i/1936, 304.

PERINEAL DRESSINGS. Emulsion in liquid paraffin 1 in 1000 used as a routine dressing in perineorrhaphies. The dressing renewed after each micturition. When operating for the cure of prolapse, with reasonable nursing, the wound will heal by first intention.—M. A. Dobbin Crawford, *Lancet*, ii/1929, 980; *Brit. med. J.*, i/1930, 822; see also E. M. R. Fraser, *Brit. med. J.*, ii/1930, 1066.

RHEUMATISM. 23 out of 33 cases cured by intravenous injection of 1 ml. of 2% solution of acriflavine hydrochloride. Two injections usually gave relief from pain. Phagocytic action. No untoward effects.—Norioka, *J. Amer. med. Ass.*, i/1929, 1022.

Emulsio Acriflavinae (B.P.C.).

Acriflavine, 1 in 1000, with liquid paraffin, white beeswax and distilled water. The value of this water-in-oil emulsion has been questioned, and claims have been made for an oil-in-water preparation. In practice it has proved the best of its type, but the directions for making could be improved by substituting the following:—Melt the wax in 9 fluid ounces of the liquid paraffin and cool; add, very gradually with constant trituration, the solution of acriflavine, and finally the remainder of the liquid paraffin.

U.C.H. has acriflavine 0·1, thymol 0·005, Japan wax 3·25, liquid paraffin 76·65, water 20.

The following has also been suggested: Dissolve acriflavine 0·5 g. in warm boiled distilled water 25 ml.; sterilise wool fat 30 g., put in a sterile mortar, add the solution in small portions with stirring, and finally add liquid paraffin to 500 ml.—*W. J. Clarke, Pharm. J.*, ii/1932, 435.

The emulsion in use at the City of London Hospital is prepared as follows: Acriflavine 1 g. is dissolved in distilled water 100 ml., to this is added olive oil 100 ml., oleic acid a few drops, and saccharated solution of lime about 10 ml.; triturate to form a cream and add olive oil or liquid paraffin to produce 1000 ml. This emulsion with the addition of aromatics is being used with success in the after-care of surgical cases, such as chronic empyema and lung abscesses where there is offensive discharge and where an antiseptic deodorant dressing is indicated for plugging. 3 ml. of the following aromatic essence is added to 100 ml. of the acriflavine emulsion: guaiacol 12·5 ml., oil of eucalyptus 25 ml., thymol 6·25 g., methyl salicylate 25 ml., oil of lemon to 100 ml.—*W. Trillwood, Prescriber*, 1935, 293.

Acriflavine emulsions of both oil-in-water and water-in-oil types were tested for their germicidal activity by the wet filter paper methods. The results showed the *B.P.C.* preparation to have little antiseptic power, and generally oil-in-water emulsions to have greater bacteriostatic and germicidal properties than water-in-oil emulsions.—*W. C. Wood, Pharm. J.*, i/1939, 327.

Suggested formula:—Acriflavine 0·1 g., hard soap 1·25 g., water 25 ml., liquid paraffin to 100 ml. Dissolve the acriflavine in 5 ml. of the water and the hard soap in the remainder of the water, previously heated. Mix the two solutions, add the liquid paraffin and shake well.—*H. W. Tomski, Pharm. J.*, ii/1939, 447.

Flavine-starch poultices in the treatment of eczema. 4 tablespoonfuls of rice starch and 10 gr. of acriflavine mixed with cold water; 1 pint of boiling water added, and the mixture boiled till it thickens. When nearly cold pour on to dressing cloth, to form a layer $\frac{1}{4}$ inch thick. When cold and set, cover with a layer of gauze and apply to part. Change 3 or 4 times a day and bathe part at each change with acriflavine 1 in 1000 in 0·85% NaCl. Resistant cases of seborrhoeic eczema successfully treated by this method.

Glycerin. Acriflavin. (N.I.F.). Acriflavine 3½ gr., glycerin to 4 fl. oz.

The Committee on Pharmacy and Pharmacognosy of the Pharmacopœia Commission (*Report* 13) have recommended the inclusion in the *B.P.* of glycerin of acriflavine (1%) to be used as a stock solution for dilution with water to prepare lotion of acriflavine containing 0·1% of acriflavine.

Guttæ Acriflavinae ex Alcohole (Mid. H.).

Acriflavine 0·1, alcohol 90% 50, water to 100. For otorrhœa.

Acriflavine Eye Drops. Acriflavine 1, distilled water 200, white wax 5, castor oil to 1500. Melt the white wax in the castor oil and triturate with a warm solution of the acriflavine in the water.—P. M. Wright, *Pharm. J.*, i/1936, 248.

Liquor Acriflavinae (B.P.C.).

Acriflavine, 1 in 1000, in normal saline.

Lot. Flavin. Conc. (N.I.F.). Acriflavine 7 gr., sodium chloride 31½ gr., distilled water to 8 oz. For use dilute with an equal quantity of hot water.

Pessus Acriflavinae (B.P.C.) contains ½ gr. (0.008 g.).

Tabellae Acriflavinae (B.P.C.) contain ½ gr. (0.03 g.) in chocolate basis.

Acriflex (Allen & Hanburys, London). An oil-in-water emulsion containing acriflavine 0.1, glycol 3.0, perfume 0.05, stearate cream to 100.0. A non-greasy application for wounds.

Burnol (Boots, Nottingham). An antiseptic cream having the following formula:—Acriflavine 0.22, thymol 0.01, cera alb. 32.0, distilled water 40.0, liquid paraffin 137.25. For use in burns and scalds, ulcers and wounds, skin infections and all types of ophthalmia.

Flavogel (Glaxo Laboratories, London). Acriflavine 1 to 1000 in a water-soluble jelly base for use in the treatment of wounds, local septic lesions, etc., and as a catheter lubricant. Stated to be an improvement on emulsions of acriflavine, since the base is emollient and enables the antiseptic action of the dye to be more readily exerted than with the usual greasy basis.

Euflavina (B.P.C.). *Syn. and Prop. Name.* ACRIFLAVINA (U.S.P. XI), ACRIDINUM HYDROCHLORICUM (*Fr. Cx.*), NEUTRAL ACRIFLAVINE, NEUTROFLAVIN, TRYPAFLAVIN (*Bayer Products, London*; not available in Gt. Britain).

Dose.—Internally ½ to 1 grain (0.03 g. to 0.06 g.) in tablets "enteric-coated."

An orange- or brownish-red powder prepared from acriflavine by neutralisation and precipitation with sodium chloride. Euflavine consists of a mixture of 2 : 8-diamino-10-methylacridinium chloride, $C_{14}H_{14}N_3Cl = 259.6$, and diaminoacridine monohydrochloride, $C_{13}H_{12}N_3Cl = 245.6$. The latter is usually present to the extent of between 30 and 40%.

This substance, being more basic than acriflavine, is even less irritant to mucous tissues and more suited for use *intravenously*.

Soluble in water, 1 in 4 of warm water, slightly soluble in alcohol 90%, almost insoluble in ether, chloroform and oils.

Uses. As for acriflavine. Stronger solutions can be employed. For *local use* to wounds 1 in 1000 to 1 in 500. For *bladder irrigation* and *urethral injection* 1 in 4000 to 1 in 1000. For skin infections 1% in alcohol.

Intravenously 1 in 1000 to 1 in 200 in lymphangitis, enlarged tuberculous glands and threatened sepsis. 50 to 100 ml. of this has been given. 50 to 100 ml. of 1 in 200 solution, in rheumatic fever, influenza, pneumonia, endocarditis, puerperal fever, septic abortion, erysipelas, etc.; 1 in 500 to 1 in 100 in gonorrhœa.

Carbasus Euflavinae (B.P.C.). Euflavine Gauze. 0.1%.

Linteum Euflavinae (B.P.C. Supp.). Euflavine lint is absorbent lint impregnated with about 0.1% of euflavine.

Curatio Normalis X (B.P.C. Supp.). *Syn.* STANDARD DRESSING No. 10, FINGER BURN DRESSING, EUFLAVINE FINGER DRESSING.

The dressing consists of an open finger-stall, made from two pieces of euflavine lint each 2 inches by $1\frac{1}{2}$ inches, sewn to an open-wave bandage measuring 1 inch by 24 inches.

Curatio Normalis XI (B.P.C. Supp.). *Syn.* STANDARD DRESSING No. 11, MEDIUM BURN DRESSING.

The dressing consists of a pad sewn to an open-wave bandage measuring $1\frac{1}{2}$ inches by 2 yards. The pad, which measures about 3 inches by 4 inches, is composed of a piece of euflavine lint 3 inches by 4 inches, superimposed on about 25 gr. of cotton-wool.

Curatio Normalis XII (B.P.C. Supp.). *Syn.* STANDARD DRESSING No. 12, LARGE BURN DRESSING.

This dressing is similar to Standard Dressing No. 11, but the pad measures 4 inches by 6 inches, and is composed of euflavine lint 4 inches by 6 inches, superimposed on about 50 gr. of absorbent cotton-wool. The open-wave bandage measures 3 inches by $2\frac{1}{2}$ yards.

Tabellæ Euflavinæ (B.P.C.) contain $\frac{1}{2}$ gr. (0.03 g.) in chocolate basis.

Gonacrine (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Ampoules containing 5 ml. of 2% solution of euflavine for intravenous use, and $\frac{1}{2}$ grain enteric-coated euflavine tablets for use in gonorrhœa and urinary tract infections.

Panflavin Tablets (*Bayer Products, London*) contain as active principle 0.003 g. of Trypflavin. *Dose.*—1 or 2 to be sucked hourly as influenza prophylactic and in inflammatory and ulcerative conditions of the mouth and throat.

Planacrine (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Euflavine lozenges 3 mg. flavoured with glycyrrhizin. Mouth and throat disinfection.

Homoflavine is the hydrochloride of 3:7-dimethyl-2:8-diamino-10-methylacridinium chloride. Closely resembles acriflavine.

Proflavina (B.P.C.). *Syn.* 2:8-DIAMINOACRIDINE SULPHATE. $C_{13}H_{11}N_3.H_2SO_4 = 307.2$.

An orange-red to brownish-red powder. The concentrated aqueous solution is brown. It stains the skin yellow similarly to acriflavine. Dilute solution is also light yellow with greenish fluorescence.

Solubility. 1 in 300 of water, 1 in 48 of alcohol 90%, 1 in 10 or less of glycerin, insoluble in liquid paraffin, oleic acid, soft paraffin and eucalyptol.

Compatible with normal saline solution as distinct from acriflavine (*q.v.*).

Antiseptic Powers.—This compound resembles acriflavine in being strongly bactericidal for all the common pathogenic bacteria. As weak a solution of proflavine as 1:200,000, it is stated, will kill *Staphylococcus aureus* in the presence of serum.

The general toxicity of proflavine for mice as tested by subcutaneous injection, and the irritating effect of concentrated

solutions on the conjunctiva, are markedly less than those of acriflavine. They may be applied to the peritoneum with safety.

Uses. Similar to those of acriflavine, but it is stated to differ in that it exerts a degree of hæmostatic action.

Since acriflavine, when freed from tarry matter and other impurities, becomes only sparingly soluble in water, there ceases to be any reason in preferring it, a mixture, to proflavine, a pure chemical. Their antiseptic powers are equivalent whilst proflavine has only a quarter of the mammalian toxicity of acriflavine and is less irritating to the tissues. Formulæ are put forward containing proflavine base and proflavine sulphate with a view to rendering them more readily available for therapeutic use.—A. Albert and C. Bennett, *Aust. J. Pharm.*, 1939, 175.

A 1 in 1000 solution of proflavine in isotonic saline is practically harmless to living brain tissue, whereas euflavine or acriflavine in the same concentration causes necrosis and hæmorrhage.—D. S. Russell and M. A. Falconer, *Proc. R. Soc. Med.*, 1940, 33, 394.

Proflavine Tablets 0·87 grain (with sodium chloride) make 2 ounces of 1 in 1000 solution; also 1·75 grains with sodium chloride to produce 4 ounces of solution.

Proflavine Bougies. Contain $\frac{1}{2}$ grain (0·03 g.) in oil of theobroma; 4 inches long.

Lotio Proflavinæ (Pro Oculis). Proflavine 1 grain in 10 ounces. Useful in ophthalmic surgery. 1 in 1000 non-irritating, but 1 in 4000 is strong enough.

Proflavine Oleate. Proflavine oleate in a strength of 1% in liquid paraffin is a valuable antiseptic for the control of local sepsis in radium therapy, and is particularly useful in the radiological treatment of carcinoma of the cervix and of malignant lesions involving the skin; in the former case, it is used by means of saturating the packing by which the radium is kept in position, and in the latter by means of preliminary dressings to dry up the septic discharge and render the part clean enough for the operation.—A. A. Charteris, *Lancet*, ii/1937, 627.

Isoflav (Boots, Nottingham). Solution tablets of proflavine sulphate prepared so that one tablet dissolved in 4 fl. oz. of distilled water makes a 1 in 1000 isotonic buffered solution at approx. pH 6·3. An antiseptic solution for the prevention and control of wound infection in all delicate tissues, and especially for infected wounds of the brain.

Rivanol (Bayer Products, London) is 2-ethoxy-6 : 9-diaminoacridine lactate. A yellow dyestuff soluble about 1 in 15 of water, incompatible with acids and normal saline and unstable in solution with Novocain and Decicain.

Used in 1 in 2000 to 1 in 500 solution as an antiseptic for wounds, puerperal infection, furunculosis and for antisepsis of the abdominal cavity. For injection for deep antisepsis requires 0·25 to 0·5% of procaine hydrochloride.

ADEPS LANÆ

B.P., U.S.P. XI, P. Ital. V, P. Helv. V, P. Jap. V, etc.

Syn. ANHYDROUS LANOLIN, LANOLÉINE (*Fr. Cx.*), WOOL FAT.
The purified yellowish cholesterin fat of sheep's wool, m.p. about 40°. Sheep's wool yields from 10 to 30%.

Soluble 1 in 25 of ether, 1 in 18 of oil of turpentine (both with some residual matter), almost insoluble in alcohol 90%.

Adeps Lanæ can only be saponified by alcoholic solutions of potassium hydroxide under pressure—paraffin can be easily detected by this means.

Adeps Lanæ Hydrosus (B.P.). *Syn.* HYDROUS WOOL FAT, LANOLIN, LANOLÉINE HYDRATÉE (*Fr. Cx.*).

Wool fat 7, distilled water 3. Melt and mix. *U.S.P. XI, Fr. Cx., P. Jap. V, P. Belg. IV and P. Ned. V* have 25% of water. *P. Ital. V* has wool fat 30, liquid paraffin 6, water 10.

Yellowish white ointment basis. More water, up to about equal weights of fat and water, may be incorporated with it without affecting its consistence. Soluble partly in alcohol, while ether and chloroform dissolve only the fats it contains.

Unmixed wool fat is not readily absorbed by the skin, but when mixed with olive oil or soft paraffin absorption is much more rapid and the stickiness greatly reduced. These mixtures may be mixed with considerable proportions of aqueous liquids forming water-in-oil emulsions, the wool fat serving as the emulsifying agent. It helps absorption of narcotic extracts, quinine, iodine, potassium iodide and chaulmoogra oil.

When an ointment containing mercuric chloride or phenol is ordered, it is usually intended for antiseptic purposes, therefore the *anhydrous* should be used, otherwise caustic action may result.

Unguentum Adipis Lanæ (B.P.C.). *Syn.* UNGUENTUM LANOLINI ANHYDROSI. Equal parts of wool fat and yellow soft paraffin.

Unguentum Adipis Lanæ Compositum (B.P.C.).

Syn. UNGUENTUM LANÆ COMPOSITUM, EMOLLIENT OINTMENT. Lard and wool fat, 40% of each, and yellow paraffin ointment 20%.

Simple ointment is a suitable substitute for lard in this ointment.

Unguentum Adipis Lanæ Hydrosi (B.P.C.). *Syn.* UNGUENTUM LANOLINI. Equal parts of hydrous wool fat and yellow soft paraffin.

Similar preparations suitably perfumed form Toilet Lanolin and Lanolin Cream.

Cholesterol. *Syn.* CHOLESTERIN. $C_{27}H_{48}OH$, $H_2O = 404.4$.

Cholesterol is a constituent of all animal cells and therefore occurs in most foods, egg yolk being especially rich. It is more commonly familiar as a constituent of gall-stones, which often contain it to the extent of 90% or more, and from which it may be obtained by extraction with spirit. It is usually obtained from wool-fat by saponification with potassium hydroxide and extraction with ether. It occurs as a white, odourless, crystalline compound, m.p. about 145° .

Soluble in acetone, chloroform, ether and hot alcohol; sparingly soluble in cold alcohol; slightly soluble in water. Soft paraffin mixed with $\frac{1}{2}$ to 1% will take up 10 to 20% of water.

Uses. Cholesterol has the property of neutralising many hæmolytic poisons such as snake-venoms, saponins, etc., and for this reason has been used in the treatment of various hæmolytic diseases such as hæmoglobinuria, pernicious anæmia, etc., but without any marked success. It has also been advocated for use in tuberculosis. A spirituous lotion, $\frac{1}{2}$ to $\frac{1}{2}\%$, has been used as a

stimulating application, and it is incorporated in many cosmetic ointments as a "skin food."

Camphosterin (*Richter, London*). Cholesterin 0.05 g., camphor 0.20 g., guaiacol 0.05 g., quinine 0.05 g., olive oil to 2 ml. *Dose*.—2 ml. intramuscularly on alternate days for a course of 20 injections. In pulmonary tuberculosis.

Oxycholesterol. $C_{27}H_{46}O_2$. A white unctuous substance, m.p. about 40°. Readily takes up water (up to 500%) forming water-in-oil emulsions. Is used in toilet creams.

Adeps (*B.P., U.S.P. XI*). *Syn.* ADEPS PRÆPARATUS, ADEPS SUILLUS (*P. Helv. V*), AXUNGIA (*P. Ned. V*), ADEPS LOTUS (*P. Dan.*).

The purified fat of the hog, *Sus scrofa* (Linn.)—from the "flare" or "omentum" which also contains 60% triolein, sold when separated by freezing and pressure as "Lard Oil" (**Oleum Adipis**), a colourless or pale yellow oil with peculiar odour. The remainder is palmitin and stearin. **Soluble** 1 in 22 of ether, hardly soluble in alcohol. **Adeps Induratus** is for use in the tropics. The liquid constituent is removed to a great extent by pressure.

Hydrogenated palm kernel oil, m.p. 40° to 42°, is a suitable fat to replace lard and suet ointments in tropical countries.—A. F. Caldwell, *Quart. J. Pharm.*, 1939, 697.

Adeps Benzoinatus (*B.P.*). *Syn.* ADEPS BENZOATUS (*P. Dan., P. Jap. V*), ADEPS SUILLUS BENZOINATUS (*Fr. Cx.*).

Is made with 3% Sumatra benzoin. To be avoided as a basis for eye ointments.

Experiments on the keeping properties of benzoinated lard have shown that 1 to 2% of Siam benzoin is more satisfactory than 3% of Sumatra benzoin.

In many ointments lard and benzoinated lard have been replaced by a mixture of wool fat and hard and soft paraffins. A mixture of the same composition as Unguentum Simplex, *B.P.* 1932, was included as a War Emergency preparation in the Codex Addendum 1918, under the name of Adeps Factitius, and was widely used as a substitute for lard in preparing *B.P.* and *B.P.C.* ointments. The Second Addendum to the *B.P.* 1932 includes alternative formulæ for official ointments for which lard was formerly required, and in a similar manner many other ointments may with advantage be prepared with simple ointment instead of lard or benzoinated lard.

Adeps Benzoinatus (*U.S.P. XI*) is made with 1% of Siam benzoin, and 5% or more of lard may be replaced by white wax in southern latitudes or in the warm season in other parts.

Sevum (*B.P., U.S.P. XI, P. Helv. V*). *Syn.* SEVUM PRÆPARATUM, SEBUM OVILLUM DEFURATUM (*Fr. Cx.*).

The purified internal fat of the abdomen of the sheep, prepared by cutting up the fresh omentum, melting and straining. M.p. 45° to 50°.

Soluble 1 in 60 of ether and 1 in 45 of boiling alcohol 90%.

TROPHIC ULCERS. The following treatment was found successful in trophic ulcers in leprotic patients which have failed to respond to all other treatments. After removal of carious bone and dead skin and general cleaning up of the ulcer, an ointment is prepared consisting of beef suet, 2 parts; ghee, 1 part;

beeswax, $\frac{1}{2}$ part. The ointment is melted and the mixture poured into the clean ulcer. As the ointment congeals a piece of thick white material is placed over the ulcer and a bandage sewn on. The ointment and dressing are at first changed twice weekly and then once a week.—N. H. Maynard, *Leprosy Rev.*, 1939, 118.

Sevum Benzoinatum (B.P.C., P. Helv. V). *Syn.* SEVUM BENZOATUM. Suet digested with 3% of benzoin.

Sevum Phosphoratum (B.P.C.). Contains 10% of phosphorus.

"University Cream." *Syn.* EMULSIO SEVI (formerly in U.C.H.). Beef suet 40 ozs., arachis oil 5 ozs., syrup 25 ozs., benzoic acid 40 grains, decoction of Irish moss 70 ozs., water to 1 gallon. Melt the suet, add the oil and the benzoic acid. Heat the moss decoction to about 60°, place in an emulsifier and add the fats at about the same temperature. Finally add the syrup and water. This keeps well and mixes well with milk. For use instead of cows' cream in preparing infants' feeds.

New Zealand Cream (*Mothercraft Training Society, London*), as manufactured in New Zealand's Government factory, contains 50% fat, of which $\frac{1}{2}$ is animal oil, including fresh New Zealand butter and cod-liver oil, and $\frac{1}{2}$ vegetable oils, mainly pea-nut; sugars, mainly dextrose and a little lactose, make up 40%. Satisfactory in use, readily assimilable, sterile, containing vitamins intact, and high calorific value of 180 per ounce.

ADRENALINA

B.P., Fr. Cx., P. Ital. V, etc.

Syn. and Prop. Names. ADRENALIN, HEMISINE, SUPRARENALIN (*Armour, London*), ADRENINE, RENAGLANDIN (*Oppenheimer, London*), SUPRARENIN (*P. G. VI*), TAKAMINA (*F.E. VIII*), ADNEPHRIN, VASO-CONSTRICTINE (*Duncan, Flockhart, Edinburgh*), LEVORENINUM (*P. Belg. IV*), EPINEPHRINA (*U.S.P. XI*), *o*-DIOXYPHENYLETHANOLMETHYLAMINE, *l*- α -3 : 4-DIHYDROXYPHENYL- β -METHYLAMINOETHANOL.

[P1] "*Suprarenal gland, the active principles of; their salts.*"

[86] "*Suprarenal gland, the active principles of, their salts—specify proportion in a preparation either*

- (a) *as the proportion of suprarenal gland or of the cortex or of the medulla of the gland, as the case may be, contained in the preparation; or*
- (b) *as the amount of suprarenal gland, or of the cortex or of the medulla of the gland, as the case may be, from which a specified quantity of the preparation was obtained, together with an indication whether the amount relates to fresh or to dried gland substance.*"

Dose.—By injection, $\frac{1}{100}$ to $\frac{1}{10}$ grain (0.0001 to 0.0005 g.).

U.S.P. XI average dose $\frac{1}{100}$ grain. *Fr. Cx.* single dose 0.001 g., max. in 24 hours 0.02 g.

It is an active principle of the suprarenal gland and may be obtained from the glands or prepared synthetically (*vide infra*). It occurs as a white or pale buff-coloured crystalline powder.

Soluble sparingly in water, readily in mineral acids and boric acid solution forming corresponding salts, also in solutions of sodium or potassium hydroxide. Aqueous solutions of its salts are levorotatory. **Insoluble** in alcohol, ether, chloroform, light petroleum, liquid paraffin and other organic solvents. Oleic acid is a poor solvent. Not precipitated by ordinary alkaloidal reagents. It is chemically a powerful reducing agent.

Incompatible with oxidising agents, alkalis, gum and tannin.

Manufacture. The suprarenal glands are reduced to pulp and macerated, excluding oxygen as much as possible, in warm (50° to 80°) water or very dilute acid for 5 hours, the mixture being then heated at 90° to 95° to coagulate albuminoids. This aqueous extractive is evaporated and extracted with alcohol. Precipitation from this liquid of impure adrenaline follows by means of ammonia. It is purified by ether-alcohol, and reprecipitation with ammonia or fixed alkali.

Synthetic adrenaline may be obtained by the interaction of catechol and chloroacetyl chloride to give chloroacetylcatechol, which is treated with methylamine and the product reduced to give racemic adrenaline. The *lævo* compound is separated by fractional crystallisation of the *d*-tartrates. *d*-Adrenaline has only about one-fifteenth the activity of the *l*-compound and the racemic form has therefore only about one-half the activity of *l*-adrenaline.

[P1] **Liquor Adrenalinae Hydrochloridi (B.P.).**

Dose.—By subcutaneous injection, 2 to 8 minims (0.12 to 0.5 ml.). The B.P. has no dose for oral administration, but doses of 10 to 30 minims (0.6 to 2 ml.) are often given. As a spray the solution is diluted to 1 in 2500, or even 1 in 5000 is effective in the nostrils or within the uterus.

Adrenaline 1, chlorbutol 5, sodium chloride 9, dilute hydrochloric acid 3, water to 1000.

The solution is liable to become pink in colour on exposure, and the Committee on Pharmacy and Pharmacognosy of the Pharmacopœia Commission (*Report* 13) have recommended the addition of 0.05% of sodium metabisulphite to retard the development of this colour.

Adrenaline, when in solution with certain of the silver compounds, is inactivated in a few hours, and when such a solution is required it is advisable to use a fresh mixture.

[P1] **Liquor Epinephrinae Hydrochloridi (U.S.P. XI).**

Average Dose.—8 minims (0.5 ml.) by parental injection.

A physiologically standardised solution of adrenaline hydrochloride in water and hydrochloric acid of the same strength as Liquor Adrenalinae Hydrochloridi (B.P.). Not more than 0.5% of chlorbutol or other suitable preservative may be added, but the nature and amount of the preservative must be stated on the label.

[P1] **Soluté d'Adrénaline (Fr. Cx.)** is similar to B.P., but contains sodium sulphite 0.08%, instead of chlorbutol. **Dose.**—1 g.

[P1] **Oleum cum Adrenalina (Fr. Cx.).** Contains adrenaline 0.1%, in alcoholic hydrochloric acid, mixed with a solution of chlorbutol in castor oil, and adjusted with olive oil.

The addition of 0.15% of sodium acid phosphate as a preservative is suggested. —J. Rae, *Pharm. J.*, i/1936, 446.

Solution of adrenaline hydrochloride retains its full potency for 16 months when stored under carbon dioxide at laboratory temperature, and while 0.1% of sodium metabisulphite has little influence on the maintenance or loss of potency under these conditions, it does improve the keeping quality of the solution. The colour of solution of adrenaline hydrochloride is not an indication of its potency, clear, colourless solutions having been shown to have lost 50%

of their activity, whilst coloured solutions may retain their full potency.—H. R. Rowlinson and S. W. Underhill, *Quart. J. Pharm.*, 1939, 392.

Toxic Effects and Contraindications. Some people show toxic effects, e.g., anxiety, palpitation, rapid pulse, tremors, dizziness, coldness of the extremities, etc., with even small doses of adrenaline, especially when given simultaneously with certain local anæsthetics such as procaine hydrochloride or cocaine. This hypersusceptibility occurs especially in patients of nervous temperament, and most markedly in those with toxic goitre, in whom its use is best avoided. Its use is also contraindicated in diabetic patients, since it raises the blood sugar by mobilising the glycogen of the liver.

Owing to its action on the heart, it should be used only with great caution in patients with cardiac disease, and it should never be given to a patient under chloroform anæsthesia, since this may precipitate ventricular fibrillation.

On the basis of animal experiments it has been suggested that continued use of adrenaline injections may give rise to arteriosclerosis, but there is little clinical evidence in support of this.

Although the ischæmic action of adrenaline is a valuable aid to the ophthalmic surgeon, its use in any visual affection following a severe hæmorrhage may be harmful owing to its constricting action on the retinal vessels.

Tetany following the use of cocaine and adrenaline (1 in 1000) is of fairly frequent occurrence. It is not a drug intoxication, but is due to a combination of hypoparathyroidism, hyperventilation, and adrenaline in nervous patients. Quickly relieved by parathyroid extract subcutaneously.—S. E. Roberts, *J. Amer. med. Ass.*, ii/1929, 906.

Latent and finally active tetany in a patient who received adrenaline during asthmatic attacks is considered to be the result of an alkalosis due to hyperventilation. Tetany did not appear when codeine was given in place of adrenaline.—Ellsworth and Sherman, *J. Amer. med. Ass.*, i/1936, 284.

Uses. When applied locally adrenaline causes constriction of blood vessels and blanching of the skin and mucous membrane, and is added to local anæsthetics to retard diffusion and produce ischæmia. This local constricting effect lasts from $\frac{1}{2}$ to 2 hours. It is useful for checking capillary bleeding, epistaxis and menorrhagia, the bleeding after tooth extractions, from superficial wounds and abrasions, and during operations to check hæmorrhage and blanch the parts, especially for operations on the eye, ear, nose, throat or larynx. Adrenaline may also be employed, in the form of suppositories or ointment, for its constrictive action in hæmorrhoids and other inflammatory conditions of the anus and rectum. Solutions of from 1 in 10,000 to 1 in 5000 are useful for application in the form of a spray to the nasal mucous membrane in coryza, asthma and hay fever. It has also been used in 1% and 10% solution as a very fine throat spray in asthma.

Hypodermic injections are used to relieve asthmatic spasms, to control anaphylaxis from serum injection and to reduce the swelling in giant urticaria. Hypodermic injection does not materially raise blood pressure, as the local vascular constriction prevents absorption. Generally speaking, intravenously its use is dangerous and

should be avoided except in emergencies, though good results are claimed in the treatment of chronic malaria by repeated intravenous injections of 0.01 to 0.1 mg. (Ascoli's method).

It may be given by mouth to check hæmorrhage from the stomach, or may be injected into the rectum, bladder and uterus for bleeding. It is of no value in hæmoptysis, and of little use in remote hæmorrhage however given, in fact the rise in blood pressure may increase the hæmorrhage.

INTRACARDIAC INJECTION IN RESUSCITATION. Adrenaline has been given by direct injection into the heart to revive its action when in sudden failure. It is not necessary or advisable to give more than 1 ml. of the 1 : 1000 solution, in view of the possible danger of a tetanic contraction of the muscle with systolic stoppage of the heart. The injection should be given directly into the cavity of the heart and not into its walls. Injection into the right auricle is probably the ideal procedure, but the right ventricle may also be used.

For resuscitation in cardiac arrest, artificial respiration should be resorted to first by the usual methods. If at the end of 3 or 4 minutes no pulse can be felt, and especially if no heart-beats can be heard on auscultation, adrenaline should be given by intracardiac injection and artificial respiration continued for a minute or two. If the heart still does not beat cardiac massage should be employed without further delay.

References to Clinical Use of Adrenaline.

ASTHMA. In status asthmaticus the continuous injection of adrenaline in small quantities, up to even a drachm in $\frac{1}{2}$ hour, the only cure.—A. F. Hurst, *Brit. med. J.*, ii/1929, 297.

Status asthmaticus can always be arrested by the continuous method of injecting adrenaline. The needle is kept in position, and with a full syringe and after an initial injection of a dose known to cause no unpleasant symptoms, one or more minims is injected every 15, 30 or 60 seconds (according to the patient's reaction), the rate being varied until it is found how frequently a dose can be given without causing unpleasant symptoms. The injections are continued if necessary for 30 minutes or more. Relief always follows and generally the patient falls into a deep sleep.—A. F. Hurst, *Pharm. J.*, ii/1934, 705.

The predisposing cause of asthma is a low content of adrenaline in the blood; patients with asthma become unable to dilate the bronchiolar airway when chronic infections cause a constriction.—J. H. Burn, *Proc. R. Soc. Med.*, 1933, 31.

Better results are obtained by inhalation (of 1% solution) than by injection. The effect is more rapid and side-effects are rare.—J. B. Graeser and A. H. Rowe, *J. Lab. clin. Med.*, 1936, 1134.

HÆMOPYSIS. Adrenaline cannot be justified on experimental grounds, but given intratracheally over back of the tongue said to be effective (1 ml. of 1 in 1000 solution in 2 ml. of water.—*Münch. med. Wschr.*, Feb., 1928), but this cannot be done in an emergency when blood is welling up into the mouth. Semi-sitting posture best.—F. G. Chandler, *Lancet*, i/1930, 589.

HEADACHE. Headache due to obstruction of frontal sinuses. Adrenaline hydrochloride solution 1 in 4000, 1 dr., and saturated boric acid solution 1 dr. used in an atomiser four times daily gives relief.—E. Podolsky, *Int. J. Med.*, July, 1930.

HEART BLOCK. Twelve cases of complete heart block tested with adrenaline chloride. The response of the heart is determined not by the amount of the dose but by the rate of the heart at the time of injection. High initial rates are followed by little or no gain in rate, but slow initial rates are followed by pronounced acceleration. For a given initial rate 0.25 ml. of adrenaline chloride solution

produced as much acceleration as a dose four times as large.—A. R. Gilchrist, *Quart. J. Med.*, Oct., 1933, 483.

Rheumatic heart block well treated with adrenaline solution, 4 m. hypodermically—a total of 32 m. in 5 days.—G. A. Sutherland, *Prescriber*, 1926, 199.

MALARIA. Good results in chronic malaria, with splenomegaly, anaemia and cachexia, obtained from the use of daily intravenous injections beginning with $\frac{1}{100}$ mg. and increasing by $\frac{1}{100}$ mg. daily to a dose of $\frac{1}{10}$ mg. Resistance to quinine often disappears, and the quinine dosage can be lowered when adrenaline is employed. The adrenaline is stated to act by sterilising the spleen and making relapses through further protozoal invasion impossible. Of 15 patients treated two years ago and 20 one year ago none have shown enlargement of the spleen again, and none have relapsed.—M. Ascoli, *Munch. med. Wschr.*, 1937, 370.

Six cases treated by the intravenous injection of adrenaline (Ascoli's method) with excellent results. The adrenaline was given in doses of 0.01 to 0.1 mg. every day for 20 days.—G. Pomilia, per *Trop. Dis. Bull.*, 1937, 598.

Numerous references to excellent results from the use of adrenaline intravenously in acute and chronic malaria and in malarial splenomegaly.—*Trop. Dis. Bull.*, 1937, 617-619; 1938, 565; 1939, 685.

Care must be taken that the adrenaline is of the best quality and the solution freshly prepared. It is claimed that the first injection is followed quickly by a diminution of fever, a normal blood picture, a feeling of better health, and a decrease in the size of the spleen, and the full course of injections will prevent relapse for about a year.—Per *Lancet*, ii/1939, 942.

MIGRAINE. Adrenaline subcutaneously aborts migraine attacks in a high proportion of cases.—T. C. Hunt, *Lancet*, ii/1933, 285.

SERUM SICKNESS. Recovery in a case of severe serum shock in a girl of 8 years, which developed three minutes after intramuscular injection of 5 ml. of concentrated scarlet fever antitoxin; treated by artificial respiration and hypodermic injection of adrenaline hydrochloride solution.—J. Grant and M. M. Scott, *Lancet*, ii/1934, 80.

STOKES-ADAMS ATTACKS have been well treated with adrenaline solution (5 m. doses) subcutaneously.

VOMITING IN MALARIA has been well treated with 7 to 8 minims—one dose sufficient.

X-RAY SICKNESS. A method for controlling this condition far superior to all others is the administration by the mouth of 10 minims of Liq. Adrenalin. Hydrochlor. as frequently as necessary up to 6 doses or even more, in the 24 hours.—N. S. Finzi, *Brit. med. J.*, ii/1935, 1072.

[D-P1-81] **Adrenaline Catheter Lubricant.** Adrenaline (base) 1, cocaine 10, atropine 10. Dissolve the adrenaline in hydrochloric acid *q.s.* (0.6 is usually sufficient) diluted with dehydrated alcohol 30. Dissolve the alkaloidal bases in oleic acid 20 and mix this and the adrenaline solution with sufficient castor oil and dehydrated alcohol in proportion of 4 to 1 to make 1000 of the lubricant.

[P1] **Guttæ Adrenalinæ cum Acid. Boric.** (R.L.O.H.).

Solution of adrenaline hydrochloride 1 dr., boric acid 10 gr., sterile water to 1 oz.

[P1] **Guttæ Zinc. Sulph. cum Adrenalin.** (R.L.O.H.).

Solution of adrenaline hydrochloride 1 dr., zinc sulphate $\frac{1}{2}$, 1 or 2 gr., boric acid 10 gr. sterile water to 1 oz.

[P1] **Insufflatio Adrenalinæ (B.P.C.). Syn. ADRENALINE SNUFF.** Adrenaline, about 1 in 1300, with boric acid, camphor, menthol, potassium chlorate, oil of eucalyptus and lycopodium.

[P1] **Nebula Adrenalinæ Aromatica (B.P.C.). Syn. ADRENALINE INHALANT.**

Adrenaline, 1 in 1000, eucalyptol and oil of sweet birch in an oily base.

[P1] **Neb. Adrenal.** (N.I.F.). Solution of adrenaline hydrochloride 45 m., sodium chloride 4 gr., water to 1 oz.

Strong Solution for Use in Asthma. Adrenaline 1 g., chlorbutol 0.09 g., 2N hydrochloric acid 2.8 ml., sodium bisulphite 0.01 g., water to 10 ml. Inhalation takes place through the mouth, the ball of the spray being pressed once at

the beginning of every inspiration and the patient breathes deeply with the mouth wide open. The dose of adrenaline is of the order of $\frac{1}{16}$ mg.—N. A. Nielsen, *Lancet*, ii/1936, 848.

[P1] **Neb. Adrenal. c. Benzamin. Hydrochlor.** (N.I.F.).

Solution of adrenaline hydrochloride $1\frac{1}{2}$ dr., benzamine hydrochloride 5 gr., glycerin 40 m., distilled water to 1 oz.

[D-P1-81] **Nebula Adrenalinae et Cocainae** (B.P.C.).

Adrenaline 1 in 5000, and cocaine hydrochloride 1% with chlorbutol and sodium chloride in water.

[P1] **Solutio Adrenalini Composita** (St. T. H.).

Solution of adrenaline hydrochloride 5 m., atropine sulphate $\frac{3}{16}$ gr., strychnine hydrochloride $\frac{1}{16}$ gr., distilled water to 10 m.

[P1] **Suppositorium Adrenalinae** (B.P.C.) contains $\frac{1}{8}$ gr. of adrenaline.

[D-P1-81] **Suppositorium Adrenalinae et Cocainae** (B.P.C.) contains $\frac{1}{8}$ gr. of adrenaline and $\frac{1}{4}$ gr. of cocaine hydrochloride.

[P1] **Unguentum Adrenalinae** (B.P.C.). Adrenaline 0.1% in a hydrous wool fat and white soft paraffin basis.

[D-P1-81] **Unguentum Adrenalinae et Cocainae** (B.P.C.) is the same with addition of 1% of cocaine hydrochloride.

[P1] **Adrenalin Inhalant** (Parke, Davis, London). A 1 in 1000 solution of adrenaline with 3% of chlorotone in an aromatised oil. Soothing and astringent in inflammatory affections.

[P1] **Adrenutol** (Evans, Sons, Lescher & Webb, Liverpool). A solution containing adrenaline 2 mg., chlorbutol 2 mg., glycerin 0.7 ml. and distilled water to 1 ml., for the treatment of asthma and other allergic disorders by subcutaneous or intramuscular injection.

[P1-87] **Asthmolysin** (C. Zimmerman, London). Solution of suprarenal and pituitary glands for subcutaneous injection in asthma.

[P1-87] **Evatmine** (British Organotherapy Co., London). Adrenaline (8 m. of 1 in 1000 solution) and pituitary (whole gland) extract in 1 ml. ampoules for subcutaneous injection in the treatment of asthma.

Glaucosan (Saccharin Corporation, London). Solution containing 0.2% of synthetic *d*-adrenaline and 1% of methylaminoacetocatechol (adrenalone). Given by subconjunctival injection in the treatment of glaucoma.

[P1] **Laevo-Glaucosan** (Saccharin Corporation, London). A solution containing 2% each of synthetic *l*-adrenaline and methylaminoacetocatechol (adrenalone). A powerful mydriatic for instillation, following the use of a local anæsthetic in the treatment of chronic glaucoma. The preparation must not be injected in any manner.

[P1-87] **Infundrenalin** (Evans, Sons, Lescher & Webb, Liverpool). Infundibulin 0.5 ml., adrenaline (1 in 1500) 0.5 ml. (in two separate ampoules). In bronchial asthma and hay fever.

[P1-87] **Pitrenalin** (Parke, Davis, London). Pituitrin and adrenaline hydrochloride solution in twin ampoules producing, when mixed, a solution containing 5 i.u. of pituitary (posterior lobe) extract and 6 m. of adrenaline hydrochloride solution in normal saline to 1 ml. Dose.— $\frac{1}{4}$ to 1 ml. hypodermically.

[P1-87] **Riddobron** (Riddell Products, London). A solution containing papaverine, hyoscine, atropine methylnitrate, adrenaline, pituitary extract and nitrates for use as a spray in asthma and hay fever.

(A foreign proprietary of similar composition was formerly marketed in this country under the Registered Trade Name "Bronchovydrin.")

[P1] **Vernol Ointment** (Allen & Hanburys, London). Contains adrenaline 1 in 5000 with anæsthesine 1 in 40. Soothing and astringent for catarrhal conditions of the nasal mucous membrane.

SOME COMPOUNDS RELATED TO ADRENALINE

Epine (Burroughs Wellcome, London). 3:4-Dihydroxyphenylethyl-methylamine. $C_8H_{11}(OH)_2 \cdot CH_2 \cdot CH_2 \cdot NH \cdot CH_3 = 167.1$.

A 1 in 100 solution equals a 1 in 1000 solution of adrenaline. Solutions acidified by the addition of 0.5 ml. of sulphurous acid to 100 ml. are more stable than adrenaline solutions.

It is supplied in 1% solution to be diluted with normal saline. It resembles adrenaline in action, but the rise of blood pressure though not so intense is said to be more prolonged. For use in ophthalmic work 0.1%; as a styptic to bleeding surfaces 0.01 to 1%; and hypodermically 1% solutions are used. For intravenous use 1 ml. of 1% solution is diluted with 500 ml. of normal saline.

Paredrine (*Smith, Kline & French, Philadelphia*). *p*-Hydroxy- α -methylphenylethylamine hydrobromide. Has a powerful pressor action due to stimulation of the smooth muscle of the arterial wall and is effective when given by mouth, intramuscularly or intravenously. Good pressor effects with 20 or 30 mg. orally, 10 or 20 mg. intramuscularly, and 5 or 10 mg. intravenously.

It possesses about $\frac{1}{10}$ the pressor activity of adrenaline when given subcutaneously and twice that of ephedrine on oral administration. Its chief clinical effects are raising of the blood pressure, dilatation of the pupil and constriction of the blood vessels of the nasal mucosa. No appreciable effect is produced on the central nervous system and in reasonable doses it has no effect on asthma. —Abbot and Henry, *Amer. J. med. Sci.*, 1937, 193, 661.

Paredrine is useful in raising the blood pressure to satisfactory levels if it becomes unduly lowered by spinal anaesthesia; it has little or no direct effect on the heart, its direct action being apparently limited to the peripheral vessels. No untoward effects have been noted following its administration. The procedure adopted is as follows: when the systolic pressure falls markedly, but not below 50, 10 mg. is given intramuscularly. If no rise occurs within 5 minutes a second injection of 10 mg. is given intramuscularly. If the systolic pressure falls below 50, 5 mg. is given intravenously. When the systolic pressure has again fallen below 100, usually in 15 or 20 minutes after intravenous injection, 10 mg. is given intramuscularly. —M. D. Altschule and S. Gilman, *New Engl. J. Med.*, ii/1939, 500.

Stryphnon (*Camden Chemical Co., London*). Preparations of methylaminocatechopyrocatechin for use as a hæmostatic, available as the solution (5%), suppositories (3%), injection (subcutaneous 0.5%, intravenous 0.05%) and in other forms.

Pholedrine. *Prop. Name*. VERITOL (*Knoll, London*). (Tablets, 0.05 g., solution, 3%, and ampoules, 1.1 ml. of 2% solution).

Dose.—(As a circulatory tonic) 10 to 20 drops or $\frac{1}{2}$ to $\frac{1}{4}$ tablet several times daily, or $\frac{1}{2}$ ampoule intramuscularly or subcutaneously, or $\frac{1}{2}$ ampoule intravenously. (As a restorative in collapse) $\frac{1}{2}$ to 1 ampoule intravenously hourly if necessary, or 1 ampoule intramuscularly or subcutaneously.

β -(4-Hydroxyphenyl)-isopropylmethylamine, a circulatory stimulant and restorative, having a less rapid but more prolonged action than adrenaline, and without the cardiac effects of ephedrine.

In hypotension and collapse, poisoning by carbon monoxide, hypnotics, etc., in infectious diseases such as pneumonia, diphtheria, etc., in surgical and traumatic shock, and for pre- and post-operative treatment of the circulation.

Its action lies between that of adrenaline and ephedrine; it resembles adrenaline in its low toxicity and absence of toxic effects on the heart and ephedrine in its long continued action and activity after oral administration. In the healthy human subject 10 mg. injected intravenously raised the blood pressure for 10 to 15 minutes; after intramuscular injection the rise persisted for 40 to 60 minutes; the effect of 40 to 80 mg. taken by mouth lasted for 2 hours. It is reported that blood-pressure levels of 200 mm. can be attained in this way. The most convincing objective evidence of efficiency is the rapid and sustained rise of blood-pressure which takes place in collapse and shock. In its effect on respiration it does not appear to be comparable with such substances as Coramine and Cardiazol. The main indication for the drug in the surgical field is the treatment of failure of the peripheral circulation during and after an operation. It has also been used successfully in broncho-pneumonia in children (given by the mouth alternately with Cardiazol) and in the acute heart failure of toxic diphtheria. —*Lancet*, ii/1938, 1070.

Clinically it has been found of considerable value in the prevention or control of surgical shock. Oral administration is not advised as the effects are inconstant. After intravenous injection the effects come on very rapidly, but sometimes pass off in about a quarter of an hour. Intramuscular injection produces a slower but more prolonged effect. With ordinary doses, 20 mg., the blood pressure is not much raised in the normal, but good effects are produced where the blood pressure is low. —R. St. A. Heathcote, *Med. Annu.*, 1939, 380.

Of all the drugs so far tried it is the most satisfactory for raising the blood pressure. The dose for intramuscular injection is 0.75 to 1 ml.; nothing less than 0.75 ml. is effective with a low blood pressure. The blood pressure begins to rise in 3 to 5 minutes and progresses to a maximum in about 20 minutes, usually reaching the normal systolic figure. The fall from this level mostly takes place during the succeeding 20 to 40 minutes, when, if the operation is still proceeding, a further dose of the same amount may be considered necessary. Subsequent injections continue to be effective, although in a truly shocked patient 1.5 ml. is usually needed. Veritol given intravenously acts immediately, and according to the dose raises blood pressure to the normal systolic level or considerably higher. It has been found by experience that 0.25 ml. is the useful dose during operation; the effect is probably over in 20 to 25 minutes. Combined intramuscular (0.75 ml.) and intravenous (0.25 ml.) injections will restore the blood pressure almost immediately and maintain it for 30 to 45 minutes. It may also be given with advantage to debilitated patients for a few days after major operations (0.75 to 1 ml. intramuscularly) when a steady rise lasting 40 to 60 minutes follows, with a general improvement and feeling of well-being. No unpleasant effects have been noted.—H. Dodd, *Lancet*, i/1940, 360.

The pharmacological actions and therapeutic uses of some compounds related to adrenaline.—J. A. Gunn, *Brit. med. J.*, ii/1939, 155, 214.

[P1] Suprarenal (or Adrenal) Gland.

Small, flattened, yellowish bodies—one at the upper end of each kidney. In man each gland weighs about 4 grammes. Each suprarenal gland is enclosed in a fibrous capsule and is composed of two parts, a cortex and a medulla. The cortex contains a glandular epithelium embedded in a fine network of connective tissue; the medulla contains finely granular chromophil cells permeated by large venous sinusoids.

[P1] **Suprarenalum (B.P.C.).** *Syn.* POUDRE DE GLANDE SUPRÉNALE (*Fr. Cx.*).

Dose.—1 to 5 grains (0.06 to 0.3 g.) three times a day.

The cleaned, dried and powdered suprarenal glands of oxen or other mammals. An average sheep's gland weighs about 30 grains (2 g.) and yields about 5 grains of dry powder.

By glycerin extraction of adrenal glands a pressor principle effective orally can be obtained. It is believed to differ from adrenaline.—Hoskins and Gottlieb, *Endocrinology*, 1936, 20, 188.

Uses. Originally the fresh glands were used in the treatment of Addison's disease, later the dried glands were used, also liquid extracts and, lastly, an extract prepared from the cortex of this gland is now used in this disease. The active principle of the medulla is adrenaline (*vide antea*). The whole gland has also been used in the treatment of Graves' disease.

Raw adrenal gland of value in post-influenzal debility— $\frac{1}{2}$ gland thrice daily on an empty stomach. Also of value in preventing attacks of asthma.—L. J. Picton, *Brit. med. J.*, i/1927, 641.

[P1] Suprarenal Snuff.

Dry suprarenal gland 1, menthol 2, ammonium chloride 6, boric acid 4, lycopodium 4; for use in hay fever.

[P1] **Adreno-Cortin (Endocrines-Spicer, Watford).** Capsules of adrenal cortex extract, each containing 5 m. In Addison's disease and in less severe fatigue syndromes, including those due to infectious diseases. *Dose.*—1 to 2 twice or thrice daily.

[P1-S7] **Adreno-Spermin (Endocrines-Spicer, Watford).** Tablets contain total adrenal, thyroid, spermin extract (from gonads), and Calcium Phosphorus Co. Asthenic conditions.

[P1] **Extractum Suprarenali Corticis (B.P.C.).** *Syn.* CORTIN.

Dose.— $1\frac{1}{2}$ to $2\frac{1}{2}$ drachms (5 to 10 ml.).

An aqueous solution of the active principle, or principles, of suprarenal cortex obtained by extraction with alcohol and subsequent purification with benzene, acetone and light petroleum.

Glycerin Extract for Oral Administration. Fresh, ground beef cortex was extracted with an equal volume of glycerin at 4° for several days. An equal volume of alcohol was then added, the product filtered through crystallite to remove adrenaline and the alcohol removed from the filtrate *in vacuo*. 1 ml. of glycerol extract represented about 1.5 g. of fresh cortex and it contained from 1:10,000 to 1:50,000 of adrenaline. It was employed in Addison's disease, usually in doses of 2 to 4 ml. three times daily after food, but up to 20 ml. per day was tried. Results in early cases were completely satisfactory, provided treatment was continuous and all stresses avoided. In severe cases the extract sufficed only under the most favourable circumstances and in the absence of strenuous activity.—F. A. Hartman, G. W. Thorn and R. R. Durant, *Endocrinology*, 1937, 516.

PHYSIOLOGY. The cortex of the suprarenal gland is essential to life, although the medulla may be removed without causing death, providing the cortex is undamaged. Extracts of the cortex when injected relieve the symptoms of Addison's disease, and up to the isolation of the crystalline principles of the gland was used mainly for this purpose. Death following removal of the suprarenal cortex is considered to be due to circulatory collapse resulting from insufficient circulating fluid, the volume of which is controlled by the suprarenal cortex. Hence the value of extracts of the cortex or preparations of the cortical hormones in the treatment of traumatic shock.

The relationship of the suprarenal cortex to sodium and chloride metabolism has been much discussed. It appears that early in the course of adrenal insufficiency the rate of sodium excretion through the kidney increases and the concentration of sodium ions in the blood decreases. There is also a decrease of chloride or of bicarbonate or of both. The loss of sodium from the body is accompanied by a loss of water which leads to decreased blood volume and a state of shock, and to a rise in serum potassium.

Ascorbic acid occurs in the suprarenal gland. It is present in considerable quantities in the cortex and to a less degree in the medulla. Whether the gland merely serves as a reserve storage organ or requires the vitamin for its own normal functioning is still a matter of controversy.

Uses. Suprarenal cortex extract is employed in the treatment of Addison's disease, though it has now been replaced to some extent by desoxycorticosterone acetate. It has also been used in neurasthenia, traumatic shock, the acute toxæmia of burns, Paget's disease, and in the persistent vomiting of pregnancy.

(For use of sodium chloride in Addison's disease, *see under Sodii Chloridum*.)

ADDISON'S DISEASE. Chief value of cortical extract in Addison's disease is in treatment of the relapse; the extract has no definite effect on hypotension or pigmentation.—G. A. Harrop *et al.*, *Amer. med. Ass.*, i/1933, 1850.

Cortical extract in adequate dosage, by itself or in addition to salt therapy, gives a much better clinical response than salt alone. When the dose of cortical

extract is adequate the addition of salt is of no benefit, but when it is inadequate the addition of salt may help appreciably. When patients have gone into a crisis in spite of having large doses of salt, the administration of cortical extract has produced recovery.—S. L. Simpson, *Proc. R. Soc. Med.*, 1936, 29, 1143.

Nine cases of Addison's disease were treated. Four deaths occurred, one from auricular fibrillation while the Addison's disease was in remission, and three from the disease itself. The remaining five have responded well to the treatment; they have survived for periods from 19 to 37 months at the date of the report and were then receiving maintenance doses of sodium chloride only (7.5 to 15 g. per day) without cortical extract, and were showing steady improvement. Very large doses of cortical extract (up to 40 or 50 ml. daily) were required in some of the cases in the initial stages.—J. F. Wilkinson (*Report to Therapeutic Trials Committee*), *Lancet*, ii/1937, 61.

BURNS, ACUTE TOXÆMIA OF. In severe toxæmia death within 100 hours is the usual outcome, whatever the treatment, but three such cases in which a fatal outcome was to be expected recovered following the use, as an adjuvant measure, of extract of suprarenal cortex (Eucortone). A dose of 1 ml. subcutaneously every two hours from the onset of acute toxæmia will suffice for a child, and 2 ml. or more every hour for an adult; injections should be continued till 100 hours after injury and renewed if toxic manifestations reappear. It should only be considered, however, as an adjuvant measure.—W. C. Wilson, G. D. Rowley, and N. A. Gray, *Lancet*, i/1935, 1400.

CONFUSIONAL STATES. Five cases of acute confusion developing during typhoid fever were successfully treated with suprarenal cortical extract 2 ml. with vitamin C daily intravenously. Four cases of mental confusion in the puerperium also responded well to the treatment.—H. Hoff and J. A. Shaby, *Lancet*, i/1940, 27.

ENTERIC FEVER. All but one of 15 cases of enteric fever (7 typhoid, 8 paratyphoid) showed immediate improvement following intravenous injection of suprarenal cortex extract and vitamin C. As soon as diagnosis is established intravenous injections of suprarenal cortex extract are begun, in doses between 5 and 20 ml., according to the age and state of the patient, the usual daily dose being 10 ml. with 500 to 1000 mg. of vitamin C. The two products are mixed in the same syringe. During the same day two more doses of 500 mg. vitamin C are injected at 4-hourly intervals. The combined administration is continued for 5 to 12 days and is followed by two intravenous injections daily of 500 ml. of vitamin C alone for at least 7 days. The effect is dramatic from the first injection, and there is no pain, shock, or reaction. There is abundant urination and a gradual fall of temperature to normal between the third and seventh day. Three cases of acute *B. coli* infection were also successfully treated in the same way.—Najib-Farah, *Lancet*, i/1938, 777.

PAGET'S DISEASE is favourably influenced by treatment with adrenal cortex. The high blood phosphatase tends to fall to normal, with improvement in clinical symptoms.—L. Berman, *Endocrinology*, 1936, 20, 226.

Used with benefit in 9 cases. Cortin was given intramuscularly in amounts of 5 to 10 ml. or more per week. In the majority of cases there was undoubted clinical improvement. Injections of desoxycorticosterone acetate and oral administration of adrenal cortical extract did not give such good effects.—E. M. Watson, *Canad. med. Ass. J.*, ii/1939, 561.

VOMITING OF PREGNANCY.—Nausea and vomiting of early pregnancy treated by desiccated suprarenal cortex, orally; also temporary improvement from cortex extract, intravenously.—W. N. Kemp, *Endocrinology*, 1932, 16, 434.

Improvement in 173 early cases of vomiting of pregnancy by subcutaneous injection of extract of suprarenal cortex for several days, followed by 9 to 12 gr. of desiccated suprarenal gland, reduced later to 6 gr. daily.—W. N. Kemp, *Med. Rec.*, N.Y., 1934, 14, 239.

[P1-S7] **Adspersen** (*Endocrines-Spicer, Watford*). Each ml. contains total adrenal 16 gr., and extract of reticulo-endothelial structures in a glycerinated solution for oral administration in asthenic conditions. *Dose*.—2 to 10 drops thrice daily in water at meals.

[P1] **Cortin Organon** (*Organon Laboratories, London*). Liquid extract of suprarenal cortex. 1 ml. equivalent to 50 g. of whole gland.

[P1] **Eschatin** (*Parke, Davis, London*). 1 ml. represents 40 g. of suprarenal cortex. *Dose*.—Severe cases, 10 ml. intravenously every 3 or 4 days; in less severe cases, 1 to 5 ml. subcutaneously.

[P1] **Eucortone** (*Allen & Hanburys, London*). 1 ml. is equivalent to 75 g. of suprarenal cortex or approximately 110 g. of whole gland.

[P1] **Supracort** (*Paines & Byrne, London*). 1 ml. represents 75 g. of fresh suprarenal cortex.

Suprarenal Cortical Hormones. Following the preparation of active extracts from the cortex of the suprarenal gland, further research culminated in the isolation in crystalline form of a number of active principles, the most potent of which was corticosterone with the empirical formula $C_{21}H_{30}O_4$. Shortly afterwards another substance, desoxycorticosterone, was artificially prepared from stigmasterol, a plant sterol occurring in the soya bean, and has proved to have ten times the activity of corticosterone. Since its artificial preparation desoxycorticosterone has been isolated from natural sources. As in the sex hormones, esterification of the cortical hormones prolongs and intensifies their action, and desoxycorticosterone is now obtainable in the form of its acetate for clinical use.

It has been shown that the adrenal cortex does not elaborate any single substance which can be described as the vital hormone of this gland. An extract of the adrenal cortex contains a surprisingly large number of closely related steroid derivatives which have specific effects qualitatively different one from the other. Substitution therapy in adrenalectomised animals is inadequate unless the hormones which influence gluconeogenesis and the efficiency of muscles are given together with the hormones that influence renal function and the distribution of water and the electrolytes.—E. C. Kendall, *Proc. Mayo Clin.*, 1940, 297.

Corticosterone. $C_{21}H_{30}O_4 = 346.36$. It has been isolated from the adrenal glands and from animal urine as a colourless, crystalline substance giving a strong fluorescence with sulphuric acid. Corticosterone differs from desoxycorticosterone in having a hydroxyl group on carbon atom 11. It melts at 180° to 182° and is soluble in alkalis and organic solvents.

Rat experiments indicate that pure corticosterone in aqueous solution is very effective in combating shock. Desoxycorticosterone is ineffective under similar conditions. The relative inefficiency of adrenal cortical extracts is probably due to the fact that the beneficial effects of the corticosterone are in part counterbalanced by harmful contaminating substances.—H. Selye and C. Dosne, *Lancet*, ii/1940, 70.

Desoxycorticosterone Acetate. *Prop. Names.* D.O.C.A. (*Organon Laboratories, London*), CORTIRON (*Schering, London*), PERCORTEN (*Ciba, Horsham*), SYNCORTYL (*Roussel Laboratories, London*).

$= 372.5$

Dose.—2 to 15 mg. by intramuscular injection.

Desoxycorticosterone acetate occurs in the form of fine needles melting at 157° to 159°, and soluble in oil.

Uses. The most important use of desoxycorticosterone acetate is in the treatment of Addison's disease in which its therapeutic action is similar to that of cortical extract, though there is evidence that it does not yield complete adrenal cortical replacement. It is usually given by intramuscular injection in oily solution in a dose of 5 to 10 mg. daily at the beginning of treatment, and 5 to 15 mg. weekly as a maintenance dose. There is usually a striking and continued improvement in the condition of the patient and the blood chemistry findings are restored approximately to normal. As an alternative method of administration, tablets containing 50 to 150 mg. may be inserted under the skin; good results are claimed for this method, but it is not recommended for patients in crisis.

The use of the substance is not devoid of risk; hypoglycæmia, oedema and hypertension are not uncommon complications and some deaths have been reported. It should only be employed where there are adequate facilities for recognising and dealing with any difficult situations which may arise during the course of treatment.

Originally this treatment was combined with a restriction of the potassium intake and an increase of the sodium intake, a measure essential to the success of treatment with cortical extract. Recent work, however, indicates that patients suffering from Addison's disease are able to tolerate a liberal intake of potassium when treated with desoxycorticosterone acetate, that excessive retention of salt and water occurs very readily when the intake of potassium is restricted, and conversely that a liberal intake of potassium has a tendency to counteract such retention. It would appear, therefore, that the use of the low potassium diet and the administration of extra sodium are not necessary in the treatment of Addison's disease with desoxycorticosterone acetate, and it is probable that the incidence of complications following the use of this substance will be reduced as the result of this modification in procedure.

In addition to its use in Addison's disease it is also of value in minor conditions of adrenal cortical insufficiency. There are good grounds for believing that such a deficiency occurs for instance in the case of severe burns, in surgical and traumatic shock, and in acute infectious diseases such as diphtheria, and intramuscular injections of 5 to 10 mg. daily have been employed with considerable benefit in such conditions.

ADDISON'S DISEASE. Desoxycorticosterone acetate was found effective in two patients with Addison's disease. It has a therapeutic action in Addison's disease similar to that of cortin. From the cases recorded it appears that 6 mg. of desoxycorticosterone acetate (1 ml. of oily solution) is equivalent to more than 5 ml., but less than 20 ml. of cortin.—S. L. Simpson, *Lancet*, ii/1938, 557.

The implantation of tablets of desoxycorticosterone acetate into the anterior abdominal wall brought about a prolonged improvement in the condition

of a patient suffering from Addison's disease and also a return of his urinary sodium concentration towards normal values.—H. W. Dryerre, *Brit. med. J.*, i/1939, 971.

In six patients who could not be maintained in a good condition by the administration of sodium chloride therapy alone, pellets of crystalline desoxycorticosterone acetate, weighing 50 to 150 mg. each, were inserted under the skin in the infrascapular region. There was a striking and continued improvement in all the patients. It was noted that one pellet of 100 to 150 mg. was required as a substitute for each 0.5 mg. of hormone in oil, and pellets weighing 50 to 150 mg. were absorbed at a rate of 0.25 to 0.35 mg. per day. No untoward reactions or signs of local discomfort were noted. This form of treatment is recommended as a substitution therapy for patients who have been restored to some degree of health by daily injections of hormone, but it is not recommended as suitable for patients in crisis. Additional sodium chloride therapy reduces the amount of desoxycorticosterone acetate required.—G. W. Thorn *et al.*, per *Practitioner*, ii/1939, 349.

The use of desoxycorticosterone esters (acetate or propionate) in patients with Addison's disease produces striking clinical and physiological effects, but extreme caution must be exercised, since excessive dosage may lead to the development of hypoproteinemia, marked oedema and cardiac insufficiency.—J. W. Ferree, *J. Amer. med. Ass.*, ii/1939, 1725.

The effect compared with that of aqueous cortical extracts in the treatment of Addison's disease. Patients have an increased sense of well-being on desoxycorticosterone acetate, and blood pressure and blood chemistry findings are restored approximately to normal. It has the advantage that it can be given in small injections and is less painful than cortin, but owing to the slow rate of absorption from the oily solution in which it is contained, it is of little use at times of severe crisis with serious vascular collapse.—R. A. Cleghorn *et al.*, *Canad. med. Ass. J.*, ii/1939, 226.

Striking and continued improvement in 21 out of 30 cases. The quantity of supplementary sodium chloride must be regulated carefully during treatment, since excessive doses of desoxycorticosterone acetate and added sodium chloride may result in the appearance of oedema, hypertension, and congestive heart failure.—G. W. Thorn and W. M. Firor, *J. Amer. med. Ass.*, i/1940, 2517.

Though clinical benefit followed its use in every one of 6 cases, there is evidence that it does not yield complete adrenal cortical replacement, and for the present it is not in the best interest of the patient to depend on desoxycorticosterone to the exclusion of adrenal cortex extract in the presence of crisis or if some symptoms are uncontrolled.—E. P. McCullagh and E. J. Ryan, *J. Amer. med. Ass.*, i/1940, 2530.

Given as the only form of replacement therapy in Addison's disease it does not appear to provide complete substitution for the normal adrenal cortex. It is highly probable that desoxycorticosterone does not represent the true hormone of the adrenal cortex, but only one of the physiologically active sterols produced by that gland, some additional factor or factors being necessary to restore the metabolic processes to normal in adrenalectomised animals. The known complications which may arise from the clinical use of desoxycorticosterone make its therapeutic use a procedure involving some risk, and until many details of its action are more thoroughly understood its use should probably be restricted. The complications of oedema and hypertension may be adequately controlled by reducing the intake of sodium salts to normal or even subnormal levels. Not only has it been found possible to allow normal quantities of potassium in the diet, but it has been found beneficial in some cases to administer extra potassium.—E. S. Gordon (Report of the Council on Pharmacy and Chemistry of the A.M.A.), *J. Amer. med. Ass.*, i/1940, 2549.

The tolerance of patients suffering from Addison's disease to potassium while such patients are being treated with desoxycorticosterone acetate.—T. B. Tooke *et al.*, *Proc. Mayo Clin.*, 1940, 353.

All cases in a state of crisis must receive cortical extract, or cortical extract plus desoxycorticosterone, salt and glucose. Mild chronic cases may keep in good health by taking up to 20 g. of extra salt daily. Moderate cases can be treated satisfactorily with salt and with desoxycorticosterone given either by injection or by implanted pellets. Several cases require salt, implanted pellets of desoxycorticosterone, and also small supplementary doses of cortical extract.—*Lancet*, ii/1940, 201.

BURNS. Successfully used in 8 cases of established toxæmia in children. A very definite clinical improvement took place coincidentally with the administration of the drug given in an average dose of 6 mg. intramuscularly every 2 hours; or it may be given intravenously by adding to the reservoir of the continuous drip (dextrose-saline) apparatus.—W. M. Dennison, *Lancet*, ii/1939, 1108.

MYASTHENIA GRAVIS treated by hypodermic injections of desoxycorticosterone acetate and by implantation of three pellets (150 mg. each) into the subcutaneous tissue of the abdomen; improvement both striking and dramatic.—R. C. Mochlig, *J. Amer. med. Ass.*, ii/1940, 123.

SHOCK. Desoxycorticosterone, which is most active in maintaining adrenalectomised animals, proved to have little if any effect in combating shock, even if large amounts were administered in divided doses. From this it may be concluded that some substance other than desoxycorticosterone is responsible for the high activity of the cortical extracts. In view of the fact that carbohydrate metabolism is seriously disturbed in shock, and that corticosterone is much more active in influencing carbohydrate metabolism in cases of adrenal insufficiency than desoxycorticosterone, it appears that the former might be responsible for the shock-combating effect of our cortical extract, which contains both these compounds. Until corticosterone becomes commercially available, active cortical extracts must be regarded as the most powerful hormonal agents which can be used for combating shock.—H. Selye *et al.*, *Canad. med. Ass. J.*, ii/1940, 7.

Adrenal cortical extract and desoxycorticosterone acetate given together both before and after trauma without other therapy, reduce the mortality from experimental shock in normal (non-adrenalectomised) rabbits. The difference in mortality between the treated and control animals is highly significant. Desoxycorticosterone acetate alone, given before trauma, is not effective, for the difference in mortality between this group and the controls is not statistically significant.—P. G. Weil *et al.*, *Canad. med. Ass. J.*, ii/1940, 11.

[P1] **Cortenil** (*Bayer Products, London*). Synthetic cortical suprarenal hormone preparation; 1 ml. = 5 mg. desoxycorticosterone acetate. *Dose*.—1 ml. once or twice daily intramuscularly. Addison's disease, asthenia, debility, severe burns and other conditions where there may be hypofunctioning of the cortical tissue.

[P1] **Cortigen** (*Richter, London*). 1 ml. contains 4 cortico-dynamic units of the suprarenal cortical hormone. *Dose*.—1 ml. daily, subcutaneously or intramuscularly.

Kidney.—Kidney substance has been given in nephritis and other kidney troubles, but the evidence of its value is conflicting.

Massive treatment said to be essential. Phenolphthalein should not be given simultaneously.

Nephritin Tablets (*Reed & Carnrick, Jersey City; Coates & Cooper, London*). Contains the hormones and internal secretions of the kidneys. *Dose*.—Four tablets four to eight times a day. *Dose* to be reduced as improvement occurs. For treatment of acute and chronic nephritis.

ÆTHER.

B.P., P. Dan., P. Jap. V.

Syn. ÆTHER DEPURATUS (*Fr. Cx.*), ÆTHER SULPHURICUS, ETHYL OXIDE (*U.S.P. XI*), SOLVENT ETHER.

Dose.—15 to 60 minims (1 to 4 ml.).

Ether is diethyl ether and is prepared by distilling a mixture of ethyl alcohol and sulphuric acid, with rectification of the distillate. The use of sulphuric acid gave rise to the misleading term "sulphuric ether," a name which rightly belongs to ethyl sulphate.

Ether is a colourless, transparent, very mobile liquid, with a characteristic odour and a sweet, burning taste. It volatilises very quickly and by so doing produces great cold. Although ether is one of the lightest of liquids its vapour is very heavy, being $2\frac{1}{2}$ times heavier than air. Only the quality of ether designated in the *B.P.* Anaesthetic Ether should be used as an anaesthetic. The quality described as Ether is suitable for general purposes and for use in chemical analysis. To emphasise this difference the Committee on General Chemistry of the Pharmacopœia Commission (*Report* 14) have recommended that the quality described as Ether should be named *Æther Solvens*, *Solvent Ether*.

Methylated ether for various technical purposes is prepared from industrial methylated spirit, or from duty-free alcohol with subsequent denaturation by the addition of wood naphtha. It can be obtained with specific gravities varying from 0.720 to 0.750. Methylated ether is unsuitable for both anaesthetic purposes and oral administration.

Caution. Ether is very volatile and inflammable and care must be taken not to use it near a flame. Mixtures of its vapour with oxygen, nitrous oxide or air in certain proportions are explosive.

Soluble 1 in $8\frac{1}{2}$ of water, and the ether similarly dissolves about the same amount of water. Is miscible in all proportions with alcohol. Ether is a solvent for a number of alkaloids, fats, resins, and of mercury perchloride and biniodide, also of bromine and iodine.

Antidotes. Treat as for poisoning by chloroform, see p. 401.

Uses. Internally ether is a rapid stimulant in syncope. Is carminative and may relieve dyspepsia and asthma. Hypodermically it may save many cases of syncope, collapse, and shock from hæmorrhage and injury, and intramuscular injections of 1 to 2 ml. have been employed in the treatment of whooping cough.

Ether has been used as an antiseptic dressing for wounds, and it is used as a menstruum and vehicle for skin medication, on account of its solvent action on sebaceous secretion. This solvent action has also been employed for dissolving gall-stones, the ether being injected into the common bile duct.

BRONCHITIS (post-operative). Intramuscular injection of 0.5 ml. of ether in 0.5 ml. olive oil, with the addition of a local anaesthetic. One such injection daily recommended in every case of acute or chronic bronchitis without emphysema.

GALL-STONES. Fragmentation of a stone in the common bile duct, and expulsion of the fragments into the duodenum, was accomplished by 3 daily injections each of 5 ml. of ether and 2 subsequent injections of a mixture of $\frac{1}{2}$ ethyl alcohol and $\frac{1}{2}$ ether.—W. Walters and H. R. Wesson, *Proc. Mayo Clin.*, 1937, 260.

The removal of gall-stones remaining in the common bile-duct after operation may be successfully achieved by the injection of ether into the duct. Following operation, a drain is inserted into the common duct and a few drops of ether are injected into the drain several times daily. This causes the stones to dissolve and the passage of the softened stones is facilitated by the injection of a small quantity of liquid paraffin. The method was successful in every one of 38 cases.—R. O. Pribram, *Lancet*, 1/1939, 1311.

The injection of ether into the biliary tract to dissolve gall-stones at first consideration appears to be a heroic measure, but it has been done in enough instances to make one feel safe in its use when done properly, though it can be applied only in a limited number of cases. The stone must be soluble, *i.e.*, either pure cholesterol or formed of small fragments bound together by cholesterol, and it must be so situated that it may be bathed directly with the solvent used.—C. M. Burgess, *J. Amer. med. Ass.*, i/1940, 2372.

OTITIS MEDIA, suppurative, has been treated by ether which is run into the affected ear and allowed to evaporate.

SCIATICA has been treated by injection of ether with either cocaine or morphine subcutaneously into the sciatic nerve. 5 minim doses of ether with 2 minims of 1 in 12 cocaine, or morphine injection 3 minims, using a 2½-inch needle.

WHOOPIING COUGH has been treated by ether injected intramuscularly in the buttock. Supposed to act by combating the spasmodic element of the disease. 1 ml. up to age of 7 or 8 months, and in older children 2 ml. repeated daily or on alternate days; also useful in broncho-pneumonia.

Provided there are no complications such as bronchitis or broncho-pneumonia present, whooping cough may be subdued within three weeks by the oral administration of ether. The following prescription is effective, inexpensive and pleasant to take: ether 2 m., tincture of quillaia 1 m., syrup simplex 30 m., water to 60 m. This represents a simple dose to be taken every 2 hours. For a day or two there may not be any marked change, but after that improvement is rapid and continuous, the paroxysms becoming less in frequency and severity until they cease altogether. Parents should be warned to keep the mixture in a cool place, tightly corked, and to avoid proximity to a naked flame when pouring out a dose.—W. T. Milton, *Brit. med. J.*, i/1938, 919.

Mistura Ætheris cum Ammonia (B.P.C.).

Dose.—½ to 1 ounce (15 to 30 ml.).

Contains 30 m. each of spirit of ether and aromatic spirit of ammonia in camphor water to 1 fl. oz.

St. T. H. has same ingredients with chloroform water, with *syn.* "PATENT"; with 1 gr. of camphor per oz., "CAMPHORATED PATENT." A rapid stimulant. *Gt. Orm. H.* has (for child 1 year old) spirit of ether 3½ m., aromatic spirit of ammonia 3½ m., tincture of orange 2 m., chloroform water to 1 dr.

Mist. Æther. (N.I.F.). Ether 10 m., ammonium carbonate 4 gr., syrup of orange 15 m., water to ½ oz.

Spiritus Ætheris (B.P.).

Ether 33% *v/v*, in alcohol (90%).

P. Belg. IV has ether 468, alcohol (94%) 532; *P. Ital. V* ether 1, alcohol (95%) 1; *F.E. VIII* ether 4, alcohol (90%) 1; *P. Dan.*, *P. Jap. V* and *P. Helv. V*, ether 1, alcohol 3; *Fr. Cx.*, ether 1, alcohol (90%) 1.

Dose.—15 to 60 minims (1 to 4 ml.).

The older formula is occasionally prescribed; *viz.*:—

Spiritus Ætheris Compositus (B.P.C.). *Syn.* HOFFMANN'S ANODYNE, LIQUOR HOFFMANNI, but the simple spirit of ether is now called Hoffmann's anodyne abroad.

Dose.—1 to 1½ drachms (4 to 6 ml.) for a single administration; 20 to 40 minims (1.2 to 2.5 ml.) for repeated administration.

An alcoholic solution of ether, about 1 in 8, with ethyl sulphate and ethyl hydrogen sulphate.

Syrupus Ætheris (Fr. Cx.). Ether 2%, alcohol (95%) 5%, water 23%, cold-prepared simple syrup 70%.

Æther Anæstheticus (B.P.). *Syn.* ÆTHER ÆTHYLICUS (*Fr. Cx.*), ÆTHER PURIFICATUS, ÆTHER (*U.S.P. XI, P. Ned. V, P. Helv. V, P. Belg. IV, P. Ital. V and F.E. VIII*), ÆTHER PURISSIMUS, ETHER OFFICINALIS, ÆTHER PRO NARCOSI (*P. Jap. V, P. Dan.*).

Limit tests are included for peroxides, acetone and aldehyde, and methyl compounds, which may cause unpleasant post-operative effects.

Anæsthetic ether should be stored in well-stoppered, amber bottles wrapped in black paper.

Storage of anæsthetic ether over solid caustic potash in dark bottles is recommended. Peroxidation is retarded and aldehyde formation accelerated by iron; decomposition of ether is increased in presence of light. It may also be preserved for 8 to 9 months without a stabiliser in the presence of iron, provided the products of reduction of the initial peroxides are removed.—A. Monkov, Z. Larionov and N. S. Gorgainova, *per Brit. chem. Abstr. (B)*, 1939, 212.

Mixtura Anæsthetica Composita (Fr. Cx.). *Syn.* SCHLEICH'S ANÆSTHETIC MIXTURE. Ether 30, chloroform 10, ethyl chloride 5, all by weight.

Anæsthesia with Ether.

Ether is almost universally considered safer than chloroform, and the occasional sudden deaths in the early stages of induction with chloroform, from cardiovascular inhibition due to vagal stimulation or from ventricular fibrillation, are unknown with ether, as also is the delayed poisoning which may follow the administration of chloroform. On the other hand, ether is more irritant to the mucous membrane and induces hypersecretion of mucus in the air passages; consequently there is an increased liability to inhalation pneumonia. The secretion of mucus by the stomach and the activity of the salivary glands are also stimulated, thus increasing the tendency to post-operative nausea and vomiting. This excessive secretion is greatly diminished by the pre-operative injection of 1 to 2 gr. of atropine sulphate, but ether must not be used where there is any affection of the trachea, bronchi or lungs. It has a toxic action on the liver and kidneys, and prolonged administration is contraindicated if there is any lesion of these organs. Ether has less effect than chloroform on blood pressure, and capillary oozing is therefore less easily controlled. Induction by ether alone is very unpleasant, and some other anæsthetic such as nitrous oxide or admixtures of ether with chloroform in various proportions are commonly employed until the second stage is reached.

For the production of anæsthesia ether may be administered by inhalation, in which the anæsthetic is vaporised by the patient's breathing, by insufflation, in which the previously vaporised anæsthetic is introduced directly into the mouth, pharynx or trachea by means of a suitable apparatus (*e.g.*, Shipway's), or rectally in oily solution. Other methods of administering ether have been proposed, such as delivery of ether vapour directly into the rectum, intravenous injection of a solution of ether in normal saline, or oral administration of 1 to 2 oz. of a mixture of equal parts of ether and liquid paraffin.

Administration as an inhalation anæsthetic may be by the "open," "semi-open" or "closed" method. In the former a piece of gauze tissue with a hole for the mouth and nose is placed loosely on the face, and above it is placed a wire mask (e.g., the Schimmelbusch) covered with a layer of gauze and a further layer of gauze tissue with a hole through which the anæsthetic is dropped on to the gauze. Air can enter around the edges of the mask as well as through it, in distinction from the semi-open method in which the mask fits the face more closely and is covered so as to prevent access of air. In this method expired air is re-breathed, and there is less chilling from evaporation of the ether; an adequate concentration of anæsthetic is thus more easily obtained and induction occurs more rapidly. Air must be admitted periodically in order to prevent asphyxiation. In the closed method the patient breathes into and from a bag into which air and the vapour of the anæsthetic are admitted as required by the anæsthetist.

The smell of pure ether, if used for induction, may be masked by the addition of oil of orange. Gwathmey has recommended the use of 1 oz. of "essence of orange" (oil of bitter orange 1, dehydrated alcohol 3) and 3 oz. of ether, in the hot-water bottle of the Gwathmey three-bottle apparatus.

When ether is to be employed for operations in which the presence of the mask would interfere, after induction by inhalation the anæsthetic may be administered by insufflation by means of a tube passed through the nose or mouth, according to the site of the operation, so that the vapour is delivered directly into the pharynx (intraparyngeal) or trachea (endotracheal). For endotracheal administration the insertion of the tube between the vocal cords is controlled with the aid of a laryngoscope, unless the condition of the mouth precludes its use. Intubation procedures may also be used with inhalation anæsthesia, but in this case the pharynx must be packed with lubricated plugs or in other ways, so as to prevent air being drawn in otherwise than through the tube.

Endotracheal anæsthesia is the method of choice for all operations on head, nose, mouth, and throat where satisfactory anæsthesia cannot be maintained with a free airway by the ordinary methods without inconvenience to the surgeon. When there is blood in the upper air passages it is a necessity.

Occasionally convulsions occur in patients under deep ether anæsthesia. It was at one time thought that these were due to the presence of impurities, such as peroxides or aldehydes in the ether, but proof of this was lacking. On the other hand, there is considerable evidence to show that the high temperature of the operating theatre, especially during the summer months, and the previous administration of atropine, are contributory causes. (*For a more detailed discussion of this subject see previous edition*).

CONVULSIONS. Description of 2 cases, 1 fatal. In both cases the ether in the bottle on the Boyle's machine was used for other patients with no ill-effects, and the same machine had been used, and the details of administration of the anæsthetics were the same as in 257 other patients anæsthetised during the previous 2 months.—H. G. Earnshaw, *Brit. med. J.*, ii/1937, 880.

The treatment for other convulsions is the early administration of even a small dose of Evipan.—H. Bailey, *Brit. med. J.*, ii/1940, 222.

Gwathmey's Oil-Ether Rectal Anæsthesia.

This method of anæsthesia may usefully be employed for laryngoscopic and bronchoscopic examinations and for operations on the mouth, nose, and throat. For rectal administration of ether the bowels are emptied by a cathartic given the previous evening and an enema on the morning of the operation. The anæsthetic is administered as a solution in olive oil, anæsthesia being complete in about 20 minutes and lasting for $\frac{1}{2}$ to 1 hour. The following dosage has been recommended: For children under 6 years a 50% solution is used, allowing 1 oz. for every 20 lb. of body weight. This is non-irritating and no preliminary medication is wanted. Between 6 and 12 years use 55 to 65% solution without preliminary medication. Keep the patient quiet and allow 20 to 30 minutes for the full effect. Use 1 oz. for every 20 lb. body weight as before. Between 12 and 15 years use the same percentage and amounts, with possibly the addition of $\frac{1}{12}$ gr. of morphine and $\frac{5}{160}$ gr. atropine hypodermically as a preliminary. From 15 years upwards a 75% mixture is used with the same amount as before—1 oz. to every 20 lb. It will be seen, therefore, that for an *adult* weighing about 160 lb., 8 oz. of the mixture would be wanted (i.e., ether 6 oz. and olive oil 2 oz.).

The 8 oz. should be passed in slowly, *i.e.*, it should take 5 minutes. A maximum strength of 65% is now advised by Gwathmey. The bowel should be washed out immediately after the operation and Vaseline smeared on the buttocks and thighs to avoid irritation from escaping ether.

Rectal ether and olive oil has many advantages over inhalation, *e.g.*, ease of administration, absence of apprehension in patient, and of coughing, retching, and straining, reduction of shock, and absence of post-operative vomiting.

Chief among the disadvantages is that depth of anaesthesia is not under such control as with inhalation. It causes irritation of the intestines. Must not be used in room with open flame.

In a series of 5000 anaesthetics slight diarrhoea occurred in only 6 cases and no deaths. (The retention enema now appears to consist of a 2 to 1 ether oil mixture with the addition of 2 dr. of paraldehyde.) A full description of technique is given. Has wider limits of safety than any inhalation method. Any pathologic condition of the bowel a contraindication.—J. T. Gwathmey, *J. Amer. med. Ass.*, **ii**/1929, 447.

Safe and easily controlled, to use in all bad surgical risks. Leaves minimum of bad effects after operations lasting many hours.—W. Wood, *Brit. med. J.*, **ii**/1929, 1156.

Synergistic Method of Painless Childbirth (Rectal Ether Analgesia).

This method depends on the supposed synergistic action of magnesium sulphate and ether, much smaller doses of both being necessary than when either is used alone. As originally advocated by Gwathmey, the procedure was as follows: when the os will admit three fingers, 0.006 g. ($\frac{1}{16}$ gr.) of morphine in 2 ml. of a 50% solution of magnesium sulphate is injected intramuscularly. The injection is repeated in 2 or 3 hours if the pain is not relieved. At the same time, an enema composed of ether 70 parts, alcohol 8, quinine hydrobromide 0.6, and olive oil to 120 parts, is administered. Sometimes a mixture of ether 90 and chloroform 10 is used instead of ether alone.

The method is not claimed to give painless childbirth, but it gives great relief during the agonising part of the ordeal in some 90% of cases, without bad effects on mother or child.

The disadvantages are the intricacy of technique, the length of time that must be spent at the bedside, the necessity of isolating the patient, and the possibility of proctitis following the introduction of ether into the rectum.

Gwathmey's original technique has now been modified in certain respects, as follows:

The formula for the rectal mixture as now used is ether $2\frac{1}{2}$ oz., quinine alkaloid 20 gr., alcohol 45 m., paraldehyde 2 dr., and liquid petrolatum or olive oil to 4 oz. The technique has been modified by the omission of the magnesium sulphate injection and the substitution of Numbutal by mouth; by the use of the degree of the patient's suffering instead of the amount of cervical dilatation as a time criterion for administration of sedatives and rectal instillations; by the substitution of a 5 to 10% solution of sodium bicarbonate (a heaped teaspoonful in a quart of water) for the soapsuds enema. If the Numbutal is not given within 8 hours after the initial enema the enema is repeated. The enema should not be given just before the rectal instillation—if this is unavoidable, any remaining water is siphoned back before the rectal instillation. Instead of the first two injections of magnesium sulphate the patient is given orally 3 gr. and $1\frac{1}{2}$ gr. respectively of Numbutal; $\frac{1}{2}$ or $\frac{1}{4}$ gr. of morphine is usually given hypodermically with the second dose of Numbutal in a primipara in active labour, but if the labour is not uncomfortably active or is of the prolonged type, the second dose of Numbutal may be repeated once or oftener before the morphine is given (not more than 10 to 12 gr. in 24 hours). When the effects of the

morphine begin to wear off the ether-oil-quinine solution is given per rectum and repeated as often as required, omitting the quinine after the second instillation. Omit morphine if delivery is anticipated within 4 hours—if it is anticipated within 4 hours the Nembutal and the rectal instillation are promptly given simultaneously. During the administration of the instillation the patient is told to breathe deeply, with mouth open, and to draw up with the anal sphincter. After all the ether mixture is passed out of the catheter, the catheter is clamped to prevent air being drawn into the rectum. The catheter is then gently withdrawn and pressure made with a towel over the anus during 3 or 4 contractions. The instillation may be given at intervals of 2½ hours if necessary. At delivery, ethylene, nitrous oxide or ether is given by inhalation, but *not* chloroform. When the baby is born, if a gas-oxygen apparatus is used, all anæsthetic is cut off and 5% carbon dioxide and oxygen under pressure is given before the cord is cut. It is the safest of all satisfactory analgesias used to date. Several series of many thousands of cases have been reported, no maternal or infant mortality being attributed to its use. In addition, the patient rarely has more than a vague recollection of the labour. There are no major physical contraindications, it is not likely to prolong labour, and the baby suffers no ill-effects.—J. T. Gwathmey and C. O. McCormick, *J. Amer. med. Ass.*, ii/1935, 2044.

ÆTHYLIS CHLORIDUM

B.P., P.G. VI, U.S.P. XI, Fr. Cx.

Syn. CHLORYL ANÆSTHETIC, ÆTHANOLI CHLORIDUM (P. Belg. IV).

At ordinary temperatures ethyl chloride is gaseous, but condenses when slightly compressed into a colourless mobile liquid with a sweetish burning taste. Slightly *soluble* in water, readily in alcohol. Sp. gr. about 0.921 at 0°.

Antidotes. Treat as for poisoning by chloroform, see p. 401.

Uses. Its main use is as a local anæsthetic by freezing and as a general anæsthetic by inhalation. On account of its low boiling-point (about 12.5°) and the intense cold produced by evaporation, it is effective as a local anæsthetic in minor surgery, also for neuralgia. The part should be washed with soap and then with alcohol or ether before applying. In dental cases the patient is instructed to breathe through the nose during operation, the part is well dried, and other parts protected. Its vapour is inflammable.

As a general anæsthetic ethyl chloride is not unpleasant; induction is rapid, occupying a minute or less, and recovery is also rapid although some patients experience nausea and malaise for a short time. As a single anæsthetic its main use is for minor surgery, such as tonsillectomy and dental extractions, in children, by whom nitrous oxide anæsthesia is badly tolerated owing to oxygen deprivation. In both adults and children it is useful for induction prior to maintenance with ether, the latter being administered as soon as breathing becomes regular. When used alone it produces an anæsthesia lasting for 1 to 2 minutes followed by analgesia for a further 30 to 40 seconds. It may be administered by either the semi-open or closed method (*vide* Æther), the latter being adopted for children (*e.g.*, using the Loosely bag).

Cardiac failure may occur as with chloroform, and there may be muscular spasm making artificial respiration difficult owing to rigidity of the chest wall.

Nasal administration of ethyl chloride.—R. B. Gould, *Brit. med. J.*, i/1934, 1073.

DENTAL EXTRACTIONS under ethyl chloride at Gt. Ormond St. Hospital for Sick Children found satisfactory. Closed method with a Loosely bag is used. 60 to 180 seconds' surgical anaesthesia.—H. Sington, *Brit. med. J.*, i/1930, 217.

Thilocologne (*Coates & Cooper, London*). A brand of ethyl chloride and eau de Cologne.

Anestile (*Bengué, London*). A mixture of ethyl chloride and methyl chloride for use as a local anaesthetic.

Ethylis Bromidum (*B.P.C.*, *P.G. VI*, *Fr. Cx.*, *P. Jap. V*, *P. Helv. V*, *P. Belg. IV*, *F.E. VIII*, *P. Ital. V*). *Syn.* HYDROBROMIC ETHER. $C_2H_5Br = 109.0$.

A colourless, very volatile liquid with a strong peculiar odour and a sweetish warm taste. Contains 1% of alcohol to prevent it becoming brown on exposure owing to decomposition and liberation of bromine. Sp. gr. 1.453 to 1.457. B.p. about 38°.

Soluble 1 in about 100 of water, and miscible with alcohol 90% and ether.

Has been used by inhalation for short general anaesthesia but is too potent a respiratory depressant.

For local anaesthesia it may be used as spray. For neuralgia it may be applied directly to the skin and covered for a short time. Capsules encased in cotton wool and silk, and containing 5 minims in each, are convenient for use by inhalation when crushed. They are useful in asthma and epileptic convulsions.

Ethyleni Dibromidum. $C_2H_4Br_2 = 187.9$. *Dose*.—1 to 2 minims in alcoholic solution or oily solution hypodermically, or in gelatin capsules. A colourless liquid of sp. gr. about 2.18.

Ethylis Iodidum. *Syn.* HYDRIODIC ETHER. $C_2H_5I = 156.0$.

Dose.—By inhalation, 3 to 5 minims (0.2 to 0.3 ml.).

May be obtained by distilling a mixture of alcohol, iodine and phosphorus. A colourless, non-inflammable, heavy liquid with a penetrating odour. It is liable to become coloured on exposure to air and light owing to liberation of iodine. B.p. 71° to 72°; sp. gr. about 1.943.

Soluble 1 in 440 of water; miscible with alcohol and ether.

Uses. It is useful *inhaled* either alone or mixed with twice its volume of chloroform to relieve the dyspnoea of bronchitis, whooping cough and bronchial asthma. As it contains four-fifths of its weight of iodine, it forms a rapid means of saturating the system with this element; iodine can be detected in the urine 10 minutes after inhalation, and as long as 30 hours after; it neither impairs appetite nor weakens digestion.

In bronchial catarrh it induces sleep and promotes expectoration when inhaled. It is useful for inhalation in oedema of the glottis from catarrhal laryngitis. It acts as an antispasmodic in angina pectoris, spasmodic asthma and certain forms of nervous dyspnoea.

Inhalations have also been successfully employed in the treatment of fungous diseases of the skin.

For inhalation it may be obtained in capsules enclosed in cotton wool and silk and containing 5 minims. The capsules are broken by pressure when required. Capsules are also obtainable containing 5 m. of ethyl iodide and 10 m. of chloroform.

Externally 10 to 20% ointment with paraffin basis may be used (stronger may blister). The system may be saturated with iodine by painting the iodide on the calf of the leg or between the shoulders, and covering with impermeable dressing.

MYCOTIC AFFECTIONS OF THE SKIN treated by ethyl iodide inhalations. A large amount of iodine enters the blood stream and only a small amount is returned in the venous blood, hence the tissues are exposed to large amounts. Inhale 1 ml. in about 20 minutes. Fungus cured. Should be tried in asthma, hypertension, and tertiary syphilis.—*Brit. med. J. Épit.*, i/1930, 62.

Ethyl iodide inhalations are a valuable means of combating the more severe and persistent fungous infections of the skin and mucous membrane. It should be tried for systemic fungous infections and should be of particular value in broncho-moniliasis. Begin with 2 ml. and increase by 0.5 ml. per dose until 4 ml. is reached, and continue with this dose. In systemic fungous infection doses as high as 5 and 6 ml. have been given without toxic effect. For children, these doses are halved. In order to avoid accumulation, treatment is omitted every third day, 48 hours being allowed to permit almost complete elimination of the accumulated iodide. It is important that the room be well ventilated during the inhalation, and the patient is advised to inhale and exhale through the mouth, the average time taken to inhale 2 ml. being about 20 minutes. The treatment is contraindicated in impaired excretory function of the kidney, in thyrotoxicosis and in active pulmonary tuberculosis. The complications following treatment are mainly cutaneous eruptions which clear up on discontinuance; peripheral neuritis occurred in 3 out of 244 cases, but cleared up in about 3 weeks. In 400 patients treated the average number of treatments required to obtain cure or improvement was as follows: epidermophytosis 27, psoriasis 40, tinea capitis 35, favus 50, blastomycosis 40.—J. H. Swartz, *Arch. Derm. Syph. N.Y.*, 1939, 40, 962.

Methyl Iodide. $\text{CH}_3\text{I} = 142.0$.

A colourless liquid (when first made) boiling at 44° . Sp. gr. 2.285. As a vesicant is even more powerful than cantharides.

Blisters may be produced in a few hours by rubbing in 15 to 20 drops.

Methylis Chloridum. $\text{CH}_3\text{Cl} = 50.5$. This gas, made by distillation of methyl alcohol, sodium chloride and sulphuric acid, is supplied compressed to a colourless liquid boiling at -21° .

Soluble in water or alcohol, and readily soluble in ether and chloroform.

A local anæsthetic, valuable in neuralgia, sciatica and rheumatism. Spray the part for 5 or 6 seconds only. If effect too strong, apply glycerin. Effect may be reduced by covering the part with a thin layer of cotton wool.

Antidotes. Keep patient lying down and warm. Give fluids freely by mouth and enemas of 3% sodium bicarbonate with 5% dextrose. Avoid oils and fats. Oxygen inhalations if necessary. Potassium bromide, 60 gr. doses, may be required for the convulsions.

METHYL CHLORIDE POISONING. Possibility of toxic effects in this country due to its increasing use in refrigerators. The symptoms of poisoning are progressive drowsiness and apathy with nausea, vomiting and abdominal pain. Possibly muscular tremors and toxic convulsions with marked cyanosis. Pupils usually dilated; ptosis and nystagmus have been noted, also amblyopia. Temperature

risks, pulse and respiration rates are increased, blood pressure is lowered and the blood picture resembles primary anemia. Anuria is usual in more severe cases and albuminuria occurs in about 50%; the urine is acid. Cerebrospinal fluid usually fairly normal but sometimes under pressure. *Treatment*.—Fresh air, oxygen, alkalis; choral or chloroform must not be used to control convulsions. Coramine as a cardio-respiratory stimulant. Rest in bed till temperature and pulse normal and nervous symptoms abated.—A. P. Gorham, *Brit. med. J.*, i/1934, 529.

Intoxication occurring among workmen at refrigerating works employing commercial methyl chloride. A toxic agent, cumulative in action and detected in urine as ammonium formate.—H. M. Baker, *J. Amer. med. Ass.*, i/1927, 1138. See also T. M. Legge and H. B. Porteous, *Brit. med. J.*, i/1930, 414, 751.

Methylene Chloride. CH_2Cl_2 = 84.9. Has been used as an anæsthetic in Germany. Unsuitable for complete narcosis, but may be used to relieve the pains of labour by a process of intermittent administration.

AGAR

U.S.P. XI, P.G. VI, P. Svec. X, P. Helv. V, P. Dan., P. Jap. V, F.E. VIII.

Syn. AGAR-AGAR, GÉLOSE (*Fr. Cx.*), JAPANESE ISINGLASS.

Dose.—1 to 4 drachms (4 to 16 g.).

Consists of a dried decoction of various species of *Gelidium* (Rhodophyceæ). The sea-weeds are collected from rocks off the coast of Japan, bleached by exposure to the sun, boiled with water, and the filtered decoction concentrated by freezing or in other ways. The slabs so obtained are cut up and dried. It occurs as thin, translucent, greyish-white strips, or as yellowish, flattened bands, *insoluble* in cold water.

Uses. 1 in boiling water 200 forms on cooling a transparent jelly, suitable for invalids. It has little nutritive value—it is not digested—but is useful for treating constipation, especially of the type where the stools are hard and dry owing to complete absorption of liquid from the digestive tract. For this purpose it is best crushed into small pieces like bran—termed **Flaked Agar**. Clinical experience shows that finely-powdered or even sand-like powder is not efficacious. Teaspoonful doses occasionally of the dry substance in flake form sprinkled in a little moist food, e.g., stewed fruit, act as a mild aperient, softening the fæces, but should be employed at first in moderation, as it may possibly cause obstruction. By taking up moisture it increases the volume of the fæces and promotes peristalsis. It is used in the preparation of culture media for bacteria (*q.v.*).

Chondrus (*B.P.C.*). *Syn.* IRISH MOSS, CARRAGEEN (*Fr. Cx.*, *P. Ned. V, P. Belg. IV, P. Helv. V, P. Dan.*).

The dried sea-weed *Chondrus crispus* (Gigartinaceæ). It occurs as yellowish, translucent horny masses.

Uses. It is used in the form of a decoction as a demulcent in the treatment of coughs. Chondrus is also employed as an emulsifying agent and as a substitute for gelatin in the preparation of jellies for invalids.

Decoctum Chondri (B.P.C.). Syn. MUCILAGO CHONDRI.

Dose.—1 to 4 ounces (30 to 120 ml.) or more. 1 in 40. A useful emulsifying agent, especially when an homogeniser is available. Demulcent and nutritive; may be flavoured with sugar and lemon juice.

Cydonia (B.P.C., P. Helv. V). Syn. QUINCE SEEDS.

The seeds of *Pyrus Cydonia* (Rosaceae), containing about 20% of mucilage (cydonin). One part of the seeds with 40 of water yields a thick jelly used as mucilaginous agent in toilet preparations. **Mucilage** of quince is official in some pharmacopœias, the strength varying from 1 in 25 to 1 in 100. The strength 1 in 25 of cold water or rose water is generally preferred. It is prepared by macerating with the cold water for from $\frac{1}{2}$ to 2 hours, and straining without expression. **Decoction** of quince (1 in 80) is made by boiling for 10 minutes. A preservative is necessary.

Fucus (B.P.C.). Syn. BLADDER OR SEA WRACK, KELPWARE. The dried plant, *Fucus vesiculosus* (Fucaceae). Contains the gelatinous substance, algin, and a variable proportion, up to 0.2% of iodine. Was formerly used in goitre, obesity, and scrofula on account of its iodine content. It is recorded that a patient lost 20 lb. in weight in 9 weeks when taking the liquid extract, without bad results.

Extractum Fuci (B.P.C.), dose—3 to 10 grains (0.2 to 0.6 g.), is a soft extract prepared with alcohol 45%.

Extractum Fuci Liquidum (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.) before meals. 1 in 1.

Adiposettes (Riddell Products, London). Ext. fuc. vesic. 5.9%, Ext. frangul. 8%, lecithin 1%, tetraboryl-bis-propan-triolester 30%, triphenylcarbinol-o-carbonic acid glycolate 10%. Two to six tablets daily in obesity.

ALCOHOL ÆTHYLICUM

Alcohol Dehydratum (B.P., U.S.P. XI, Fr. Cx., P.G. VI, P. Jap. V, P. Helv. V, P. Dan.). Syn. ALCOHOL ABSOLUTUM.

Ethyl hydroxide, with not more than 1% w/w of water. Sp. gr. 0.7936 to 0.7967 representing not less than 99.4% v/v or 99% w/w.

Fr. Cx.—Sp. gr. must not exceed 0.79683 at 15°. *P. Ned. V* allows 2% of water; *U.S.P. XI* sp. gr. 0.798.

Antidotes (ACUTE POISONING). Empty stomach by emetic or stomach tube. Keep patient warm, apply cold to head. Give 1 dr. of aromatic spirit of ammonia in 4 oz. of water, and a cupful of hot black coffee. Strychnine, $\frac{1}{8}$ gr., hypodermically. Oxygen inhalations if necessary. Medicinal charcoal, $\frac{1}{2}$ oz. in water, has been recommended.

REFERENCE. 10% carbon dioxide in oxygen administered with open slot mask; carbon dioxide increases respiratory excretion of alcohol, and oxygen will save life of rabbits given a dose of alcohol lethal to controls. Oxygen effective by speeding oxidation of alcohol rather than by relieving oxygen want. Clinically, results are encouraging; treatment recommended for acute alcoholism when danger of paralysis threatens life.—Robinson and Selesnick, *Lancet*, i/1936, 50.

Alcohol (95%) (B.P.). Syn. ALCOHOL (U.S.P. XI, P. Helv. V, F.E. VIII), ALCOOL OFFICINAL or SPIRITUS RECTIFICATUS (Fr. Cx.), SPIRITUS RECTIFICATISSIMUS (P. Ital. V).

Contains 94.7 to 95.2% v/v or 92.0 to 92.7% w/w of ethyl hydroxide. Sp. gr. 0.815 to 0.817.

Alcohol (90%) (*B.P., P. Jap. V.*). *Syn.* SPIRITUS RECTIFICATUS, SPIRITUS VINI (*P. Austr.*), SPIRITUS (*P. Ned. V, P. Helv. V.*).

Contains 89.6 to 90.5% *v/v* or about 85.7% *w/w* of ethyl hydroxide. Sp. gr. 0.832 to 0.835. Strength 57.80° O.P. (*i.e.*, 100 volumes contain approximately the same quantity of ethyl hydroxide as 157.8 volumes of proof spirit). It is generally manufactured commercially of higher alcoholic strength, *i.e.*, about 70 O.P., sp. gr. 0.809, containing nearly 95% *w/w* of ethyl hydroxide, and is diluted as required.

For various pharmaceutical purposes dilutions containing 70, 60, 45, 25 and 20% by volume are convenient. Alcohols of these strengths when required for official preparations may be prepared from alcohol (95%) by dilution with water, as described in the *B.P.*

For Alcohol Dilution Tables see also Vol. II.

Alcohol Dilutum (*U.S.P. XI*). Contains 41.5% *w/w* or 48.9% *v/v* of ethyl hydroxide.

Note.—*U.S.P. XI* orders on occasion a mixture of "Alcohol" 3 parts and water 1 part as menstruum in making tinctures and fluid-extracts. This is approximately equivalent to 70% by volume.

Alcohol Dilutus (*P. Jap. V*) is alcohol 60%.

Proof Spirit. *Syn.* SPIRITUS TENUIOR (*B.P. '85*).

Proof Spirit contains 49.28% *w/w* of ethyl alcohol, or at 60°F., 57.10% *v/v* of ethyl alcohol. Sp. gr. 0.91976. It was defined in the Spirits Act, 1815, as that spirit which at 51°F. weighed exactly $\frac{1}{12}$ of an equal volume of distilled water. It may be prepared by mixing 5 volumes of rectified spirit (sp. gr. 0.838) with 3 volumes of distilled water.

The strength of alcohol is frequently stated in terms of proof spirit. Spirit of such a strength that 100 volumes contain as much ethyl alcohol as 160 volumes of proof spirit is described as "60 O.P." (over proof). Spirit of which 100 volumes contain as much alcohol as 40 volumes of proof spirit is described as "60 U.P." (under proof).

For the purposes of Customs and Excise the quantity of spirit is always expressed in proof gallons, obtained by adding 100 to the number of degrees "overproof." Hence it follows that the figure for the number of proof gallons is no direct indication of the volume of the spirit. For example: 100 gallons of 90% *v/v* alcohol ("57.8 O.P.") is equivalent to 157.8 proof gallons, while 100 gallons of 10% *v/v* alcohol ("82.47 U.P.") is equivalent to 17.53 proof gallons.

Uses. Alcohol administered internally is a depressant to the central nervous system, the apparently stimulating effect being due to early inhibitory action on the higher centres such as those controlling self-criticism and judgment. It stimulates the secretion of gastric juice, thus increasing appetite when taken before meals and improving digestion when taken during meals. Continued excessive dosage leads to chronic gastritis. Strong alcohol causes increase in the rate and strength of the heart beat, and the skin vessels are dilated, causing a sensation of warmth. It should not

be given to those in a cold atmosphere, since the vasodilatation and the depression of the heat-regulating centre cause a greater loss of heat. It is employed as a prompt reflex stimulant in fainting and collapse. In fevers, especially in acute pneumonia, it is valuable as a readily assimilated food, acting at the same time as a nerve sedative. Its food value is also useful in cases of diabetes when the diet must be restricted. Externally, alcohol is applied diluted in evaporating lotions in various superficial inflammations such as bruises, sprains, etc. Concentrated alcohol, *e.g.*, surgical spirit, is applied for the prevention of bed sores, for hardening the nipples prior to lactation, and as an anhidrotic. It is extensively used for sterilising the skin and instruments; the maximum bactericidal effect is exhibited by a 70% dilution; stronger solutions are less effective because less able to penetrate the bacterial cell. An injection of 15 m. of alcohol 80 or 90% into the Gasserian ganglion is of value in trigeminal neuralgia, owing to destruction of nerve tissue, but the relief is rarely more than temporary. Similar injections have been tried in other neuralgias and in sciatica, and it has been employed by intraspinal injection for the relief of pain in cancer. As a gargle or spray diluted alcohol is a useful local application in tonsillitis, pharyngitis and diphtheria.

A compress of alcohol applied on cotton-wool so as to cover the whole abdomen and covered with a cold-water compress and a layer of impermeable tissue, the cold water being renewed hourly, has been used in the treatment of typhoid fever, especially of children.

ANÆSTHESIA. *General anæsthesia* by alcohol in glucose solution. Two solutions are used: (a) Isotonic glucose solution, (b) 30 ml. of 96% ethyl alcohol in 70 ml. of 25% glucose solution. *Intravenous dose* is estimated according to patient's weight at 2 to 3 ml. of the 96% pure alcohol per kilo, but the maximum allowance is seldom exceeded. A few ml. of (a) is allowed to run in first. —J. D. Constantin, *Lancet*, i/1929, 1247, 1263; *ibid.*, i/1930, 1393.

CANCER. The subarachnoid injection of a mixture of 60% absolute ethyl alcohol and 40% absolute methyl alcohol is of value for the relief of intractable pain in advanced cancer. Puncture is performed in the interspace corresponding to the level of emergence from the cord of the nerves supplying the painful area, an amount of spinal fluid equivalent to the amount of alcohol to be injected being withdrawn. The head of the patient is kept at a lower level than the site of injection and the spine flexed to as acute an angle as possible at this point. 0.8 to 2.0 ml. of the alcohol mixture is injected slowly (at least 1 minute for each ml.). The patient is then kept as nearly as possible in the same position for 4 hours, then flat in bed for 12 hours, and confined to bed for several days. No serious complication, but preoperative administration of phenobarbital 0.2 g. and morphine 0.01 to 0.015 g. is of value. Visceral pain is less amenable than somatic pain. —J. E. Dumphy, *New Engl. J. Med.*, 1936, 214, 472.

The injection of sterile dehydrated alcohol in small doses is advocated for the relief of pain in chronic painful conditions such as cancer. A single subarachnoid injection usually gives relief for 10 to 12 months and obviates the need for large doses of narcotics. Excessive dosage may cause rectal and vesical incontinence. —E. L. Stern, *Med. Rec.*, N.Y., i/1936, 327.

The following procedure recommended for the relief of pain in the final stages of cancer of the bladder, prostate and rectum. Lumbar puncture is performed at the first lumbar interspace and 1 to 1.5 ml. of dehydrated alcohol injected slowly. The side on which pain is most severe is placed uppermost, the patient left in position for 10 minutes and then on his back with the foot of the bed raised for 3 hours. The second injection can be given a few weeks later or when necessary. —G. M. McKenna and E. Oldberg, *per Med. Annu.*, 1937, 56.

NEURALGIA. Intractable trigeminal neuralgia or tic douloureux has been treated by alcohol injections (80% usually employed). Injection of the nerve at the foramen ovale, or rotundum, relieves pain for at least a year, with injection of ganglion if neuralgia returns within 18 months.

Trigeminal neuralgia. Hartel injection route, using alcohol, into the region of the Gasserian ganglion.—L. Morris, *Lancet*, i/1931, 122.

Wilfred Harris now uses 2% Novocain to test cutaneous anaesthesia. Important to inject not more than 2 minims of alcohol at a time and test anaesthesia with a pin before injecting more. To correct commencing anaesthesia of the eye (causes "blinking") push needle another $\frac{1}{4}$ inch into ganglion, but before injecting watch for cerebrospinal fluid—if this appears withdraw partly and reinsert in a more backward direction.—*Brit. med. J.*, ii/1932, 88.

PROLAPSE OF RECTUM. Injection treatment using absolute alcohol, 1.5 ml. being injected on each side into the perirectal tissues at a depth of 2 to 2 $\frac{1}{2}$ inches, the needle being inserted about a $\frac{1}{4}$ inch from the anal margin. A pad is then placed in the perineum and kept in position by strapping the buttocks, the pad and strapping being reapplied daily for a week.—L. Findlay, *Brit. med. J.*, ii/1934, 340; H. Williamson, *ibid.*, 331.

PRURITUS VULVÆ. Successful results from alcohol injections in 41 cases (average duration 8 years) in which more conservative measures had failed. At one sitting, under general anaesthesia, from 2 to 4 minims of 95% alcohol were injected just beneath the dermis at each of a number of points at least 1.5 cm. apart. Oedema, thickening, and itching disappeared almost at once. 24 patients had enduring relief from one injection and in only two patients was the treatment completely ineffective.—W. M. Wilson, *J. Amer. med. Ass.*, i/1938, 493.

SCIATIC NEURALGIA. Alcohol injections recommended, but the small margin of safety demands strict adherence to proved technique.—C. W. Goff, *Amer. J. Surg.*, 1936, 37.

Alcohol in Medicinal Preparations.

The conditions under which alcohol may be obtained, used and sold are controlled through H.M. Customs and Excise. Two classes of spirit are recognised, Mature Spirit and Immature Spirit. The former is that which has been stored for at least three years in bond, the latter is that which has not been so stored, and which is used for the preparation of medicinal and other products. Both classes are subject to a duty which is payable at the time of purchase.

Rebate. When spirit on which the full duty has been paid is used in the preparation of medicinal products, the Customs and Excise will, under suitable conditions, allow a rebate. In order to claim the rebate, the manufacturer must comply with the official regulations, keeping a record of spirit purchased, how used, quantity of preparations produced, etc., in a register which must be open to inspection and balance by the Officers of the Customs and Excise. The claims for rebate are made to the local office of the Customs and Excise on a special form obtainable from them, and may be made once in every two weeks, but must not extend over a period longer than three months. Rebate is allowed on medicinal preparations such as Liq. Quinin. Ammon. B.P. or Tinct. Myrrhæ et Boracis B.P.C., but not on flavouring or colouring agents such as Tinct. Limonis B.P. or Tinct. Cocci B.P. Further, special permits are granted to draw rebate on formulæ which have been submitted to and approved by the Customs and Excise, provided the conditions of manufacture are complied with. The rebate claimed should be on the actual quantity of alcohol used in the manufacture of the preparation.

Drawback. For export purposes a drawback is allowed by the Customs and Excise equal to the amount of duty which has been paid on the spirit which is actually contained in the quantity of preparations exported. Claims for drawback must be made on official forms, and the various conditions imposed by the Customs and Excise must be complied with.

Further information on rebate and drawback can be obtained from the local Officer of Customs and Excise, who will advise inquirers of the conditions required.

Duty Free Alcohol. Under certain special conditions Immature Spirit can be obtained duty free for use where methylated spirit is unsuitable or detrimental, such as in the manufacture of esters, or for use by hospitals, schools, chemists, or other scientific workers for use in research or teaching. A bond must be given and the spirit must be denatured with 2% pure Methyl Alcohol in the presence of an officer of Customs and Excise in the place where it is to be used.

Sale of Medicated Wines and Rectified Spirit.

Although there is no statutory exemption permitting pharmacists to sell wines or spirits for medicinal use without an excise licence, in practice the Commissioners of Customs and Excise do not require an excise licence to be taken out by a person or limited company for the retail sale of medicated wines and sweets of the B.P., or other medicated wines and sweets or spirits which in the opinion of the Commissioners are sufficiently medicated to render them unsuitable as a beverage. The directions on the label as to dose, etc., must clearly indicate that the preparation is intended for use as a medicine. The Commissioners also allow the sale without licence of rectified spirit in quantities not exceeding 5 ounces at one time for medical purposes or scientific research.

[P2] **Alcohol Ammoniatum (B.P.C.).** A 10% *w/w* solution of ammonia gas in alcohol. Is used in the preparation of parogens.

Lotio Evaporans (B.P.C.). Alcohol, 1 in 8, with ammonium chloride and distilled water.

Spiritus Frumenti. Whisky prepared by distillation of fermented grain—barley, wheat, rye, Indian corn. Sp. gr. is usually about 0.925. It usually contains about 40% *v/v* of alcohol, 0.1 to 0.2% of higher alcohols, 0.03 to 0.08% of esters, 0.2 to 0.8% of volatile acid with traces of furfuraldehyde and other substances.

U.S.P. XI—From wholly or partly malted cereal grains and not less than four years old, 47–53% by vol.

Spiritus Vini Gallici. BRANDY. *Syn.* EAU DE VIE (*Fr. Cx.*). The liquid obtained by distillation of the wine of grapes and matured by age. Contains 40 to 50% (or 60% in case of good Cognac) by volume of alcohol. *P. Helv. V* requires a minimum of 50%, *Fr. Cx.* 45 to 55%, *P. Jap. V* 35 to 39%.

Contains about 0.05 to 0.15% of higher alcohols, 0.1 to 0.15% of esters, 0.05 to 0.2% of volatile acid with traces of furfural and other substances.

Spiritus Vini Vitis (U.S.P. XI) has 48 to 54% by vol., and is not less than 4 years old.

Mistura Spiritus Vini Gallici (B.P.C.).

Dose.—1 to 2 ounces (30 to 60 ml.), as a draught.

2 oz. contains about $\frac{1}{2}$ oz. of brandy with yoke of egg, sugar and cinnamon water.

Vinum Xericum (B.P.C.). *Syn.* SHERRY-TYPE WINE.

Prepared by the fermentation of grape juice. It may be either true sherry, prepared only in Spain, or wine of a similar type prepared elsewhere; such as in Australia or South Africa. It contains not less than 16% *v/v* of alcohol.

Vinum Xericum Detannatum (B.P.C.) is sherry-type wine detannated with gelatin. It does not yield precipitates with alkaloidal solutions.

Alcohol Allylicum. $\text{CH}_3\text{CH}_2\text{CH}=\text{CH}_2\text{OH} = 58.05.$

A colourless liquid miscible with water, with a pungent odour and burning taste. It inhibits bacterial growth.

Open chain derivatives containing unsaturated carbon atoms are more toxic than isomeric saturated bodies. Thus allyl alcohol is 50 times more toxic than normal propyl alcohol.

ALCOHOL AMYLICUM**B.P.C.**

Obtained by purifying fusel oil, and consists of a mixture of about 90% of primary isoamyl alcohol, $(\text{CH}_3)_2\text{CH}\cdot\text{CH}_2\cdot\text{CH}_2\text{OH}$, and 10% of primary active amyl alcohol, $\text{CH}_3\cdot\text{CH}_2\cdot\text{CH}(\text{CH}_3)\cdot\text{CH}_2\text{OH}$. Occurs as a colourless liquid with characteristic odour. B.p. 128° to 132°. Sp. gr. 0.815 to 0.817.

Soluble slightly in water; miscible with fixed and volatile oils and with alcohol, ether, chloroform and other organic liquids.

Amylis Acetas (*B.P.C.*). $\text{CH}_3\cdot\text{COOC}_4\text{H}_9$. A colourless, inflammable liquid with a powerful, pear-like odour. Very slightly **soluble** in water, miscible with ether, alcohol 90% and other organic liquids.

[P.] **Amylis Nitris** (*B.P., U.S.P. XI, etc.*). *Syn.* AMYLUM NITROSUM, AZOTITE D'AMYLE. $\text{C}_4\text{H}_9\text{NO}_2 = 117\cdot15$.

Dose.—By inhalation, the vapour of 2 to 5 minims (0·12 to 0·3 ml.); up to 10 minims may be inhaled. Very rarely it has been given by the mouth in doses of $\frac{1}{2}$ to 1 minim (0·03 to 0·06 ml.), or hypodermically in doses of 1 to 5 minims (0·06 to 0·3 ml.).

A yellowish ethereal liquid with a peculiar, not disagreeable odour; produced by the action of nitrous acid on amylic alcohol boiling between 128° and 132° , and consists chiefly of the nitrites of isobutylcarbinol, $(\text{CH}_3)_2\text{CH}\cdot\text{CH}_2\cdot\text{CH}_2\text{OH}$, and *sec.*-butylcarbinol $(\text{C}_2\text{H}_5)(\text{CH}_3)\text{CH}\cdot\text{CH}_2\text{OH}$. Should be kept cool; on exposure to the air it becomes comparatively inert.

Insoluble in water; miscible with alcohol and ether.

Thin glass capsules, encased in cotton-wool and silk, are made containing usually 3 minims, also 1, 2, 4, 5, 6 or 10 minims.

In use the capsule is broken, the liquid soaks the cotton-wool, and the vapour can be inhaled.

Incompatible with alkaline carbonates, potassium iodide, bromides and ferrous salts.

Antidotes. Empty stomach by emetic (if amyl nitrite has been swallowed). Keep patient lying down and warm. Apply artificial respiration if necessary and give inhalations of oxygen, alone or with 5% carbon dioxide. Injections of adrenaline or ephedrine.

Pharmacology. Amyl nitrite dilates the vessels and lowers blood-pressure. The vessels of the head and neck are most affected, and within 30 to 40 seconds after inhalation or swallowing a dose, the face flushes, the heart beats become rapid and violent, and the head and neck perspire. The effect on the pulse can be shown within 10 seconds of inhalation, but lasts usually for 2 to 3 minutes only. The rapidity of action is due to the large area of the lungs absorbing the drug—roughly 100 sq. metres—and to the thinness of the membranes (about $\frac{1}{1000}$ mm.) separating the air of the pulmonary vesicles from the blood.

Uses. It is mainly used for the relief of attacks of angina pectoris, acting by dilatation of the coronary artery. Its use is contraindicated in coronary thrombosis. In chloroform syncope amyl nitrite affords the quickest means of restoring the heart's action. It may be used in status epilepticus, and will frequently abort an epileptic fit if inhaled during the aura of an attack. Hæmoptysis can in most cases be immediately arrested if amyl nitrite is inhaled as soon as the first signs of blood are seen in the sputum. It is also valuable in cerebral and in post-partum hæmorrhage, and may be used to control menstrual flooding, *e.g.*, in tiding over fibroid disease until the menopause. It may also be used in migraine and neuralgic dysmenorrhœa and in the spasms of tetanus, false croup, whooping cough and strychnine poisoning. Inhalation of 1 minim may be used in infantile convulsions and

may cut short the attack. It is a powerful agent for causing relaxation of uterine spasms and hour-glass contraction, whether natural or caused by ergot; spasm of the bile duct during passage of a calculus may also be relieved by the inhalations. Externally amyl nitrite 10% in alcohol 90% has been applied to the scalp on alternate nights to assist the action of stimulant hair lotions such as pilocarpine hair lotion. Local application supplemented by inhalation has been used successfully in the treatment of urticaria, eczema and other skin diseases.

ANGINA PECTORIS. Observations upon angina pectoris. Nature and distribution of the pain, duration of attack, ætiology—the current theory is that it results from muscular anoxæmia—diagnosis, prognosis, treatment. If the blood pressure is raised during attacks the nitrites are useful, but useless if it is not raised.—John Cowan, *Brit. med. J.*, i/1931, 879.

No reason why amyl nitrite and nitroglycerin should not be used indefinitely. They enable patient to lead a more normal life.—Maurice Campbell, *Practitioner*, ii/1931, 35.

AORTIC INCOMPETENCE of syphilitic origin. Amyl nitrite gave almost instant relief of pain.—C. F. Coombs, *Brit. med. J.*, i/1928, 1012.

UTERINE SPASM. In cases of "contraction ring" amyl nitrite inhalation is the one method of treatment which alone seems to meet with universal success. Description of 5 cases, inhalation followed by delivery.—C. R. Croft, *Lancet*, ii/1928, 167.

VOMITING OF PREGNANCY. Spasm of the duodenum occurs in some cases of vomiting of pregnancy. In such cases relief may be obtained by inhalation of amyl nitrite or by administration of glyceryl trinitrate $\frac{1}{10}$ grain placed under the tongue 3 times daily.—J. M. McGowan *et al.*, *J. Amer. med. Ass.*, i/1938, 498.

Amyleni Hydras (*B.P. Add. III, P. Helv. V; P. Ned. V, P.G. VI*). *Syn.* DIMETHYL-ETHYL CARBINOL, TERTIARY AMYL ALCOHOL. $(CH_3)_2C_2H_5C-OH = 60.09$.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). The Continental pharmacopœias have maximum single dose 1 dr. approx., maximum in 24 hours 2 dr. May be given in capsules or in a mixture flavoured with liquorice.

A colourless liquid, of pungent taste and odour, resembling a mixture of paraldehyde and camphor.

Soluble in 8 of water; miscible with alcohol 90%, ether, chloroform and glycerin.

Uses. Hypnotic, occupying a position between chloral and paraldehyde; a stage of excitement may precede hypnosis. Capsules contain 10 minims in each. It is used as a solvent for tribromoethylalcohol in bromethol (*see p. 316*).

ALCOHOL ISOPROPYLICUM

B.P.C.

Syn. and Prop. Name. SECONDARY PROPYL ALCOHOL, DIMETHYL CARBINOL, AVANTINE (*Howards & Sons, Ilford*).

Isopropyl Alcohol Regulations, 1927.

Manufacturers, sellers and users of Isopropyl Alcohol in Great Britain and Northern Ireland must render returns to the Customs

and Excise authorities, showing the quantity manufactured, used, and/or sold, together with the names of purchasers, and the purposes for which the Alcohol has been used.

A colourless liquid with spirituous odour and somewhat burning taste, containing about 96% *v/v* (94% *w/w*) of C_2H_5O . Sp. gr. 0.808 to 0.810; b.p. 80.5° to 82.2° (B.P.C. gives sp. gr. 0.810 to 0.812, b.p. 80.5° to 81.5°). It is also obtainable containing 98 to 99% *w/w*, with sp. gr. 0.793 to 0.795 and b.p. 81.5° to 82.4°. In the anhydrous condition it has sp. gr. 0.788 and b.p. 82.4°. It is miscible with water or ethyl alcohol in all proportions.

Preparation. It may be made synthetically, *e.g.*, by reducing acetone, using sodium amalgam or by passing acetone and hydrogen over a metallic catalyst. It is also obtained from propylene, a by-product of the petroleum industry in the U.S.A., by absorbing the olefine gases, containing propylene, in sulphuric acid and hydrolysing the resulting alkylsulphuric acids.

The rectified product contains 91% of the alcohol; with dry caustic soda it can be made anhydrous.

Pharmacology. Isopropyl alcohol is twice as toxic as ethyl alcohol intravenously in cats. Vapour of isopropyl alcohol did not kill rats exposed to fumes (*cf.* methyl alcohol). 50 ml. given *per os* to a dog weighing 6.5 kilo. caused serious incoordination, but the animal completely recovered. Applied to wounds in concentration up to 50% allowed same to heal normally.

It is stated to be less toxic than *n*-propyl alcohol. Administration by mouth produces narcosis, in larger doses anæsthesia, finally coma and death. Very little is absorbed by inhalation or through the skin.

Uses. It is safe internally in small doses in dilute form, and could be used for making tinctures of drugs. It has been suggested as a surgical antiseptic and could, no doubt, replace ethyl alcohol in many surgical and medical procedures. In commerce, it is also suitable as a solvent for crystallising and for extract manufacture. It is now largely used in perfumery and in the culinary arts (flavouring essences). *Externally*, it has been found harmless to the skin and hair, and within reason it can be inhaled mixed with air.

The above remarks apply, it should be noted, to isopropyl alcohol. The isomeric NORMAL, OR PRIMARY, PROPYL ALCOHOL, $CH_3 \cdot CH_2 \cdot CH_2 \cdot OH$, is more toxic and unsuitable for making tinctures and the like.

ALCOHOL METHYLICUM

B.P.C.

$CH_3 \cdot OH = 32.04$.

Syn. METHANOL.

Dose.—30 to 60 minims (2 to 4 ml.).

Methyl alcohol is synthesised on a commercial scale from water gas (a mixture of carbon monoxide and hydrogen) under pressure at about 400° in presence of a catalyst, usually metallic copper containing 10% of zinc oxide.

Synthetic methyl alcohol has been used as an anti-freeze mixture for radiators. Toxic effects in U.S.A.—*Brit. med. J.*, ii/1930, 745.

If absolute and "acetone-free," methyl alcohol has sp. gr. 0.796, but it is not allowed by the Excise to be retailed pure unless duty-paid. *B.P.C.* requires the sp. gr. to be not higher than 0.799. The commercial substance known as WOOD NAPHTHA, PYROXYLIC SPIRIT, or WOOD SPIRIT, is 60 to 90% pure, and contains acetone and other empyreumatic impurities. The variety used for denaturing alcohol contains 72% *v/v* of methyl alcohol. It is a solvent of pyroxylin. The methylated spirit licence is not necessary for the sale of wood spirit, but that licence does not, of course, cover the sale of pure methyl alcohol.

Antidotes. Empty stomach by emetic or by stomach tube, using 5% sodium bicarbonate solution. Give water freely. Keep patient warm. Strychnine, $\frac{1}{2}$ gr., hypodermically.

Methylated Spirits. Four varieties of methylated spirits are recognised. Mineralised Methylated Spirits, Industrial Methylated Spirits, Industrial Methylated Spirits (Pyridinised) and Power Methylated Spirits. Mineralised Methylated Spirits consists of alcohol mixed with wood naphtha (9.5%) and crude pyridine (0.5%). To every 100 gallons of the mixture is added $\frac{1}{4}$ of a gallon of mineral naphtha (petroleum oil) and not less than $\frac{1}{4}$ of an ounce of methyl violet. It forms an opaque mixture with water.

Caution. Mineralised Methylated Spirits is not well adapted for local use, *e.g.*, for bed sores. It caused dermatitis amongst surgeons of Manchester Royal Infirmary, and among barbers of that city. Pyridine, added to render the spirits undrinkable, was probably the cause of the trouble.

Industrial Methylated Spirit consists of alcohol containing 5% of wood naphtha. Its use is permitted in the preparation of a number of *B.P.* and *B.P.C.* formulæ, in the articles specified in the *N.P.U.* formulary, and in special formulæ which have been approved by the Customs and Excise authorities.

Spiritus Methylatus Industrialis (B.P.). *Syn.* SPT. ANTI-SEPTICUS (*N.I.F.*); INDUSTROL (*N.I.F.*). Industrial methylated spirit, *B.P.*, is a mixture of 19 parts of alcohol (95%) and 1 part of wood naphtha, and is of the quality known as 66 O.P. industrial methylated spirits. It is, therefore, considerably purer than the mineralised spirit and of greater utility for manufacturing purposes.

Spiritus Methylatus Industrialis sine Acetono (B.P.C.). INDUSTRIAL METHYLATED SPIRIT (ACETONE-FREE).

Is of the same strength as industrial methylated spirit, *B.P.*, but the denaturant used is practically free from acetone. It is compatible with iodine, with which industrial methylated spirit containing acetone yields irritating vapours.

Spiritus Chirurgicalis (B.P.C.). SURGICAL SPIRIT.

Formula No. 1 contains industrial methylated spirit with castor oil, methyl salicylate and ethyl phthalate. Formula No. 2 contains

industrial methylated spirit with castor oil, mineral naphtha and ethyl phthalate.

These are the only formulæ which are at present approved by the Board of Customs and Excise, and there are no restrictions on purchase or sale by chemists. Surgical spirit made to any other formula may be supplied on prescription only; it cannot be purchased from the wholesaler but must be made by the chemist as required, and is subject to the statutory regulations relating to dispensing prescriptions for preparations containing I.M.S.

When surgical spirit is ordered on a *N.H.I.* prescription, No. 2 formula must be dispensed unless the prescription directs otherwise.

Surgical spirit may not be used as a base in the manufacture of other preparations. It must be sold exactly as received from a wholesaler.—*Pharm. J.*, i/1926, 323, 536.

Methylated Spirit Drinking. Methyl alcohol is capable of producing an intoxication similar to that caused by ethyl alcohol but distinct in the slowness of the onset and the extraordinary duration of the symptoms which may last from 3 to 4 days after taking a comparatively moderate dose. The symptoms observed are a marked fall of body temperature, convulsions, vomiting, dilatation of the pupils, and nystagmus. Characteristic of the poisoning is the loss of vision which begins generally within 24 hours and may progress to complete blindness, and permanent blindness has even followed the inhalation of the fumes by workmen engaged in industrial processes. The fatal dose is comparatively small and death has been reported from the drinking of less than 30 ml. In 1926 two thousand people died in America as a result of drinking so-called whisky prepared from denatured alcohol. Some years ago in the poorer quarters of London and Glasgow the drinking of a mixture of methylated spirits and cheap red wine constituted a matter of serious concern to the authorities. The mixture, which was obtainable at ninepence a quart bottle, was popularly known as "Red Lizzie" or "Red Biddie." It was said that a man or woman taken when under the influence of this drink might be unconscious for 24 hours, and at the end of that period if they took a drink of water or any other liquid they immediately became drunk again.

Methylated Spirits Regulations.

The regulations governing the use of Methylated Spirits have been revised and consolidated by the Methylated Spirits Regulations, S.R. & O., 1930, No. 832, amended by the Methylated Spirits (Amendment) Regulations S.R. & O., 1934, No. 1139, and amplified by Notices issued by the Commissioners of Customs and Excise. Methylated spirits must not be purified and must not be recovered or redistilled, except by sanction of the Commissioners. Any methylated spirits or spirits so recovered or redistilled shall be kept under the control of the user, or under lock or otherwise to the satisfaction of the proper officer. Bottles or other containers holding articles made with Industrial Methylated Spirit for medical purposes and put up for sale or supply must be labelled "For External Use Only," "Not To Be Taken" or otherwise to the same effect. The following are among the other conditions governing the sale of mineralised and industrial methylated spirits.

Mineralised Methylated Spirits. Only mineralised methylated spirits may be sold by retail for general use, and every retailer must obtain a Customs and Excise licence, renewable annually, at a cost of 10/-. A chemist, upon application for a licence, must notify the local officer of Customs and Excise of the premises he intends to use in connection with the storage and sale of spirits.

A licensed retailer may not hold in stock more than 200 gallons and he may neither buy more than 4 gallons from another retailer nor sell more than 4 gallons to any one person at one time. Mineralised methylated spirits may not be sold between 10 p.m. on Saturday and 8 a.m. on Monday.

Industrial Methylated Spirit.

A. Sale for medical and scientific purposes by wholesale chemists and dispensing chemists (NOTICE No. 53).

(1) Any wholesale or dispensing chemist with a Methylated Spirits Retailer's Licence may, on application, receive Industrial Methylated Spirit in quantities *not exceeding 4 gallons* for sale to authorised users on receipt of requisition in the *official form*. This applies to *all* sales of Industrial M.S. to dispensing chemists, and the limit of 1 gallon is now *withdrawn*.

May be sold in quantities *not exceeding $\frac{1}{2}$ gallon* at a time to a medical practitioner, dentist, veterinary surgeon, hospital or nursing home, on a *signed order*—purchaser *need not hold official authority* or submit a requisition, but order must be signed by a doctor, chemist, or veterinary surgeon. This does *not* cover supplies to dispensing chemists.

(2) Industrial M.S. may be exported in quantities *not exceeding 4 gallons*. Requisitions unnecessary, and the spirits may be supplied merely on customer's order.

(3) Every wholesale or dispensing chemist wishing to sell Industrial M.S. must apply for special authority, *whatever authority he may already hold*.

(4) Regn. 50 requires Industrial M.S. for sale in accordance with para. (1) and (2) to be kept apart from I.M.S. used for other purposes, a separate stock being kept under proper control, and an account kept of this separate stock. Accounts must be balanced monthly, orders and documents must be kept for two years and the contents of bottles or other containers must be labelled "Industrial Methylated Spirits."

B. Dispensing chemists (NOTICE No. 54):

1. Where already authorised to receive Industrial M.S. for dispensing, he is automatically and without further application entitled to use and dispense I.M.S. as at (i) and (ii) para. 2, while being liable to conditions in para. 3 and 4. If existing authority covers use of I.M.S. in making articles not in Second Schedule he will continue to be entitled to use I.M.S., but as from Jan. 1, 1931 no authority held prior to that date to sell I.M.S. to other chemists is valid, and special authority must be obtained.

2. All future applications must be made on special form (Ex. No. 225A), and grant of authority will convey (i) right to make and sell articles in Second Schedule; (ii) right to make and dispense on prescription only articles not scheduled or authorised, or I.M.S. subject to Regulations and Conditions in para. 4. Application may also include request for authority to use I.M.S. in making other articles or for other specified purposes.

3. Permits received from methylators must be kept and delivered to Officer. M.S. must not be purified, except with special sanction. M.S. must be kept under proper control. All containers to be labelled "For external use only," or "Not to be taken," or otherwise to the same effect. Return to be made once a year.

4. Articles not in the Second Schedule or authorised may be supplied only on the following conditions:—

- (i) Dispensed only on signed order or prescription by medical practitioner, dentist, or veterinary surgeon.
- (ii) A prescription or order for I.M.S. diluted or undiluted must specify the quantity required, must not be acted on more than once, or more than 7 days after date borne, and, unless issued under N.H.I. must be kept for two years.
- (iii) Articles made with I.M.S. on prescription *not* issued under N.H.I. must be entered in Prescription Book with name of person for whom prescription is written and person by whom signed. Prescriptions according to formulae given in any recognised book of reference may be quoted by the recognised short title.
- (iv) Not more than 1 pint of I.M.S. alone, or diluted, or as an ingredient may be supplied at one time to any one person.
- (v) Containers to be labelled.

The Second Schedule to the Regulations, 1930, as amended by the Regulations, 1934, includes articles in the *B.P.*, *B.P.C.*, *N.I.F.*, and *N.P.U. Formulary* for external use only, *B.P.* and *B.P.C.* preparations made with alcohol providing

no spirit remain in the finished product, *B.P.* and *B.P.C.* reagents, and paint and varnish thinners.

C. Regulations concerning doctors, dentists, veterinary surgeons, hospitals, and nursing homes (NOTICE NO. 54).

1. Medical men, etc., may obtain authority to receive I.M.S.
2. I.M.S. (95% Ethyl Alcohol denatured with 5% Wood Naphtha) may be had in various strengths, including a strength corresponding to absolute Alcohol.
3. From a methylator not less than 5 gallons, or from an authorised wholesale or dispensing chemist not more than 4 gallons, may be obtained at one time, and official requisition must be sent.
4. Without authority he may obtain $\frac{1}{2}$ gallon from a chemist.
5. I.M.S. may be used for dispensing or be used without admixture for any medical, etc., purposes *only*.
6. Must be labelled "For external use," or "Not to be taken," or words to that effect.

Only 1 pint may be dispensed by a medical man, etc., either alone or as an ingredient, at one time for any one person.

French Polish or Finish (Spirit Varnish).

Industrial M.S., providing special authority is obtained from the Commissioners of Customs and Excise, may be used in making for sale: (a) Mixtures containing not less than 8 ounces of resin (or 6 ounces of commercial shellac) to the gallon, (b) hot lacquers, irrespective of the proportion of resin (if not less than 3 ounces).

Mineralised M.S. may be used in making **Finish** for which the minimum of 3 ounces of gum resin is required.

Mixtures (except hot lacquers) containing 3 ounces or more but less than 8 ounces (or 6 ounces if the resin is commercial shellac) to the gallon, must, if for sale, be made with I.M.S. (Pyridinised).

The Retailing of Mineralised Methylated Spirits and Surgical Spirit in Scotland is controlled by the Methylated Spirits (Sale by Retail) (Scotland) Act, 1937, and a summary is given of the restrictions so far as they relate to *authorised sellers of poisons in Scotland*.

Mineralised methylated spirits and surgical spirits may only be sold on premises registered under the Pharmacy and Poisons Act, 1933. Containers must be labelled with the name of the seller, the address of the premises from which the sale is made and the words "methylated spirits" or "surgical spirit" as the case may be. Prior to delivery the seller must either enter in a book the date of the sale, the name and address of the purchaser, the name and quantity of spirits sold and the purpose for which it is required, and obtain the signature of the purchaser, or he must receive a signed order specifying the address of the purchaser, the name and quantity of spirits required and the purpose for which it is required. He must be satisfied that the signature is genuine and must make the same records as for a sale over the counter, entering in the place reserved for the signature of the purchaser the words "Signed Order." No time limit is specified for the preservation of records and there is no requirement to retain signed orders for inspection.

It is an offence to sell by retail methylated spirits or surgical spirit to any person under the age of fourteen.

Alternative procedure for surgical spirit. The container must be distinctly labelled with the name and address of the person by whom it is supplied or dispensed, and the following particulars must be entered in a book used regularly but not exclusively for the purpose. In the case of sales on the prescription of a doctor, dentist or veterinary surgeon, the date dispensed, the quantity supplied, the name or initials and, if known, the address of the prescriber, the name and, if known, the address of the person to whom, and the date on which, the prescription was given, must be recorded, or in the case of sales without a prescription, the date, the quantity and the name of the person to whom supplied. In the case of repeat prescriptions for surgical spirit it is sufficient to record the date and quantity supplied, together with a reference to a previous entry recording the dispensing of the spirit. The requirements need not be satisfied in the case of N.H.I. prescriptions for surgical spirit.

ALLIUM

*B.P.C., Fr. Cx.**Dose.*— $\frac{1}{2}$ to 2 drachms (2 to 8 g.).

The fresh bulb of *Allium sativum* (Liliaceæ). Garlic has a very strong and disagreeable odour; the taste is strongly pungent and persistent.

Uses. Preparations have been given in pulmonary phthisis, bronchiectasis, chronic bronchitis, gangrene of the lung, and whooping cough.

Laryngeal tuberculosis has been treated by $\frac{1}{2}$ to 1 drachm, 2 or 3 times a day, of the juice, with Tinct. Lavand. Co. and Syrup. Simplex, also gargle or spray (or combined), accompanied by poultice (or blister) of pulped garlic externally—latter also to tuberculous ulcers. Fresh juice is not so severe in action as the pulped garlic. The juice should never be applied to broken surfaces. Lengthy application of poultices (3 to 4 weeks with changes) may be required, but effect should first be tried for a few hours, as some are more susceptible than others.

For lupus, apply the fresh juice at night and allow to dry; wash off in morning and apply a bland ointment.

Suppuration of wounds may be controlled by the juice diluted with 3 or 4 parts of water, a 1 in 10 dilution being used later when the suppuration is definitely controlled.

An inhalation of fresh garlic juice is also useful in pulmonary tuberculosis. The following solution may be used:—fresh garlic juice 56, alcohol (90%) 7, oil of *Eucalyptus citriodora* 1. Four ounces is sufficient for 3 weeks' treatment. The juice is *fresh* and *not filtered*. Patient to use the inhalation in a respirator at least 1 hour night and morning.

Succus Allii (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

The expressed juice preserved by the addition of alcohol.

Syrupus Allii (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Contains about 18% *v/v* of the juice.

Tinctura Allii (*Fr. Cx.*). Prepared by maceration with alcohol 60%, using 1 of drug to 5 of menstruum.

Allisatin (*Sandoz, London*). Tablets of garlic and activated charcoal for intestinal affections, etc.

Allium Cepa, the ordinary onion, is of less strength than *Allium sativum*. *Hydrarthrosis* has been cured by placing the fleshy scales of the onion round the joint and keeping in place with a bandage.

Oleum Allii Essentiale. This oil is excreted through the lungs and skin—not apparently by the kidney. Its principal constituent is usually taken to be allyl sulphide. Stimulant, expectorant and stomachic. In chronic bronchitis, pneumonia, also in cholera and tuberculosis. *Dose* of either the natural oil or allyl sulphide, $\frac{1}{2}$ to 2 minims, in capsules. $\frac{1}{2}$ minim of allyl sulphide per kilo weight may be taken as lethal dose.

Allylis Sulphidum (*B.P.C.*). (C_3H_5)₂S = 114.2.

Dose.— $\frac{1}{2}$ to 2 minims (0.03 to 0.12 ml.).

A colourless or yellowish oil with a garlic-like odour. B.p. about 138°, sp. gr. 0.890 to 0.900.

Slightly **soluble** in water; soluble in alcohol and ether.

Uses. Allyl sulphide when taken orally is excreted by the lungs and skin, and is employed for its bactericidal action in the treatment of pulmonary tuberculosis, for which purpose it is taken diluted with oil in capsules or by inhalation from an oronasal inhaler. Its use diminishes cough and expectoration and it is said to be of value in chronic bronchitis and bronchiectasis. It should not be given undiluted.

Externally it has been used in lupus and tuberculous abscesses.

ALOE

B.P., U.S.P. XI.

Dose.—2 to 5 grains (0.12 to 0.3 g.). *U.S.P. XI* average dose 4 gr.

Aloes is the solid residue obtained by evaporation of the liquid which drains from the cut leaves of various species of *Aloe* (Liliaceæ). Four varieties are official in the B.P., namely: Cape aloes (*A. Ferox*), Curaçao aloes (*A. vera* var. *officinalis*), which was formerly produced on the island of Barbadoes and is still frequently called Barbadoes aloes, Socotrine and Zanzibar aloes (*A. Perryi*). *Aloe* (*Fr. Cx., P. Ital. V, F.E. VIII* (Acibar) and *P. Jap. V*) is from various sources; *P. Belg. IV* and *P. Helv.* specify *A. ferox*; *P. Dan.* includes *A. ferox* and other species.

Cape aloes occurs in dark brown, glassy masses with a vitreous fracture and a characteristic odour. It is mostly used for veterinary purposes. Curaçao aloes occurs as dark, chocolate-brown, opaque masses with a dull waxy fracture, Socotrine aloes as nearly black opaque masses with a porous fracture and a pleasant cheesy odour, and Zanzibar aloes as livery-brown masses with a nearly smooth fracture and a slight odour. Cape and Curaçao aloes are almost entirely soluble in alcohol 60%.

Uses. Aloes and aloin act chiefly on the lower bowel. They are employed with soap, with iron and with strychnine in the treatment of habitual constipation. Aloes, in dose of 10 grains a day, is very unsafe for pregnant women, since it is likely to produce abortion.

Decoctum Aloes Compositum (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 ounces (15 to 60 ml.).

A 1% solution of aloes, with myrrh, potassium carbonate, liquorice and compound tincture of cardamom.

Decoctum Aloes Compositum Concentratum (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.).

Diluted with 3 parts of water it yields a preparation of about the same strength as compound decoction of aloes.

Extractum Aloes (B.P.C., P. Jap. V).

Dose.—1 to 4 grains (0.06 to 0.25 g.).

The dried aqueous extractive.

Pilula Aloes (B.P.).

Dose.—4 to 8 grains (0.25 to 0.5 g.).

Contains aloes 58%, and hard soap, 29%.

Pilulæ Aloes (U.S.P. XI). *Average dose.*—2 pills.

Each pill contains 2 grains of aloes and 2 grains of hard soap.

Pilula Aloes et Asafœtidæ (B.P.).

Dose.—4 to 8 grains (0.25 to 0.5 g.).

Contains 30% each of aloes, asafœtida and hard soap.

Pilula Aloes et Ferri (B.P.).

Dose.—4 to 8 grains (0.25 to 0.5 g.).

Contains exsiccated ferrous sulphate 10% and aloes 20%, with cinnamon, cardamom and ginger.

Pilulæ Aloes et Myrrhæ (B.P.C.). *Syn.* PILULÆ RUFI.

Dose.—1 or 2 pills.

Contain aloes 2 gr. and myrrh 1 gr.

[P1-81] **Pilulæ Aloes et Nucis Vomicae (B.P.C.).**

Dose.—1 pill.

Contain aloes 2 gr., dry extract of nux vomica $\frac{1}{2}$ gr., and dry extract of belladonna $\frac{1}{2}$ gr.

Pulvis Aloes et Canellæ (B.P.C.). *Syn.* HIERA PICRA.

Dose.—3 to 10 grains (0.2 to 0.6 g.).

Aloes 4, canella 1.

Tinctura Aloes (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). Aloes 1 in 40, and liquid extract of liquorice.

Tampons saturated with this give relief in pruritus vulvæ.

Tinctura Aloes Composita (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Aloes, about 1 in 30, with gentian, rhubarb and ginger.

Tinctura Aloes et Myrrhæ (B.P.C.). *Syn.* ELIXIR PROPRIETATIS.

Dose.—1 to 2 drachms (4 to 8 ml.).

Aloes about 1 in 10, with saffron, in tincture of myrrh.

[P1] **Tinctura Antiperiodica (B.P.C.).** *Syn.* WARBURG'S TINCTURE.

Dose.—1 to 4 drachms (4 to 16 ml.).

Contains aloes 1 in 40, quinine sulphate 1 in 50, with opium (0.03%) and 15 other drugs.

Vinum Aloes (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Aloes about 1 in 30, with cardamom, in sherry-type wine.

Aloinum (B.P., U.S.P. XI).

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.). $\frac{1}{2}$ grain may be considered an aperient, and 1 grain a full purgative dose. The former is U.S.P. XI average dose.

A mixture of crystalline principles from aloes. Usually obtained from Curaçao aloes and then contains approximately equal proportions of barbaloin ($C_{21}H_{20}O_9$) and isobarbaloin.

Soluble about 1 in 130 of water, 1 in 20 of alcohol 90%. Almost insoluble in ether, chloroform and benzene.

Administered in a pill with hard soap. Assuming aloes to contain 25% of aloin, it follows that $\frac{1}{2}$ grain of the latter is equivalent in activity to 1 grain of aloes.

Has been tried as *hypodermic purgative*— $\frac{1}{2}$ grain in warm water 30 minims, but it is not always satisfactory.

[P1-S1] **Pilulæ Aloini Compositæ** (B.P.C.). *Syn.* ANDREW CLARK'S LIVER PILLS.

Dose.—1 pill.

Contain $\frac{1}{2}$ gr. each of aloin, dry extract of nux vomica, exsiccated ferrous sulphate, myrrh and hard soap.

[P1-S1] **Pilulæ Aloini et Podophyllini Compositæ** (B.P.C.).

Dose.—1 to 4 pills.

Aloin $\frac{1}{10}$ gr., jalap resin $\frac{1}{10}$ gr. and resin of podophyllum $\frac{1}{2}$ gr., with oleoresin of capsicum and dry extracts of nux vomica and hyoscyamus.

[P1-S1] **Pilulæ Aloini et Strychninæ Compositæ** (B.P.C.).

Dose.—1 or 2 pills.

Aloin $\frac{1}{2}$ gr., strychnine $\frac{1}{100}$ gr. with dry extract of belladonna and powdered ipecacuanha.

[P1-S1] **Pilulæ Phenolphthaleini Compositæ** (B.P.C.). *Syn.* PILULÆ PHENALOINI.

Dose.—1 or 2 pills.

Aloin $\frac{1}{2}$ gr., phenolphthalein $\frac{1}{2}$ gr., strychnine $\frac{1}{100}$ gr., dry extract of belladonna $\frac{1}{12}$ gr., powdered ipecacuanha $\frac{1}{15}$ gr.

Tabellæ Aloini (B.P.C.) contain $\frac{1}{2}$ gr. (0.03 g.).

[P1-S1] **Tabellæ Aloini Compositæ** (B.P.C.).

Dose.—1 or 2 tablets.

Aloin $\frac{1}{2}$ gr., powdered ipecacuanha $\frac{1}{2}$ gr. and dry extract of nux vomica $\frac{1}{2}$ gr.

[P1-S1] **Allophen Pill** (Parke, Davis, London). Aloin, $\frac{1}{2}$ gr., phenolphthalein $\frac{1}{2}$ gr., ipecacuanha $\frac{1}{15}$ gr., strychnine $\frac{1}{100}$ gr., and extract of belladonna $\frac{1}{12}$ gr.

Dose.—1 to 3 pills at bedtime.

[P1-S1] **Asbic Pills** (Lilly, London). Aloin $\frac{1}{2}$ gr., strychnine $\frac{1}{100}$ gr., extract of belladonna leaves $\frac{1}{2}$ gr., ipecacuanha $\frac{1}{15}$ gr., calomel $\frac{1}{2}$ gr.

[P1-S1] **Lapactic Pills** (Sharp & Dohme, London). Aloin $\frac{1}{2}$ gr., strychnine $\frac{1}{100}$ gr., extract of belladonna $\frac{1}{2}$ gr., powdered ipecacuanha $\frac{1}{15}$ gr.

ALUMINIUM

Al = 26.97.

Pharmacology. The soluble salts are gastro-intestinal irritants in large doses but do not cause chronic poisoning. When injected a slow toxic action occurs with fatty degeneration of liver and kidneys.

The use of aluminium cooking vessels is generally considered to be innocuous, although occasional cases of chronic malaise,

possibly due to idiosyncrasy, have been reported, which cleared up on ceasing the use of aluminium utensils.

The physiological action of aluminium compounds is discussed; the action is on the blood system and is observed only when injected. Ordinary amounts have no action by the mouth, and aluminium in the diet in small amounts is harmless. The relief of pain attending the discontinuance of aluminium cooking vessels is due to psychological forces.—J. H. Burn, *Analyst*, 1932, 428.

There is no convincing evidence that aluminium in the amounts in which it is likely to be consumed as a result of using aluminium utensils has a harmful effect upon the ordinary consumer. It is possible that there may be individuals who are susceptible to even such small doses of aluminium as may be derived from aluminium utensils, but evidence of this is inconclusive.—G. W. Monier-Williams, *Rep. publ. Hlth Med. Subj., Lond.*, No. 78, 1935.

Uses. Aluminium, in fine powder, may be used for dusting the skin of the abdominal wall as a protective in cases of intestinal fistulæ. The skin is dried and freed from grease and repeated applications of the powder made until a thick film adheres. Alternatively, a paste, known in America as "Baltimore Paste," made by mixing powdered aluminium with sufficient liquid paraffin to produce a stiff paste 1 part and zinc oxide ointment 4 parts, may be employed. This paste is useful for application to the skin round an ileostomy to prevent irritation.

Alumen (B.P., U.S.P. XI, *Supp.* II). *Syn.* ALUMEN PURIFICATUM, PURIFIED ALUM.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

May be either potassium aluminium sulphate (potash alum), $KAl(SO_4)_2 \cdot 12H_2O = 474.4$, or ammonium aluminium sulphate (ammonia alum), $NH_4Al(SO_4)_2 \cdot 12H_2O = 453.3$. *Fr. Cx.*, *P. Jap. V*, *P. Helv. V* and *P. Dan.* have potash alum only. In colourless crystals or white powder with sweetish astringent taste.

Soluble 1 in 10 of water (potash alum), 1 in 8 (ammonia alum), and 1 in 3 of glycerin; insoluble in alcohol.

Incompatible with mercury salts and borax.

Uses. As an astringent for local application, solutions of $\frac{1}{4}$ to 1% or stronger may be used in stomatitis, pharyngitis, leucorrhœa, gonorrhœa, hyperhidrosis and weeping eczema. The solution may be used as a hæmostatic, for example, after tooth extraction, and for superficial abrasions and cuts. Stronger solutions harden the epidermis and are useful in treating soft corns. Ulcers on the lips may be cured by touching with a crystal of alum. As a mouth-wash its solution is possibly not desirable, since destruction of the teeth may occur unless it be quickly removed by rinsing. Internally alum is astringent in small doses and emetic in larger doses such as $\frac{1}{2}$ to 1 teaspoonful. It is a valuable antidote in acute lead poisoning since it is not only emetic but forms an insoluble sulphate.

Aqua Hæmostatica (*P. Ital. V*, *P. Belg. IV*). *Syn.* ACQUA DEL PAGLIARI.

Alum (potash) 80, tincture of benzoin 10, benzoic acid 2, water to 1000. Filtered after allowing to deposit, Pollacci's modification contains 10% of sodium chloride.

Collyrium Aluminis (B.P.C.). 1% w/v.

Gargarisma Aluminis (B.P.C.). Glycerin of alum, 1 in 8, with acid infusion of roses.

Glycerinum Aluminis (B.P.).

Potash alum, 13% *w/w* in water and glycerin. An astringent in chronic pharyngitis; is less disagreeable than tannic acid.

Injectio Aluminis (L.H.) for vaginal use. 60 grains in 1 pint.

Injectio Aluminis et Zinci (St. T. H.).

Alum 2 parts, zinc sulphate 1 part. Powder and mix.

One or two teaspoonfuls dissolved in 1 pint of warm water for vaginal injection.

Pessus Aluminis (B.P.C.) contains 5 gr. (0.3 g.).

Points of Alum mounted in wooden cases are prepared for ophthalmic and other uses.

Pulvis pro Pedibus (P. Helv. V).

Potash alum 15, talc 85, in fine powder. For tender feet. Another useful form of foot powder is: talc 2, boric acid 2, orris 1, zinc oleate 1.

Solvellæ Aluminis (B.P.C.) contain 10 gr. (0.6 g.).

Alumen Chromicum (B.P.C.). $\text{KCr}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O} = 499.4$.

Large violet crystals giving a violet aqueous solution which becomes green on heating to 60° to 80° , returning to the original colour on prolonged standing.

Soluble 1 in 7 of water; insoluble in alcohol 90%. Used commercially in tanning and as a mordant, also for hardening gelatin in photographic materials.

Alumen Exsiccatum (B.P.C., P. Helv. V, U.S.P. XI). *Syn.* ALUM USTUM (P. *Jap. V*), BURNT ALUM. Made by heating potash alum until it has lost 45 to 46% of its weight. *U.S.P. XI* makes from potash or ammonia alum.

Soluble slowly and completely 1 in 20 of water. If dried above 200° the product will not dissolve completely owing to formation of oxysulphate.

Is a powerful astringent useful as a dressing for old ulcers and sores. Also used for preserving skins, and as a water-softener.

Alumen Ferricum (B.P.C.). *Syn.* IRON ALUM, FERRIC AMMONIUM SULPHATE. $\text{NH}_4\text{Fe}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O} = 482.2$.

Dose.—5 to 10 grains (0.3 to 0.6 g.). Amethyst coloured efflorescent crystals, of astringent taste. **Soluble** 1 in 3 of water (best with a little sulphuric acid added), insoluble in alcohol. Internally to arrest hæmorrhage, also as an astringent gargle (2%), throat spray or pigment (8%).

Aluminii Acetas. $\text{Al}_2(\text{C}_2\text{H}_3\text{O}_2)_3$.

A gummy mass soluble in water, obtained by interaction of lead acetate and aluminium sulphate.

Aluminii Subacetes. $\text{Al}_2\text{O}_3 \cdot 4\text{C}_2\text{H}_3\text{O}_2 \cdot 4\text{H}_2\text{O}$. *P. Dan.* gives the formula $\text{Al}(\text{OH})(\text{CH}_3\text{COO})_2$.

A white powder sparingly soluble in water, obtained by heating a solution of the normal acetate.

Is used as a desiccant and deodorant in powder or with glycerin. For ophthalmia neonatorum a 10% ointment has been used, applied between the lids every hour, in place of silver nitrate drops.

HÆMORRHAGE, UTERINE AND POST-PARTUM. 2 to 3% solution of aluminium acetate arrests hæmorrhage from inertia of uterus at child-birth.

OXYURIASIS. As an *anthelmintic* aluminium subacetate has been used in treatment of oxyuriasis. *Dose* for an adult 1 g. 3 times daily for three days; for children 0.5 g. twice daily—preceded in each case by a dose of calomel.

Alumeevan (Evans, Sons, Lescher & Webb, Liverpool). Solution of aluminium acetate (B.P.C.) 1½ fl. oz., syrup 360 m., essence of cherry 4 m., purified honey to 4 fl. oz. *Dose.*—1 drachm 4 times daily after food; a pint of milk should be taken each day. Rheumatoid arthritis and allied bone diseases (*see* communication by A. J. Helfert, *Brit. J. Surg.*, 1940, 27, 651).

Lenicet Ointment (*Riddell Products, London*). Polymerised aluminium acetate 5%, anhydrous wool fat 10%, white soft paraffin 85%. In dermatitis, eczema, burns, etc. [P1] **Lenirenin Belladonna Ointment** is composed of Lenicet, adrenine, local anæsthetics and 1% extract of belladonna. For hæmorrhoids, tenesmus, pruritus ani, etc. Also available as suppositories.

Liquor Aluminiumi Acetas (*B.P.C., P.G. VI, P. Austr., P. Jap.*). *Syn.* LIQUOR ALUMINII ACETICUS, BUROW'S SOLUTION (Burow's Solution, *P. Belg. IV*, is Liquor Aluminiumi Aceto-Tartratis, similar to *P. Helv. V*). A solution containing a basic aluminium acetate.

Is used on the Continent in place of boric lotion for moist fomentations in cutaneous erysipelas and other dermatoses. Gauze soaked in the solution may be used as a dressing for suppurating wounds. Diluted with twice its volume of water it is used as an antiseptic astringent lotion, and diluted 1 with 4 or more of orange-flower water it forms a pleasant mouth-wash.

A 1 in 8 dilution forms an effective substitute for Calamine Lotion, and in some cases may produce better and quicker therapeutic results.—R. M. B. MacKenna, *Brit. med. J.*, i/1932, 78.

[P1] **Solution de Burow avec Précipité** (*P. Belg. IV*). Potash alum 10, lead acetate 50, water 940. The salts are dissolved in half the water and mixed.

Liquor Aluminiumi Aceto-Tartratis. *Syn.* ALUMINIUM ACETO-TARTARICUM SOLUTUM (*P. Helv. V*).

Dissolve aluminium sulphate 30 in warm water 135, cool and add, with stirring, calcium carbonate 13, and then acetic acid (30%) 36, allow to stand 3 days with occasional shaking, filter off the solution and add to every 100 of filtrate tartaric acid $4\frac{1}{2}$.

Sp. gr. 1.057 to 1.063. Contains about 10% of aluminium aceto-tartrate. According to *P. Helv. V* this is to be supplied when Burow's solution is ordered.

Aluminiumi Chloridum (*B.P.C.*). $\text{AlCl}_3 \cdot 6\text{H}_2\text{O} = 241.4$.

Dose.—2 to 4 grains (0.12 to 0.25 g.). May be administered in solution or as pills containing 2 gr.

A white, amorphous deliquescent powder. *Soluble* 2 in 1 of water, 1 in 4 of alcohol and in glycerin. Has been found of distinct service in locomotor ataxy; relieves the lightning pains.

Liquor Aluminiumi Chloridi. Dissolve aluminium chloride (+6H₂O) 20, in water to produce 34 by volume = 42.5% by weight. Sp. gr. 1.35.

Aluminiumi Hydroxidum (*B.P.C.*). $\text{Al}(\text{OH})_3 = 78.0$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

Prepared by pouring hot potash alum solution into a hot solution of sodium carbonate. A white, odourless, tasteless, amorphous powder, *insoluble* in water, soluble in caustic alkali solutions.

Uses. For the treatment of flatulence, hyperacidity, pyrosis and allied gastric disturbances. Colloidal aluminium hydroxide is a valuable adjuvant in the treatment of peptic ulcer, the dose advised being 60 to 180 gr. 1 hour after meals.

PEPTIC ULCER. The continuous administration of colloidal aluminium hydroxide has advantages over all other forms of treatment and is of particular value in cases of ulcer with massive hæmorrhage. In a series of 101 such patients only 3 died, a mortality percentage far below that for other forms of therapy. Pain is relieved at once and the ulcer heals in 7 to 10 days. The technique of

administration requires constant and continuous medication both day and night. If given in the usual way, not more than one hour should elapse between doses. A preferable method of administration is by the continuous drip method.—E. Woldman and C. J. Polan, *Amer. J. med. Sci.*, 1939, 198, 155.

It has proved itself a highly effective antacid and offers many advantages over the older remedies in the treatment of peptic ulcer. Although it may be used in conjunction with frequent feedings, these are no longer required to control acidity, and one may safely dispense with them if sufficient hydroxide is given. One drachm 3 times daily is often enough to control symptoms and promote healing in some cases. There is evidence that the drug may inhibit gastric secretions when given over a considerable period.—J. F. McIntosh and C. J. Sutherland, *Canad. med. Ass. J.*, i/1940, 140.

Observations on 30 patients indicated that aluminium hydroxide gel is an effective substance for neutralising the gastric contents; that it is a valuable adjuvant in the treatment of peptic ulcer, and that it is not liable to cause alkalosis. In doses of 1 to 3 drachms its neutralising powers are as great as those of ordinary doses of alkaline powder. Nearly all the patients were completely free from pain while taking this preparation, and diarrhoea (often a troublesome complaint while taking alkalis) was absent in every case except one.—T. Izod Bennett and A. M. Gill, *Lancet*, i/1939, 500.

ULCERATIVE COLITIS. Good results reported in 26 patients convalescing from acute attacks of ulcerative colitis, from the rectal injection of a mixture of 6 fl. oz. of a preparation containing 20% of kaolin, 10% of liquid paraffin and 70% of an aluminium hydroxide gel, equivalent to $2\frac{1}{2}\%$ of aluminium hydroxide and 4 fl. oz. of water. Injections were given at first thrice weekly and then gradually reduced to once weekly. The first and second injections were not retained for more than 30 minutes, but retention overnight was possible subsequently. If faeces were being passed three or more times per 24 hours, a small low saline enema was given 2 hours before treatment. Blood streaks in the faeces disappeared in 3 to 4 weeks, sometimes in a much shorter period, the average number of treatments required being 11.4. The treatment must not be used during the acute stages of the disease.—W. Z. Fradkin, *J. Lab. clin. Med.*, 1937, 22, 896.

Aludrox (John Wyeth, London). A colloidal suspension of hydrated alumina stated to be capable of neutralising in 1 hour the free HCl of 12 vols. of average gastric juice. Its pH is 6.8, so that alkalinity is not produced even with excess. *Dose*.—1 to 2 teaspoonfuls.

Alocol (Wander, London). Colloidal aluminium hydroxide in powder, or tablets containing 0.5 g. *Dose*.—2 tablets to be dissolved in the mouth $\frac{1}{2}$ hour before and after each meal.

Collumina (Evans, Sons, Lescher & Webb, Liverpool). Colloidal aluminium hydroxide for the treatment of gastric inefficiency and abnormal acidity of the stomach.

Hydronal (Bayer Products, London). Aluminium hydroxide with a strong peptisation action. Supplied in $7\frac{1}{2}$ gr. tablets.

Lactalumina (Crookes Laboratories, London). Colloidal aluminium hydroxide. *Dose*.—1 to 2 fluid drachms in water.

Aluminii Sulphas (B.P.C.). *Syn.* ALUMINIUM TRISULPHATE. $\text{Al}_2(\text{SO}_4)_3 \cdot 16\text{H}_2\text{O} = 630.4$. *Fr. Cx.*, *P. Jap.* V, *P. Helv.* V and *P. Dan.* have $18\text{H}_2\text{O}$.

Dose.—2 to 5 grains (0.12 to 0.3 g.).

White crystalline powder or lumps made by dissolving freshly precipitated aluminium hydroxide in sulphuric acid. *Soluble* 1 in 1 of water nearly; insoluble in alcohol.

Incompatible with alkalis and alkaline carbonates.

Uses. Similar to alum but more astringent. A saturated solution has been used as a mild caustic for enlarged tonsils and nasal polypi. 5 to 10% solutions may be applied locally to ulcers. A 2% solution may be used for removing wrinkles.

Kaolinum (*B.P., Fr. Cx.*). *Syn. and Prop. Names.* BOLUS ALBA (*P.G. VI, P. Jap. V, P. Helv. V, P. Dan.*), BOL BLANC (*P. Belg. IV*), CHINA CLAY, KAYLENE (*Kaylene Ltd., London*). OSMO KAOLIN (*Morson, London; Allen & Hanburys, London*) and COLLOSOL KAOLIN (*Crookes' Laboratories, London*) are brands of colloidal kaolin.

Dose.— $\frac{1}{2}$ to 2 ounces (15 to 60 g.), with water or milk. Best on empty stomach.

Native white, hydrated aluminium silicate, purified by elutriation from sandy matter. It is a soft whitish powder.

Although the usual material sold as Kaolin *B.P.* conforms to official standards it is still grossly contaminated with sharp grits undesirable in a medicine designed for internal use. Many of the failures of indiscriminate kaolin therapy can be explained as due to the use of unsuitable preparations, *i.e.*, those containing abrasive gritty contaminants and those which tend to coalesce into sticky masses because they contain uncompensated electrolytes. The therapeutic efficiency of kaolins and allied substances should not be assayed in terms of methylene blue, congo red, or any other dye, but in terms of some definite food poison or decomposition product.—N. Mutch, *Brit. med. J.*, i/1937, 596.

Insoluble in all ordinary solvents and in mineral acids.

Uses. Kaolin acts as a protective of the mucosa of the stomach and intestines, and may be given as a substitute for bismuth carbonate in gastric and intestinal affections. It does not constipate like bismuth and is superior in that it is unaffected by the gastric juice. It also adsorbs toxins from the alimentary canal, and is valuable in cholera, dysentery, bacillary diarrhoea, food poisoning and in diarrhoea of phthisis. Externally kaolin is a useful absorbent for irritation of the skin. It is a useful filtering medium for clarifying liquids.

ASIATIC CHOLERA. A suspension of 800 g. of kaolin in a litre of water may be employed, 3 ounces being given every half-hour until vomiting and diarrhoea abate, then continued every hour and then every two hours up to 12 or 15 hours.

BURNS. Spread a thick layer of kaolin powder daily on the burn; cover with gauze and a thin layer of zinc ointment.

FISTULÆ. For protection of skin round gastric or intestinal fistulæ opening through the abdominal wall, kaolin is better than ointments.

Cataplasma Kaolini (*B.P.*). *Syn.* KAOLIN POULTICE.

Kaolin 52.7%, boric acid 4.5%, with thymol, methyl salicylate, oil of peppermint and glycerin.

Sodium lactate (70%) may be used in place of glycerin in making this preparation.

Uses. Kaolin poultice is used as a carrier of heat and moisture in various local inflammations. It has largely replaced the domestic bread and linseed poultices since it retains heat and moisture more efficiently.

Antiphlogistine (*Denver Chemical Co., London*—for formula, see Vol. II), **Antithermogen** (*Hewlett, London*), **Caloplast** (*Allen & Hanburys, London*), **Sorbefacin** (*Christy, London*), and **Thermofuge** (*Parke, Davis, London*) are similar preparations used for relieving inflammation.

Emulsio Paraffini Liquidi et Kaolini (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 2 ounces (15 to 60 ml.).

Contains 25% *v/v* of liquid paraffin and about 80 gr. of kaolin per oz.

Mist. Kaolin. (*N.I.F.*). Kaolin 15 gr., sodium bicarbonate 10 gr., heavy magnesium carbonate 10 gr., peppermint water to $\frac{1}{2}$ oz.

Pulv. Kaolin, Co. (*N.I.F.*). *Average dose.*—60 grains.

Sodium bicarbonate 160 gr., heavy magnesium carbonate 320 gr., kaolin 480 gr.

Unguentum Kaolini (*B.P.C.*). *Syn.* KAOLIN MASS.

1 in 4 in a paraffin basis. Spread on lint and applied to abraded skin, it allays irritation.

Carbokaylene (*Kaylene Ltd., London*). Kaylene colloidal kaolin with activated charcoal. *Dose.*—3 to 4 tablets three times daily half-hour before meals, for flatulence.

Charkaolin (*Allen & Hanburys, London*). Colloidal kaolin and activated charcoal in granules and tablets. For intestinal affections.

Kaldrox (*John Wyeth, London*). Emulsoid of a 20% colloidal kaolin activated in a 2½% aluminium hydroxide gel. For gastric hyperacidity, intestinal putrefaction and diarrhoea.

Kaomin (*Lilly, London*). Powder containing bismuth subcarbonate 100, kaolin 280, magnesium hydroxide 60, sucrose 180, vegetable mucilage 20, vanillin 0.6. For colitis and gastric-intestinal diseases.

Kaylene-Oil (*Kaylene Ltd., London*). *Dose.*— $\frac{1}{2}$ ounce before meals. A preparation of kaolin with liquid paraffin for use as an evacuant and adsorbent.

Lacto-Kaolin (*Crookes' Laboratories, London*). Combination of Collosoil kaolin and lactose for ulcerative colitis.

Neutralon (*Schering, London*). Synthetic aluminium sodium silicate. *Dose.*—A teaspoonful in $\frac{1}{2}$ glass of water 3 times daily. Astringent, antacid, adsorptive. Gastric hypersecretion, hyperchlorhydria and gastric and duodenal ulcer. [P1] **Belladonna-Neutralon** contains in addition extract of belladonna equivalent to 0.0075% of hyoscyamine; for use where vagal irritability is present.

Parakaolin (*Duncan, Flockhart, Edinburgh*). An emulsion of kaolin 20%, with liquid paraffin 33½%, for use in chronic constipation, etc.

Fuller's earth is a grey or brown native aluminium silicate containing iron, magnesium and calcium which is dried in kilns over coke fires. It is used largely for decolorising oils, as a filler for various purposes, in cosmetic powders, and for mud baths. A special grade of activated fuller's earth is employed for the recovery by adsorption of vitamin B₁.

Cimolite (*John Taylor, London*) is a special preparation of fuller's earth agreeably perfumed, for toilet and nursery use.

Terra Alba in commerce is variously kaolin, gypsum, burnt alum or magnesia, in preference the first.

Talcum Purificatum (*B.P.C., U.S.P. XI, Fr. Cx., P. Helv. V*). *Syn.* CRETA GALICA PURIFICATA.

A native hydrated magnesium silicate, $Mg_3(Si_2O_5)_4(OH)_4$, purified by treating with boiling dilute hydrochloric acid and washing free from acid. Venetian talc is from the Tyrol.

A soft white powder insoluble in acids and the ordinary solvents. Used in dusting powders to allay irritation and to prevent chafing. Also used as a lubricant for massaging, and in tablet making. Can be used as a filtering medium for clarifying liquids.

French Chalk is a harder silicate of magnesium.

Soapstone. A hard, massive variety of French chalk, consisting chiefly of magnesium hydrogen silicate, $Mg_3H_4Si_2O_{11}$.

Steatite. A hydrated magnesium silicate with some aluminium, iron, and lime, used as a furnace lining.

Bentonite, mineral soap or soap clay, is a refractory clay of volcanic origin obtained at Fort Benton in the Missouri valley and in California. It consists of the hydrous silicates of aluminium, magnesium and calcium; small amounts of iron are also present. The analysis corresponds to the formula $(\text{Mg}, \text{Ca})\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 5\text{SiO}_2 \cdot n\text{H}_2\text{O}$. In contact with water bentonite swells, forming a gelatinous viscous mass and in weak concentration it gives a stable colloidal solution. Gels and colloidal solutions of bentonite are weakly alkaline to litmus and are affected by electrolytes which produce flocculation. The properties of bentonite are unaffected by temperatures up to 400° , thus allowing sterilisation by heat. It does not contain any poisonous principle. Bentonite is recommended for use in pharmaceutical preparations and cosmetics, such as ointments, lotions and emulsions, and formulæ for various preparations are described.—*Pharm. J.*, ii/1939, 528.

Elkonite. A naturally occurring colloidal clay found in Nevada. When placed in water it swells to form a firm jelly-like mass. It is much more colloidal than the group of clays known as bentonites, and is essentially an aluminium magnesium silicate. It is moderately detergent and has been used as a soap substitute. In 15% concentration elkonite forms a gel suitable for use as an ointment base, which has advantages over bases in common use in that it dries on the skin, leaving an adherent film which will not rub off or stain clothing, and yet can be readily removed by washing with water.—*M. L. Tainter et al., J. Amer. pharm. Ass., Sci. Edn.*, 1940, 306.

Magnesium Silicate (Precipitated). *Syn. and Prop. Names.* MAGNESIUM TRISILICATE, SYNTHETIC SEPIOLITE, GASTOMAG (*Boots, Nottingham*), MAGSORBENT (*Kaylene Ltd., London*), NOVASORB (*Evans, Sons, Lescher & Webb, Liverpool*).

Dose.—5 to 30 grains (0.3 to 2 g.).

A white amorphous magnesium silicate prepared by precipitation on mixing solutions of magnesium sulphate and sodium silicate. The composition of the precipitate varies considerably when made with different proportions of sodium silicate and magnesium sulphate, and good results are said to be obtained with quantities equivalent to the ratio $2\text{MgO}:3\text{SiO}_2$, using sufficient sodium hydroxide with the silicate so as to complete the decomposition of the sulphate.

(For a detailed account of its preparation and composition see Norman Glass, *Quart. J. Pharm.*, 1936, 445.)

Medicinal magnesium trisilicate is defined as a "compound represented by the formula $\text{H}_2\text{Mg}_2\text{Si}_3\text{O}_{10}$, and giving the pure diffraction radiograph as the natural mineral sepiolite No. 1." The ratio $\text{MgO}:\text{SiO}_2 = 1:2.24$ (gravimetric). Many marketed brands fail entirely to conform with these basal requirements. It is shown that (a) artificial sepiolite No. 1 does not cause alkalosis; (b) the extent and speed of interaction with acids diminish rapidly at hypochlorhydric strengths (within certain limits of dosage the neutralising effect is automatically adjusted to the demands of the gastric juice); (c) within a certain range a useful amount of the silicate can be given in hypochlorhydric states without its neutralising the gastric contents to such an extent as to destroy peptic activity.—*N. Mutch, Brit. med. J.*, ii/1937, 735; see also N. Glass, *ibid.*, 878.

Insoluble in water. Interacts slowly with dilute mineral acids with formation of the magnesium salt of the acid and separation of colloidal silica.

Uses. Antacid and adsorbent. May prove preferable to other antacids and kaolin, especially in the treatment of peptic ulcer because of its greater adsorptive properties and the moderately slow and even rate of neutralising acid.

Synthetic hydrated trisilicate of magnesium exhibits powerful adsorbent qualities. At the saturation point for methylene blue it is seventeen times as active as colloidal kaolin (room temperature), and at body temperature the disparity is

even greater. Its immediate adsorptive activity is considerable, but several days are required for saturation. The range of its adsorptive affinities covers a great variety of substances, including acid and basic dyes, alkaloids, bacterial toxins, putrefactive amines, and food poisons.—N. Mutch, *Brit. med. J.*, i/1936, 148.

PEPTIC ULCER. 15 cases successfully treated by administration of hydrated magnesium trisilicate in doses ranging from 7 to 28 grains (or 5 to 21 grains of the anhydrous substance) mid-way between each feed (feeds at first 2-hourly and later 3-hourly when pain was under control and occult blood tests negative), with 1 to 4 teaspoonfuls of an emulsion of paraffin in a watery dispersion of colloidal kaolin half an hour before each feed. The special features of the employment of a synthetic hydrated magnesium trisilicate are: (1) the combination of antacid, antiseptic and antitoxic actions; (2) a sustained action whereby hydrochloric acid, destructive ferments and toxins can be removed continuously for several hours after administration of a single dose; (3) the possibility of a local therapy at the ulcer base; (4) freedom from the risk of inducing toxic alkalosis.—N. Mutch, *Brit. med. J.*, i/1936, 256.

Magnesium trisilicate in 60 to 120 gr. doses has been fully proved to be an efficient antacid and has no disadvantages except that it often produces constipated motions which irritate the rectum and cause frequent straining at stool.—A. H. Douthwaite, *Practitioner*, ii/1939, 46.

Six-ounce feeds of milk given every two hours with a drachm of aluminium hydroxide or magnesium trisilicate half an hour after each feed will produce complete control of free acidity in almost every case.—*Lancet*, i/1940, 973.

Magnesil (Duncan, Flockhart, Edinburgh). An antacid mixture containing 60 gr. of synthetic magnesium trisilicate in each fl. oz.

Dose.— $\frac{1}{2}$ to 2 tablespoonfuls in water between meals.

[P1] **Magsorbent Atropine Tablets** (Kaylene Ltd., London). These contain $\frac{1}{100}$ gr. of atropine in each, absorbed so that it cannot be removed by the addition of water, but is released in the digestive tract.

Trinesium (Abbott Laboratories, London). Magnesium trisilicate, tablets 7 $\frac{1}{2}$ gr.

Diatomite (B.P.C.). *Syn.* PURIFIED SILICEOUS EARTH, PURIFIED KIESELGUHR, TERRA SILICEA PURIFICATA (U.S.P. XI, P. Dan.).

Obtained from the siliceous skeletal remains of Diatomaceæ, large deposits being found in Scotland, Germany and elsewhere. The crude material is crushed, ignited, boiled with hydrochloric acid, washed and dried. Occurs as a bulky, white or pale buff odourless powder, *soluble* in alkalis, insoluble in acids except hydrofluoric. Used as an adsorbent dusting powder and as a filtering medium.

Sodium Silicate. *Syn.* SOLUBLE GLASS, WATER GLASS.

Is made by fusing silica, fine sand, or powdered flint, powdered coal and dried sodium carbonate mixed in powder, in an earthenware crucible, and pouring out the fused mass on to a stone slab to cool. This is pulverised and treated with boiling water to dissolve the soluble part. The solution is filtered and concentrated. Commercial solutions usually contain about 20% of silica and 10% of soda.

Senile pruritus and other senile skin disorders have been treated by intravenous injections of 1% sodium silicate, each injection representing 0.01 to 0.02 g. of the pure silicate. From 8 to 12 injections necessary, given at intervals of 2 or 3 days. Arteriosclerosis, pulmonary tuberculosis, and stenosis of the cardiac valves are also alleged to have benefited from such injections.

Silantox (Silica Gel, London; Savory & Moore, London). Colloidal silica. Used internally as an intestinal absorbent and externally as a dusting powder.

AMMONIUM

[P2] "*Ammonia.*"

[B3] "*Ammonia—in substances not being solutions of ammonia or preparations containing solutions of ammonia; substances containing less than 5%, weight in weight, of ammonia (NH₃); refrigerators; smelling bottles.*"

Ammonii Carbonas (B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V).

Dose.—5 to 10 grains (0.3 to 0.6 g.). *U.S.P. XI* average dose 5 grains.

White masses with ammoniacal odour and alkaline taste, consisting of a variable mixture of ammonium bicarbonate ($\text{NH}_4\text{HCO}_3 = 79.05$) and ammonium carbamate ($\text{NH}_4\text{NH}_2\text{CO}_2 = 78.06$). It contains 30 to 32.5% NH_3 .

Soluble 1 in 4 of water, 1 in 5 of glycerin. The carbamate portion is soluble in alcohol 90%.

Incompatible with acids, iron salts and salts of alkaline earths.

For dispensing, powdered ammonium carbonate is unsuitable since if the bottle is frequently opened ammonium bicarbonate is formed. A 1 in 8 solution has been found to be stable. It is best prepared by suspending translucent lumps, free from powder, in a muslin bag just below the surface of the water in a covered vessel.

Uses. Ammonium carbonate is stimulant, carminative and expectorant. Is excreted as urea and has a slight diuretic action. Does not increase alkalinity of blood or urine. Used as a stimulating expectorant in chronic bronchitis, broncho-pneumonia, especially of children, and in cardiac asthma. The solution is a useful application to insect bites and wasps' stings.

WOUNDS. Gauze pads soaked with a 2% solution of ammonium carbonate or bicarbonate promote healing in purulent and indolent wounds.—*W. Robinson, Amer. J. Surg.*, 1940, 47, 111.

Mist. Tuss. (N.I.F.). Ammonium chloride 5 gr., ammonium carbonate 3 gr., liquid extract of ipecacuanha $\frac{1}{2}$ m., solution of bordeaux B $2\frac{1}{2}$ m., chloroform water to $\frac{1}{2}$ oz.

[P1] **Mist. Tuss. Sed. (N.I.F.).** Potassium bromide 10 gr., ammonium carbonate 3 gr., camphorated tincture of opium $7\frac{1}{2}$ m., liquid extract of ipecacuanha $\frac{1}{2}$ m., liquid extract of liquorice 20 m., water to $\frac{1}{2}$ oz.

Liquor Ammoniae Aromaticus (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 ml.).

Is prepared with ammonium carbonate, strong solution of ammonia and terpeneless oils of lemon and nutmeg and is of the same ammoniacal strength as the official spirit.

It gives a clear mixture with distilled water as distinct from the *B.P.* spirit. It is not so pungent to the taste.

Mistura Ammoniae cum Senega (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains 4 gr. of ammonium carbonate and 5 gr. of ammonium chloride with tincture of ipecacuanha, syrup of tolu, and infusion of senega to 1 oz.

Spiritus Ammoniae Aromaticus (B.P.). *Syn.* SPIRIT OF SAL VOLATILE.

Dose.—15 to 60 minims (1 to 4 ml.).

Ammonium carbonate dissolved in a mixture of strong solution of ammonia with a distillate of oil of lemon, oil of nutmeg, alcohol and water. Contains 2.1 to 2.4% *w/v* of NH_3 .

Spiritus Ammoniae Aromaticus (U.S.P. XI).

Average dose.—30 minims (2 ml.).

Prepared by dissolving oils of lemon, lavender and nutmeg in alcohol, adding a solution of ammonium carbonate, and ammonia water, and filtering after 24 hours. It contains more ammonium carbonate and less ammonia than the corresponding preparation of the *B.P.*

Ammonii Bicarbonas (B.P.). $\text{NH}_4\text{HCO}_3 = 79.06$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

A white crystalline powder or white crystals volatilising slowly at room temperature. **Soluble** 1 in $5\frac{1}{2}$ of water; insoluble in alcohol 90%.

Is formed from ammonium carbamate when ordinary ammonium carbonate is exposed to air, and has been suggested as a more stable compound for use instead of the carbonate, especially for preparing tablets and capsules.

[P2] **Liquor Ammoniae Fortis (B.P.).**

Dose.—3 to 6 minims (0.2 to 0.4 ml.).

Contains 32.5% *w/w* NH_3 ; sp. gr. 0.885 to 0.891 ("0.880 ammonia" contains 34.5% *w/w* NH_3). **AQUA AMMONIAE FORTIOR (U.S.P. XI)** contains 27 to 29%. **AMMONIAQUE OFFICINALE (Fr. Cx.)** 20-18%. **AMMONIACA LIQUIDA (P. Ital. V, F.E. VIII)** is 20%; sp. gr. 0.925.

Incompatible with iodine, hypochlorites, salts of heavy metals, notably mercuric chloride and silver salts, and vegetable tannins.

Antidotes. Stomach tube and emetic must *not* be used. Give well diluted vinegar freely, or copious drinks of orange or lemon juice. Keep patient lying down and warm. Demulcent drinks, olive oil. Morphine, $\frac{1}{4}$ gr., hypodermically for pain. Tracheotomy may be necessary.

Enema Ammoniae. Strong solution of ammonia 1, water 160 (1 drachm to the pint).

Has been used in post-operative ileus and intestinal paresis. Its effect is enhanced by a dose of pituitary extract hypodermically given $\frac{1}{2}$ hour previously.

Linimentum Ammoniae (B.P.C.).

Contains 25% *v/v* of solution of ammonia with oleic acid and liquid paraffin. Does not thicken on standing as is the case with liniments made with vegetable oils. Liniment of ammonia is usually supplied for hartshorn and oil.

[P2] **Liquor Ammoniae Domesticus (vel Detergens), Household Ammonia.**

Oleic acid 1, alcohol 1, mix and add strong solution of ammonia 7, distilled water 7; shake well. For use diluted as a detergent of the skin. In the bath 1 in 1000 to 2000 softens the water; also for general domestic purposes.

[P2] **Cloudy Ammonia** is made with tap water—for this the gravity of the preparation must not be too light, otherwise the lime salts constituting the "cloud" will settle down. The following is a suitable formula:—Dissolve castile soap 1.3 in water 60, and add strong solution of ammonia 27, lime water 0.6, and water to 100.

Lotio Olei Amygdalae Ammoniata (B.P.C.). *Syn.* LOTIO CRINALIS, ERASMUS WILSON'S HAIR LOTION.

Almond oil 1 in 8, strong solution of ammonia 1 in 8, with oil of rosemary, in alcohol 90%, and honey water.

For alopecia areata, strong ammonia solution 1, chloroform 1, olive oil 1, spirit of rosemary to 8, is useful.

[P2] **Liquor Ammoniae Dilutus (B.P.).** *Syn.* LIQUOR AMMONIAE, AQUA AMMONIAE (U.S.P. XI, P. Jap. V), AMMONIA LIQUIDA (P. Ned. V), AMMONIUM HYDRICUM SOLUTUM (P. Helv. V).

Contains 10% *w/w* of NH_3 . [P2] **AMMONIAQUE OFFICINALE DILUÉE (Fr. Cx.)** is about the same strength. Exposure to the fumes may cause injury to the eyes.

Dose.—10 to 20 minims (0.6 to 1.2 ml.).

Hypodermically 2 to 6 minims for collapse; or up to 36 minims for snake poisoning.

Internally it is stimulant, diuretic and diaphoretic. Used as a restorative by inhalation, it acts by reflex stimulation of heart and respiration. In embolism large doses of ammonia, well diluted, tend to reduce the coagulability of the blood.

Ammonii Acetas (B.P.C.). $\text{CH}_3\cdot\text{COONH}_4 = 77.08$.

Dose.—10 to 30 grains (0.6 to 2 g.).

This salt is obtainable in white crystals, very soluble in water.

Incompatible with mineral acids, alkaline carbonates, potassium chlorate and dichromate, and with mercurous nitrate.

Serviceable in all fevers and in delirium tremens, one drachm every hour at first, reduced gradually.

Liquor Ammonii Acetatis Fortis (B.P.).

Dose.—15 to 60 minims (1 to 4 ml.).

Prepared by neutralising glacial acetic acid with ammonium carbonate and a sufficient quantity of strong solution of ammonia, and diluting the product with distilled water. It contains 57.5% w/v of $\text{C}_2\text{H}_7\text{O}_2\text{N}$ and has a pH of 7.0 to 8.0.

Liquor Ammonii Acetatis Dilutus (B.P.). *Syn.* LIQUOR AMMONII ACETATIS, SOLUTION OF AMMONIUM ACETATE, SPIRIT OF MINDERERUS.

Dose.— $\frac{1}{4}$ to 1 ounce (8 to 30 ml.).

Strong solution of ammonium acetate 1 part, distilled water to 8 parts. It contains 7.2% of $\text{C}_2\text{H}_7\text{O}_2\text{N}$.

Keep in lead-free stoppered bottles.

Liquor Ammonii Acetatis (U.S.P. XI).

Average dose.— $\frac{1}{2}$ ounce (15 ml.).

Prepared so as to yield a solution containing free acetic acid and carbon dioxide, and for dispensing purposes it is required to be freshly prepared. It is made by dissolving 5% of solid ammonium carbonate in dilute acetic acid (5.7 to 6.3%) or by mixing a 10% w/v solution of ammonium carbonate with a 32% v/v solution of acetic acid (36 to 37%) in water. *P. Helv. V* and *P. Jap. V* contain 15 to 16% of ammonium acetate. Acetate d'Ammonium Dissous (*Fr. Cx.*) contains 18.6 w/v.

Liquor Ammoniae Anisatus (B.P.C.). *Syn.* SPIRITUS AMMONIAE ANISATUS.

Dose.— $\frac{1}{4}$ to 1 drachm (1 to 4 ml.).

Contains 16.67% v/v of dilute solution of ammonia with oil of anise in alcohol 90%. Several foreign pharmacopœias, e.g., *P.G. VI*, give similar formulæ.

Mistura Ammonii Acetatis Composita (B.P.C.).

Syn. MISTURA DIAPHORETICA.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Potassium citrate 20 gr. with strong solution of ammonium acetate, spirit of nitrous ether and spirit of chloroform in camphor water to 1 oz.

Mist. Salin. (N.I.F.). *Syn.* MIST. DIAPHORET.

Potassium citrate 10 gr., strong solution of ammonium acetate 8 m., concentrated solution of ethyl nitrite 2 $\frac{1}{2}$ m. (equivalent to spirit of nitrous ether 20 m.), water to $\frac{1}{2}$ oz.

[P.] **Mistura Anti-Catarrhalis** (Burney Yeo.).

Solution of ammonium acetate 3 dr., spirit of nitrous ether 1 dr., tincture of opium 10 m., ipecacuanha wine 5 m., camphor water to 1 $\frac{1}{2}$ oz. To be taken at night. Assists action of skin and kidneys.

Ammonii Citras (B.P.C.). $C_3H_4 \cdot OH(COONH_4)_3, H_2O = 261.2$.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 g.).

A deliquescent white powder tending to lose ammonia to form an acid salt. Very *soluble* in water.

A mild expectorant and diuretic acting similarly to the acetate.

Liquor Ammonii Citratis Dilutus (B.P.C.). *Syn.* LIQUOR AMMONII CITRATIS.

Dose.—2 to 6 drachms (8 to 24 ml.).

Contains about 15% w/v of ammonium citrate. Store in green bottles.

Liquor Ammonii Citratis Fortis (B.P.C.).

Dose.— $\frac{1}{2}$ to 1½ drachms (2 to 6 ml.).

Four times as strong as the above.

Ammonii Nitras. NH_4NO_3 .

Dose.—5 to 20 grains (0.3 to 1.2 g.).

Occurs in colourless crystals, m.p. 165°. 7½ gr. tablets, enteric coated, have been administered in conjunction with the ketogenic diet (*see Vol. II*) to render the urine acid in the treatment of chronic bacilluria. The fused salt is used for making nitrous oxide.

Doses of 10 to 12 grains daily frequently maintain diuresis and diminish œdema in cardiac insufficiency, where other drugs fail. Disguise taste with syrup of orange.—P. Vallery-Radot and E. Gilbrin, *Brit. med. J. Epit.*, ii/1932, 18.

AMPULLÆ

Ampoules

Ampoules are hermetically sealed containers, commonly made of glass, and intended usually for preparations to be used for parenteral administration. Thin glass ampoules covered with cloth are also used for substances such as amyl nitrite for purposes of inhalation, the ampoule being crushed in the fingers and the vapour of the liquid inhaled.

Since ampoules hold sufficient material for one dose only, thus avoiding the risk of infection during the withdrawal of successive doses suffered by multiple-dose containers, and since also there is no possibility of the contents losing their sterility during storage, they present by far the best means of dispensing sterile preparations. They vary in shape, and their capacities range from 0.5 ml. (8 minims) to 100 ml. (3½ fl. oz.). Ampoules should be made of good quality, alkali-free glass, and when required for solutions of certain substances such as alkaloidal salts, adrenaline, extract of pituitary, insulin, etc., they must conform with the tests for the limit of alkalinity described in the *B.P.* The tests are on whole and crushed ampoules. The test on the whole ampoules requires the ampoules, up to a capacity of 25 ml., to be filled with a standard* acid solution of methyl red, sealed and heated. They comply with the test if the colour of the solution has not changed from pink to a full yellow. For the second test the ampoules are crushed and sieved. The particles which pass through a No. 25 sieve, but fail to pass through a No. 36, are washed with alcohol, dried and boiled for half an hour with the test solution, the colour of which must not change from pink to a full yellow. Both tests would

appear to need modification. The former, which requires each ampoule to be filled to its prescribed capacity, is much more severe on a 1 ml. ampoule for example than on a 2.5 ml. ampoule, whilst the latter prevents the use of ampoules which have been coated on their inner surface with a film of resistant glass to enable them to pass the test on whole ampoules. The use of ampoules of coloured glass for preparations unstable to light is of doubtful value. It is preferable to ensure that they are kept in their boxes in order to minimise the effect of light.

Ampoules as received from the manufacturers are usually sealed. Before use they are unsealed, thoroughly washed with distilled water, and sterilised either in an autoclave at 115° for 30 minutes or in a hot air oven at 150° for one hour. Great care should be taken to guard against fragments of glass remaining in the ampoules, since autoclaving causes some batches of glass to flake. They should be examined by shaking well in a good light.

Since ampoules are single dose containers, solutions contained in them do not need the addition of a bacteriostatic, equivalent to 0.5% of phenol, providing they are sterilised by an *absolute* method such as autoclaving. Where the emergency process of the B.P. is applied, the phenol may only be omitted if the preparation is intended for intravenous injection.

Ampoules may be filled on a small scale by means of a hypodermic syringe, and on a large scale by means of a burette fitted with a hypodermic needle, or by inverting the empty ampoules in the solution, placing under reduced pressure and then releasing the pressure, when the solution will be sucked into the ampoules. Ampoules should always be filled with more than the required dose to facilitate withdrawal with the syringe of the required volume, e.g., 1.1 ml. should be put in for a dose of 1 ml.

Sealing is done in the blow-pipe flame and it should be tested by placing the ampoules in some coloured solution, and then warming and cooling the latter, or by placing the ampoules immersed in the solution under reduced pressure and releasing the pressure. The coloured solution will enter any ampoules which are improperly sealed and these should be rejected.

Each ampoule should be individually labelled with the name and strength of its contents, such as 1 ml. = 0.02 g. Morph. Hydrochl.

Ampoules may also be used as containers for solid substances, such as neoparsphenamine, sodium citrate, sodium bicarbonate or iodophthalein required for the preparation of sterile solutions. Such solutions are made by adding sterilised water to the solid in the ampoule, dissolving, and using immediately. Special aseptic precautions must be taken with the preparation of these as it is rarely possible to heat and sterilise the final sealed container.

Solutions in ampoules for injection are issued under proprietary names, such as **Ampulique** (Hewlett, London), **Azoule** (Allen & Hanburys, London), **Glaseptic** (Parke, Davis, London), **Hypoloid** (Burroughs Wellcome, London), **G.L.** (Glaxo Laboratories, London), **Sterules** (Martindale, London), **Tubonic Ampoule Syringe** (Roche Products, Welwyn Garden City), consisting of a collapsible tube filled with the solution and fitted with a needle.

AMYGDALA AMARA

B.P.C., U.S.P. XI, Fr. Cx., P. Helv. V.

The dried ripe seeds of *Prunus communis* var. *amara*. Contains 50% of fixed oil and 3 to 4% of amygdalin, and yields 3 to 4% of essential oil.

Antidotes. Treat as for poisoning by hydrocyanic acid, see p. 71.

[P1] Aqua Amygdalæ Amaræ (I.A.) contains 0.1% of HCN.

Average dose.—1 drachm.

Lotio Amygdalæ Amaræ (B.P.C.). *Syn.* MISTURA AMYGDALÆ AMARÆ.

Bitter almond 7½% w/v in water.

Oleum Amygdalæ (*B.P., P. Helv. V, P. Dan.*) is expressed from the seeds of the bitter or the sweet almond. The content of oil in bitter almonds is about 50% and in sweet almonds about 45 to 50%. The residue from bitter almonds is utilised for the production of essential oil of bitter almond.

Soluble in all proportions in chloroform, about 1 in 2½ of ether and slightly in alcohol 90%.

[P1-S1] **Oleum Amygdalæ Amaræ** (*B.P.C., U.S.P. XI*).

Syn. OLEUM AMYGDALÆ ESSENTIALE.

Dose.—¼ to 1 minim (0.016 to 0.06 ml.).

The natural oil may contain up to 10% of HCN but is adjusted to contain from 2 to 4%. It is stated that the presence of the HCN retards oxidation of the benzaldehyde to benzoic acid. The oil can also be distilled from apricot and peach kernels.

Oleum Amygdalæ Volatile Purificatum (*B.P. Add. II*).
Syn. OLEUM AMYGDALÆ AMARÆ SINE ACIDO HYDROCYANICO (*B.P.C.*), OLEUM AMYGDALÆ AMARÆ (*s.A.P.*).

Dose.—¼ to 1 minim (0.016 to 0.06 ml.).

Consists of the above essential oil freed from HCN by treatment with ferrous sulphate and calcium hydroxide, and redistillation. Contains not less than 95% w/w of benzaldehyde.

Spiritus Amygdalæ Amaræ (*B.P.C.*). *Syn.* ESSENCE OF BITTER ALMONDS. 1 in 16.

Benzaldehydum (*B.P.C.*). $C_6H_5 \cdot CHO = 106.0$.

Dose.—¼ m. (0.03 ml.).

A colourless or slightly yellow liquid, sp. gr. about 1.051, solidifying at about 26° and boiling at about 180°. Used as a flavouring agent in place of the natural oil of bitter almond.

Amygdala Dulcis (*B.P.C.*). *Syn.* SEMEN AMYGDALI DULCIS (*Fr. Cx., P. Jap. V*).

The dried ripe seeds of *Prunus communis* var. *dulcis*. Contains fixed oil but no amygdalin.

Lotio Rosæ (*B.P.C.*). *Syn.* MILK OF ROSES. A perfumed emulsion of sweet almond, 1 in 10, with white beeswax and almond oil.

Mistura Amygdalæ (*B.P.C.*).

Dose.—¼ to 1 ounce (15 to 30 ml.).

Compound powder of almond 1 in 8 in water. A demulcent vehicle for cough mixtures and for suspending liquids not miscible with water.

Pulvis Amygdalæ Compositus (*B.P.C.*). A mixture of powdered sweet almond, sucrose and acacia.

Oleum Persicæ (B.P.C.). *Syn.* PEACH OR APRICOT KERNEL OIL (or mixtures). Is obtained from the kernels of *Prunus Persica* (peach) or *Prunus Armeniaca* (apricot). The latter is used almost exclusively. The oil is used instead of almond oil in the culinary arts and for face creams, etc.

[Pl] **Aqua Armeniacæ (P. Jap. V).** Apricot water, containing 0.1% of HCN.

AMYLUM

B.P., U.S.P. XI, Fr. Cx., P. Dan., P. Helv. V, P. Jap. V, etc.

Maize starch, from *Zea Mays*, is the only variety official in *B.P.* '32 and *U.S.P. XI*, but *B.P. Add. I* admits also rice starch (*Oryza sativa*). The Committee on Pharmacy and Pharmacognosy of the Pharmacopœia Commission (*Report* 13) have recommended the addition to the *B.P.* monograph of wheat (*Triticum aestivum*) and potato (*Solanum tuberosum*) starches. Other pharmacopœias include arrowroot starch from *Maranta arundinacea*. Potato starch, by treatment with hydrochloric acid, yields **Amylum Solubile**. Soluble starch is readily soluble in hot water.

Cataplasma Amyli (B.P.C.). Starch 10% boiled with water.

Cataplasma Amyli (St. J. H.).

Boric acid 1 dr., starch 1 oz., cold water 2 oz., boiling water to 20 oz.

One of the very safest remedies to apply to an inflamed, weeping or crusted surface and many cases of infantile eczema can be completely cured by its continued use alone.—J. E. M. Wigley, *Practitioner*, 1935, 353.

Glycerinum Amyli (B.P.).

Starch 8.5% *w/w* heated with water and glycerin at not over 140° until it gelatinises. Wheat starch is stated to be most suitable for producing a stable preparation.

Glyceritum Amyli (U.S.P. XI).

Starch (maize) 1, water 2, glycerin 7, heated to 140° to 144°.

Glyceritum Amyli (Fr. Cx.). Wheat starch 1, water 1, glycerin 13. This is used as the base for a number of glycerita in *Fr. Cx.*

Mucilago Amyli. Heat 16 oz. of water to boiling, add $\frac{1}{2}$ oz. of starch previously rubbed down with 4 oz. of water, and again raise to boiling.

Maranta (B.P.C.). *Syn.* ARROWROOT. The starch from *M. arundinacea* (Marantaceæ). 1 tablespoonful to the pint of hot water produces a demulcent mucilage.

Mucilago Marantæ.

Triturate arrowroot 6 dr. with water 2 oz. to make a smooth paste and make up with boiling water to 1 pint. Heat until semi-transparent. Cool and add spirit of chloroform 2 dr.

To suspend heavy medicaments this and a similar preparation of cornflour have been found useful. It will suspend bismuth salts in a proportion as high as 1 drachm to the ounce.

Lycopodium (B.P.C., P. Helv. V, U.S.P. XI, Fr. Cx.). The spores of the clubmoss, *Lycopodium clavatum* (Lycopodiaceæ). *U.S.P. XI* requires not more than 0.75% of acid-insoluble ash. As a pill powder, also as a diluent for insufflations for the throat,

nose, and ear, and as a dusting powder. Its use in quantitative microscopy is based on the presence of 94,000 spores per mg.

Tinctura Lycopodii (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 g.). 1 in 10.

To stop frequent micturition and irritation of the bladder.

ANETHUM

(with ANISUM, ANTHEMIS, etc.)

Anethum (B.P.). *Syn.* DILL.

Consists of the dried ripe fruits of *Anethum graveolens* Linn.

Oleum Anethi (B.P.).

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Distilled from dill, it is a yellow oil with odour resembling caraway. Sp. gr. 0.900 to 0.915. It contains not less than 43 to 63% w/w of carvone, $C_{10}H_{14}O$.

Soluble 1 in 1 of alcohol 90% and 1 in 10 of alcohol 80%.

Aqua Anethi Concentrata (B.P.) is prepared with 2% v/v of oil of dill, and is approximately 40 times the strength of the distilled water.

Aqua Anethi Destillata (B.P.) is prepared by distillation from dill.

Anisum (B.P.C., Fr. Cx., P. Helv. V). Anise (aniseed) is the dried ripe fruit of *Pimpinella Anisum* (Umbelliferae). Contains $1\frac{1}{2}$ to $3\frac{1}{2}$ % of a volatile oil containing anethole.

Aqua Anisi Concentrata (B.P.C.).

Dose.—5 to 15 minims (0.3 to 1 ml.).

Contains 2% v/v of oil and is approximately 40 times the strength of the distilled water.

Aqua Anisi Destillata (B.P.C., U.S.P. XI). Distilled from anise, 1 in 10.

Syrupus Anisi (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Concentrated anise water 1, syrup to 8.

Anisi Stellatum (B.P.C.). *Syn.* STAR ANISE FRUIT, BADIANE DE CHINE (*Fr. Cx.*). The ripe fruits of *Illicium verum* (Magnoliaceae), containing about 5% of volatile oil.

A fatal case of poisoning in Malaya by *Illicium religiosum* taken in mistake for *I. verum*. The distinctions between the toxic and harmless species are not very marked, but the taste of the seed of *I. religiosum* is pungent and bitter, and the odour resembles oil of cajuput or cardamom.—I. A. Simpson, per *Trop. Dis. Bull.*, 1936, 634.

I. religiosum goes by the name of "Badiane" in China and Japan, and in the Philippines a decoction named "sanki" is made from the fruit and is used for its stimulating effects. *I. religiosum*, being cheaper, is often used as a substitute for the non-toxic variety.—Per *Trop. Dis. Bull.*, 1936, 634.

Japanese Star Anise (*Illicium religiosum*) is smaller and less regular in appearance, and contains a poisonous principle sikamin. The volatile oil contains saffrole.

Oleum Anisi (B.P., U.S.P. XI, Fr. Cx.).

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Volatile oil from anise or from star anise, the latter source being used exclusively in this country. Colourless or yellowish oil congealing at not lower than 15° and melting again at not below 17°. Sp. gr. 0.980 to 0.994.

Elixir Anisi (B.P.C.). *Dose*.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). Contains oils of anise, fennel and bitter almond (without HCN), in alcohol, syrup and water.

Linctus Anisi (C.X.H.).

Oil of anise 1 m., chloroform 1 m., vinegar of squill 10 m., liquid extract of liquorice 10 m., mucilage of tragacanth to 1 dr.

Spiritus Anisi (B.P.C.). *Dose*.—5 to 20 minims (0.3 to 1.2 ml.). 1 in 10 in alcohol 90%. U.S.P. XI has the same strength in alcohol 95%.

Anetholum (B.P.C.). *Syn.* p-METHOXYPROPENYLBENZENE.

$C_9H_9(OCH_3)C_2H_5 = 148.1$.

Dose.— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.).

A white crystalline mass with characteristic anise odour and taste; m.p. 22° to 23°, congealing at 21° to 22°.

Anthemis (B.P.C.). *Syn.* ROMAN CHAMOMILE (*Fr. Cx.*), FLOS CHAMOMILLÆ ROMANÆ (*P. Helv. V.*).

The dried double or semi-double flowerheads of cultivated varieties of *Anthemis nobilis* (Compositæ). Tonic, aromatic and stomachic; emetic in large doses. The infusion ("chamomile tea," 1 in 20, *dose* 1 to 4 ounces) is a domestic remedy for indigestion, and a tincture (2 of fresh flowers in alcohol 90% 3 and water 1, *dose* 3 to 10 minims), has been given for summer diarrhoea of children. A decoction with poppy heads is used as a fomentation.

Extractum Anthemidis (B.P.C.). *Dose*.—2 to 8 grains (0.12 to 0.5 g.).

The soft aqueous extract with added oil of chamomile.

Extractum Anthemidis Liquidum (B.P.C.). *Dose*.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 1.

Kamillosan (Camden Chemical Co., London). A pharmacologically tested and clinically effective preparation of fresh chamomile. Has disinfecting, deodorising and astringent properties. For enemas, fomentations and gargles.

Oleum Anthemidis (B.P.C.). *Dose*.— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.).

Distilled from anthemis. A blue liquid when freshly distilled (due to the presence of azulene) becoming greenish and then brownish-yellow. **Soluble** in less than its own vol. of 90% alcohol.

Matricaria (B.P.C.). *Syn.* GERMAN CHAMOMILE FLOWERS, FLOS CHAMOMILLÆ (*Fr. Cx.*, *P. Jap. V.*, *P. Helv. V.*, *P. Dan.*).

Dose.—2 to 4 drachms (8 to 16 g.).

The dried flowerheads of *Matricaria Chamomilla*. They have a hollow conical receptacle and no paleæ, while the receptacles of *Anthemis nobilis* are solid and covered with concave, blunt, narrow bracts. Used for the same purposes as anthemis. Oil of German chamomile is inferior in odour to oil of *Anthemis nobilis*.

Fœniculum (B.P., *Fr. Cx.*, *P. Jap. V.*, *P. Helv. V.*, *P. Dan.*).

Syn. FENNEL FRUIT.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

The dried ripe fruits of cultivated plants of *Fœniculum vulgare* (Umbelliferae). Contains volatile oil.

Given to infants in form of Aqua Fœniculi.

Aqua Fœniculi Concentrata (B.P.C.).

Dose.—5 to 15 minims (0.3 to 1 ml.).

Contains 2% of oil and is approximately 40 times the strength of the distilled water.

Aqua Fœniculi Destillata (B.P.C.). *Dose*.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). Represents 10% of fennel.

Oleum Fœniculi (*B.P.C., U.S.P. XI, P. Jap. V.*)

Dose.— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.).

Contains anethole, also fenchone, $C_{10}H_{16}O$. *Soluble* 1 in 3 to 5 parts of alcohol 90%. Aromatic carminative, usually given as Aqua Fœniculi.

ANEURINÆ HYDROCHLORIDUM

B.P. Add. III.

$C_{12}H_{17}ON_4SCl, HCl, H_2O = 355.2$.

Syn. ANEURINE CHLORIDE HYDROCHLORIDE, VITAMIN B_1 , THIAMINE HYDROCHLORIDE (*U.S.P. XI Supp. II*), THIAMIN CHLORIDE.

Dose.—Prophylactic (daily) $\frac{1}{1000}$ to $\frac{1}{100}$ grain (0.0003 to 0.0006 g.), equivalent to 100 to 200 units; therapeutic (daily) $\frac{1}{100}$ to $\frac{3}{8}$ grain (0.0006 to 0.0018 g.) equivalent to 200 to 600 units. (For further details as to dosage see USES.)

The hydrochloride of 3-(4'-amino-2'-methylpyrimidyl-5'-methyl)-4-methyl-5- β -hydroxyethylthiazolium chloride, prepared synthetically or from rice polishings, yeast and other natural sources. It occurs as a colourless, crystalline substance with a faint, yeast-like odour; m.p. 245° to 250° with decomposition.

Soluble about 1 in 1 of water; less soluble in glycerin and alcohol; insoluble in oils, ether, acetone and other fat solvents.

Aneurine hydrochloride is present in a number of vegetable food-stuffs, but even in the most abundant sources, namely the germ of cereals and yeast, the amount does not exceed 5 p.p.m. Animals are unable to synthesise or store it in any quantity, and with the exception of liver, milk, eggs and lean pork, foods of animal origin are poor sources of aneurine. The vitamin is stable in the dry form (heating at 100° for 24 hours does not diminish its potency). In aqueous solution it is fairly stable in the presence of weak acids, but is unstable in the presence of alkalis. Solutions may be sterilised by heating in an autoclave at 120° for half an hour if the pH is maintained below 5.5.

Since 1938, the international unit for aneurine hydrochloride has been defined as the antineuritic activity of 3 microgrammes of the international standard preparation of crystalline aneurine hydrochloride. In addition, however, various other units have been defined, due to the number of different methods of assay which have been described. While it is impossible to estimate accurately the equivalence of these units, nevertheless it is possible to make rough approximations, and the following values have been suggested—one international unit equals one Roscoe unit, 2 Chase-Sherman units, and 0.5 Smith-curative unit.

Incompatibilities. Mercuric chloride, iodides, carbonates, acetates and ferric sulphate. Tannic acid, iron ammonium citrate and iodine produce brown precipitates. Soluble phenobarbitone produces a white, crystalline precipitate, so that when phenobarbitone is desired in combination with an elixir of thiamine, the base should be used.—L. Greengard, *J. Amer. pharm. Ass., pract. Pharm. Edn.*, 1940, 230.

Pure thiamin hydrochloride will reduce Benedict's solution *in vitro*; this should be borne in mind in the diagnosis of diabetes.—R. S. Hart *et al.*, *J. Amer. med. Ass.*, 1/1939, 423.

Human Requirements. Owing to the fact that aneurine is not stored in the body and is rapidly lost from the tissues during short periods of deficiency, normal health cannot be maintained unless the diet regularly contains an adequate amount of the vitamin. At present there is no method available for making an accurate estimation of borderline degrees of aneurine deficiency, but from such information as is available it is possible to arrive at a rough approximation. Cowgill has shown that the minimum aneurine requirements tend to vary greatly not only between individuals but even in the same individual under different physiological conditions, and that they appear to depend on the bodyweight, the calorie requirement, and the carbohydrate intake (the larger the bulk of carbohydrate in the diet, the greater the need for aneurine). These variables are expressed in the formula (*Cowgill's Formula*): Aneurine requirements = Bodyweight in Kg. \times Calorie requirement \times 0.0000284. This worker places the daily requirements for the vitamin at 10 i.u. per 100 calories of food intake.

The Council on Pharmacy and Chemistry of the American Medical Association (1940) consider, in the light of present knowledge, that the minimum daily requirement is not less than 50 i.u. for infants and 200 i.u. for the average adult, though other authorities consider that the average adult intake should be between 300 and 400 i.u. On the basis of present indications it would seem that infants, children and adolescents require a larger daily intake than adults in proportion to the caloric needs, while pregnant and nursing women are said to require from three to five times the normal intake.

While an average well-balanced diet would yield these minimum requirements, it is widely held that the diet of large sections of the poorer classes of the community, containing as it does an unduly high proportion of carbohydrate and white bread, is on or below the borderline of deficiency. This deficiency could be largely overcome by the substitution of wholemeal bread for white bread. There are two difficulties, however, in the way of achieving this, one being that wholemeal flour does not keep so well as white flour, and the other that in spite of persistent propaganda on the part of dietitians the public continues to prefer white bread to wholemeal. In order to overcome these difficulties and to meet the admitted deficiency of aneurine intake, the Government have arranged (1941) for the large-scale production of wholemeal flour and bread and are taking steps for enriching all white flour with aneurine and a calcium compound.

Physiological Action. Aneurine is fundamentally associated with carbohydrate metabolism. In combination with pyrophosphoric acid it acts as the co-enzyme of carboxylase, an enzyme essential for the breakdown of pyruvic acid in the body. In the absence of aneurine, pyruvic acid accumulates in the tissues which

in consequence lose their power to take up oxygen. The heart and nervous system are the organs most markedly affected and the severe symptoms of aneurine deficiency occur earliest in these structures.

Uses. The most important symptoms of aneurine deficiency are degeneration of the nervous system, cardiac enlargement and dysfunction, oedema, gastro-intestinal disturbances, anorexia, and muscular atrophy. Beri-beri is the most serious clinical result of prolonged aneurine deficiency, the nervous, cardiovascular and alimentary systems all being affected. Acute cases respond rapidly to aneurine therapy, but in chronic cases the treatment is not so successful. Other conditions which are known to be due to marked aneurine deficiency are alcoholic polyneuritis and the polyneuritis of pregnancy; in these instances there is an extremely high carbohydrate and fat intake, or a very low food retention, both of which call for additional aneurine. The oral administration of 5 to 10 mg. for two or three days, with a subsequent reduction of dosage, often leads to a striking improvement. Alternatively, the same doses may be given intramuscularly or even intravenously. Other forms of neuritis which are not definitely known to be due to aneurine deficiency but which nevertheless respond well to treatment, are sciatica, neuralgia, the nerve pains of tabes dorsalis, neuritis due to treatment with metals such as lead and arsenic, and that associated with diabetes. A dosage of 2 to 4 mg. daily is usually sufficient to secure improvement in these cases. Good results have also been obtained in gastro-intestinal disturbances, especially those associated with intestinal atony, constipation and loss of appetite. In these conditions aneurine is best given by intramuscular injection in a dose of 1 or 2 mg. daily. Patients on special diets, such as the routine diets for gastric and duodenal ulcer, or the high carbohydrate diets sometimes employed in nephritis, require a supplementary source of aneurine, and in febrile conditions there is an increase in the aneurine requirement.

There is evidence to suggest frequent deficiency of vitamin B₁ in the human dietary. At the present time only the state of extreme vitamin B₁ deficiency is usually diagnosed. Lesser degrees of B₁ avitaminosis in human beings rarely receive clinical recognition. Experimental results indicate that amounts of B₁ greater than the quantity necessary to protect against extreme deficiency (*i.e.*, beri-beri) produce beneficial effects in lesser deficiencies in both animals and man. Results of a previous study indicate a relationship between vitamin B₁ deficiency and disturbances of the carbohydrate metabolism. In a study of 100 cases of clinical neuritis in which vitamin B₁ was administered orally in a dose of 10 mg. daily, 44 were rendered symptom-free, 48 were improved and 8 showed no benefit. In a group of 8 cases of unexplained gastro-intestinal hypotonicity and anorexia, 6 became free from all symptoms on ingestion of vitamin B₁; 2 were improved. The use of a single agent—pure vitamin B₁—is urged in the study and treatment of suspected B₁ avitaminosis.—M. G. Vorhaus, R. P. Williams and R. E. Waterman, *J. Amer. med. Ass.*, ii/1935, 1580.

BERI-BERI. The amounts of vitamin B₁ given in the treatment of cardiac beri-beri are often much too small. The therapeutic dose should never be less than four times the maintenance dose which, in the average male, is approximately 1 mg. of the crystalline product. It follows that the therapeutic dose should be at least 5 mg. daily and in some circumstances doses as high as 50 mg. are reasonable.—N. H. Fairley, *Practitioner*, ii/1939, 496.

ECZEMA. It is possible in practically all cases to cure eczema by the administration of vitamin B complex. In a few days the itching disappears and healing begins. Generally in a week or ten days the acute eczema and chronic cases are definitely better, though the time required for complete healing varies. When a patient has been cured he may be continuing the treatment, in smaller dosage, prevent relapses.—K. P. Kristensen and S. N. Vendel, *Lancet*, i/1940, 170.

NEURITIS. Daily intramuscular injections in alternate arms of 1 mg. (400 pigeon units) of vitamin B₁ gave good results in neuritis. Of 14 resistant cases of neuritis, 8 were cured and 4 were very much improved, and of 18 cases of sciatica 6 were cured and 6 very much improved. In all cases there was a marked degree of improvement in general bodily health. The treatment should be combined with some form of electrotherapy, with or without massage.—D. Stevenson, *Practitioner*, i/1938, 301.

Complete relief of pain in 7 out of 10 patients suffering from peripheral vascular disease was obtained by the intravenous administration of vitamin B₁ in doses of 100 mg., but no improvement was noted in the gangrene, ulcers or objective neurologic changes. Maintenance doses of 20 to 100 mg. once or twice weekly were found necessary to keep the patient free from pain.—M. Naide, *Amer. J. med. Sci.*, 1939, 197, 766.

NEURITIS in pregnancy. Four cases successfully treated by oral administration of tablets, each containing 150 units of vitamin B₁, the dosage being from 10 to 15 tablets daily.—G. W. Theobald, *Lancet*, i/1936, 834.

TRIGEMINAL NEURALGIA. Of 7 patients treated with thiamin chloride 6 obtained relief. Four patients who were completely relieved received 160, 210, 84 and 90 mg. each, and in all of them improvement commenced promptly.—I. Bakhsh, *Indian med. Gaz.*, 1939, 456.

VARICOSE ULCERS. Of 10 patients with painful varicose ulcers treated with vitamin B₁, all but one were definitely relieved of pain and 8 had complete subsidence of their symptoms; in 2 cases the symptoms completely subsided in 4 days. In 5 of the cases there was, in addition, definite improvement in the healing of the ulcer. Large doses are necessary, at least 5 mg. (1500 units) 3 times daily by the mouth, and this dose doubled if symptoms do not subside in 3 or 4 days.—A. Ochsner and M. C. Smith, *J. Amer. med. Ass.*, i/1940, 947.

Pulvis Vitamin B₁ (B.P. Add. I). Adsorbate of vitamin B₁.

Dose.—Prophylactic, 15 to 30 grains (1 to 2 g.), equivalent to 100 to 200 units per day. Therapeutic, 30 to 90 grains (2 to 6 g.), equivalent to 200 to 600 units.

The adsorbate on fuller's earth of the antineuritic vitamin, vitamin B₁, containing 100 units of antineuritic activity per g. It is a cream-coloured, tasteless, odourless powder, insoluble in water or acids.

Befortiss (Vitamins Ltd., London). Ampoules contain 2, 10 or 20 mg. of vitamin B₁, and tablets contain 200 i.u. per g. and 666 i.u. per g. of B₁, and other factors of the vitamin B complex.

Bekailin Brand Vitamin B₁ (Vitamins Ltd., London). Tablets (0.5 g.) of vitamin B₁ concentrate, each containing 100 i.u.

Bemax (Vitamins Ltd., London). A stable preparation of wheat germ, standardised to contain 12-15 international units of vitamin B₁ per g., also 3 international units of vitamin A per g., the factors of the vitamin B₂ complex and a high proportion of vitamin E. For constipation, arthritis and conditions of vitamin B₁ deficiency, also in pregnancy and lactation.

Benerva (Roche Products, Welwyn Garden City). Preparations of vitamin B₁ available in tablets (1 mg.), and ampoules (2 or 10 mg.).

Berin (Glaxo Laboratories, London). Crystalline vitamin B₁. Ampoules contain 2 mg. in 1 ml. **Forté Ampoules** contain 10 mg. in 1 ml. **Tablets** contain 1 mg.

Betabion (Merck, Darmstadt; Savory & Moore, London). Pure crystalline vitamin B₁ in tablets each containing 1 mg.; ampoules containing 2 mg. in 1 ml., and ampoules ("strong") containing 10 mg. in 1 ml.

Betalin 1 (Lilly, London). Capsules of vitamin B₁ containing 125 i.u. per capsule.

Betalin S (*Lilly, London*). Synthetic vitamin B₁ in tablets and ampoules.

Betalin Compound (*Lilly, London*). Capsules containing 0.5 mg. of vitamin B₁ and 40 Sherman units of vitamin B₂ from a liver-stomach concentrate.

Betaxan (*Bayer Products, London*). Ampoules containing synthetic vitamin B₁, 1 ml. containing 2 or 10 mg. of the vitamin. Also available in tablets containing 1 mg.

Crysto-Vibex (*Parke, Davis, London*). Crystalline vitamin B₁ supplied in tablets containing 0.5 mg. and 1 mg., and in ampoules containing 6.7 mg. in 1 ml.

Davitamon B₁ (*Organon Laboratories, London*). Tablets, each containing 1 mg. of aneurin, and 1 ml. ampoules, each containing 2 mg. of aneurin. **Davitamon B₁ Forte**. 1 ml. ampoules, each containing 10 mg. of aneurin.

Dibexin Capsules (*Parke, Davis, London*). A combination of aneurin 1 mg. (333 i.u.), vitamin B₂ (riboflavin) 40 Sherman units, with B₃, B₄, B₅ and B₆ and nicotinic acid. Advocated for the treatment of deficiencies of vitamins B₁ and B₂. **Dose**.—As a dietary supplement 1 to 3 capsules daily. Up to 10 daily may be taken in severe vitamin B₁ deficiency. In atonic constipation the dose is 2 to 6 capsules daily.

Ryzamin-B (*Burroughs Wellcome, London*). A concentrate of rice polishings, supplied in tubes containing not less than 80 i.u. of vitamin B₁ per g.

Syrup Vitafruct (*Thackray, Leeds*). Contains in each fl. dr. 0.33 mg. of vitamin B₁, 3 fl. dr. representing 500 i.u. **Dose**.—3 fluid drachms daily.

Riboflavin. *Syn.* VITAMIN B₂, LACTOFLAVIN, VITAMIN G.

Dose.—2 to 3 mg.

Riboflavin occurs as an orange-yellow crystalline substance, which is *soluble* in water, producing solutions which have a green fluorescence, but is insoluble in chloroform, ether and other fat solvents. It is relatively highly heat-stable. The flavines are a group of yellow water-soluble pigments widely distributed in nature. Riboflavin was first obtained from milk, and on that account is often referred to as lactoflavin. It has been obtained from a large number of natural sources, including such substances as egg albumin, egg yolk, milk, liver, malted barley and yeast.

Uses. Although animal experiments indicate that riboflavin is an essential to growth, no therapeutic claims have so far been advanced on its behalf.

Acidum Nicotinicum (*U.S.P. XI Supp. II*). *Syn. and Prop. Name*. P.P. FACTOR, PELONIN (*Glaxo Laboratories, London*) (tablets and ampoules each contain 50 mg.).

$C_5H_4N \cdot COOH = 123.1$.

Dose.—Average daily dose 5 grains (0.3 g.).

Nicotinic acid or pyridine- β -carboxylic acid is a product of the oxidation of nicotine. It is obtained synthetically and occurs in colourless, odourless crystals melting at 234° to 237°.

Soluble about 1 in 60 of cold water; freely soluble in hot water and hot alcohol; insoluble in ether.

Uses. Nicotinic acid is either the pellagra-preventive vitamin, or a pro-vitamin, or it may be conjugated with other substances in the body into a more complex compound that is essential to counteract pellagra. Nicotinic acid is used in the treatment of acute pellagra, causing the disappearance of the characteristic lesions of the disease, a greatly improved mental condition and a normal porphyrin content of the urine. Chronic cases do not

respond so well. It does not affect the polyneuritis often associated with pellagra and such cases require the administration of aneurine. Nicotinic acid has also been employed in the treatment of acrodynia, sprue, and some forms of glossitis and stomatitis.

DELIRIUM TREMENS. In a chronic whisky addict an attack of delirium tremens (recurrence) associated with severe gastro-intestinal manifestations and acute stomatitis was made to disappear within 12 hours by the administration of nicotinic acid (0.5 g.). Previous to this thiamin had been given in large doses but without perceptible result.—F. Mainzer and M. Krause, *Brit. med. J.*, ii/1939, 331.

PELLAGRA. Elvehjem has shown that nicotinic acid or its amide (isolated from liver) has a curative effect on blacktongue in dogs and it has since been found at the Cambridge Nutritional Laboratory that nicotinic acid has a curative action on monkey pellagra due to a diet deficient in the P-P (pellagra-preventing) factor. Trials on 5 human pellagrins using up to 0.33 g. daily showed in all cases that nicotinic acid exerted a curative effect on the erythema but had less effect on the general condition of the patients. It is suggested that either human pellagra is due to a deficiency of more than one factor or nicotinic acid may be the precursor of the P-P factor which is formed from it in the body.—L. J. Harris, *per Lancet*, ii/1937, 1467.

Studies on 15 pellagrins showed the administration of nicotinic acid is followed promptly by remission of the pellagrous glossitis, stomatitis, pruritus, vaginitis, urethritis, and porphyrinuria. None of these manifestations of pellagra returned so long as the patient continued to take the nicotinic acid, even though he ate only a basic diet, but they returned if he continued to take only a pellagra-producing diet and did not take nicotinic acid. The suggested safe and effective dose is 0.5 g. per day in five doses of 100 mg. each, or it may be given parenterally in a dose of 10 to 20 mg. in sterile physiological saline four times a day. Its use should be combined with a well-balanced diet.—T. D. Spies, *Lancet*, i/1938, 252. *See also J. Amer. med. Ass.*, i/1938, 622.

Thirteen cases of endemic pellagra responded promptly to nicotinic acid therapy. The most striking effect was the rapid healing of lesions of the alimentary tract with development of an excellent appetite and gastrointestinal function and the spectacular disappearance of mental symptoms. It does not seem to be effective against the peripheral neuritis associated with pellagra, which is improved, however, by large doses of synthetic vitamin B₁, intravenously and intraspinally.—R. S. Matthews, *J. Amer. med. Ass.*, ii/1938, 1148. *See also T. D. Spies et al., ibid.*, 584.

RADIATION SICKNESS. Results from nicotinic acid therapy (200 mg. 3 times daily) would appear to be better than from Nembutal or intramuscular liver. Ease of administration with no unpleasant after effects is definitely advantageous.—J. W. Graham, *J. Amer. med. Ass.*, ii/1939, 664.

VINCENT'S DISEASE. Four cases of severe Vincent's disease successfully treated by nicotinic acid by mouth, 250 mg. daily dissolved in water.—J. D. King, *Lancet*, ii/1940, 32.

Nicotinic Acid Amide. *Syn.* NICOTINAMIDE.

$C_6H_4N \cdot CONH_2 = 122.1$.

Dose.—Average daily dose 5 grains (0.3 g.).

Nicotinic acid amide occurs as white, odourless, needle-like crystals with a bitter taste. M.p. 133°.

Soluble in water, alcohol and benzene; insoluble in ether.

Uses. May be used similarly to nicotinic acid in the treatment of pellagra.

15 patients with pellagra and dermatitis, and 2 with pellagrous stomatitis were treated with nicotinamide (1 g. by mouth or 0.5 g. by injection daily), meat and milk being cut off as soon as treatment was begun. Nicotinamide effected great improvement in the acute mucous membrane lesions and a slower improvement in the acute skin conditions. The appetite, mental condition and general physical health of all the patients were improved.—A. C. Alport, *Lancet*, ii/1938, 1460.

Pyridoxin. *Syn.* VITAMIN B₆, ADERMIN. C₈H₁₁NO₃ = 169.2.

Dose.—50 to 100 mg. subcutaneously at weekly intervals.

Pyridoxin is 2-methyl-3-hydroxy-4 : 5-(hydroxymethyl)-pyridine, occurring in yeast, liver, rice bran, etc., and prepared synthetically. White crystals, m.p. 160° (with decomposition).

Soluble in water, alcohol and acetone; less soluble in chloroform and ether.

Uses. The available evidence indicates that pyridoxin is an important factor in nutrition, and deficiency may give rise to a symptom complex in which muscular weakness and rigidity are prominent. It has been employed with some success in a small number of patients in myasthenia gravis, in muscular dystrophy and in paralysis agitans.

ANÆMIA. When administered in large amounts, has a definite effect upon the hæmopoietic system of human beings who have macrocytic anæmia of pellagra or pernicious anæmia in relapse. This substance does not, however, act specifically either as the true anti-pernicious factor or as the extrinsic factor of Castle.—R. W. Viller, H. S. Schiro and T. D. Spies, *Nature, Lond.*, i/1940, 388.

MUSCULAR DYSTROPHY. Used in six cases of pseudo-hypertrophic muscular dystrophy with considerable improvement.—W. Antopol and C. E. Schotland, *J. Amer. med. Ass.*, i/1940, 1058.

PARKINSONISM. Definite improvement in all of three post-encephalitic cases and in two out of eight arteriosclerotic cases.—T. D. Spies *et al.*, *J. Amer. med. Ass.*, ii/1940, 294.

ANTIMONIUM

Sb = 121.76.

[P1] "*Antimony, chlorides of; oxides of antimony; sulphides of antimony; antimonates; antimonites; organic compounds of antimony.*"

[S1] "*Antimonial poisons except substances containing less than the equivalent of one per cent. of antimony trioxide.*"

[S3] "*Antimony, chlorides of—in polishes.*"

[S6] "*Antimonial poisons—specify proportion as the proportion of antimony trioxide (Sb₂O₃) or antimony pentoxide (Sb₂O₅) that the preparation would be calculated to contain on the assumption that the antimony (Sb) in the poison had been wholly converted into antimony trioxide or antimony pentoxide as the case may be.*"

Antidotes to Antimony Salts. Give emetic if vomiting has not occurred and wash out stomach with 180 gr. of tannic acid in 2 gallons of water, using stomach tube. Give 20 gr. of tannic acid in water and repeat 5 gr. doses every $\frac{1}{2}$ hour for 4 or 5 doses. Keep patient warm and give demulcent drinks. Strychnine, $\frac{1}{8}$ gr., hypodermically. Saline infusion may be necessary. Morphine, $\frac{1}{4}$ gr., hypodermically, in cases of extreme irritability.

[P1-S1] **Antimonii Oxidum (B.P.C.).** ANTIMONIOUS OXIDE.

Sb₂O₃ = 291.5.

Dose.—1 to 2 grains (0.06 to 0.12 g.).

A white powder, *soluble* in hydrochloric acid and in alkaline tartrate solution, caustic alkalis, etc. Diaphoretic, expectorant and emetic.

[P1-81] **Pulvis Antimonialis (B.P.C.).** *Syn.* JAMES'S POWDER.

Dose.—3 to 6 grains (0.2 to 0.4 g.).

Contains 33½% of antimonious oxide in calcium phosphate.

[P1-81] **Antimonii Trichloridum (Fr. Cx.).** ANTIMONIOUS CHLORIDE. SbCl_3 = 228.1. A colourless, crystalline mass. M.p. 73°. It is very corrosive and hygroscopic, hence **butter of antimony** is usually liquid; on addition of water it decomposes into free hydrochloric acid and basic antimony oxychloride. A solution of pure antimonious chloride in chloroform is used as a test for vitamin A.

[P1-81] **Liquor Antimonii Chloridi (B.P.C.).** *Syn.* BUTTER OF ANTIMONY. A solution of antimonious chloride containing 17 to 18% w/w of Sb. Formerly used as an escharotic, now used mainly in veterinary practice and in furniture polishes.

[P1-81] **Antimonii et Potassii Tartras (B.P., U.S.P. XI, F.E. VIII, P. Belg. IV, P. Helv. V, P. Dan., and P. Ital. V).** *Syn.* POTASSIUM ANTIMONYL TARTRATE, TARTAR EMETIC, ANTIMONIUM TARTARATUM, TARTARATED ANTIMONY, ANTIMONY AND POTASSIUM TARTRATE, EMÉTIQUE (Fr. Cx.).

$\text{C}_4\text{H}_4\text{O}_7\text{SbK}, \frac{1}{2}\text{H}_2\text{O}$ = 333.9.

Dose.—Diaphoretic and expectorant $\frac{3}{8}$ to $\frac{1}{2}$ grain (0.002 to 0.008 g.), emetic $\frac{1}{2}$ to 1 grain (0.03 to 0.06 g.). *Intravenously* $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.), usually in 1 or 2% solution. *Hypodermically* it is painful, irritating and *not advised*, and *intramuscularly* it is too painful.

Fr. Cx. has max. single dose 1 grain; max. in 24 hours 3 grains. *P. Helv. V* max. in 24 hours $4\frac{1}{2}$ grains.

A single dose over limit of safety, *i.e.*, between 0.01 and 0.02 g. per kilo weight, is sufficient to cause death.

Asphyxia in a woman following 1 grain in 6% solution intravenously. Recovery after intracardiac injection of 0.2 ml. of 1 in 1000 adrenaline.—*Lancet*, ii/1931, 1325.

Made by combining antimonious oxide with potassium acid tartrate. It occurs in colourless crystals or as a white powder.

Soluble 1 in 17 of cold water, 1 in 3 of boiling water and 1 in 20 of glycerin. Almost insoluble in alcohol 90%.

Incompatible with acids and alkalis, soap, and tannin.

Uses. Diaphoretic and emetic when given orally. In sub-emetic doses it is an active remedy in acute bronchitis, often given in combination with opium. It is mainly used for the intravenous administration of antimony in the treatment of cutaneous leishmaniasis, frambæsia, filariasis, schistosomiasis, espundia, kala-azar and oriental sore. Is also beneficial in relapsing fever and has been given with benefit in cerebrospinal fever. Is almost specific in granuloma inguinale, and has proved of value in the treatment of trypanosomiasis in cattle.

For schistosomiasis and kala-azar it is commonly given as a 2% solution in initial doses of $\frac{1}{2}$ gr., increasing at each injection by $\frac{1}{2}$ gr. to a maximum of 2 gr. The injections are given on alternate

days or twice weekly until 25 to 30 gr. has been given. During the course of the injections, red blood first disappears from the urine although smokiness remains until about 20 gr. has been given. Injections should be given only with great caution if there is any lesion of the heart, lungs, kidneys or liver. In the treatment of schistosomiasis it has also been employed rectally; initial dose 1 gr., then 2 gr. every second day, increasing to 3, 4 and 5 gr. during three weeks in 100 ml. of water.

ACNE ROSACEA cured in 5 weeks by tartarated antimony, $\frac{1}{8}$ gr. *per os* thrice daily after meals, combined with application night and morning of a lotion containing sulphur, zinc oxide and magnesium carbonate. Good results also in furunculosis and ulcerative legs.—L. W. Bain, *Brit. med. J.*, ii/1929, 51.

CHANCROID well treated. 5 ml. of a 1% solution intravenously, every second day or at longer intervals; 4 to 6 injections increased by 1 ml. to a total of 12 ml.

KALA-AZAR. Compulsory treatment in Assam with tartar emetic intravenously "has converted a disease with a 90% mortality into one with a 90% rate of cure."

There is sufficient evidence to demonstrate that antimony is by no means a satisfactory specific for kala-azar in the Sudan, although up to the present time it has been the only drug of any value.—E. S. Horgan and R. Kirk, *Nature*, *London*, i/1940, 228.

KERATITIS has been well treated by tartar emetic intravenously.

SCHISTOSOMIASIS. "Rheumatic pains" liable to occur during the night following the 4th or 5th injection. There is increased hæmaturia as treatment proceeds; later, the blood and the ova vanish. Where there is intolerance, give brandy, $\frac{1}{2}$ ml. adrenaline solution and $\frac{1}{2}$ ml. post-pituitary extract intramuscularly.

In bilharzia its use is generally accompanied by cough, vomiting, and fainting.—M. Khamil and M. H. Betache, *Lancet*, i/1930, 234.

Exceeding the maximum dose causes sudden displacement of the bilharzia parasites, which lose their hold on the vein-walls and are precipitated as thrombi into the liver, possibly resulting in hepatitis, congestion of the bile ducts, or even septic foci in the pulmonary circulation, if not completely destroyed. The method of choice is gradual destruction over a period of one month.—F. G. Cawston, *J. trop. Med. (Hyg.)*, Feb. 16, 1931.

TRACHOMA. The corneal complications of trachoma which respond poorly to the usual methods of treatment show distinct improvement following the intravenous injection of 1% tartar emetic. The dose is 5 ml. on 6 successive days, 10 ml. on the 8th day and this dose repeated on the 10th, 12th, 15th, 19th, 22nd, 25th, 28th and 31st days of treatment, or a total of 1.2 grammes in 31 days. The treatment may be supplemented by painting the fornices with the 1% solution once a day and instilling drops of the same strength three times a day. If more than a small quantity of the drug escapes into the subcutaneous tissues severe local reactions may occur. Muscular stiffness is a not uncommon complication in the later stages of treatment; it is felt in the mornings but wears off during the day.—Julianelle *et al.*, *per Brit. med. J.*, i/1939, 516.

TUBERCULOUS HÆMOPTYSIS may be arrested with tartar emetic by the mouth—a total daily dose of 0.05 to 0.15 g., usually for 5 days, in pills containing 0.02 to 0.05 g. with 0.01 g. of opium, with water an hour before or after meals.

TRYPANOSOMIASIS IN CATTLE. Of value in *T. congolense* or *T. vivax* infections—1 g. intravenously every 5 days for 6 doses. Of no value in horses infected with *T. brucei*.—Wenyon, p. 462. Successful in saving the lives of thousands of animals.—Ll. E. W. Bevan, *Trans. R. Soc. trop. Med. Hyg.*, Aug., 1923, 154.

After a single course of tartar emetic injections relapses to *T. vivax* infection are the exception, whereas relapses to *T. congolense* infection are the rule.—H. E. Hornby, *Trans. R. Soc. trop. Med. Hyg.*, Jan., 1929, 403; also J. N. Hall, *ibid.*

Following the use of the injections (in Swaziland) abscess formation round the injected jugular vein is very common, the injections often being attempted by the farmers themselves who rely on distilled rather than boiled water for making the solution. To control any local reaction from unskilful injections of stock infected with nagana it is recommended that the powder be dissolved in a

1 or even 2% solution of phenol and a little glycerin added.—F. G. Cawston, *J. trop. Med. (Hyg.)*, 1935, 306.

[P1] **Hausus Emeticus Purgans** (*Mid. H.*).

Potassium antimonyltartrate $\frac{1}{2}$ gr., magnesium sulphate 60 gr., water to 1 oz. for a dose.

[P1] **Vinum Antimoniale** (*B.P.C., P. Ned. V, I.A.*).

Dose.—10 to 30 minims (0.6 to 2 ml.); as emetic 2 to 4 drachms (8 to 15 ml.).

Contains 1 in 250 of potassium antimonyltartrate in sherry-type wine.

Pneumonia has been treated by repeated $2\frac{1}{2}$ minim doses of antimonial wine. Crisis comes at the end of the fourth day.

HEADACHE DUE TO HIGH BLOOD PRESSURE. Especially of value where chronic interstitial nephritis is a contraindication to blue pill.—A. Feiling, *Brit. med. J.*, ii/1930, 907.

[P1] **Mist. Antimon.** (*N.I.F.*). Antimonial wine 5 m., potassium nitrate 10 gr., strong solution of ammonium acetate 30 m., camphor water to $\frac{1}{2}$ oz.

[P1] **Mistura Vini Antimonialis** (*St. J. H.*).

Magnesium sulphate 20 gr., antimonial wine 10 m., water to $\frac{1}{2}$ oz.

Will give very gratifying results in the early stages of many inflammatory diseases such as psoriasis or lichen planus.—J. E. M. Wigley, *Practitioner*, 1935, 359.

[P1-S1] **Unguentum Tartari Stibiati** (*P. Ital. V*).

Potassium antimonyltartrate 20 g., lanolin or soft paraffin 80 g.

[P1-S1] **Antimonii et Sodii Tartras** (*B.P.*). *Syn.* SODIUM ANTIMONYLTARTRATE. $C_4H_4O_7SbNa = 308.8$.

Dose.—As for Antimonii et Potassii Tartras.

Caution. One-third of the amount of antimony injected is excreted by the kidneys in 24 hours. Great caution is required where heart, kidney or lung disease exists. In weak, emaciated and anæmic subjects begin with small dose gradually increased.

In colourless, hygroscopic scales or powder with sweetish taste.

Soluble 1 in $1\frac{1}{2}$ of water; insoluble in alcohol.

Uses. This compound has properties similar to those of tartar emetic. Its greater solubility may be of some advantage and it is considered to be less irritant and less toxic than the potassium compound. It has been largely employed in schistosomiasis and in oriental sore and kala-azar in the same dosage as potassium antimonyltartrate.

Antimony sodium tartrate is less toxic and irritant than tartar emetic. It can be sterilised by boiling and the following method is used. The drug is weighed out, dissolved in more than the required volume of water and filtered into a flask graduated to the required volume. It is then sterilised by gently boiling down to the graduation mark.—O. Turner, *Trans. R. Soc. trop. Med. Hyg.*, 1940, 34, 111.

[P1-S1] **Antimonium Sulphuratum** (*B.P.C.*).

Dose.—1 to 2 grains (0.06 to 0.12 g.).

A mixture of the sulphides and oxides in orange red powder.

Uses. Alterative and emetic, but uncertain in action. Has been used in conjunction with calomel and guaiacum and resin in the treatment of gout and rheumatism (Plummer's Pills).

[P1-S1] **Kermes Minerale** (*Fr. Cx., P. Belg. IV*) is made by boiling black antimony sulphide (trisulphide) with sodium carbonate solution, and allowing the liquor to cool. [P1-S1] **Tabletæ Kermetis** (*P. Belg. IV*) contain 0.01 g.

Dose.—1 to 2 grains. *Incompatible* with acids, sodium bicarbonate and potassium acid tartrate.

[P1-S1] **Antimonii Pentasulphidum** (*P. Ned. V, P. Belg. IV, P. Ital. V, P. Helv. V, P. Dan.*). $\text{Sb}_2\text{S}_3 = 403.82$

An orange powder made by decomposing Schlippe's salt (sodium sulph-antimonate, $\text{Na}_3\text{SbS}_4 \cdot 9\text{H}_2\text{O}$) with dilute sulphuric acid.

[P1-S1] **Antimonium Nigrum Purificatum** (*P. Belg. IV, P. Helv. V*). $\text{Sb}_2\text{S}_3 = 339.7$.

Greyish crystalline powder obtained by purification of native antimony sulphide. Decomposed by boiling hydrochloric acid. Used in veterinary practice as parasiticide.

[P1-S1] **Stibium Sulfuratum Depuratum** (*Fr. Cx.*). Sb_2S_3 . Grey, crystalline substance; sp. gr. about 4.6; m.p. 540° . It is used for making Kermes Minerale (*Fr. Cx.*).

[P1-S1] **Stibium Sulfuratum (Trisulfuro) Crudum**. *Syn.* STIBINA OR ANTIMONIO CRUDO (*P. Ital. V*) is converted into [P1-S1] **Stibium Sulfuratum depuratum**, *syn.* STIBINA DEPURATA, by treatment with ammonia. *F.E. VIII* is similar.

[P1-S1] **Antimony Crocus**. For veterinary use, is a mixture of trioxide (about 4 parts) and trisulphide (1 part). Formed by heating equal weights of antimony trisulphide and potassium nitrate to which $\frac{1}{2}$ of hydrochloric acid has been added.

Colloidal Antimony has been given intramuscularly in leprosy, leishmaniasis, and pulmonary tuberculosis.

[P1-S1] **Stibophenum** (*B.P. Add. III*). *Prop. Name.* FOUDIN (*Bayer Products, London*). $\text{C}_{12}\text{H}_4\text{O}_{16}\text{S}_4\text{SbNa}_5 \cdot 7\text{H}_2\text{O} = 895.1$.

Dose.— $1\frac{1}{2}$ to 5 grains (0.1 to 0.3 g.), by intravenous injection.

Similar dosage is employed intramuscularly.

Sodium - antimony - bispyrocatechol - 3:5 - sodium disulphonate, containing about 15.8% of antimony. It is a colourless, odourless, crystalline powder.

Freely *soluble* in water; almost insoluble in organic solvents. Aqueous solutions are at first colourless, but gradually turn lemon-yellow in colour. The formation of the yellow colour may be prevented by the addition of acid.

Uses. Stibophen is employed principally in the treatment of schistosomiasis, usually in the form of a 6.3% solution. A dose of 1.5 ml. of this solution is given intramuscularly on the first day, 3.5 ml. on the second day, and 5 ml. on the third day and every other day, to a total of 40 to 75 ml. A similar scheme of dosage may also be employed with success in the treatment of undulant fever and oriental sore. It is rapidly effective, especially when given in conjunction with sulphanilamide (0.5 g. five times daily for 5 days, and then four times daily for 3 days), in granuloma inguinale.

Although it is much less toxic than tartar emetic and seldom gives rise to local complications, toxic symptoms such as nausea, epigastric pain, giddiness and vomiting are occasionally experienced. It is also cumulative in action and may have a deleterious effect on the liver if the course of treatment is too prolonged.

Test for excretion. In schistosomiasis, although the majority are cured, there are some resistant cases that need prolonged treatment, while there are others (a very few) which cannot tolerate the drug. The drug is excreted mainly through the kidneys and it has been found that the amount and rate of excretion differs greatly in different persons, and patients who excrete the drug very quickly belong to the class that are not cured by the ordinary course of treatment, whereas those who excrete the drug very slowly are those that readily show symptoms of

intolerance. The test is as follows: To 5 ml. of the urine add 5 ml. of a fresh 0.05% solution of FeCl_3 and make the mixture alkaline by adding strong ammonia. A red colour indicates the excretion in some form of the drug. The depth of colour is found to correspond approximately to the amount of antimony in the urine as revealed by the Reinsch test. The excretion of antimony continues, however, after the colour-test has become negative. By means of this test it is possible to test indirectly the excretion of antimony after the first injection, and to adjust the dose according to the results—increasing it for quick excretors and reducing it for slow excretors.—M. Khalil, *Lancet*, ii/1936, 132.

DISSEMINATED SCLEROSIS. A course of 10 or 12 intramuscular injections is often very helpful.—Macdonald Critchley, *Med. Pr.*, i/1936, 520.

GRANULOMA INGUINALE. A safe and rapid specific. Generally superior to potassium antimonyltartrate and without dangerous reactions.—*J. Amer. med. Ass.*, i/1933, 1674.

SCHISTOSOMIASIS cured by intramuscular injections of 1 to 5 ml. of 7% solution. Local reaction slight, and no deaths or serious symptoms occurred in 20 cases. 2 weeks treatment gives cure.—*Brit. med. J. Epit.*, ii/1929, 92.

Schistosomiasis in W. African children. Given intramuscularly, the total course of treatment being equivalent in ml. to the weight of the child in kilos; given in 10 doses, the third to the tenth being equal and given on alternate days; the first injections given on consecutive days and being about 30% and 70% respectively of succeeding full doses. Of 6 cases treated all were clear of ova by the twenty-fourth day, but there was loss of weight and considerable local pain.—R. M. Gordon and E. P. Hicks, *Ann. trop. Med. Parasit.*, Oct. 22, 1930.

Nine intramuscular injections for an adult cure in the majority of cases. First day, 1.5 ml.; second, 3.5 ml.; third, 5 ml.; fifth, 5 ml.; seventh, 5 ml.; ninth, 5 ml.; eleventh, 5 ml.; thirteenth, 5 ml.; fifteenth, 5 ml. If ova found give further two doses.—M. Khalil and M. H. Betache, *Lancet*, i/1930, 234.

Because of its inferior antimony content it cannot be recommended in the treatment of schistosomiasis except where intravenous injections are impossible and where treatment can be repeated if found necessary.—F. G. Cawston, *J. trop. Med. (Hyg.)*, 1936, 29.

UNDULANT FEVER. Eight cases at Malta successfully treated by intramuscular injection of 1.5 ml. on the first day, 3.5 ml. on the second day, followed by 5 ml. on alternate days. As a result of the injections, there were no waves of fever after the first, though such waves are one of the characteristics of the disease.—C. Z. Neumann, *Lancet*, i/1936, 1001.

[P1-81] **Anthiomaline** (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Lithium antimony-thiomalate. An organic compound containing 16% of antimony. *Dose*.—From 0.5 to 2 ml. (1 ml. = 0.01 g. Sb) intramuscularly, for a course of 12 to 20 injections, at the rate of 2 or 3 a week. In lympho-granuloma inguinale, schistosomiasis and leishmaniasis. Has low toxicity and is well tolerated.

SCHISTOSOMIASIS. 2 ml. of Anthiomaline is a sufficiently large repeated dose for a child, and 4-ml. doses should not be exceeded in adults. Excessive doses cause salivation or retching. A cure may sometimes be obtained in less than the month usually required with tartar emetic.—F. G. Cawston, *Prescriber*, 1936, 233.

[P1-81] **Neostam** (*Burroughs Wellcome, London*). A brand of stibamine glucoside (the nitrogen-glucoside of sodium *p*-aminophenylstibonate) available in phials of 0.05, 0.1, 0.2, 0.5 and 1 g. for use in kala-azar, etc. *Dose*.—0.1 g. per 100 lb. body weight intravenously as a 4% solution in distilled water on alternate days until 3 g. per 100 lb. b/w has been given.

[P1-81] **Neostibosan** (*Bayer Products, London*). *Syn.* "693 B." Diethylamine-*p*-aminophenyl stibinate. In kala-azar. *Initial dose*.—0.05 to 0.02 g. according to age intravenously; 8 injections on 8 consecutive days for intensive treatment.—*See also Brit. med. J. Epit.*, i/1931, 65.

KALA-AZAR. It has been shown by Napier that the treatment of all cases in Bengal villages with Neostibosan has been followed in a few years by the disappearance of the disease.—*Trop. Dis. Bull.*, 1940, 350.

MEDITERRANEAN VISCERAL LEISHMANIASIS. The pentavalent preparations have attained their maximum effect and most convenient form in Neostibosan. With tartar emetic and Neostibosan almost 100% of cures have been obtained during the last few years. Contraindications are profound renal lesions and serious

cardiac disorders.—Caronia (Italy). Neostibosan has yielded excellent results.—Sergent (Algeria). Results with Neostibosan highly favourable—70% of cures.—Pittaluga (Spain).—*Quart. Bull. Hlth Org. L.o.N.*, Dec., 1935, 801.

[P-51] **Urea Stibamine** (*Brahmachari Institute, Calcutta; Pharmaceutical Products, London*) is composed of urea and *p*-aminophenylstibinic acid, $\text{NH}_2\text{C}_6\text{H}_4\text{SbO}(\text{OH})_2$, but apparently not a definite compound.

Safer than tartar emetic in the treatment of kala-azar. Intravenous injections on alternate days, starting with 0.1 g. in cold sterile water, increasing by 0.05 g. to a maximum of 0.25 g. and continued for subsequent doses. Rapidity of disappearance of symptoms compared with sodium antimonyl tartrate, 2 to 3 weeks as against 3 months.

It has been shown (Gray *et al.*, *Proc. R. Soc. Med.*, B, 1931, 108, 54) that the effective active principle of Urea Stibamine is *S*-diphenylcarbamide-4:4-distibinic acid, which is rendered water-soluble in the presence of protective colloids, and that the analysis of Urea Stibamine gives fairly constant results. The conclusions of early workers that the so-called Urea Stibamine varied widely in its antimony content and was uncertain in its composition are therefore erroneous, and due to the fact that various products were marketed which did not conform to the original specification.—U. Brahmachari, *Nature, Lond.*, 1/1940, 1021.

It was found at the Peiping Union Medical College that an adequate course of Urea Stibamine (in kala-azar) for a child was 1.0 to 1.5 g., as contrasted with 1.5 to 2.5 g. for Neostibosan. For an adult the figures were 1.5 to 2.5 g. and 4.0 to 5.0 g. Urea Stibamine is thus definitely more potent than Neostibosan, which, on the other hand, has the advantage of being a definite chemical compound of a lower toxicity. After treatment with either of these drugs patients must be followed for at least 7 months to a year before cure can be pronounced.—C. U. Lee and C. F. Chu, *Chinese med. J.*, 1935, 328.

APIOL

B.P.C., P. Belg. IV, Fr. Cx.

Dose.—3 to 10 minims (0.2 to 0.6 ml.), in perles, 3 minims in each, or capsules 3, 5 and 10 minims in each.

Apiol is obtained by alcoholic extraction from the fruit of *Carum Petroselinum*, *syn. Apium Petroselinum, Petroselinum sativum*, common parsley. The alcohol is evaporated and the residue allowed to cool, the clear liquid being decanted. It is a green oil, with a peculiar odour and a pungent taste like parsley. Sp. gr. 1.055 to 1.091.

Soluble readily in alcohol and ether.

Apiol is claimed to be efficacious in primary amenorrhœa or deficiency of secretion, as well as in dysmenorrhœa. It is given night and morning for 4 or 5 days during the period.

The Inter-Departmental Committee on Abortion recommended the inclusion of apiol in the Fourth Schedule.—*Report of the Inter-Departmental Committee on Abortion, H.M.S.O.*, 1939.

Toxic Effects. Clinical observations on 37 women with toxic polyneuritis following the use of apiol as an abortifacient.—R. Carrillo and J. W. G. T. Braak, *per J. Amer. med. Ass.*, ii/1932, 698.

Polyneuritis frequently follows its administration. Due to tri-ortho-cresyl phosphoric acid of which apiol contains 28 to 50%.—*Brit. med. J. Ept.*, i/1933, 12.

Three cases of polyneuritis following use of apiol as an abortifacient, due to the presence in it of tri-ortho-cresyl phosphate.—J. J. Waite, *per Brit. med. J. Ept.*, ii/1933, 5.

TRI-ORTHO-CRESYL PHOSPHATE. The use of this compound in the preparation of a synthetic ginger extract, caused an epidemic of peripheral motor paralysis of the legs and arms. 20,000 cases of paralysis due to the drinking of this imitation ginger extract occurred in the South-East of the United States in 1930 before the cause was discovered. Very few deaths resulted, but partial recovery occurred

only after some months, and in many cases the paralysis seems permanent. This paralysis is only produced by tri-ortho-cresyl phosphate: it is not produced by ortho-cresyl, or by para- or meta-tri-cresyl phosphate.—*Brit. med. J.*, ii/1933, 579.

[P1-S1] **Capsules of Apiol and Ergotin.**

Contain apiol 5 minims (0.3 ml.) and extract of ergot 2 grains (0.12 g.).

[P1-S1] **Ergoapiol** (*Martin H. Smith, New York; Christy, London*). Capsules containing ergot extract 0.065 g., aloin 0.008 g., oil of savin 0.03 g., and apiol 0.3 g. For amenorrhœa, dysmenorrhœa and allied disorders.

A fatal case of poisoning in a young woman who took 17 of the capsules to induce abortion.—*K. Lowenberg, J. Amer. med. Ass.*, i/1938, 573.

Oleum Petroselinii (*B.P.C.*). *Syn.* OIL OF PARSLEY.

Dose.—3 to 5 minims (0.2 to 0.3 ml.).

The oil distilled from the fruit of parsley, *Carum Petroselinum*. A viscous colourless or yellowish oil, resembling apiol in properties.

“**Green Apiol**” is obtained by extracting the fruits with ether and evaporating the solvent. It has a lower sp. gr. than apiol (about 0.93). This may be purified to yield a viscous, oily, yellow, liquid apiol.

Apium (*F.E. VIII*). *Syn.* APIOLE, CRYSTALLINE APIOL, “WHITE APIOL,” ÉTHER MÉTHYLÉNIQUE ET DIMÉTHYLIQUE DE L'ALLYL-APIONAL, CAMPRE DE PERSIL. $\text{CH}_2\text{O}_2\text{C}_6\text{H}_4(\text{OCH}_2)_2\text{CH}_2\text{CH}:\text{CH}_2 = 222.25$.

In acicular crystals, slightly soluble in water, readily soluble in chloroform, ether and alcohol 90%. M.p. 29° to 30°.

Dill-Apiole, $\text{C}_{12}\text{H}_{14}\text{O}_4$, is an isomeric substance obtained from oil of Indian dill (*Anethum Sowa*).

Apium (*B.P.C.*). *Syn.* CELERY FRUIT, CELERY SEED.

Dose.—20 to 60 grains (1.2 to 4 g.).

The dried ripe fruits of cultivated plants of celery, *Apium graveolens* (Umbelliferae). Contain 2 to 3% of volatile oil. Nervine sedative and tonic. The decoction (1 in 20) is a domestic remedy for rheumatism. The root is used in “Sirop des Cinq Racines” (*Fr. Cx.*).

Extractum Apii Liquidum (*B.P.C.*). *Dose.*—5 to 20 minims (0.3 to 1.2 ml.). 1 in 1.

Oil of Celery. *Dose.*— $\frac{1}{2}$ to 3 minims or more. Capsules are made $3\frac{1}{2}$ and 5 minims. Contains a small proportion of apiol. Antispasmodic and nerve stimulant. In rheumatoid arthritis 5 to 15 minim doses have been used successfully. It acts probably as an intestinal antiseptic.

APOMORPHINÆ HYDROCHLORIDUM

B.P., U.S.P. XI, P. Helv. V, P. Jap. V, P.G. VI, P. Ned. V.

$\text{C}_{17}\text{H}_{17}\text{O}_2\text{N}\cdot\text{HCl}, \frac{1}{2}\text{H}_2\text{O} = 312.8$.

Syn. CHLORETUM APOMORPHICUM (*P. Dan., P. Ital. V, F.E. VIII, P. Belg. IV*).

[P1] “*Alkaloids, the following; their salts, simple or complex:—Apomorphine.*”

[S1] “*Alkaloids, the following; their salts, simple or complex:—Apomorphine except substances containing less than 0.2% of apomorphine.*”

Dose.— $\frac{1}{64}$ to $\frac{1}{32}$ grain (0.001 to 0.002 g.), increased, as an expectorant; $\frac{1}{32}$ to $\frac{1}{8}$ grain (0.002 to 0.008 g.) hypodermically as an emetic and hypnotic. The oral dose as an emetic is $\frac{1}{10}$ to $\frac{1}{4}$ gr. (0.006 to 0.016 g.).

A derivative of morphine or codeine obtained by heating them with an excess of hydrochloric acid in sealed tubes. In commerce the hydrochloride occurs in greyish white, acicular crystals which become greenish on exposure to air and light. *Fr. Cx.* has the anhydrous salt.

Soluble 1 in 60 of water, 1 in 30 of alcohol 90%. Almost insoluble in ether and chloroform. A trace of acid prevents solutions turning green, *vide* *Injectio postea*.

Incompatible with sodium carbonate and bicarbonate, tannin and iron salts.

Antidotes. Give repeated $\frac{1}{2}$ -dr. doses of aromatic spirit of ammonia in water, or ammonia inhalations. Keep patient lying down and warm.

Uses. In all cases of non-corrosive poisoning it is of great value as an emetic. It is an anti-stimulant; in bronchial asthma doses of $\frac{1}{8}$ grain are very useful. Small doses are expectorant and relieve bronchitis and pertussis. In puerperal convulsions it soon causes vomiting and free perspiration; patient sleeps and awakes quiet.

In a case of obstruction of the œsophagus by a plum-stone, the injection of apomorphine hypodermically caused its removal.

[P1-S1] **Injectio Apomorphinæ.**

Apomorphine hydrochloride 1, dilute hydrochloric acid 1, distilled water to 100. $\frac{1}{10}$ gr. in 11 m.

Dose.—5 to 10 minims (or more) as an emetic. The addition of the trace of acid keeps it stable and colourless.

The effect produced by a small injection on a mad-drunk patient is remarkable. As hypnotic $\frac{1}{10}$ to $\frac{1}{8}$ grain. The patient, however wild, sleeps 12 hours and awakes refreshed.

[D-P1-S1] **Mistura Apomorphinæ Composita.** *Syn.* MISTURA TUSSIS, *Luff.*
Dose.— $\frac{1}{2}$ ounce every 4 hours.

Apomorphine hydrochloride $\frac{1}{4}$ gr., morphine hydrochloride $\frac{1}{4}$ gr., diamorphine hydrochloride $\frac{1}{4}$ gr., dilute hydrochloric acid 5 m., syrup of wild cherry $\frac{1}{2}$ dr., chloroform water to $\frac{1}{2}$ oz.

A palatable mixture useful for irritable cough, especially post-influenzal cough. The hydrochloric acid effectually prevents the precipitation of any of the alkaloids.

[P1] **Syrupus Apomorphinæ (B.P.C.).**

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains $\frac{1}{4}$ gr. of apomorphine hydrochloride in 1 dr.

ARGENTUM

Ag = 107.88.

Argenti Acetas. CH_3COOAg = 166.9.

In white crystals, **soluble** in water. A 1% solution is useful for the prevention and treatment of purulent ophthalmia in infants and causes less catarrh than the nitrate. Dilute salt solution may be used after it.

Argenti Iodidum. AgI = 234.8.

A light yellow powder, *insoluble* in water, alcohol and acids; soluble in solutions of potassium iodide, potassium cyanide and sodium thiosulphate.

Storage. In amber-coloured bottles protected from light.

Uses. In the freshly precipitated form this salt has been used in cases of ophthalmia. It has astringent properties. Efficacious in gonorrhœal ophthalmia. One drop of weak solution instilled 3 times a day or oftener in cases of extensive chemosis and danger of corneal sloughing.

Corneal opacities, conjunctivitis and pannus have been treated, commencing with 1% strength. In ulcer of the cornea it should be used cautiously.

A 5% silver iodide emulsion makes a good opaque medium for cystography, and has soothing antiseptic action on the bladder. Also of value for urethrogramms.

Nascent silver iodide in 3% suspension may be produced from silver nitrate 2.2 g., potassium iodide 2.2 g., distilled water 50 ml., mucilage of Irish moss to 100 ml. For a light flocculent precipitate dissolve each in 50 ml. of water. To produce a coarse precipitate the salts are separately dissolved in 5 ml. of water, shaken and diluted with the mucilage. Gelatin 0.3% has also been used to dissolve the potassium iodide.

Neo-Protosil (*Parke, Davis, London*). A colloidal silver iodide compound prepared with a soluble protein base. Contains 20% of silver iodide. Used in solution for treatment of inflammations of the mucous membranes of the eye, nose, throat, etc.

Argenti et Potassii Iodidum. *Syn.* SILVER POTASSIUM IODIDE.
KAgI₂ = 400.8.

The double iodide of potassium and silver. A crystalline substance readily soluble in water. Silver iodide is precipitated on dilution but precipitation is not complete until a fairly high dilution is reached.

Preparation of an injection. One part of crystallised silver potassium iodide and 4 parts of potassium iodide are dissolved in water, as required, in strengths of 0.5 g., 1 g. and 1.5 g., in 20 ml. in each case. Each of the dilutions contains a fine suspension of silver iodide and a solution of the double salt.

GONORRHEA. The injection of 20 ml. into the meatus (apply tight bandage over glans for 15–30 minutes after injection), causes a rapid decrease of discharge after 6 injections and a complete disappearance of gonococci after 12 to 15 injections. Injections need only be given twice or thrice weekly, as silver iodide persists in the urethra.—S. R. Naidu, *Brit. med. J.*, i/1927, 139.

Argenti Nitras (*B.P., U.S.P. XI, Fr. Cx., P. Helv. V*).
Syn. LUNAR CAUSTIC. AgNO₃ = 169.9.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.008 to 0.016 g.) in a pill, best with kaolin ointment as an excipient. Up to $\frac{1}{2}$ grain has been given. *U.S.P. XI* average dose $\frac{1}{4}$ grain. *Fr. Cx.* max., single dose 0.03 g., max. in 24 hours 0.15 g.

A colourless, odourless, crystalline substance with a bitter, metallic taste.

Soluble 1 in 0.53 of water and 1 in 14 of alcohol 90%; slightly soluble in ether and glycerin.

Incompatible with organic material, e.g., rose water, if used instead of distilled water for preparing a lotion or pigment; also with tartaric acid, hydrocyanic acid, iodine and halides.

Antidotes. Empty stomach by stomach tube, using 2 oz. of

sodium chloride in 2 gallons of water, or give $\frac{1}{2}$ oz. sodium chloride in 1 pint of water or milk, followed by an emetic. Demulcent drinks. Castor oil. Morphine, $\frac{1}{4}$ gr. hypodermically for pain, if necessary.

Silver nitrate stains on the skin may be removed with mercuric chloride solution, or with potassium cyanide solution, or by wetting the skin and rubbing potassium iodide on the stain, leaving it on for a few hours.

In argyria a mixture of 1% of potassium ferricyanide and 6% of sodium thiosulphate injected intradermally removes a large part of the silver from the skin in old cases with deep pigmentation. A small dose of morphine and atropine cuts short sting of the injection.—A. W. Stillians and T. K. Lawless, *J. Amer. med. Ass.*, 1/1929, 21.

Occupational argyria in silver nitrate workers and silversmiths.—J. M. Harker and D. Hunter, *Brit. J. Dermat.*, 1935, 441.

Uses. Small doses internally check diarrhœa of children. In typhoid, where there is hæmorrhage, $\frac{1}{8}$ grain every 3, 4 or 6 hours, or even as often as every 2 hours. Rectal injections are also useful for the bleeding of dysentery (60 grains in 3 pints). In laryngeal phthisis a spray $\frac{1}{4}$ to 2 gr. to the ounce. In vomiting of pregnancy $\frac{1}{8}$ grain in a wine-glass of water every 6 hours has been found effective. In gastric ulcer $\frac{1}{8}$ grain in a pill 3 or 4 times daily half an hour before food useful. Solutions have also been used.

It is an excellent caustic for warts, condylomata, granulations, etc. In eczema of the flexures and particularly of mucous surfaces, a 2 to 3% solution, alternating with *Lotio Calaminæ Oleosa*, is valuable. Pigments, 1 to 5%, are used for the throat in pharyngitis and laryngitis, and applied to ulcers as a stimulant. Lotions for pruritus ani or vulvæ and eye-drops vary from 1 in 1000 to 1 in 100. 1% eye-drops are applied for the prophylaxis of ophthalmia neonatorum. Purulent ophthalmia and ulcerative blepharitis are treated with 1 to 2% drops. Ulcerative stomatitis is well treated by 0.5 to 2% solution. Glycerin 15% added to $\frac{1}{2}$ to 2% silver nitrate solution renders it less painful, and possibly more effective.

Solutions of from 1 to 10%, either alone or in conjunction with tannic acid, may be employed in the treatment of burns (*see Tannic Acid*).

URETHRAL AND VAGINAL INJECTIONS. 0.02 to 0.2% (1 in 5000 to 1 in 500) is usually employed.

In lavage of the entire urethra in cystitis and for epithelial tumours of the urinary bladder 2 grains to the pint (1 in 5000 approx.) is sufficiently strong. In some cases it may be advisable to commence with a quarter of this strength. Hydrostatic pressure may be used, *i.e.*, the container being about 5 feet above the couch, instead of a syringe.

URETHRAL BOUGIES of silver nitrate contain $\frac{1}{8}$ grain with theobroma basis. Give good results in obstinate cases of gonorrhœa.

BURNS. Spray or paint a 1% silver nitrate solution on burn and expose for 1 to 5 minutes to mercury vapour or tungsten arc lamp at 6 to 20 inches distance, or to real sunlight for $\frac{1}{2}$ hour. No dressings used. Repeat if necessary in 24 to 36 hours.—*Brit. med. J.*, ii/1929, 668.

W. C. Wilson now uses a single application of a 10% solution of silver nitrate, preceded and followed by a 1% solution of gentian violet.—*Proc. R. Soc. Med.*, 1940, 34, 52.

For areas which cannot be constantly exposed to the air or cannot easily be kept dry the following jelly preparation is useful: Tragacanth 2, glycerol 10, powdered activated charcoal 15, silver nitrate 0.5, water to 100. This is preferable to tannic acid-acriflavine jelly.—W. C. Wilson, *Proc. R. Soc. Med.*, 1940, 34, 52.

ERYSIPELAS in the newborn treated with 4% solution, the lesion being swabbed 4-hourly day and night. The erysipelas tends to subside after 3 days' treatment, the average duration of which is 21 days. The treatment is almost painless.—H. Graner, per *Med. Annu.*, 1935, 135.

PEMPHIGUS NEONATORUM. Evacuation of the fluid by means of a pipette and the injection of 20% silver nitrate solution.—H. Carter and H. A. Osborn, *Brit. med. J.*, 1/1936, 465.

Gutt. Argent. Nit. (*N.I.F.*).

Silver nitrate $\frac{1}{2}$ gr., distilled water to 2 dr. (approx. 0.5%).

Liquor Argenti Nitratis (*R.L.O.H.*). 4 or 8 gr. to 1 oz. of sterilised water (1 or 2% approx.).

As prophylactic, drops should not be used in stronger solution than 1%, and caution needed if used more than once or twice. Conjunctival hæmorrhage has followed 5 instillations of 1.5% solution.

Pigmentum Argenti Nitratis Æthereum (*L.H.*).

Silver nitrate 10 gr., water 1 dr., spirit of nitrous ether to 1 oz.

Caustic even when painted on a greasy skin. 3 to 10 grains to the ounce relieves pruritus ani and pruritus vulvæ. Useful in eczema and for prevention of bedsores.

[D-P1-81] Pillula Argenti Nitratis et Morphine Acetatis. *Syn.* CROCQ'S PILL. Contains $\frac{1}{2}$ gr. of each salt, made with kaolin ointment.

Unguentum Argenti Nitratis. Silver nitrate 0.25 g., distilled water 25 g., lanoline 50 g., olive oil 25 g. For burns. Cleanse with sterile saline, removing blisters and apply spread on a soft cloth. Cover with oiled silk and bandage. It is painless and suitable for children.—M. Kissmeyer, *Bull. med.*, Paris, 1937, 51, 323; see also *Lancet*, ii/1936, 985.

Unguentum Argenti Nitratis Compositum. *Syn.* UNGUENTUM BILLROTHI (*P. Ned. V.*).

Silver nitrate 1, balsam of Peru 5, yellow soft paraffin 94.

Natasil (*Parke, Davis, London*). 1% silver nitrate solution. Supplied in wax capsules with paraffin lining, each containing 6 drops of the solution. For use in the prophylaxis of ophthalmia neonatorum.

Partagon Bougies (*Sandoz, London*). Bougies of silver nitrate associated with selected organic colloids. Supplied for men in two strengths: "mild" (0.75% AgNO_3) and "strong" (2% AgNO_3); and for women in one strength (1.5% AgNO_3).

Argenti Nitras Induratus (*B.P.*). *Syn.* TOUGHENED CAUSTIC. Contains 5% of potassium nitrate moulded into caustic points. *U.S.P. XI* has 94.5% AgNO_3 .

Argenti Nitras Mitigatus (*B.P.C.*, *P. Helv. V*, *P. Jap. V*). *Syn.* MITIGATED CAUSTIC, ARGENTI NITRAS DILUTUS.

Silver nitrate 1, potassium nitrate 2, fused together and moulded into sticks for use as caustic.

Argenti Oxidum (*B.P.C.*). $\text{Ag}_2\text{O} = 231.8$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.) in a pill with kaolin ointment.

Is not so caustic in action as silver nitrate. Continued administration may discolour the skin. It readily yields its oxygen, and will explode if mixed with such bodies as phenol and creosote. Soluble very slightly in water; insoluble in alcohol 90%. Has been given in epilepsy, chorea and dysentery. It stains the skin less than the nitrate.

Novoxil Ointment (*Squibb, New York; Savory & Moore, London*). Colloidal silver oxide ointment containing 5% anhydrous silver oxide, for use as a general antiseptic in the treatment of skin diseases, ulcerations and proctological conditions.

Argenti Picras. $C_6H_2(OAg)(NO_2)_3 \cdot H_2O = 354.0$.

Syn. SILVER TRINITROPHENOLATE, PICROTOLO.

Silver picrate is a yellow, crystalline substance which slowly discolours in light.

Sparingly **soluble** in water and alcohol; slightly soluble in acetone, chloroform, ether and glycerin.

Uses. Employed either in the form of a 1 or 2% solution, or as a compound powder (1% in purified kaolin) by insufflation, or as vaginal suppositories (2 gr. in a boroglyceride gelatin base), in the treatment of vaginitis due to *Trichomonas vaginalis* or *Monilia albicans*.

TRICHOMONAS VAGINITIS is successfully treated by one insufflation of 5 grains of silver picrate powder (30%) followed by daily dry swabbing and the insertion of a pessary containing 2 grains of silver picrate. The pessary treatment is continued for 6 days and is then followed by another insufflation. No douching is allowed during the treatment and no treatment is given during the menstrual period. After insufflation the *Trichomonas vaginalis* disappeared on the next day in 26 out of 28 cases.—W. M. Mascal, *Brit. med. J.*, i/1937, 1115.

Argentoproteinum (*B.P. Add. I*). *Syn. and Prop. Names.* ARGENTI PROTEINAS (*B.P.C.*), ARGENTUM PROTEINICUM (*Fr. Cx.*, *P. Ital. V*, *P. Jap. V*, *P. Ned. V*, *F.E. VIII*, *P. Belg. IV*, *P. Helv. V*), ARGENTUM PROTEINICUM FORTE (*U.S.P. XI*), STRONG SILVER PROTEIN, SILVER PROTEIN, ARGEIN (*Allen & Hanburys, London*), PROTARGOL (*Bayer Products, London*).

Dose.—1 to 3 grains (0.06 to 0.2 g.). No dose is given in *B.P. Add. I*.

Note.—The *U.S.P. XI* names, Strong Silver Protein for preparations containing 8% of Ag and Mild Silver Protein for those containing 20% or more of Ag, are based on the fact that the former are the more strongly bactericidal. They are also more irritant.

A fine, brownish-yellow, somewhat hygroscopic powder containing 7.5 to 8.5% of Ag. *P. Svec.* has 7.8 to 10% of Ag.

Soluble about 1 in 2 of water; almost insoluble in alcohol, chloroform and ether. Aqueous solutions may be prepared by shaking on to surface of cold water and allowing to dissolve slowly, or by triturating to a cream with water and diluting as required.

Incompatibility with Alkaloids. Solutions of many silver-protein compounds are alkaline and precipitate alkaloids from solutions of their salts. Where the combination of silver-protein compound and cocaine is necessary, cocaine nitrate should be prescribed.

Uses. Strong silver protein has a more prolonged but much less powerful antiseptic action than silver nitrate, and has the advantages of being non-corrosive and unaffected by body secretions. It is especially useful for application to the mucous membrane and is employed as an antiseptic in stomatitis, tonsillitis, conjunctivitis and ophthalmia neonatorum in 0.5 to 10% solutions: For the urethra, 1 to 2% solutions are used, or in chronic gonorrhœa up to 10%. As a urethral irrigation a 0.1% solution is employed. Pessaries and bougies for use in gonorrhœa are made with 5 to 10%. A 0.5% agar jelly containing 0.5% of silver protein (Schindler's jelly) has also been applied to the urethra.

in gonorrhœa. As enemata in dysentery and colitis solutions of 0.1 to 1% are suitable.

For the early preventive treatment of venereal disease the parts are thoroughly washed with soap and water and a 2% solution of strong silver protein solution is then injected into the urethra and retained for 5 minutes. The glans is then inuncted with 30% mild mercurous chloride ointment for 5 minutes. This has a marked efficacy if employed within an hour of exposure and is fairly effective up to 3 hours.

Solutions should be freshly prepared since old solutions may be slightly caustic.

Argyria can result from the use of silver-containing intranasal medication. A 100% increase in such cases reported during a recent period of 5 years. In addition, rabbits treated intranasally with 5% mild protein silver, showed lung changes. There is a clear case against the intranasal use of silver preparations.—B. L. Bryant, per *J. Amer. med. Ass.*, 1/1940, 1017.

Guttæ Argenti Proteinatis (R.L.O.H.). Silver protein 8, 20, 40 or 60 gr., sterilised water to 1 oz. N.I.F. has 40 gr. in 1 oz.

Neisser's Bougies. Silver proteinate 1%, phenazone 2%, in oil of theobroma or in gelatin basis. For the treatment of gonorrhœa.

Hegonon (Schering, London). Ammoniacal silver nitrate derivative of albumose containing 7% Ag. Tablets containing 3.75 gr. for local treatment of gonorrhœa in $\frac{1}{4}$ to $\frac{1}{2}$ % solution.

Argenti Proteinæ Mite (B.P.C.).

Syn. and Prop. Names. ARGENTO-PROTEINUM MITE, ARGENTI NUCLEINAS, ARGENTI VITELLIN, ARGENTUM VITELLINATUM (*Fr. Cx.*, *P. Belg. IV*), PLATA VITELINA (*F.E. VIII*), ARGENTUM PROTEINICUM MITE (*U.S.P. XI*), MILD PROTARGIN, ARGYROL (*Barnes, Philadelphia; Fassett & Johnson, London*) (20% Ag, also in solution-tablets containing 0.5 g.), ARVITIN (*Johnson & Sons, London*) (20% Ag, with egg yolk protein), CARGENTOS (*Sharp & Dohme, London*) (20 to 25% Ag, with casein), LUNARGEN (*Lilly, London*) (20% Ag).

Note.—The name Mild Silver Protein is given to this group of compounds because, although containing more silver than the strong silver protein compounds, they are less bactericidal, and also less irritant.

A brown powder or nearly black scales or granules containing 19 to 25% of Ag.

Soluble slowly but readily in water, almost insoluble in alcohol, chloroform and ether.

Incompatible with cocaine hydrochloride, but compatible with 1% atropine sulphate.

Uses. Is used for the same purposes as silver protein but in stronger solutions, especially where irritation must be avoided. For corneal ulcers and as a spray for the nose and throat may be used up to 50% strength.

In purulent conjunctivitis (gonorrhœal, neonatorum, etc.), free instillation of 25% solution every 3 or 4 hours; catarrhal conjunctivitis, 5 to 20% 1 or more times daily; trachoma, 25% solution rubbed with force on wool into lids once daily; dacryocystitis, 25% solution. For gonorrhœa may be used in various strengths

up to 20%. As a rectal or urethral irrigation solutions of 0.1 to 1% are employed. Pessaries for vaginitis may contain 5 to 10%.

Ulcerative colitis has been treated by washing out with 1½ pints of 1% solution at 80°F.

Gutt. Argent. Vitellin. (*N.I.F.*). Mild silver protein 40 gr., distilled water to 1 oz.

[P1] **Guttæ Argyrolis cum Adrenalina** (*Mid. H.*).

Argyrol 25 gr., solution of adrenaline hydrochloride 20 m., glycerin 15 m., water to 1 oz. Three drops into each nostril night and morning in acute or chronic sinusitis.

Unguentum Argenti Proteinatis Mitis 2% with paraffin basis in eczema-tous conjunctivitis and keratitis.

Silver Gelatose. *P.G. VI* (15% Ag), *P. Svec. X* (16%).
Prop. Name. ALBARGIN (*Bayer Products, London*).

According to the patent specification, gelatose (produced by hydrolysis of glutin, etc., by acid or alkali) 10 g., is dissolved in water 10 ml. and mixed, after neutralising, with silver nitrate 1.5 g. in water 5 ml. The mixture is evaporated to dryness *in vacuo*. The salt thus obtained is a yellow-white powder of sand-like appearance containing 15% of silver.

Soluble about 1 in 2 of water, and about 1 in 130 of alcohol 90%. For gonorrhœa a 0.2% solution injected 4 or 5 times daily, or irrigation with 1 to 4000 solution. 0.5 to 3% for ophthalmic use. In bacillary dysentery silver gelatose by rectal injection is of great value—not in amœbic cases.

Incompatible with chlorides and tannin.

Stains on fabric may be removed with hot sodium thiosulphate solution 1 in 10.

Silver Gelatose Enema.

Dose.—1 pint increased to 1½ pints of strength 1 gr. per oz. on successive days.

Protosil (*Parke, Davis, London*). A combination of colloidal silver with an albuminoid. Contains about 20% of silver. Used in solution for treatment of inflammatory conditions of the mucous membranes.

Argentum Colloidale (*P. Helv. V, P.G. VI, Fr. Cx., P. Ned. V, P. Svec. X, P. Jap. V*). *Syn.* ARGENTUM CRÉDÉ, PLATA COLOIDAL (*F.E. VIII*).

A preparation of silver in combination with protein, containing at least 70% of Ag (*P. Ned. V* 74.5 to 80%, *P. Svec.* 72 to 80%). In green or bluish-black plates with metallic lustre and bitter metallic taste.

Soluble slowly 1 in 2.5 of water; insoluble in organic solvents. Aqueous solutions should be freshly made as required and filtered.

Incompatible with dilute mineral acids and concentrated salt solutions. In the latter case the precipitate dissolves on diluting with water.

Uses. For local treatment in the form of solution or ointment, 1 to 15%. For ophthalmic use 1 to 10% solutions are employed. Diphtheritic membrane is said to disappear under swabbing with 5% solution. Intravenously, 2 to 10 ml. of ½ to 2% solution for septic affections such as endocarditis. Orally as a ½ to 1% solution or in pills for gastric and intestinal catarrh.

Pommade à l'Argent Colloidal (*Fr. Cx.*). Colloidal silver 15 g., water 15 g., wool fat 35 g., Vaseline 35 g. Make a paste of the colloidal silver and water; melt the wool fat and Vaseline, cool, and incorporate the paste in the base.

Unguentum Crédé. Collargol 15, white wax 10, benzoinated lard 75. For eczema, syphilis and gonorrhœa, and as a prophylactic to gonorrhœal ophthalmia.

Unguentum Argenti Colloidalis (*P. Jap. V.*). Colloidal silver 10%, in equal parts of wool fat and Vaseline.

Argentum (*Abbott Laboratories, London*). A mild colloidal silver preparation containing 16% silver bromide. It may be used dissolved in water, in strengths varying from 5 to 40% in the treatment of infections of the eye, nose, throat and urinary tract.

Cryptargol (*Anglo-French Drug Co., London*). A silver derivative of thio-glycerin sulphonate of sodium, containing 35% of Ag. Supplied in pills or syrup for internal use as a gastro-intestinal antiseptic, and as a concentrated (10%) solution for external use as a general antiseptic and for use in dermatology, urology and gynecology. Also as ovules (in vaginitis, metritis, etc.) and as collyria (1% and 5%).

Neo-Reargon (*Napp, London*). Compound of silver and anthraquinone glycosides containing about 14% of Ag. For urethral injection in gonorrhœa in 1·5 to 2·5% solution, and for vaginal irrigation in 1 to 2% solution.

ARSENUM

As=74·91

[P1] "*Arsenical substances, the following, except those specified in Part II of this List:—Arsenic, halides of; oxides of arsenic; arsenates; arsenites; organic compounds of arsenic.*"

[P2] "*Arsenical substances, the following:—Arsenic sulphides; arsenious oxide; calcium arsenates; calcium arsenites; copper acetarsenites; copper arsenates; copper arsenites; lead arsenates; potassium arsenites; sodium arsenates; sodium arsenites; sodium thioarsenates.*"

[81] "*Arsenical poisons except substances containing less than the equivalent of 0·01% of arsenic trioxide and except dentifrices containing less than 0·5% of acetarsol.*"

[83] "*Arsenical poisons—in pyrites ores or sulphuric acid containing arsenical poisons as natural impurities.*"

[86] "*Arsenical poisons—specify proportion as the proportion of arsenic trioxide (As_2O_3) or arsenic pentoxide (As_2O_5) that the preparation would be calculated to contain on the assumption that the arsenic (As) in the poison had been wholly converted into arsenic trioxide or arsenic pentoxide as the case may be.*"

[P2-81] **Arseni Trioxidum** (*B.P., U.S.P. XI, P. Dan.*). *Syn.* ACIDUM ARSENIOSUM, ARSENIC, WHITE ARSENIC, ARSENIOS ANHYDRIDE (*Fr. Cx.*), ARSENIOS ACID, ARSENIOS OXIDE, ACIDUM ARSENICOSUM (*P. Helv. V, P. Jap. V.*). $As_2O_3 = 197·86$.

Dose.— $\frac{1}{10}$ to $\frac{1}{12}$ grain (0·001 to 0·005 g.). *U.S.P. XI* average dose $\frac{3}{10}$ grain.

Maximum single dose $\frac{1}{12}$ grain (0·005 g.); maximum daily dose $\frac{1}{4}$ grain (0·016 g.). Possible fatal dose 2 grains.

Made by roasting arsenical ores. It occurs in white lumps or powder, and is usually a mixture of two varieties, one of which is opaque and crystalline and the other transparent and vitreous. The latter slowly changes to the former.

Soluble very slowly about 1 in 65 of water (B.P.). The solubility varies with the relative proportion of the two varieties present, the vitreous being more readily soluble than the crystalline. With some samples the solubility is not more than about 1 in 100. More soluble in water acidified with hydrochloric acid and in alkaline hydroxide and carbonate solutions. Soluble about 1 in 8 of glycerin; slightly soluble in alcohol 90% and ether.

Incompatible with iodine, iron salts, lime water, magnesia and tannins.

Antidotes. Empty stomach by emetic, or by stomach tube, using 2 gallons of water to which has been added precipitated ferric hydroxide (2 oz. of solution of ferric chloride, add sodium carbonate till effervescence ceases, filter and use precipitate). Give 4 oz. of arsenic antidote B.P.C., repeating the dose if necessary. (If this is not available, give 1 oz. of tincture of ferric chloride in 4 oz. of water with 1 oz. of sodium bicarbonate added; or give magnesia mixed with water freely.) Keep patient warm. Give castor oil or saline purgative (magnesium sulphate). Demulcent drinks freely. Stimulants, e.g., caffeine sodium benzoate, 2 gr. hypodermically, may be necessary for collapse, or morphine, $\frac{1}{2}$ gr. hypodermically, for pain. Saline infusion if required.

For use of sodium thiosulphate and sodium hydrosulphite in arsenical poisoning, see p. 110.

Antidotum Arsenum (B.P.C., *P. Helv. V*, *P. Dan.*). *Syn.* FERRI HYDROXIDUM CUM MAGNESII OXIDO. *F.E. VIII* and *P. Jap.* use ferric sulphate, and in other pharmacopœias:

Dose.—4 ounces (120 ml.).

Contains freshly precipitated ferric hydroxide and light magnesium oxide.

Two solutions are stored ready for use:—(1) Strong solution of ferric chloride 288 m. mixed with $2\frac{1}{2}$ oz. of water. (2) Light magnesium oxide $87\frac{1}{2}$ gr., triturated to a smooth paste with water and diluted to 15 oz. For use add $3\frac{3}{4}$ oz. of the magnesium oxide suspension, well shaken, to 400 m. of the ferric chloride solution.

Magma Ferri Hydroxidi (U.S.P. XI).

Average dose.—4 ounces (120 ml.).

Arsenic antidote kept ready for use in two parts: (1) 40 ml. of solution of ferric sulphate diluted to 125 ml., (2) 10 g. of magnesium oxide or 300 ml. of Magma Magnesiae diluted to about 750 ml. in a 1000 ml. bottle. The two are mixed for use.

Acute arsenical poisoning. Overdosage with arsenic is indicated by vomiting and diarrhoea, numbness and tingling in the feet, followed by muscular cramps, suppression of urine, intense thirst, prostration and collapse. In criminal cases of arsenical poisoning the symptoms may be those of acute arsenical poisoning, such as one would expect from a single dose, masked by those of prolonged action of arsenic. Thus, symptoms of arsenical neuritis or renal or liver disease may be superimposed upon those of the acute gastrointestinal symptoms. Arsenic can be found months or years after taking, in the nails and hair.

Chronic arsenical poisoning is characterised by a disposition to œdema, especially of the face and eyelids, a feeling of stiffness in those parts, pruritus, tenderness of the mouth, loss of appetite, nausea, sickness, and diarrhoea. Continued use of small doses over long periods may cause dryness of the skin, pigmentation and keratinisation, which may be accompanied by peripheral neuritis.

Uses. Arsenic is given internally after meals as a general tonic and it is one of the few substances which really deserves this name, since it increases both the weight and strength of the patient, *e.g.*, in wasting diseases such as tuberculosis and certain types of neurasthenia with malnutrition. It was at one time much employed in chorea, beginning with small doses rapidly increased to the limit of tolerance. In the treatment of the secondary anæmias, though possessing no apparent beneficial action by itself, it increases the hæmatinic effects of iron. In leukæmia it often produces marked temporary improvement; commencing with 3 to 5 m. of Fowler's solution three times daily, the dose is gradually increased to the limit of tolerance and then reduced to a maintenance level of 5 m. thrice daily, continued for 3 or 4 months. Fowler's solution, 2 dr. to the ounce of water, is a valuable local application in Vincent's angina.

Externally it has a caustic action, and is put into the cavities of carious teeth to kill the nerves (*see* Pasta Arsenicalis).

ECZEMA. Arsenic continues to hold an important place in the therapy of chronic eczema. It should never be used during the acute phase. In the subacute stage it should be given only if the eruption proves refractory to other therapeutic measures. Solution of potassium arsenite is prescribed in gradually ascending doses, starting with 3 m. twice daily after meals and increasing the dose by 1 m. daily until 20 m. is taken; this dose can be maintained for several weeks, a course of treatment usually lasting from four to six weeks. Arsenical medication must not be frequently repeated and the danger of delayed late effects must be kept in mind. At the first signs of intolerance, *e.g.*, sweating of the palms, coated tongue, dryness of the throat, abdominal pain, and puffiness of the eyelids it should be discontinued.—F. Wise and J. Wolf, *J. Amer. med. Ass.*, ii/1938, 2106.

HODGKIN'S DISEASE. A severe case of Hodgkin's disease in a young man of 28 successfully treated with colloidal elemental arsenic. Treatment was begun in September 1935 with daily intravenous doses of 0.25 ml. gradually increased to 2 ml., and gradually changed from 2 ml. daily to 3 ml. three times a week and finally to 5 ml. tri-weekly. In March, 1937, the patient was looking and feeling well and all the enlarged glands had disappeared.—A. C. Hendrick and E. F. Burton, *Canad. med. Ass. J.*, i/1937, 519.

[D-P1-81] **Gossypium Arsenii (R.D.H.).** ARSENIUS WOOL.

Arsenic trioxide 5 parts, tannic acid 2 parts, morphine acetate 10 parts, liquefied phenol sufficient to make a thin paste. Mix with a sufficiency of finely cut cotton wool. Used in the same way as Pasta Arsenicalis. Some formulæ contain creosote instead of phenol.

[P1-81] **Granula Acidi Arsenicosi (Fr. Cx., P. Dan.).** *Syn.* GRANULA DIOSCORIDIS.

Contains 1 mg. of arsenic trioxide. *Dose.*—1 to 5.

[P2-81] **Liquor Arseni Acidus (B.P.C.).** *Syn.* LIQUOR ARSENICI HYDROCHLORICUS.

Dose.—2 to 8 minims (0.12 to 0.5 ml.). Contains 1% of arsenic trioxide in hydrochloric acid and water. Is compatible with acid mixtures.

[P2-81] **Liquor Acidi Arsenosi (U.S.P. XI).**

Average dose.—3 minims (0.2 ml.).

Contains 1% of arsenic trioxide and 5% of dilute hydrochloric acid; it resembles Liquor Arseni Acidus, B.P.C.

[P1-81] Liquor Arseni Alkalinus (B.P.C.).

Dose.—2 to 8 minims (0·12 to 0·5 ml.).

Contains 1% of arsenic trioxide, dissolved with the aid of potassium carbonate and coloured with compound tincture of lavender.

Incompatible with Liquor Strychninæ Hydrochloridi. Employ Liquor Arsenicalis. Poisoning has occurred.

[P2-81] Liquor Arsenicalis (B.P.). Syn. FOWLER'S SOLUTION.

Dose.—2 to 8 minims (0·12 to 0·5 ml.).

Contains the equivalent of 1% of arsenic trioxide in neutral solution. The oxide is dissolved in potassium hydroxide and neutralised with dilute hydrochloric acid. The solution contains no compound tincture of lavender (*see* Liquor Arseni Alkalinus), but the addition of 0·5% of spirit of lavender to prevent growth of moulds has been recommended.

Numerous complaints have been made that this preparation is liable to yield a deposit of As_2O_3 crystals and to become fungoid. After thorough investigation E. M. Smelt (*Quart. J. Pharm.*, 1933, 375) reported that the growth of moulds could be inhibited by adjusting the pH to 2·0 or to 8·0, and the deposition of crystals by adjusting the pH to less than 3·0 or more than 9·0. The paper gives references to the principal previous investigations.

VINCENT'S ANGINA. Arsenic is specific; full doses of the Liquor Arsenicalis may be given three-hourly, or it may be used as a paint with glycerin.—E. Watson-Williams, *Practitioner*, i/1936, 47. *See also* Pigmentum Ipecacuanhæ et Arsenici, p. 657.

[P2-81] Liquor Potassii Arsenitis (U.S.P. XI).

Average dose.—3 minims (0·2 ml.).

The same strength as Liquor Arsenicalis, B.P., but prepared with potassium bicarbonate and alcohol instead of potassium hydroxide and hydrochloric acid, and therefore alkaline in reaction. Resembles Liquor Arseni Alkalinus (B.P.C.) but is colourless.

[P2-81] Liquor Arsenicalis Glycerinatus (A.P.F.).

Heat arsenic trioxide 87½ gr. with glycerin 2 oz. to 150° to dissolve. Cool, add water 17 oz., then compound tincture of lavender 288 m. and water to 1 pint.

Solutions of arsenic trioxide in dilute glycerin are liable to give a very slight deposit of a crystalline form of As_2O_3 on standing for 2 to 3 months.

[P2-81] Soluté d'Arsenite de Potassium (Fr. Cx.). Syn. FOWLER'S SOLUTION (Fr. Cx.).

Dose.—Max. single 0·5 g., max. in 24 hours 1 g.

Dissolve arsenic trioxide 1 g., and potassium carbonate 1 g., in 2 g. of water. Add 40 g. of water, 12 g. of alcohol 90%, 3 g. of "Alcoolat de Melisse Composé" and sufficient water to produce 100 g. Other foreign pharmacopœias have similar preparations.

[P2] Mistura Antimalarica (Bacelli) (P. Ital. V). Dose.—½ to 1 ounce (15 to 30 ml.).

Quinine sulphate 3 g., iron and potassium tartrate 7·5 g., distilled water 300 g., Fowler's solution 25 drops.

[P2] Mistura Arseni Quininae et Ferri. Syn. BACCELLI'S MIXTURE (slightly modified).

Dose.—½ to 1 ounce (15 to 30 ml.).

Dissolve quinine sulphate 3 in water 150 with aid of a little dilute sulphuric acid. Then dissolve green ammonio-citrate of iron 5 in water 150, mix and add Fowler's solution 3. Employed in malaria.

[P1-81] Pasta Arsenicalis (B.P.C.).

Arsenic trioxide 2 and morphine hydrochloride 1, mixed to a paste with creosote (*exempt* [D]). R.D.H. is similar but uses morphine acetate.

The equivalent of about ⅛ grain of arsenic trioxide is sufficient.

Apply as follows:—Remove as much carious tissue as possible, exclude moisture and disinfect. Apply the paste as near pulp as possible and protect by concave cap. Seal cavity carefully with mastiche in chloroform.

For preparations of similar composition also exempt [D] see pp. 1140, 1141.

[P2-S1] **Caustiscin** (*Saccharin Corporation, London*). Pellets containing arsenious oxide and procaine hydrochloride for devitalising dental pulp. Prepared in three different strengths:—"Blue," contains 40% As_2O_3 —has powerful action and should be left for 24 hours only; "Yellow," contains 30% of As_2O_3 —slower in action and may be left for 3 to 5 days; "Black," contains slow and mildly acting metallic arsenic (40% As), used particularly for milk teeth.

[P2-S1] **Pilula Acidi Arseniosi et Ferri Redacti**.—MONCKTON.

Dose.—1 to 3 grains. Arsenic trioxide 12 gr., reduced iron 1 oz., excipient *q.s.*

[P1-S1] **Pilula Arsenicalis et Strychninae** contains $\frac{1}{80}$ grain (0.0013 g.) of each.

[P2-S1] **Pilulae Asiaticae** (*B.P.C.*). *Dose*.—1 or 2 daily.

Each pill contains arsenic trioxide $\frac{1}{12}$ gr. (0.005 g.) and black pepper $\frac{1}{2}$ gr. (0.05 g.). In chronic skin affections.

In psoriasis this is a convenient method of giving arsenic.

P.G. VI contains $\frac{1}{80}$ gr. (0.001 g.) of arsenic trioxide, and $\frac{1}{2}$ gr. (0.03 g.) of pepper.

[P2-S1] **Tablets of Arsenic, Iron and Quinine** contain arsenic trioxide $\frac{1}{80}$ gr., ferric hypophosphite 2 gr., quinine acid sulphate 1 gr.

[P2-S1] **Tablets of Arsenious Acid and Mercuric Chloride** $\frac{1}{80}$ gr. (0.001 g.) of each. In exophthalmic goitre have been given thrice daily.

[P1-S1] **Liquor Potassii Arsenatis et Bromidi** (*B.P.C.*).

Syn. CLEMENS' SOLUTION, LIQUOR ARSENII BROMIDI.

Dose.—2 to 8 minims (0.12 to 0.5 ml.), once or twice a day.

A solution containing potassium arsenate and potassium bromide equivalent to 1% *w/v* of As_2O_3 and 0.5% *v/v* of bromine.

The solution has been employed in epilepsy and diabetes.

[P1-S1] **Arseni Triiodidum** (*B.P., U.S.P. XI, Fr. Cx.*).

Syn. ARSENII IODIDUM, ARSENIOUS IODIDE. $\text{AsI}_3 = 455.7$.

Dose.— $\frac{1}{8}$ to $\frac{1}{2}$ grain (0.004 to 0.016 g.), in a pill. *U.S.P. XI* average dose $\frac{1}{12}$ grain.

The two elements combine, forming orange-coloured crystals. It should be recrystallised so as to exclude a melted mixture of elementary arsenic and iodine, or powdered arsenic 10, may be mixed with iodine 51 in presence of water, digested at gentle heat and evaporated to dryness.

Soluble 1 in 11 of water, forming a slightly cloudy acid solution, 1 in 40 of alcohol 90%, 1 in 18 of carbon disulphide, 1 in 73 of benzene; slightly soluble in ether, chloroform and carbon tetrachloride.

Solution 1% in 1 to 10 drop doses in milk, useful for lymphatic and scrofulous children, has marked iodine effect. Also used externally in the treatment of lupus and other skin conditions requiring a powerful stimulant.

It is of use in diseases of the alimentary canal, especially gastritis, and in all cases of neuritis.

[P1-81] Injectio Arseni Iodidi.

Dose.— $\frac{1}{100}$ grain (0.0006 g.) in 6 minims (0.4 ml.) of sterile water. The strength may be increased if desired.

[P1-81] Liquor Arseni et Hydrargyri Iodidi (B.P., Fr. Cx.).

Syn. DONOVAN'S SOLUTION.

Dose.—5 to 15 minims (0.3 to 1 ml.).

Contains arsenic triiodide and mercuric iodide, of each 1%.

Given for syphilitic skin diseases.

Incompatible with potassium iodide and sal volatile (cf. Nessler's reagent), also with alkaloids and acids.

Should be *freshly prepared* or stored in small bottles completely filled. A sample after 14 months was found to contain no arsenous arsenic.—T. Tusting Cocking, *Quart. J. Pharm.*, 1929, 409.

DISSEMINATED SCLEROSIS. Most neurologists consider arsenic the most useful drug. 10 to 12 m. of Donovan's solution in $\frac{1}{2}$ oz. of water may be taken regularly thrice daily for months. Tincture of belladonna 10 m. may be added if there is faulty control of the bladder.—Macdonald Critchley, *Med. Fr.*, 1/1936, 520.

[P2-81] Cupri Arsenis. *Syn.* SCHEEL'S GREEN. $\text{Cu}_3\text{As}_2\text{O}_6 = 436.6$.

Dose.— $\frac{1}{100}$ to $\frac{1}{25}$ grain (0.0006 to 0.0025 g.).

Amorphous green powder, used in various intestinal affections, cholera morbus, cholera infantum, diarrhoea, dysentery and typhoid. *Dose* for adults $\frac{1}{100}$ to $\frac{1}{25}$ grain every 10 minutes for an hour, then hourly; for children, half this quantity. Small repeated doses essential. For chlorosis and functional anæmia $\frac{1}{25}$ to $\frac{1}{10}$ grain thrice daily are given.

[P1-81] Acidum Arsenicum (B.P.C.) *Syn.* ORTHO-ARSENIC ACID.

$\text{H}_3\text{AsO}_4 \cdot \frac{1}{2}\text{H}_2\text{O} = 151.0$.

Dose.— $\frac{1}{10}$ to $\frac{1}{25}$ grain (0.001 to 0.005 g.).

A crystalline powder soluble about 2 in 1 of water, and very soluble in alcohol 90%. Arsenites are said to be twice as active as arsenates.

[P1-81] Ferri Arsenas (B.P.C., Fr. Cx., F.E. VIII).

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.004 to 0.016 g.). *Fr. Cx.* has *max. single dose* $\frac{1}{2}$ grain, *max. in 24 hours* $2\frac{1}{2}$ grains; *F.E. VIII* gives $\frac{1}{10}$ grain and $\frac{1}{2}$ grain respectively.

This is an amorphous greenish powder and consists of ferrous and ferric arsenates and iron oxide, the ferrous iron content being equivalent to not less than 10% of $\text{Fe}_3(\text{AsO}_4)_2$. The ferrous arsenate rapidly oxidises in the air. In chronic skin affections of all kinds.

[P2-81] Sodii Arsenas Anhydrosus (B.P.C.). *Syn.* SODIUM ARSENATE, DISODIUM HYDROGEN ARSENATE. $\text{Na}_2\text{HASO}_4 = 185.9$.

Dose.— $\frac{1}{10}$ to $\frac{1}{25}$ grain (0.0015 to 0.006 g.).

Sodium arsenate crystallises with 7 or with 12 molecules of water. The former, $\text{Na}_2\text{HASO}_4 \cdot 7\text{H}_2\text{O} = 312.0$, is included in *I.A.*, *Fr. Cx.*, *P. Ned. V*, *P. Helv. V*, *P. Belg. IV*, *P. Ital. V*, and *P. Dan.* *Fr. Cx.* has *max. single dose* $\frac{1}{2}$ grain; *max. during 24 hours*, $\frac{1}{2}$ grain approximately.

The anhydrous salt, in white powder, dried at 150° , contains 61.8% of As_2O_5 . 1 of the anhydrous salt equals 1.68 of the salt with $7\text{H}_2\text{O}$.

Soluble 1 in 6 of water. Slightly soluble in alcohol.

Possesses the therapeutic properties of arsenic and is used similarly. It is stated to have been found beneficial in deafness;

$\frac{1}{2}$ grain (in pill) followed by $\frac{1}{4}$ grain the next day—altogether, 40 to 60 pills in as many days.

[P1-81] **Injectio Sodii Arsenatis et Strychninae.**

Dose.—5 to 10 minims (0.3 to 0.6 ml.) hypodermically.

Sodium arsenate 2 ($\frac{1}{2}$ gr. in 10 m.), strychnine hydrochloride 1 ($\frac{1}{2}$ gr. in 10 m.), water to 600.

[P1-81] **Injectio Sodii Arsenatis et Strychninae et Quininae** contains 1 gr. of quinine acid hydrochloride added to 10 m. of the above.

[P2-81] **Liquor Sodii Arsenatis (B.P.C.).**

Dose.—2 to 8 minims (0.12 to 0.5 ml.). 1% of the anhydrous salt.

[P2-81] **Pearson's solution of arsenic** used on the Continent, *e.g.*, *P. Ital. V*, is 1 of crystallised sodium arsenate ($7H_2O$) in water 600; *P. Belg. IV* is 1 in 1000.

ORGANIC ARSENIC COMPOUNDS

An organic arsenic compound, as distinct from the inorganic form, has the arsenic in combination with a carbon atom. This appears to lessen its toxic properties. Furthermore, arsenum acts either as a tri- or penta-valent element and, broadly, the former compounds are more potent upon protozoa. Examples of the first class are arsphenamine and of the second, sodium cacodylate, sodium arsanilate, tryparsamide, etc. The compounds are classified below under the headings (i) *Aliphatic*, (ii) *Aromatic*, (iii) *Bis-phenyl nucleus* bodies, as far as practicable.

(I) Aliphatic Series.

[P1-81] **Acidum Cacodylicum (B.P.C.).**

Syn. DIMETHYLARSONIC ACID. $(CH_3)_2AsO \cdot OH = 138.0$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.).

The ultimate product of oxidation of cacodyl, tetramethyldiarsine, $(CH_3)_2As-As(CH_3)_2$, discovered by Bunsen in 1842, and of cacodyl oxide, *syn.* alkarsin, $(CH_3)_4As_2O = 226.0$. Colourless hygroscopic crystals neutral to methyl orange, acid to phenolphthalein.

Soluble about 2 in 1 of water, 1 in 4 of alcohol 90%, readily in chloroform.

Although containing 54.3% of As, equivalent to 71.6% of As_2O_3 , it is relatively non-toxic—similarly with the salts. It will be noted that this acid has only 1 OH group, hence it is not so toxic as its parent arsonic acid, with 3 OH.

[P1-81] **Calci Cacodylas.** $[(CH_3)_2AsO]_2Ca = 314.0$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.) *per os* or intramuscularly.

A white amorphous powder. Soluble 2 in 1 of water, 1 in 2 of alcohol. Its uses are the same as those for sodium cacodylate, *q.v.*

[P1-81] **Ferri Cacodylas.** $[(CH_3)_2AsO]_2Fe = 466.8$.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.016 to 0.03 g.) *per os* three times daily, up to 5 grains *per diem* may be given. Intramuscularly $\frac{1}{2}$ to 1 $\frac{1}{2}$ grains (0.03 to 0.1 g.) *per diem*. Intravenously 1 grain (0.06 g.) in 5 ml.

Yellowish powder soluble 1 in 15 of water. Used for anaemia and chlorosis, also in glandular swellings, *e.g.*, in syphilis, hypodermically.

[P1-81] **Ferosin (Richter, London).** Ampoules contain iron cacodylate $\frac{1}{2}$ gr., strychnine nitrate $\frac{1}{2}$ gr., sodium glycerophosphate 1 $\frac{1}{2}$ gr. in 1 ml. *Dose.*—Three subcutaneous injections of 1 ml. weekly. Tablets contain strychnine nitrate $\frac{1}{2}$ gr., iron cacodylate $\frac{1}{2}$ gr., calcium glycerophosphate 2 $\frac{1}{2}$ gr. *Dose.*—1 or 2 tablets daily. Asthenic conditions and anaemia.

[P1-S1] **F.N.S. (Ferruginous Neurasthenic Serum)** (Allen & Hanburys, London). Ampoules contain iron cacodylate 0.01 g., sodium glycerophosphate 0.1 g., strychnine cacodylate 0.0005 g., in normal saline, to 1 ml. *Dose*.—1 ml. intramuscularly for 12 days. Anæmia and debility.

[P1-S1] **Ferruginous Ampoules** (Wilcox, JozEAU, London) contain iron cacodylate 0.01 g. ($\frac{1}{10}$ grain), sodium glycerophosphate 0.1 g. ($1\frac{1}{2}$ grains) and strychnine cacodylate 0.0005 g. ($\frac{1}{200}$ grain) in 1 ml. *Dose*.—1 ml. subcutaneously or intramuscularly daily for 12 days.

[P1-S1] **Drops** containing the above quantities in 25 minims are prepared.

Dose.—8 to 10 drops in water after food twice a day (for adults). Maximum daily dose 25 drops.

[P1-S1] **Ferruginous Solution** (Duncan, Flockhart, Edinburgh). Ampoules for intramuscular injection containing iron cacodylate $\frac{1}{2}$ gr., strychnine cacodylate $\frac{1}{10}$ gr., sodium glycerophosphate $1\frac{1}{2}$ gr. in 1 ml.

[P1-S1] **Iron-Arsenic-Strychnine Compound G.L.** (Glaxo Laboratories, London) is a preparation in ampoules for injection as a tonic and in anæmia.

[P1-S1] **Sodii Cacodylas** (B.P.C., *P. Helv. V, Fr. Cx., P.G. VI, U.S.P. XI, P. Ital. V, F.E. VIII, P. Belg. IV*).

Syn. SODIUM DIMETHYLARSONATE. $(\text{CH}_3)_2\text{AsO}_2\text{Na}$, $3\text{H}_2\text{O} = 214.0$.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.) orally, per rectum or hypodermically. When given orally an alliaceous odour is imparted to the breath; the odour is less marked when the compound is given by injection.

Fr. Cx. has max. single dose $1\frac{1}{2}$ grains and max. during 24 hours 3 grains approximately. *P. Helv. V* has $1\frac{1}{2}$ and 5 grains respectively for oral administration and 3 and 10 grains respectively for hypodermic injection.

A white, odourless, crystalline or granular powder, very deliquescent.

The salt of the above formula contains 35% of As whilst the anhydrous salt contains 46.8%, equivalent to 61.8% arsenious acid.

Soluble 2 in 1 of water, 1 in 1 of alcohol 90%.

Uses. In tuberculosis generally (curative results very slow), exophthalmic goitre, pernicious anæmia, malaria, chorea, psoriasis and other chronic skin affections, and in all cases in which arsenic has been used, but when given by the mouth or per rectum may cause renal congestion with albuminuria and fall in the quantity of urine excreted. The usual dose in syphilis is 1 to 2 gr. intramuscularly *per diem* for a week or 10 days. Some prefer 3 gr. daily for 7 days, then 1 gr. doses subcutaneously.

DISSEMINATED SCLEROSIS. Good results with $\frac{1}{2}$ gr. doses injected daily or every other day for 12 to 14 days. Courses of injections at 3-monthly intervals.

ENDOCARDITIS treated by daily intravenous injections beginning with 1 gr. and increasing gradually to 5 gr. Free from ill effects.

FURUNCULOSIS. Sodium cacodylate hypodermically on alternate days rapidly clears up furunculosis.

MALARIA well treated by intravenous injections of 30 gr., divided into 4 doses of $7\frac{1}{2}$ gr. at 6-hour intervals, until parasites have disappeared from peripheral blood, when dose is halved and continued for a fortnight.

PEMPHIGUS of acute type responds to 2 gr. doses. Total 50 gr. during 5 weeks.

PERNICIOUS ANÆMIA. Sodium cacodylate $\frac{1}{2}$ gr. may be given hypodermically daily for 20 days.

[P1-S1] **Injectio Sodii Cacodylatis.** A sterile preparation containing the equivalent of 0.05 g. ($\frac{1}{2}$ grain) of cacodylic acid in 1 ml. (15 minims approx.). The same dose diluted with 4 drachms of water is used for rectal injection.

[P1-S1] **Injectio Cacodylatum Compositum.** *Dose* (average).—15 minims (1 ml.), containing sodium cacodylate $\frac{1}{2}$ gr., iron cacodylate $\frac{1}{2}$ gr., strychnine cacodylate $\frac{1}{4}$ gr. It should be rendered slightly acid with cacodylic acid. 1 ml. contains approx. 0.03 g. ($\frac{1}{2}$ gr.) of As.

[P1-S1] **Cyto-Sol** (*Corbière, Paris; Anglo-French Drug Co., London*). Ampoules of 5 ml. contain sodium cacodylate 0.3 g., strychnine sulphate 0.001 g. in isotonic saline. *Dose*.—5 ml. intramuscularly or intravenously daily or every other day.

[P1-S1] **Hemo-Cyto-Sol** (*Corbière, Paris; Anglo-French Drug Co., London*). Colloidal iron 0.01 g., sodium cacodylate 0.3 g., strychnine sulphate 0.001 g., isotonic saline 5 ml. *Dose*.—5 ml. intramuscularly daily or every other day.

[P1-S1] **Optarson** (*Bayer Products, London*). Solution of ammonium heptachlorarsonate and strychnine nitrate. *Dose*.—1 ml. subcutaneously (= 0.004 g. of As_2O_3 and 0.001 g. of strychnine nitrate). Tonic.

[P1-S1] **Strychnokodyl** (*Richter, London*). Issued in two strengths; A contains sodium cacodylate $\frac{1}{2}$ gr., strychnine $\frac{1}{125}$ gr., in 1 ml., B contains $\frac{1}{2}$ gr. and $\frac{1}{125}$ gr. respectively. *Dose*.—1 ml. subcutaneously on alternate days. General tonic and stimulant and in alcoholism.

[P1-S1] Strychnine Cacodylas.

$C_{21}H_{22}N_2O_8 \cdot (CH_3)_2AsO \cdot OH = 472.4$.

Dose.— $\frac{3}{5}$ to $\frac{1}{15}$ grain (0.002 to 0.006 g.), usually by injection.

White crystalline powder hardly *soluble* in water, readily soluble in chloroform. Has proved a useful salt.

[P1-S1] **Sérum Névrosthénique Ampoules** (*Fraisse, Paris; Wilcox, JozEAU, London*) contain 0.1 g. of sodium glycerophosphate and 0.0005 g. of strychnine cacodylate, for hypodermic injection. In neurasthenia and other nervous affections. *Dose*.—1 ampoule daily for 12 days.

[P1-S1] **Drops** are also prepared for use by the mouth, containing the above quantities in 25 minims. *Dose*.—25 drops daily.

[P1-S1] Di-sodii Methylarsonas (*F.E. VIII, P. Ital. V*).

Syn. and Prop. Name. SODIUM METHYL ARSONATE (*Fr. Cx.*), SODIUM METHARSINITE, ARRHENAL (*Adrian, Paris*), "NEW CACODYLE." $AsO(CH_3)(ONa)_2 \cdot 6H_2O = 292.0$. *P. Belg. IV* has $5H_2O$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.) *per os* or hypodermically. *Fr. Cx.* has max. single dose $1\frac{1}{2}$ grains; max. in 24 hours, 3 grains.

Prepared by the interaction of methyl iodide and sodium arsenate in presence of excess of alkali. In white crystalline powder containing (with $6H_2O$) 25.65% of As.

Soluble about 1 in 1 of water, only slightly in alcohol 90%.

Uses. Similar to sodium cacodylate, *q.v.*

It is stated not to produce cacodyl oxide when given by the mouth.

[P1-S1] **Enesol** (*Clin Laboratories, Paris; Mertens, London*), is MERCURY SALICYLARSONATE, a combination of disodium methylarsonate and mercury salicylate. A white powder containing 36% mercury. It is best supplied in solution. This is said to be painless on injection.

Dose.— $\frac{1}{2}$ to 1 grain (0.015 to 0.06 g.) intramuscularly.

Syphilis and parasyphilis are treated by 2 ml. of 3% solution (= 1 grain approx.) intramuscularly once daily, or for intensive treatment of syphilis 4 to 8 ml. every 2 or 3 days. Intravenously, 4 to 10 ml. every 2 or 3 days according to urgency. When a total amount of 1.5 g. is reached, treatment should be suspended for 10 days.

General paralysis, malaria, and psoriasis, are also treated with it.

[P1-S1] **Arsylen** (*Roche Products, Welwyn Garden City*). Allylarsonic acid. In granules containing 0.01 g. in the form of calcium allylarsonate, or ampoules containing 0.05 g. as sodium allylarsonate. In skin and blood diseases, convalescence, etc.

(II) Aromatic Series

[P1-81] **p-Aminophenylarsonic Acid.** *Syn.* ARSANILIC ACID, ANILINE-ARSENIC ACID. $\text{NH}_2\text{C}_6\text{H}_4\cdot\text{AsO}(\text{OH})_2 = 217.0$.

Arsanilic acid is weakly basic. Its hydrochloride is immediately hydrolysed by water. It is soluble in methyl and ethyl alcohols. It has been employed as:—

[P1-81] **Sodii Aminarsonas (B.P.C.).** *Syn. and Prop. Names.* SODIUM p-AMINOPHENYLARSONATE, SODIUM ARSANILATE, ATOXYL (*Boehden, Berlin*), SOAMIN (*Burroughs Wellcome, London*). $\text{NH}_2\text{C}_6\text{H}_4\text{AsO}(\text{OH})\text{O}\cdot\text{Na} = 239.0$. Contains a variable proportion of water, usually 3 to 4 molecules. *P. Belg. IV* requires $3\text{H}_2\text{O}$, *Fr. Cx.* $4\text{H}_2\text{O}$. *B.P.C.* requires 24 to 25.6% of As.

Dose.— $\frac{1}{2}$ to 3 grains (0.05 to 0.2 g.). This dosage *per os* for syphilis and chronic skin diseases has been advised daily for a week, then to be intermitted, but caution is recommended (*vide infra*). Max. single dose 3 grains (0.2 g.). It has also been given subcutaneously, intramuscularly and intravenously.

Many patients object to subcutaneous injections of Atoxyl on account of the pain. This may be avoided by dissolving the dose of Atoxyl in 10% solution of sodium citrate.—*M. Berté, per Trop. Dis. Bull., 1939, 671.*

Solutions should be freshly prepared with cold boiled water and may be slightly warmed at time of injection.

A white crystalline powder with slightly saline taste.

Soluble about 1 in 6 of water. Also soluble about 1 in 125 of alcohol 90% and more so in methyl alcohol. The anhydrous substance is readily soluble in methyl alcohol but practically insoluble in ether, acetone, benzene or chloroform.

Incompatible with mercurials (*e.g.*, perchloride), and other heavy metals in solution, also with acids.

Uses. This compound was first employed in the treatment of trypanosomiasis. Owing to the success achieved by its use in this condition it was subsequently employed in syphilis, malaria, relapsing fever, pernicious anæmia, elephantiasis and other diseases. Unfortunately, although the single dose is far less toxic than the equivalent amount of arsenic, its continued use over prolonged periods causes degenerative changes in the central nervous system leading to blindness and even to death, and its use has now largely been abandoned in favour of other preparations such as tryparsamide and neoarsphenamine, though it is still employed to some extent for its original indication, *i.e.*, trypanosomiasis.

[P1-81] **Sodii Acetylarsanilas (P.G. VI, P. Belg. IV).**

Syn. SODIUM ACETYLAMINOPHENYL-ARSONATE.

$\text{C}_6\text{H}_4\cdot\text{NHCOCH}_3\cdot\text{AsO}_3\text{HNa}\cdot 4\text{H}_2\text{O} = 353.1$. *P. Helv. V* has $5\text{H}_2\text{O}$.

Dose.—*Per os* $\frac{1}{2}$ grain (0.03 g.) 3 or 4 times a day.

Colourless crystals. **Soluble** 1 in 10 of water, insoluble in alcohol.

This has been used similarly to sodium aminarsonate in trypanosomiasis, syphilis, etc., but is stated to be less effective therapeutically and to produce similar toxic effects.

[P1·S1] **Acetarsol** (*B.P. Add. I*). *Syn. and Prop. Names.* ACETARSONE, 3-ACETYLAMINO-4-HYDROXYPHENYLARSONIC ACID (*Fr. Cx.*), FOURNEAU 270, STOVARSOL (*Pharmaceutical Specialities (May & Baker) Ltd., London*), KHAROPHEN (*Burroughs Wellcome, London*), ORARSAN (*Boots, Nottingham*), ORSANINE (*Société Parisienne d'Expansion Chimique, Paris*), SPIROCID (*Bayer Products, London*).

Dose.—1 to 4 grains (0·06 to 0·25 g.) for adults; $\frac{1}{2}$ grain (0·03 g.) maximum for children. Stated to be readily absorbed from the gastro-intestinal tract.

Colourless crystals having a high As content (27% approx.) and low toxicity. It was introduced by Fourneau and Levaditi in 1922.

Insoluble in cold water, alcohol 90% and dilute acids; moderately soluble in boiling water and in alkalis, the corresponding salt being formed.

Toxic symptoms sometimes occur, *e.g.*, diarrhoea, vomiting, headache and cutaneous eruptions. Exfoliative dermatitis has been reported following continued use.

Dermatitis, from administration of 40 gr. in 13 days, quickly subsided on giving 10 ml. intravenous injections of a 10% strontium bromide solution.—H. C. Semon, *Lancet*, ii/1932, 341.

Toxic erythema in 13, and peripheral neuritis in 2, out of 232 cases of amœbiasis treated. Risk of treatment considerable and particularly dangerous unless patient is under constant supervision.—P. W. Brown, *J. Amer. med. Ass.*, i/1935, 1321.

Uses. In amœbiasis, yaws, lambliasis, malaria, and the early treatment of syphilis. Has the advantage of being active when given orally. It is also employed both orally and intravenously in the treatment of neurosyphilis, though it may give rise to toxic reactions. It is effective in congenital syphilis, but should be used with caution.

Used with success in spirillary diseases, *e.g.*, intestinal spirochaetosis, ulcer-membranous-stomatitis, spirillary bronchitis, phagedenic ulcer, and Vincent's angina; also lesions resistant to arsphenamines.

In acute cases of amœbiasis destruction of cysts entails dosage of 8 gr. per day for 10 days. Stated to cure when emetine has failed. In chronic cases, 4 gr. the first day, later 4 gr. every other day for a week, then twice a week for several weeks. (For the combined treatment with Auremetine, *v.* p. 663.)

The combined treatment of amœbic dysentery (in France) with acetarsol and emetine lasts 4 weeks and consists of administration of 0·5 g. of acetarsol a day during 1st and 3rd weeks, and emetine during 2nd and 4th weeks. The "opening" treatment with acetarsol alone consists of administration of 0·75 g. a day for one week, discontinued following week and resumed on 3rd week, followed for one or two months by daily dose of 0·25 g. Amœbæ disappear in 4 days and cysts in 8 days.

In yaws the following has been advised: Two 4 gr. tablets the first day, three the second day, four the third day. Omit for one day, then four, three and two tablets respectively on alternate days.

For lambliasis, one 4 gr. tablet a day for six days. The dose may be doubled and treatment extended, in cases with cysts. The dosage for children should be *pro rata*. Improvement with disappearance of cysts. Blastocysts, the cause of diarrhoea, destroyed.

In malaria 15 gr. *per os*, in a single dose, will free the blood of tertian parasites but does not affect malignant or quartan forms. It is said to be a useful adjuvant to quinine.

CONGENITAL SYPHILIS. While acetarsone is effective in the treatment of congenital syphilis the effective dose is so near to the dose that causes severe reactions that its indiscriminate employment is felt to be unwise. Maxwell and Glaser report a death after 7.68 g. of acetarsone over a period of 84 days.—H. N. Cole, *J. Amer. med. Ass.*, i/1937, 825.

DIPHTHERIA. Successful results in disinfection of 47 infant carriers of diphtheria by nasal instillation thrice daily for five days of a 10% watery suspension of Spirocid. From one to three such series of treatments are commonly required. Only one child showed toxic symptoms, consisting in morbilliform and erythematous eruptions.—A. Iancon *et al.*, *per Brit. med. J. Epit.*, i/1937, 2.

NEUROSYPHILIS. Good results reported from *intravenous* injection of Stovarsol. Solution prepared by dissolving 1 g. in 9 ml. of 4% sodium hydroxide and adding 11 ml. of distilled water. Initial dose 0.5 g. and succeeding doses 1 g. at weekly intervals.—L. H. Griggs and J. F. Schamberg, *Arch. Derm. Syph.*, N. Y., 1934, 645.

Oral administration of Stovarsol in cases of neurosyphilis certified as insane. The serological results in 22 cases warrant further trial. Clinical results, though favourable in some cases, do not at present justify any conclusions. The drug was given on alternate weeks, the number of tablets given daily being regulated approximately by the body weight, patients of 11, 9 and 7 st. receiving respectively 5, 4 or 3 tablets (each 4 gr.). Toxic effects may be produced, requiring the use of calcium thiosulphate as an antidote, but the insidious onset of blindness, sometimes observed with Tryparsamide, is a rare complication.—R. Fakenham-Walsh, *Lancet*, i/1937, 982.

VINCENT'S ANGINA. The most rapid cure is obtained by the use of a thick paste, prepared by triturating a tablet of 0.25 g. in a few ml. of water or glycerin which is massaged into the gums. Tablets of the same dose are also given three or four times (half doses for children).—C. H. Maxwell, *per Practitioner*, ii/1936, 660.

YAWS. Yaws is as difficult to cure as syphilis. It is true that the lesions of yaws are easily healed with a few doses of arspenamine and that bismuth compounds are also effective, but to say that this means that the disease is easily cured is as fallacious as the statement would be if applied to syphilis. If one is to be guided by the number and frequency of relapses and by the persistently positive serologic reactions one feels inclined to say that yaws is incurable in a large proportion of cases and that the treatment should be, as for syphilis, vigorous and continuous. In Cuba the treatment for patients with yaws is the same as that for syphilis, but where continuous treatment by injection is not practicable, successful therapy was instituted with acetarsone tablets in a dose of 0.25 g. daily for 20 days, these courses of treatment being repeated at least three times with intervals of two weeks of rest.—V. Pardo-Castello, *Arch. Derm. Syph.*, N. Y., 1939, 40, 772.

[P1-S1] **Acetarsol Sodium.** *Syn. and Prop. Names.* SODIUM ACETYLAMINOHYDROXYPHENYLARSONATE (*Fr. Cx.*), ORSANINE-SODIQUE (*Société Parisienne d'Expansion Chimique, Paris*), STOVARSOL-SODIUM (*Pharmaceutical Specialities (May & Baker) Ltd., London*). A white powder soluble 1 in 8 of water.

For injection in yaws, general paralysis and malaria.

Ampoules contain 0.5, 1 and 1.5 g., injections being given three times a week until a total of 20 g. has been given.

[P1-S1] **Devegan Vaginal Tablets** (*Bayer Products, London*). Acetarsol and boric acid with carbohydrate hydrolysed by a special process. In leucorrhœa, especially that due to *trichomonas vaginalis*.

Review of results of 185 cases of vaginal discharge. Best results only obtained with in-patients. One to four tablets of Devegan inserted high in the vaginal fornices, at first twice daily and then at lengthening intervals, and finally just after the menstrual periods only. Desired result obtained in from 2 weeks to 2 months in two-thirds of the cases. Complete disappearance of discharge, or a substantial improvement, occurred in all but a small proportion of cases. Results definitely superior to antiseptic douches.—P. Hauptstein, per *Lancet*, i/1936, 382.

All but 7 of 47 patients clear of trichomonas infection after 3 months (and 5 of the 7 had an associated gonorrhœa). The tablets are more effectively inserted by an experienced person.—J. L. Collis, *J. Obstet. Gynec.*, Feb., 1936, 87.

The best results in trichomonas vaginitis have been obtained by the use of Devegan tablets; 2 tablets, inserted once or preferably twice daily and used in conjunction with an alkaline or a 1 in 1000 potassium permanganate douche, have relieved the condition quickly. It must be realised, however, that unless treatment is continued for from two to three months relapses are almost certain to occur.—E. W. Assinder, *Brit. med. J.*, i/1936, 882.

In hypersensitive patients arsenical intolerance may arise from the local use of arsenical preparations in the treatment of *trichomonas vaginalis* infection. A case described.—C. G. H. Campbell, *Lancet*, ii/1937, 688.

A case of severe dermatitis following use of vaginal tablets for *trichomonas vaginalis* infection. This result was not due to hypersensitivity, but to adsorption over a period of seven weeks, owing to the fact that the daily vaginal douche was omitted. The skin condition cleared up on cessation of the treatment.—M. C. W. Long, *Lancet*, ii/1937, 828.

[P1-S1] **Stovarsol Vaginal Tablets** (*Pharmaceutical Specialities (May & Baker) Ltd., London*) are used for similar purposes.

[P1-S1] **Bistovol** (*Pharmaceutical Specialities (May & Baker) Ltd., London*). The bismuth salt of acetarsol, in ampoules containing 3 ml. of 10% suspension in oil. For adults a series of 12 injections of 1.5 to 3 ml. at intervals of 4 to 5 days is suggested.

Primary and secondary syphilis well treated by Bistovol *per os* either in solution or tablets. Well tolerated in doses of 2 g. daily for 8 to 11 days. Rapid disappearance of spirochaetes and prompt cicatrization of lesions.—C. Levaditi and L. Fournier, *Lancet*, i/1928, 697.

[P1-S1] **Acetylarsan** (*Pharmaceutical Specialities (May & Baker) Ltd., London*).

Diethylamine acetarsol, a white crystalline powder, soluble in water. Two solutions are prepared: (1) for adults, containing 23.6% of active product, 1 ml. of which is equivalent to 0.05 g. of arsenic; and (2) for children weighing less than 15 kg., containing 9.4% of active product, 1 ml. of which equals 0.02 g. of arsenic (the basis of dosage with this solution is 0.15 ml. per kilo body weight). It is given subcutaneously or intramuscularly, the dosage in adults (after two preliminary injections, one of 1 ml. and one of 2 ml.) being 3 ml. given at three-day intervals, a course consisting of 16 injections with an interval of one month between courses. Alternatively 5 ml. may be given, once a week for 8 weeks (not more than 3 ml. at one site). Indicated in all stages of syphilitic infection, in neurosyphilis, congenital syphilis, and in yaws. Used in hepatitis with success—dose, 0.75 g. once a week for 4 weeks. Also used, in conjunction with emetine, for amebiasis.

Effect on *S. pallida* equal to that of the arsenobenzenes, and serological effect compares favourably. More frequently followed by minor toxic effects than the arsenobenzenes.—V. E. Lloyd, *Lancet*, i/1928, 1323.

[P1-S1] **Parosan** (*Pharmaceutical Specialities (May & Baker) Ltd., London*).

8-Acetyl-amino-3-hydroxy-1:4-benzisoxazine-6-arsonic acid. Has some analogy with Stovarsol and Tryparsamide. Tablets contain 4 gr. In disseminated sclerosis and neurosyphilis. Of little use in early syphilis.

[P1-S1] **Carbarsonne**. $\text{NH}_2\text{CONH}\cdot\text{C}_6\text{H}_4\text{AsO}(\text{OH})_2 = 260.07$.

Syn. and Prop. Names. *p*-CARBAMINOPHENYLARSONIC ACID, AMEBEVAN (*Evans, Sons, Lescher & Webb, Liverpool*), LEUCARSONE (*Pharmaceutical Specialities (May & Baker) Ltd., London*).

Dose.—0.25 gramme twice daily for 10 days.

A white crystalline solid without odour or taste, containing 28.85% of arsenic. M.p. 174°.

Practically *insoluble* in water but dissolves in aqueous alkaline solutions.

Uses. Carbarsone is employed in the treatment of chronic intestinal amœbiasis. While it is said to be less toxic than acetarsol (and more amœbicidal), cutaneous and other reactions common to arsenic compounds have been observed and the possibility of optic injury, though not serious, should nevertheless be kept in mind. The arsenic is only slowly liberated and suitable intervals between courses should be allowed in order to avoid a cumulative effect; in common with other arsenicals it should not ordinarily be employed in the presence of hepatitis or kidney damage.

Carbarsone is usually administered by the mouth in a dose of 0.25 g. twice daily for a period of ten days, the course being repeated if necessary after an interval of a week or ten days. In resistant cases, or in cases with acute symptoms, it may be given as a retention enema, 2 g. of the drug being dissolved in 200 ml. of warm 2% sodium bicarbonate solution; this is given on alternate nights for a maximum of five doses. The retention enema is preceded by a cleansing alkaline enema. It is not advisable to give the drug by mouth concurrently with the rectal administrations.

It is non-toxic in clinically effective doses.—A. C. Reed and co-workers, *J. Amer. med. Ass.*, i/1932, 189-198. Apparently effective.—*ibid.*, 231.

Study of forty-four drugs in order to find one with low toxicity and high amœbicidal powers showed carbarsone to be the best. 0.25 g. given twice daily for ten days. In obstinate cases retention enema of 2 g. of carbarsone in 200 ml. of warm water with 1% of sodium bicarbonate; after preliminary cleansing, enema repeated on alternate nights for five treatments. No toxic symptoms—only slight epigastric discomfort reported.—H. H. Anderson, *J. trop. Med. (Hyg.)*, i/1933, 69.

Doses of 0.25 g. of carbarsone twice daily for 10 days with no untoward effects in 31 cases and with 23 cures reported by R. N. Chopra, B. and S. Sen, *Indian med. Gaz.*, 1933, 315.

200 ml. enemas of 1% carbarsone in 2% sodium bicarbonate last thing at night after a sedative of sodium amytal, repeated until they have been retained on five occasions, of value when the oral use of the drug had failed. In extensive trials orally and rectally in total quantities of 75 to 2100 mg. per kilo, over periods of up to 15 months, intolerance only noted in one case of hepatitis after 5 g. in ten days.—H. H. Anderson and J. C. Reed, *Amer. J. trop. Med.*, 1934, 257.

A total oral dosage of 3.0 g. per kilo over a period of 48 weeks has been employed with no perceptible harm.—H. A. Anderson, *J. trop. Med. (Hyg.)*, 1935, 272.

The therapeutic failures of the carbarsone treatment of amœbiasis were reduced from 10 to 3% by combining it with retention enemas of chiniofon. A single course of carbarsone was given in 104 cases, 0.25 g. before breakfast and supper for 10 days and enemas of 250 ml. of a 2.5% chiniofon.—J. G. Mateer [P1-81], *Amer. J. digest. Dis.*, 1940, 154.

[P1-81] Amibiarsen (Bengal Chemical & Pharmaceutical Works, Calcutta). 4-carbamino-phenyl-arsenic acid. *Dose.*—0.25 grammes (in gelatin capsules) twice a day *per os* for 10 to 15 consecutive days. For the treatment of chronic intestinal amœbiasis.

Patients are kept on ordinary diet and a saline purgative is taken with the Amibiarsen. Cure is recorded when 6 or more consecutive stools have been examined on different days and found negative in respect of *E. histolytica*. Of 40 patients who received this treatment 25 (62.5%) were cured; in 10 (25%) the result was indeterminate and in 5 (12.5%) it failed.—T. N. Chopra, B. Sen and G. Sen, *Indian med. Gaz.*, 1935, 324.

[P-81] **Tryparsamidum** (B.P. Add. I, U.S.P. XI, Fr. Cx.).
Syn. SODIUM N-PHENYLGLYCINEAMIDE-*p*-ARSONATE (P. Ital. V),
 GLYPHENARSINUM (P. Belg. IV), TRYPARSONUM (B.P.C.).

$\text{NaO}(\text{OH}) \cdot \text{AsO} \cdot \text{C}_6\text{H}_4 \cdot \text{NH} \cdot \text{CH}_2 \cdot \text{CONH}_2, \frac{1}{2} \text{H}_2\text{O} = 305.1$.

(The U.S. patent, owned by the Rockefeller Institute, having expired on September 24th, 1935, the Institute dedicated the name tryparsamide to the public as a non-proprietary designation, and the Council on Pharmacy and Chemistry of the A.M.A. adopted the name as a non-proprietary name for the product.)

Dose.—15 to 30 grains (1 to 2 g.) by subcutaneous, intramuscular or intravenous injection. U.S.P. XI average dose 30 grains intravenously. Up to 45 grains may be given for a dose.

A white crystalline powder obtained by treating sodium *p*-aminophenylarsonate with chloracetamide and recrystallising the sodium salt of the acid thereby obtained. The anhydrous substance contains about 25% of As. It is required to comply with biological tests for freedom from toxicity.

Soluble 3 in 10 of water, forming a neutral solution; almost insoluble in alcohol, chloroform and ether.

Uses. Originally introduced for the treatment of trypanosomiasis, but is effective only against *T. gambiense* (African sleeping sickness); *T. rhodesiense* is not destroyed. Is now used also in neurosyphilis and is usually preferred to arsphenamine compounds in tabes and paresis. The best results seem to be obtained in patients with early dementia paralytica. It is liable to produce optic atrophy, and is contraindicated in neurosyphilis with optic neuritis. Has no effect on primary or secondary syphilis. It is a valuable follow-up treatment after malaria therapy in G.P.I. Should be given in courses of 8 or 10 weekly injections, the total dosage required being 20 to 40 g. in trypanosomiasis (more in chronic cases), and 130 g. or more in neurosyphilis. Injections are usually given intravenously. Toxic effects are indicated by ocular pain, lachrymation and photophobia.

TRYPANOSOMIASIS. In patients of the first stage, a total dosage of 20 to 40 g. usually cures, but in chronic cases 50 to 100 g. is necessary (Van den Branden). The best dosage for adults in good condition is 3 g. weekly, and in poor condition 2 to 3 g.; for children 0.5 to 2 g. Action is rapid, durable, constant, and superior to any other drug, relapses or incomplete cures being due to extraneous causes; toxic reactions are negligible, cases of total blindness recorded being due to previous arsenical treatment (Marugo).

The single course of 50 g. for an adult appears to cure 52% and to ameliorate greatly 48% in the second stage. Accidents insignificant and ocular troubles rare and not severe (Infante).—Abstracts of papers on the use of tryparsamide, per *Trop. Dis. Bull.*, Oct., 1928, 790.

Results of use in 1000 cases. Exerts unique action on advanced cases, but equally satisfactory in early cases.—Louise Pearce, *Rockefeller Inst. Monograph*, 1930; *Brit. med. J.*, ii/1930, 1094.

During 1934, 47,187 cases of sleeping sickness were treated in Nigeria, the great majority with a course of 20 to 25 g. of tryparsamide—initial dose 1 g., followed by 2 g. doses at 5-day intervals. Fewer toxic symptoms using distilled rather than boiled and filtered water. Antrypol (see p. 1009) became available towards the end of 1934, and patients are now being given 3 doses each of 1 g. of Antrypol, followed by a course of 9 to 11 g. of tryparsamide, with 5-day intervals between injections with both drugs.—H. M. O. Lester, *Report of the Tsetse Investigation*, per *Trop. Dis. Bull.*, 1936, 33, 169.

Lester found that toxic symptoms after tryparsamide only occurred when boiled and filtered water was used instead of distilled water. Routine treatment of trypanosomiasis in N. Nigeria now consists of three 1 g. doses of Bayer 205 or Antrypol, followed by five 2 g. doses of tryparsamide.—*Trop. Dis. Bull.*, 1940, 321.

GENERAL PARALYSIS AND TABES. In general paralysis, particularly megalomaniac forms, the prolonged use is worthy of trial. 1 to 2 g. doses given at weekly intervals intravenously.—M. Brown and A. R. Martin, *Lancet*, ii/1926, 699. See also *J. Amer. med. Ass.*, i/1927, 475.

The drug has no spirocheticidal effect in man but has a local stimulating effect on the nervous system. In 37 cases of general paresis there was clinical cure or marked improvement in 63%, and serological cure or marked improvement in 75%. Clinical improvement depends very largely on the duration of the parenchymatous involvement and the degree of pre-existing damage. Tryparsamide appears capable of arresting the active syphilitic process but not of undoing the damage done. Optic injury is rarely produced after the tenth injection, and early and repeated examination of the eye is therefore essential.—F. E. Cormia, *Brit. J. ven. Dis.*, 1934, 99.

From observation of 155 patients with various types of syphilis of the central nervous system treated with tryparsamide and kept under rigid ocular control for a period of years, it is concluded that: (1) subjective reactions are not infrequent but are often due to suggestion; (2) severe objective signs of damage to the optic nerve occur infrequently with reasonable ocular control; (3) of patients treated with tryparsamide the percentage of those benefiting so far as the optic nerve is concerned is far greater than the percentage of those in whom damage may occur; (4) patients with optic atrophy due to syphilis should have the advantage of the use of tryparsamide when the drug is indicated.—L. L. Mayer, *J. Amer. med. Ass.*, ii/1937, 1793.

[P1-81] **Biarsamide** (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Bismuth tryparsamide, containing 14.5% As and 40.5% Bi. Ampoules contain 2 or 5 ml. of 5% solution for intramuscular injection in nervous syphilis.

[P1-81] **Treparsol** (*Lecoq et Ferrand, Paris; Bengué, London*) (0.25 g. tablets). *SYN. ACIDUM 4-OXY-3-FORMYLAMINOPHENYLARSINICUM (P. Belg. IV)*, FORMYLPHENARSINE.

Treparsol is formyl-m-amino-p-oxyphenylarsonic acid, a white powder almost insoluble in water, alcohol and ether. For oral administration in syphilis.

[P1-81] **Neocryl**. *SYN. SODIUM SUCCINANILOMETHYLAMIDE-p-ARSONATE*. A white crystalline substance readily soluble in water. Rather less toxic than tryparsamide and has greater trypanocidal activity. Well tolerated in man, by intravenous injection of a 15 to 20% solution in sterile distilled water, in weekly amounts of from 2 to 4 g., the usual course consisting of the administration of this amount weekly up to a total of 30 to 36 g.; one patient had an uninterrupted course of 69 g. without showing toxic symptoms. Neocryl has a definite action on primary, secondary and tertiary syphilis, though in primary syphilis it is best combined with bismuth. In neurosyphilis and tabes it gave very satisfactory results; and of 11 cases of Nigerian trypanosomiasis treated by a single course, 10 became clinically normal and the other was improved.—Warrington Yorke and co-workers, *Brit. med. J.*, i/1936, 1042 (Report to Therapeutic Trials Committee).

For an account of the preparation and therapeutic activity of succinyl derivatives of p-arsenic acid see G. T. Morgan and E. Walton, *J. chem. Soc., Lond.*, March, 1931.

NEUROSYPHILIS. A comparison in a series of 570 cases showed that Neocryl is in no way inferior to tryparsamide as a therapeutic agent, and that toxic effects from its use are much less common than with tryparsamide. Visual disturbance occurred in 47 out of 256 treated with tryparsamide, whereas only one case occurred in 314 treated with Neocryl.—A. O. F. Ross, *Brit. med. J.*, ii/1940, 283.

(III) Bis-phenyl Nucleus Series

[P1-81] **Arsphenamina** (*B.P.C., U.S.P. XI, Fr. Cx.*). *SYN. and Prop. Name.* ARSENOBENZENE, ARSENOBENZOL (*P. Jap. V*), ARSENPHENOL-AMINE, AMINO-ARSENO-PHENOL, DIOXYDIAMINO-ARSENO-BENZENE DIHYDROCHLORIDE, SALVARSAN (*Bayer Products, London*) (*P.G. VI*), EHRLICH-HATA, or "606."

Arsphenamine consists mainly of the dihydrochloride of 3 : 3'-diamino-4 : 4'-dihydroxyarsenobenzene.

Dose.— $1\frac{1}{2}$ to 10 grains (0.1 to 0.6 g.), by intravenous injection. *U.S.P. XI average dose* 6 grains.

Therapeutic Substances Act, 1925.—Under this Act and the Statutory Rules and Orders issued under it in 1931, arsphenamine, commonly known as *Salvarsan*, and analogous substances used for the specific treatment of infective disease, are controlled by Licence, under the Minister of Health in England and Wales, the Scottish Board of Health in Scotland, and the Minister for Home Affairs in Northern Ireland, both with regard to manufacture and standards of strength, quality and purity.

The Standard Preparations of arsphenamine, etc., are kept in the National Institute for Medical Research, Hampstead. Biological tests and tests for stability are applied. The label must state that the contents have been tested in accordance with Regulations under the Act.

Introduction. Ehrlich and his assistants (notably S. Hata of Tokyo) conducted research which led finally to the introduction of arsphenamine for the treatment of syphilis and other affections. It was hoped the compound would effect a "sterilisation of the system."

Arsphenamine solutions kill protozoa *in vitro*, and the $\frac{C}{T}$ ratio,

Curative dose or sufficient to destroy all parasites
i.e., *Toxic dose or max. dose which patient can tolerate* for the substance is satisfactory. Ehrlich maintained that this ratio must be $\frac{1}{2}$ or less for a drug to be of value in this type of disease.

Note.—The
Chemotherapeutic Index (R) = $\frac{\text{M.T.D.}}{\text{M.C.D.}}$ = $\frac{\text{Max. tolerated dose.}}{\text{Min. curative dose.}}$

If it is fairly large (5 to 10), the minimum curative dose is sufficiently far removed in quantity from the maximum dose tolerated for the drug to be useful.

Arsphenamine is a bright yellow powder, freely mobile in contact with glass surfaces, and odourless except for a slight smell of ether. Theoretically it contains approximately 31.6% of As. The Therapeutic Substances Regulations require not less than 30% or more than 34%. It is available in ampoules, each containing 0.6, 0.5, 0.4, 0.3, 0.2 or 0.1 g. filled with inert gas to prevent oxidation. If discoloured—either grey or brownish—it must not be used.

Soluble 1 in 5 of water, forming a thick syrupy liquid with acid reaction, but not acid to congo-red paper, 1 in 3 of methyl alcohol, 1 in 12 of ethyl alcohol; also soluble in glycerin. Insoluble in ether.

Toxic Effects and their Treatment.

Arsphenamine compounds in excess are all liable to damage capillary endothelium. In the dosage commonly employed a wide variety of toxic manifestations may occur. *Vasomotor symptoms* of an anaphylactic nature ("nitritoid" reactions) may occur during or immediately after the injection, and last for about 30 minutes, rarely longer. For treatment, 10 to 15 m. of adrenaline solution should be given subcutaneously. These toxic symptoms may be

avoided by careful preparation of the solution and by slow administration.

Rigor and headache, diarrhoea and cramp in the legs may occur. They are usually due to faulty diet. All patients should fast for at least two hours before injection.

Late effects, including stomatitis, erythema, exfoliative dermatitis, headache, lassitude and possibly jaundice and cerebral disturbances may come on at periods varying from a few days to a few weeks. Stomatitis is more common in patients treated with mercury or bismuth in addition to arsenic. Headache and lassitude are indications for a break in treatment. For the dermatitis, sodium thiosulphate is given intravenously or intramuscularly (0.45, 0.6, 0.75 and 0.9 g.) on alternate days with 25 ml. of 25% dextrose intravenously on each of the intervening days. 30 gr. doses orally may also be given. Liver extract is also often very beneficial. Jaundice is rarely severe but may cause death. A high fat and high protein diet with low carbohydrate is useful for prevention. For treatment, intravenous injections of 25 ml. to 50 ml. of 25% glucose should be given daily.

Some authorities recommend routine injection of sodium thiosulphate before treatment with arsphenamine compounds. More recently ascorbic acid (*q.v.*) has been used with success in the treatment of dermatitis due to arsphenamine.

Cerebral symptoms are rare but usually fatal. Prompt treatment by phlebotomy to 20 oz., removal of 15 ml. of cerebrospinal fluid, and injection of 1 ml. of solution of adrenaline may be successful, the lumbar puncture being repeated if symptoms continue.—L. W. Harrison, *Price's Practice of Medicine*, 4th Edn., 1934.

Atropine $\frac{1}{2}$ gr. hypodermically is also advised for immediate vasomotor reactions. The cardiac reactions are best treated with hypodermic injections of strychnine $\frac{1}{32}$ gr., ether 30 m., or camphor $1\frac{1}{2}$ gr.—P. Power, *J. R. Army med. Cps*, Jan., 1927, 46.

In the 17-year period 1919-35 there were 63 deaths in the United States Navy following the administration of the arsphenamines. Neoarsphenamine caused the largest number (34) of the deaths, which was to be expected, as this is the arsenical most extensively used in the Navy. None of the patients died after the first injection of an arsenical; 12 died after the second; 23 after 5 injections or less; and 20 had received more than 6 injections. Autopsies were performed on 44 cases, the results of which are presented and discussed. The striking findings were frequent hæmorrhages and œdema in the various organs of the body.—S. S. Cook, *Publ. Hlth Rep., Wash.*, 1936, 929.

Contraindications. Addison's disease, hæmophilia, severe visceral disease. Small initial doses and extra caution are necessary in alcoholism, cachexia, renal or cardiac lesions and where there is a tendency to eczema, also in diabetes since arsphenamine compounds increase the amount of blood sugar.

Uses. The acidity of arsphenamine must be neutralised at the time of use; it has been largely replaced by neoarsphenamine, which needs only to be dissolved in water when required for use. The compounds are similar in effect and the description of uses, etc., below applies also in a large measure to the latter. Combined treatment with mercury or bismuth in addition is now more usual than treatment with arsenic alone.

Arsphenamine is usually given intravenously by the gravity method. Intramuscular injections, into the gluteal muscles, are now little used on account of the pain produced. Sulpharsphenamine has superseded it for that route.

A syphilitic chancre, a secondary syphilide or ulceration, or a tertiary gumma or ulceration, yields remarkably to the arsenicals. They are also of value in acquired or congenital syphilis. While arsphenamine, and more particularly neoarsphenamine, may be found of value in the early stages of neurosyphilis, other arsenicals, such as silver arsphenamine or tryparsamide are now more frequently employed.

Arsphenamine compounds are also used in malaria, septicæmia, relapsing fever, rat-bite fever, and yaws, and as a local application in Vincent's angina.

Preparation of the Injection.—Dissolve the dose in about 10 ml. of sterile water and make it alkaline by adding normal caustic soda solution (40 g. per litre), using the amount on the label required to dissolve the dose. (*U.S.P. XI* directs the addition of 0.85 ml. of N sodium hydroxide solution for each 0.1 g. of arsphenamine.) A precipitate is formed which re-dissolves on shaking. Dilute with normal saline so that each 0.1 g. is contained in approx. 20 ml. of solution. Injection is usually through one of the veins of the fold of the elbow, *e.g.*, the median cephalic, but any prominent vein may be used.

Dose.—0.1 to 0.6 g. Early syphilis is generally treated with from 0.2 to 0.3 g., and a number of injections, at intervals of a few days, gradually increasing up to 0.6 g., are given, with a total of 4 to 5 g. This course is usually *repeated* after an interval varying from 4 to 6 weeks, and *three or four such courses* are generally required. No food should be taken for two hours before or after the injection and alcohol should be forbidden. A mild purgative before the injection lessens the liability to untoward reactions. *Children* may receive from 0.02 to 0.2 g., according to age, but sulpharsphenamine subcutaneously, or neoarsphenamine intravenously, are preferable in such cases.

"Combined Treatment" with mercury, *vide postea*.

Patients should be treated in bed and observed for at least three days. If patient shows any signs of collapse during administration, the injection should be stopped at once.

League of Nations Recommendations.

An enquiry in five countries (Denmark, France, Germany, Gt. Britain and the U.S.A.), carried out under the auspices of the Health Organisation of the League of Nations, into the treatment of syphilis in selected clinics. Statistical material was obtained from 94 clinics with 25,623 cases. As a result of the enquiry the following recommendations were made.—*Quart. Bull. Hlth Org. L. o. N.*, 1935, *I*, 239.

1. Treatment as early as possible in the sero-negative primary stage.

H*

2. Prior to treatment, there should be an adequate physical examination to determine the absence or otherwise of any indication for caution in dosage.

3. In carrying out the treatment, a strict supervision of the patient should be exercised, especially in respect of mucous membranes, skin, kidneys and liver.

4. Observations, clinical and serological, after completion of treatment should be for not less than three years.

5. Adequate examination of the spinal fluid, at least before dismissal from observation, is essential.

6. The principles to be followed in carrying out the actual treatment should be as follows: (a) To employ a comparatively heavy individual dosage of the arsenobenzene and of the bismuth or mercurial compounds, the doses being administered in comparatively rapid succession, especially at the commencement; (b) to maintain a persistent attack on the disease, avoiding intervals of such length as to afford the parasite an opportunity of recovering; (c) to administer approximately as much treatment to primary as to secondary cases.

A system either of intermittent treatment or of continuous treatment can be expected to yield satisfactory results in ordinary cases of early syphilis. (*For full details of these treatments see Vol. I, 21st Edn.*)

[P1-S1] **Stabilarsan** (*Boots, Nottingham*). A stable compound of arsphenamine and glucose for intramuscular or intravenous injection supplied ready for use, as an approximately 10% solution in 50% glucose. Ampoules contain 0.05, 0.1, 0.15, 0.20, 0.30, 0.45, 0.6, 0.75 and 0.9 g. Doses larger than 0.45 g. should not be given intramuscularly.

In congenital syphilis the preparation is stated to be safe. For an infant 15 lbs. weight dose 0.075 g. (0.75 ml. of the solution in the ampoule). For routine treatment of syphilis a course is given combined with potassium iodide on the lines of arsphenamine methods. Has also been used with success in Vincent's angina, disseminated sclerosis and lymphadenoma.

[P1-S1] **Arsphenamina Argentica** (*B.P.C.*). *Syn. and Prop. Name.* SILVER ARSPHENAMINE, SILVER ARSENOBENZOL, SILBERSALVARSAN (*P.G. VI*), SILVER SALVARSAN (*Bayer Products, London*).

Dose.— $1\frac{1}{2}$ to 10 grains (0.1 to 0.6 g.) intravenously in 1% solution, one or two injections of 0.1 g. each, then 0.2 g. for women, and 0.25 g. for men at intervals of not less than 4 days. Repeated at intervals until clinical symptoms and blood test satisfactory. In weakly patients begin with 0.05 g.

The sodium salt of silver 3 : 3'-diamino-4 : 4'-dihydroxyarsenobenzene. It is a brownish-black powder, containing 18 to 21% of As and 12 to 13% of Ag, readily *soluble* in water, with alkaline reaction. Ampoules contain 0.05, 0.1, 0.15, 0.2, 0.25 and 0.3 g.

Clinically 0.1 g. corresponds to about 0.2 g. of arsphenamine or 0.3 g. of nearsphenamine. It is thought to have the combined effect of arsphenamine and silver against syphilitic parasites. Mercury to be suspended during treatment. It is used especially for syphilis of the central nervous system, and must be given

very slowly to avoid vasomotor disturbances. It has also been employed with success in the treatment of disseminated sclerosis, the course consisting of three injections of 0.05 g. and three of 0.1 g.

Contraindications.—As for arsphenamine.

TRICHINOSIS. Six to 10 intravenous injections of silver arsphenamine make up the treatment usually required. Commencing with 0.05 g. the dose is increased with 0.05 g. each time until the dose of 0.30 g. is reached, then descended, decreasing the dose in the same proportion. The patients regained lost weight, abdominal pains ceased and cheeks again showed healthy colour.—J. Ragany, *Med. Rec.*, N.Y., 1935, 142, 335.

[P1-81] **Neoargentarsphenaminum** (*P. Helv. V*). *Syn. and Prop. Name.* NEOSILBERSALVARSAN (*P.G. VI*), NEOSILVER SALVARSAN (*Bayer Products, London*).

A molecular compound of neoarsphenamine and silver arsphenamine.

[P1-81] **Neoarsphenamina** (*B.P., U.S.P. XI, Fr. Cx., F.E. VIII, P. Belg. IV, P. Helv. V*). *Syn. and Prop. Names.* "914," NOVARSENO BENZENE, NOVARSENO BENZOL, N.A.B., NEO-ARSEN OBENZOLUM (*P. Jap. V*), NEOARSENPHENOLAMINE, NEO-KHARSIVAN (*Burroughs Wellcome, London*), NEOSALVARSAN (*P.G. VI*) (*Bayer Products, London*), NOVARSENO BILLON (*Pharmaceutical Specialities (May & Baker) Ltd., London*), NOVARSAN (*Synthetic Drug Co., Toronto; Allen & Hanburys, London*), NOVOSTAB (*Boots, Nottingham*), ARSEN OBENZOL ACID SODIUM FORMALDEHYDE-SULPHOXYLATE, SODIUM DIHYDROXYDIAMINOARSEN OBENZENE METHANESULPHONATE, NEOARSAMINOL (*P. Svec.*). The proper name under the Therapeutic Substances Act is Neoarsphenamine.

Dose.—2½ to 14 grains (0.15 to 0.9 g.) by intravenous injection. *U.S.P.* average dose 10 grains.

Consists mainly of sodium 3 : 3'-diamino-4 : 4'-dihydroxy-arsenobenzene-*N*-methylenesulphoxylate—

Neoarsphenamine is controlled by the Therapeutic Substances Act, 1925. It is made under licence and tested biologically (see Vol. II).

It is a yellow powder, readily **soluble** in water. The compound changes in the air, hence it is issued in sealed ampoules. The dry powder as taken from the sealed ampoules must contain not less than 18% or more than 21% of arsenic. The *B.P.* states that it contains approximately 20% of As. *Injections must be used immediately after preparation.*

Manufacture. Aqueous solutions of arsphenamine and formaldehyde sulphoxylate give a precipitate which is soluble in a

minute quantity of alkali to form an almost neutral solution. The product differs according to the temperature employed. At ordinary temperature the precipitate contains one "sulphur-acid" group.

Uses. Neoarsphenamine has almost entirely replaced arsphenamine owing to the ease with which solutions may be prepared—by simple solution in sterile water—and to the fact that it is less toxic. It is, however, also less toxic to spirochætes. Clinically it is found to have about two-thirds the activity of arsphenamine. It is given intravenously since intramuscular injections are painful, although the pain is reduced by using as solvent a solution of guaiacol 1, dextrose 50, sterile water to 100. For intramuscular injection sulpharsphenamine is more usual. Neoarsphenamine has been used in various diseases other than syphilis in place of arsphenamine. Its action in anthrax is stated to be almost specific, and good results are claimed for its use in the early stages of disseminated sclerosis. Vincent's angina and gangrenous balanitis are promptly arrested by a single intravenous injection of neoarsphenamine. Both arsphenamine and neoarsphenamine are specific in the treatment of yaws.

Dosage.—Many authorities recommend an initial intravenous injection of a small dose, *e.g.*, 0.45 g., followed by 8 to 10 doses at intervals of 3 to 8 days, gradually increasing the dose up to 0.75 or 0.9 g. as a maximum, repeating after an interval of 4 to 6 weeks. Three or four series may be required for complete treatment. Mercury or bismuth is frequently given during the intervals. 0.15 to 0.45 g. is given in from 5 to 10 ml. of water, or 0.6 to 0.9 g. in 15 to 20 ml. water, by slow injection into the median cephalic vein. More concentrated solutions have been employed, *e.g.*, 0.9 g. in 2 to 3 ml. water; concentrated solutions, however, require great caution.

For contraindications and treatment of after-effects see Arsphenamina.

Intravenous drip therapy. The massive dose method of chemotherapy employing intravenous drip therapy in early syphilis yields immediate clinical and serological results that equal the best results obtainable by the optimal methods of routine continuous treatment, and the course of therapy is measured in days rather than months. The intravenous drip is set up so that 5% dextrose is administered by the gravity method at the rate of about 100 ml. an hour. At the end of each hour there is added a solution of 0.1 g. of neoarsphenamine dissolved in 50 ml. of 5% dextrose.

In turn, this is followed by another hour of the plain dextrose, followed by another 0.1 g. of the drug until the total daily dose is administered. Thus, in a period of 15 hours a patient might receive 1500 ml. of 5% dextrose and 1 g. of neoarsphenamine. The treatment is started at 8 a.m. and continued throughout the day, the needle remaining *in situ*. In 86 male patients treated the average dose of neoarsphenamine was slightly in excess of 4.1 g. and the average duration of treatment slightly less than 5 days. Rapid healing of both primary and secondary lesions was noted and dark field examinations invariably became negative within 24 hours. In view of the toxic reactions, however, the treatment must still be considered in the experimental phase. A previous group of cases, similarly treated, and followed for a period of 5 years, appears to be clinically and serologically cured.—R. T. Hyman *et al.*, *J. Amer. med. Ass.*, ii/1939, 1208. (See also under Mapharside, p. 235.)

Preliminary Report of the Council on Pharmacy and Chemistry of the A.M.A. on the Chemotherapy of Syphilis by Massive Dose Intravenous Drip.—*J. Amer. med. Ass.*, ii/1940, 857.

Combined Arspenamine and Mercurial (or Bismuth) Treatment. (An analysis of records of 3598 cases treated at St. Thomas's Hospital V.D. Centre between January, 1920 and March, 1926.)

A course consisted of not less than 5 g. of an arspenamine compound (except with silver arspenamine, *q.v.*) with a minimum of 5 gr. of mercury or 2 g. of bismuth, intramuscularly or subcutaneously, over a period of not more than 4 months. With silver arspenamine a total of not more than 2.5 g. was given, with or without mercury or bismuth. A second course was given 3 months after the first and completed in 4 months.

The results of treatment with arspenamine compounds and mercury, compared with those with arspenamine compounds and bismuth, showed no superiority of bismuth over mercury, though bismuth was better tolerated. (The preparation of bismuth used was mainly the oxychloride suspended in glucose solution.) In sero-negative primary cases not less than two courses were necessary, and in sero-positive primary and early secondary cases even three courses did not give a satisfactory percentage of cures. Most relapses in early cases occurred in the first year, and a very small proportion after the second.

UNIT COURSE ON WHICH TREATMENT OF CASES ANALYSED IN REPORT WAS BASED.

(Potassium iodide from 57th to 78th day.)

COURSE INSTITUTED 22/2/1928.

In this course the principle is to follow three short "bursts" of "914" (which ought effectually to destroy accessible spirochaetes) with three rests of a month each to allow liver cells and skin to recover, and to finish with two full courses of "914." The bismuth is crowded into the first 10 weeks to build up a depot.

—L. W. Harrison, *Spec. Rep. Ser. med. Res. Coun., Lond.*, No. 132, 1929.

Whitechapel Course. 1st to 5th week:—Intravenous neoarsphenamine 0.45 g. weekly; bismuth 0.2 g.; deep subcutaneous sulpharsphenamine 0.3 g. weekly; bismuth 0.2 g. 6th to 8th week:—Potassium iodide mixture 5 to 15 gr. thrice daily after meals. 9th to 13th week:—repeat as first 5 weeks. Patient to report for blood tests 7 days following last injection of course and again in 28 days and then given potassium iodide mixture until next course begins. A prophylactic draught of concentrated liver extract and glucose is given before each injection. Three courses are given at intervals of 8 weeks. In patients over 45, or with late syphilis, a course of intravenous injections once a week only, or deep subcutaneous injections once a week only, spaced as above, may be given. This course was primarily prepared for those in the acute infectious stages, but the patient's age is important.

The effects of treatment on 241 consecutive cases gave 236 Wassermann-negative within a month after first course of treatment. There were comparatively few complications (5·8%) and these were mostly mild cases of dermatitis.—T. Anwyl-Davies, *Brit. med. J.*, ii/1933, 487. Confirmed by 10 years' experience at the Seaman's Hospital, Liverpool.—A. O. Ross, *ibid.*, 585. Also by E. T. Burke, *ibid.*, 623.

An analysis of the results of treatment of early, latent, and muco-cutaneous tertiary syphilis. Based on the treatment at the Western Infirmary of Glasgow, of 1766 cases during the twelve-year period 1919-1932, a standard course of treatment having been adhered to throughout the whole period, and the technique of the Wassermann reaction remaining unchanged and under the control of one observer. The standard treatment employed throughout the investigation was the combined administration of "914" and a heavy metal. Results show that the prospects of radical cure are only good when treatment is commenced in the early stages of the disease, and even with existing methods of treatment many of the patients treated appear to be "cured" after two years treatment and observation. Chronic syphilis, however, cannot with certainty be cured, and thus any individual ought to undergo life-long observation.

The suggested first course should be:—

	"914" Bismuth metal			"914" Bismuth metal	
	g.	g.		g.	g.
1st day	0·45	0·2	19th day	0·60	0·2
4th day	0·60	0·2	26th day	0·60	0·2
8th day	0·45	0·2	33rd day	0·60	0·4
12th day	0·60	0·2	40th day	0·60	0·4
15th day	0·45	0·2	47th day	0·60	0·4

Thus 3·15 g. of "914" is given for primary penetration on the first 19 days and the amount of bismuth given amounts to 0·4 g. per week. A change from bismuth to mercury is suggested during the period between the courses of "914," and the mercury should be given intramuscularly. After the first course a period of four months will allow jaundice or evidence of skin intolerance to appear. After one month's rest eight weekly injections of calomel cream should be given. During this time potassium iodide may also be administered. Then a rest of 1½ months should be followed by a repetition of the first course. A third course is desirable in all cases of early syphilis and should be the same as the first two. The interval between the second and third courses should be extended to six months, and during this time ten injections of calomel cream will maintain the principles of continuous treatment. Thereafter the patient should be examined at two-monthly intervals and a Wassermann test of the blood should be performed. After two years, periodic examination should be made if possible at six-monthly intervals for as long as the patient will attend. A Wassermann test of the cerebrospinal fluid should be made at the end of the second year. In the event of an unfavourable Wassermann reaction at any time after the first course, at least one course should be given after the reversal of that unfavourable reaction.—W. R. Snodgrass and R. J. Peters, *Spec. Rep. Ser. med. Res. Coun., Lond.*, No. 224, 1937.

SYPHILIS IN PREGNANCY. Syphilis in pregnancy is treated on much the same lines as secondary syphilis, treatment being continued almost to the end of pregnancy, a careful watch being kept on the liver and kidneys. In the presence of albuminuria treatment by bismuth should be continued alone.

CONGENITAL SYPHILIS IN CHILDREN. Vary dose according to age of child: e.g., for child 1 month old, initial dose of N.A.B. 0·05 g., 1 to 3 years 0·1 g., and for older children 0·15 g., increasing during the course of six injections to respectively 0·1 g., 0·25 g., and 0·3 or 0·45 g., subsequent courses starting with larger doses and reaching higher maxima, but not exceeding 0·45 g. for a child of 12. For older children commence with 0·04 to 0·06 g. and increase up to 0·36 g. Injections are given intravenously or intramuscularly in from 1 to 3 ml. distilled water. (Alternatively, sulpharsphenamine intramuscularly may be employed, and is

frequently preferred.) Mercury is given either as Hyd. c. Cret., $\frac{1}{2}$ to 1 gr. thrice daily, or better still, the ointment rubbed in once a day, or as green iodide of mercury, $\frac{1}{2}$ to $\frac{1}{4}$ grain, 2 or 3 times daily during injections. In older children thirty or even forty arsenic injections may be necessary.

Intraperitoneal injections may be given with safety in infants suffering from congenital syphilis. A child of 10 lbs. should receive 50 mg., or 5 ml. of a solution consisting of 150 mg. of neoarsphenamine dissolved in 15 ml. warm sterile water. The usual treatment consists of 4 injections at 3-day intervals, followed by 4 injections at 7-day intervals, the ideal site for entrance of the needle being in the middle of the left rectus sheath, slightly below the level of the umbilicus. The method is not so rapid as intravenous injections, but neoarsphenamine is absorbed with sufficient rapidity to act in any condition. It is ideal for children with small veins needing urgent treatment.

References to use in other diseases.

ANTHRAX. N.A.B., 0.6 g. intravenously daily, or on alternate days, is specific; will save life and render surgical intervention unnecessary. Treatment generally adopted throughout S. Africa.—A. B. M. Thomson (Durban), *Brit. med. J.*, ii/1931, 921.

Report of a case so treated with success at St. Olave's Hosp., Rotherhithe.—J. J. Coghlan and H. J. Shorvon, *ibid.* Widely used in this country.—C. G. Brentnall, *ibid.*, 966.

Nine patients with pustular anthrax were treated with neoarsphenamine only. Seven of them made remarkable recoveries; the other two, aged 1 year and 5 years, died. The results suggest that neoarsphenamine, if given within four days of the appearance of the pustule, will almost certainly cure the disease.—F. W. Gilbert, *Lancet*, ii/1935, 1283.

HERPES ZOSTER. Neoarsphenamine hypodermically causes disappearance of pain in 3 to 4 hours and disappearance of eruption in a few days. Second injection rarely necessary.—Milian, *J. Amer. med. Ass.*, i/1929, 1024.

LUNG AFFECTIONS, CHRONIC, treated with intrapleural injection of Neosalvarsan. The pleura tolerates high dosage, 0.45 to 0.6 g. in 10 ml. water. It is a powerful antiseptic, especially against streptococci. It has been used in the bronchial tree in bronchiectasis.—*Lancet*, ii/1929, 32.

Intrathoracic injections valuable in suppurative lung conditions, e.g., gangrene, abscess, empyema and bronchiectasis. First aspirate pus and inject 0.15 g. Neosalvarsan, and repeat injection every 4 or 5 days, increasing to 0.6 g.—*Per Practitioner*, ii/1929, 155.

[P1-81] **Pigmentum Neoarsphenaminæ (Mid. H.).** *Syn.* N. A. B. PAINT.

Neoarsphenamine 5, glycerin 50, water to 100. For Vincent's angina.

[P1-81] **Neoarsphenamine Suppositories** (0.10 g. in cocoa butter) given to three months' old baby with hereditary syphilis, with good results.—E. G. Melon, per *J. trop. med. (Hyg.)*, Oct., 1922, 334.

[P1-81] **Sulpharsphenamina (B.P., Fr. Cx., P. Ital. V, F.E. VIII, P. Belg. IV).** *Syn. and Prop. Names.* SULPHARSENOBENZENE, SULFARSENOL (*Sulfarsenol Laboratories, Alpertons; Modern Pharmacals, London*), KHARSULPHAN (*Burroughs Wellcome, London*), METARSENOBILLON (*Pharmaceutical Specialities (May & Baker) Ltd., London*), SULPHOSTAB (*Boots, Nottingham*), MYOSALVARAN (*Bayer Products, London*), DI-SODIUM DIHYDROXY-DIAMINO-ARSENOBENZENE-DIMETHYLENE SULPHONATE. The proper name under the Therapeutic Substances Act is Sulpharsphenamine.

Described in the B.P. as consisting mainly of disodium 3 : 3'-diamino-4 : 4'-dihydroxyarsenobenzene-*N* : *N'*-dimethylene-bisulphite, but shown by Dyke and King to be a sodium salt of 3 : 3'-diamino-4 : 4'-dihydroxyarsenobenzene-OO'*N*-trimethylenesulphurous acid.

Sulpharsphenamine is controlled by the Therapeutic Substances Act, 1925, and Therapeutic Substances Regulations, 1931. It must comply with tests for toxicity, therapeutic potency and stability. It is a yellow powder soluble in water, giving a faintly acid solution in which gelatinous particles must not be visible. It contains approx. 20% of arsenic.

Dose.— $1\frac{1}{2}$ to 10 grains (0.1 to 0.6 g.) by subcutaneous or intramuscular injection, in fairly concentrated solution. The following is suggested as a course in primary syphilis for an average adult:—

	Water.		Water.
1st day 0.12 to 0.18 g. in 2 to 3 ml.		19th day 0.54 to 0.6 g. in 8 to 10 ml.	
3rd " 0.18 " 0.3 g. " 3 " 5 "		25th " 0.6 g. " 10 "	
5th " 0.30 " 0.42 g. " 5 " 7 "		40th " and later, Wassermann	
8th " 0.42 " 0.6 g. " 7 " 10 "		40th to 60th day, Arthrenal.	
13th " 0.48 " 0.6 g. " 8 " 10 "		61st day, new series of injections.	

It is supplied commercially in a range of doses.

Toxic Effects and Contraindications. As for arsphenamine. It sometimes induces purpura hæmorrhagica and occasionally aplastic anæmia.

Death following intravenous administration of sulpharsphenamine.—J. R. Williams, *J. Amer. med. Ass.*, ii/1929, 1096.

Uses. It is less toxic than arsphenamine, and is used particularly for intramuscular injection because of freedom from pain. It is recommended for the treatment of congenital syphilis in infants, commencing with 0.05 g. for an infant 1 to 2 months old. Mercury should also be given either as grey powder orally, $\frac{1}{2}$ to $\frac{1}{2}$ gr., or by inunction with mercury ointment. Sometimes given intravenously, but this is not advisable. It is stated to have given good results in other diseases such as gonorrhœa, arthritis, rheumatism, hyperkeratosis and epididymitis.

[P1-S1] **Pigmentum Sulfarsenol** (*Sulfarsenol Laboratories, Alpertons; Modern Pharmacals, London*). A 3% solution of Sulfarsenol in glycerin for use as a paint, mouth-wash or gargle in infections of the mouth and throat, such as Vincent's angina, stomatitis, gingivitis, etc.

[P1-S1] **Bismarsen** (*Abbott Laboratories, London*). Described as bismuth arsphenamine sulphionate or sulpharsphenamine bismuth. It is a precipitation compound made by adding bismuth potassium tartrate to sulpharsphenamine and pouring the solution, made by means of soda, into methyl alcohol. A yellowish soluble compound with arsenic content 13% approx. and bismuth content 24%.

Dose administered intramuscularly. *Initial dose.*—0.1 g., followed by doses of 0.2 g. in 1 ml. of sterile water, to which is added 2 minims of Butyn 2% as a local anæsthetic. Weekly doses at first, then 2 injections weekly for 20 injections. Repeat the course after an interval of a week. Children over 5 tolerate adult dosage well. Of value in early syphilis. Toxicity low and reactions benign and controllable.

It is said to be somewhat slower in action than sulpharsphenamine intramuscularly or nearsarsphenamine intravenously, and there may be some pain at the site of injection.

Criticism of the compound.—E. Tytler Burke, *Lancet*, i/1931, 1127.

Early syphilis treated with Bismarsen 0.1 to 0.2 g. intramuscularly.—Stokes, Miller and Beerman, per *Brit. med. J. Epit.*, i/1931, 110.

[P1-S1] **Mapharside** (*Parke, Davis, London*). *Syn.* MAPHARSEN. $\text{HCl} \cdot (\text{NH}_2) \cdot \text{C}_6\text{H}_4(\text{OH})\text{AsO}_2 \cdot \frac{1}{2}\text{C}_2\text{H}_5\text{OH} = 258.53$.

Dose.—0.04 g. intravenously as an initial dose for men, increased to a maximum of 0.06 g. Injections should be given every four or

five days, since it is rapidly excreted by the kidneys. For women the initial dose is 0.03 g., increasing to 0.04 g. for subsequent doses.

Mapharside is the semi-alcoholate of *m*-amino-*p*-hydroxyphenylarsine oxide hydrochloride. It is a white amorphous, odourless powder containing approximately 29% of trivalent arsenic.

Soluble in water, alcohol, acids and alkalis.

Uses. Mapharside is indicated in all forms of syphilis amenable to treatment by the arsphenamines, but is much less toxic and gives rise to less severe reactions. It is especially valuable in early syphilis.

Over a period of 18 months 233 persons were given 4666 intravenous injections of Mapharsen, the usual dose being 40 to 60 mg. (without addition of bismuth or mercury). Healing of visible lesions was rapid, comparing favourably with arsphenamine. Wassermann reaction reversed to negative in nearly all cases of early syphilis, but in half of the cases there was serological relapse. Clinical relapse and return to positive serological findings occurred most frequently after irregular or short periods of therapy. Nitritoid reactions were not observed, but mild gastro-intestinal disturbances were not uncommon and Herzheimer reactions were occasionally noted. Mild jaundice occurred in four cases and increase of renal impairment in four others.—Foerster and co-workers, *Arch. Derm. Syph.*, N.Y., Dec., 1935, 868.

Severe reactions such as exfoliative dermatitis and jaundice seem to be rare.—*Brit. med. J.*, ii/1936, 1038.

As the result of the administration of 15,000 intravenous injections of Mapharsen to 1400 patients with syphilis it was concluded that Mapharsen is as efficient as the arsphenamines. Reactions were minimal, mostly gastro-intestinal; no case of nitritoid reaction, hepatitis or exfoliative dermatitis was seen.—L. E. Schmidt and G. G. Taylor, *Amer. J. Syph.*, 1937, 21, 402.

Excellent results in the treatment of artificially induced malaria. The drug is given intravenously in a dosage of from 0.04 to 0.06 g. every 5 to 7 days. Parasites generally disappeared within 24 hours of the injection, and fever did not recur unless the paroxysm of ague was due within the next 24 hours.—D. Goldman, *Amer. J. med. Sci.*, 1938, 196, 502.

The use of Mapharsen in the treatment of congenital syphilis has much to recommend it. It is safe and easy to administer and reactions are mild and can be completely eliminated with care. An analysis of 40 cases treated over a period of 16 months suggests that the drug is a more powerful agent in affecting a serological cure than any other arsenical compound previously used.—E. A. Morgan, *Canad. med. Ass. J.*, i/1938, 53.

Mapharsen is therapeutically adequate to control infectious syphilis, producing rapid sterilisation of active reactions.—C. R. Rein and F. Wise, *J. Amer. med. Ass.*, ii/1939, 1946.

In all cases of early syphilis the percentage of unsatisfactory results with Mapharside was less than with the arsphenamines. In primary syphilis the contrast is even more significant—the percentage of unsatisfactory results with arsphenamine and neoarsphenamine being more than twice that with Mapharside.—L. Chargin *et al.*, *Arch. Derm. Syph.*, N.Y., 1939, 40, 208.

Intravenous drip therapy. At the Mount Sinai Hospital, New York City, neoarsphenamine has now been replaced by Mapharsen. At the present time four doses of the drug in the diluent are given without intermission each day so that the patient receives 240 mg. of Mapharsen in 2400 ml., in 5% dextrose solution, the rate of flow being approximately 3 ml. per minute. The drip is set up at 8 a.m. and the full dose is injected by the end of 10 to 12 hours. At the end of this period the needle is withdrawn, treatment being discontinued during the night and resumed the next morning. This procedure is carried out daily for 5 consecutive days until a total of 1200 mg. of the drug has been administered in 12,000 ml. of diluent containing 600 g. of dextrose. The total arsenic content is approximately 360 mg. The choice of vein is important, the choice of election being a vein on the forearm between the elbow and wrist, the right and left arms being used alternately. With this technique local disturbances are uncommon and infiltrations have occurred in less than 0.5% of cases. Polyneuritis, which

was a troublesome complication with nearsphenamine was reduced to negligible importance in the Mapharsen series.—per *Lancet*, 1/1940, 896.

When nearsphenamine was used approximately one patient in three developed polyneuritis. In addition there was a high percentage of toxic erythema, fever, and reactions referable to the gastro-intestinal tract. Since Mapharsen has been substituted the incidence of reactions has markedly diminished, but (as with nearsphenamine) there have been several cases of hæmorrhagic encephalitis, with two deaths to date.—F. E. Cormia, *Canad. med. Ass. J.*, ii/1940, 184.

ASAFŒTIDA

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V.

Dose.—5 to 15 grains (0.3 to 1 g.). *U.S.P. XI* average dose 6 grains.

An oleo-gum-resin obtained by incision from the root of *Ferula fœtida* or other species (*U.S.P. XI* from *F. Assa-fœtida* and *F. fœtida*). Occurs in greyish-white or yellowish tears, or in masses of agglutinated tears. Nervine stimulant, expectorant and carminative.

Emulum Asafœtidæ (U.S.P. XI). *Average dose.*— $\frac{1}{2}$ ounce (15 ml.). Asafetida 1 in 25 of distilled water.

Enema Asafœtidæ (B.P.C.). *Dose.*—4 ounces (120 ml.). Tincture of asafetida 6 to 12% *v/v* in mucilage of starch. For intestinal flatulence.

Mistura Asafœtidæ Composita (St. T. H.). Asafetida 5 gr., liquid extract of cascara sagrada 10 m., ammonium carbonate 4 gr., infusion of valerian to 1 oz.

Pilulæ Asafœtidæ (B.P.C.). *Dose.*—1 or 2 pills. Each pill contains 3 grains. If required to be coated should first be coated with acacia mucilage and, when this is dry, with pill varnish. A silver coating may be applied over the varnish, which prevents the silver from being blackened.

Spiritus Ammonia Fœtidus (B.P.C.).

Dose.—For a single administration, 1 to 1½ drachms (4 to 6 ml.); for repeated administration, 20 to 40 minims (1.2 to 2.5 ml.).

A distilled spirit representing 7½% *w/v* of asafetida with 10% *v/v* of strong solution of ammonia.

Tinctura Asafœtidæ (B.P.). 1 in 5. *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Galbanum (*B.P.C., Fr. Cx.*).

Dose.—5 to 15 grains (0.3 to 1 g.).

Gum resin from *Ferula galbaniflua* (*Umbelliferae*) and other species. Expectorant and stimulant.

Pilulæ Galbani Compositæ (B.P.C.). *Syn. PILULÆ ASAFŒTIDÆ COMPOSITÆ.* *Dose.*—1 or 2 pills.

Contain 1 grain each of galbanum, asafetida and myrrh.

Myrrha (*B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V.*).

Dose.—5 to 15 grains (0.3 to 1 g.).

A yellowish or reddish oleo-gum-resin from *Commiphora molmol* and possibly other species (*Burseraceæ*). *Soluble* in water to the extent of about 50% (forms whitish emulsion on trituration), the remainder being mostly soluble in alcohol 90%. It is soluble in alkalis, e.g., potassium carbonate. A favourite constituent in mouth-washes, e.g., tincture of myrrh and borax.

Tinctura Myrrhæ (B.P.). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 5 of alcohol 90%.

Tinctura Myrrhæ (U.S.P. XI). *Average dose.*—30 minims (2 ml.). 1 in 5.

Tinctura Myrrhæ Composita (B.P.C.). *Syn.* TINCTURA MYRRHÆ ET ALOES. Myrrh and aloes of each 5% *w/v* in diluted alcohol.

Tinctura Myrrhæ et Boracis (B.P.C.). Contains about 33% *v/v* of tincture of myrrh with tincture of krameria, borax and aromatic oils. Used as an astringent mouth-wash and gargle.

Sagapenum.

Dose.—10 to 30 grains (0.6 to 2 g.). A gum-resin, obtained from a species of *Ferula*, with taste resembling that of asafetida, and properties similar to this and galbanum. Has been given in amenorrhœa and hysteria.

ATROPINA

B.P., Fr. Cx., U.S.P. XI, F.E. VIII.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Atropine.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Atropine except substances containing less than 0.15 % of atropine.*"

Dose.— $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.00025 to 0.001 g.). The dose may be increased to $\frac{1}{8}$, or in acute mania to $\frac{1}{4}$ grain or more. *Fr. Cx.*—**Maximum dose** in 24 hours 0.002 g. It is generally given internally as the sulphate.

Young children are less sensitive to the action of atropine than adults and may require slightly larger doses than those proportional to their weights.

An alkaloid obtained from *Atropa Belladonna*, and other solanaceous plants. Generally in acicular crystals, alkaline in reaction; m.p. 114° to 116°.

Soluble 1 in 560 of water, 1 in 50 of boiling water, 1 in 3 of 90% alcohol, 1 in 35 of benzene, 1 in 60 of ether, 1 in 1 of chloroform, 1 in 40 of olive oil; freely soluble in glycerin and oleic acid.

Incompatible with caustic alkalis and mercurial salts. Alkalis cause hydrolysis into tropine and alkali tropate. The change takes place when solutions are left in contact with ammonia or alkali carbonates and to some extent with bicarbonates.

The mydriatic alkaloids, atropine and hyoscyamine, may be manufactured from *Atropa Belladonna*, *Datura Stramonium*, and *Hyoscyamus niger*, and hyoscyne may be obtained from the last-named and from *Duboisia Myopyroides*. Atropine is *dl*-hyoscyamine. It does not exist as such in these plants, but is produced from the *l*-hyoscyamine by careful racemisation with alkali.

Antidotes. Give 20 gr. of tannic acid in 4 oz. of water, then empty the stomach by emetic (which may not be effectual) or by a stomach tube (which should be well lubricated because of the dryness of the mucous membrane), using dilute tannic acid solution or a solution of potassium permanganate 60 gr. in 2 gallons of water. Medicinal charcoal, 2 dr. in 4 oz. of water, may

be administered. Keep the patient warm. Give fluids freely to aid excretion. Hot, strong coffee may be given by rectum. Oxygen inhalations and artificial respiration may be necessary. Morphine and pilocarpine are not recommended.

Uses. The dominant action of atropine is to depress the nerve-endings of cardiac and unstriated muscles and glands. In addition it first stimulates and then depresses the central nervous system.

By reason of its depressant action on the secretory nerve-endings it lessens secretions, especially the saliva, bronchial secretion, and gastric juice. It is thus used internally to check excessive salivation (*e.g.*, during pregnancy or in mercurial poisoning), to abort incipient catarrh ($\frac{1}{100}$ gr. of the sulphate in a tumbler of water), and in gastric ulcer. It also lessens the perspiration and is given to check the night-sweats of phthisis and other conditions. Full doses are recommended in the treatment of pulmonary œdema.

By virtue of its depressant action on the vagus, atropine increases the heart rate and is of value in poisoning by morphine, muscarine, pilocarpine, physostigmine, aconitine and the like. It is of value in partial heart-block not due to organic causes, but has no effect in complete heart-block. Excessive vagal stimulation, due to an overdosage of digitalis, may be abolished by means of an injection of atropine. A hypodermic injection of atropine $\frac{1}{100}$ gr. is usually given, in association with morphine $\frac{1}{4}$ gr., half an hour before the induction of general anæsthesia to diminish vagal inhibition of the heart and reduce bronchial secretion.

By its action in relaxing spasmodic contractions of involuntary muscle it has been found of considerable value in the treatment of renal and biliary colic, bronchial asthma, whooping cough, urinary incontinence and dysmenorrhœa. In the stomach and intestines, atropine, by lowering the tone of the muscle, abolishes spasmodic contractions which cause colic and griping, and it is commonly prescribed in pills to alleviate the griping associated with the action of purgatives. An injection of atropine sulphate frequently facilitates reduction of a hernia by relaxing intestinal spasm, and intravenous injections have been employed for the gastric crises of tabes.

Injections of atropine, usually combined with strychnine, have been employed in the treatment of alcoholism (*vide infra*), and high-dosage atropine treatment has given remarkable results in the symptomatic treatment of post-encephalitic parkinsonism, in which as much as 54 mg. daily has been given.

Atropine is widely used in ophthalmology as a mydriatic and to paralyse accommodation. Mydriasis (following instillation or lamellæ) occurs in half an hour and lasts for a week or more; accommodation is paralysed in two hours, with recovery in two or three days. It has the disadvantage of increasing intraocular tension, necessitating caution in glaucoma, and its use is contra-indicated in persons over 40. Its prolonged mydriatic action is used in the treatment of iritis to secure rest and to prevent or break down adhesions, and it is also used in interstitial keratitis.

Atropine in aqueous solution is not absorbed by the skin, but when rubbed in with substances which are absorbed, such as alcohol or glycerin, or if applied to mucous membranes or inflamed or broken skin, it paralyzes the sensory nerve-endings and acts as a local anæsthetic, and in the form of liniment or plaster is used to relieve the pain of muscular rheumatism, sciatica and gout.

References to Use of Atropine and its Salts.

ALCOHOLISM. 1st week: Injection of atropine $\frac{1}{160}$ gr., with strychnine $\frac{1}{80}$ gr., thrice daily; 2nd week: atropine $\frac{1}{80}$ gr., strychnine $\frac{1}{80}$ gr., thrice daily; 3rd week: $\frac{1}{40}$ and $\frac{1}{80}$ gr. respectively, thrice daily; 4th week: $\frac{1}{20}$ gr. of atropine without strychnine. Together with a mixture of extract of cinchona, sal volatile, and spirit of chloroform thrice daily.

GASTRIC ULCER. For diminishing the secretion of acid in gastric ulcer give $\frac{1}{160}$ gr. of atropine sulphate in 1 dr. of water before three of the feeds and a double dose the last thing at night. Increase both doses by 10 minims ($\frac{1}{320}$ gr. of atropine sulphate) every day until the patient complains of dryness of the mouth or paralysis of accommodation. Reduce the doses by 10 minims and continue throughout the period of treatment. The influence of atropine on salivary secretion is approximately parallel to its influence on gastric secretion. It is impossible to guess what will be the adequate dose in an individual.—A. F. Hurst, *Pharm. J.*, ii/1934, 703.

In single maximum doses by hypodermic injection, atropine may have a limited value in reducing secretion and spasm; but in the doses usually employed by mouth, or permissible for any continued treatment, atropine and belladonna are practically without effect on the secretory and motor functions of the stomach.—W. A. Bastedo, *J. Amer. med. Ass.*, i/1936, 88.

In stomach disorders, atropine, $\frac{1}{32}$ to $\frac{1}{160}$ gr., in 1 ml. of saline solution intravenously gives relief from nausea, vomiting and pain within from 2 to 5 minutes in patients with smooth muscle spasm secondary to a peptic ulcer or pylorospasm, and in other symptoms thought to be related to the parasympathetic nervous system, including angina pectoris, biliary dyskinesia, ulcerative colitis and the dyspnoea of asthma.—E. A. Lehnher, *J. Amer. med. Ass.*, i/1936, 642.

Atropine should be used only when pain and symptoms suggesting pyloric spasm are present. Its routine administration in the absence of such symptoms is unnecessary because of its failure to influence gastric secretion. When it is given, the small doses usually recommended should be replaced by larger doses, sufficient to produce pharmacological effects, e.g., $\frac{1}{40}$ gr. followed by $\frac{1}{20}$ gr. every four hours until the limit of tolerance is reached.—B. M. Nicol, *Lancet*, ii/1939, 884.

HYPERTENSION. Improvement, especially in subjective symptoms, obtained by the oral administration of 0.6 mg. of atropine daily in cases of vascular hypertension. No benefit was obtained in hypertension due to heart disease.—S. Murakami and S. Okinaka, per *Brit. med. J. Epit.*, ii/1936, 15.

POST-ENCEPHALITIC PARKINSONISM. Treatment of 16 cases with a dosage of 3 to 5 minims three times a day of a 0.1% solution of atropine sulphate, the dose being increased every day, every other day, or every third day by 1 minim until a single dose contains over 1 mg., when it is given in pill form until an optimum effect is obtained—usually at a dosage of 4 to 8 mg. 3 times a day. Rigidity banished in 6 and diminished in 7 cases, tremor (in 9 cases) disappeared in 1 and diminished in 7. But atropine alone is inadequate; it must be supplemented by such measures as salt-water baths, massage, gymnastics, courses of arsenic and psychic encouragement.—O. J. Nielsen, *Hospitaltidende*, 1935, 806.

High dosage atropine treatment causes remarkable improvement in certain cases of post-encephalitic parkinsonism. The greatest benefit is seen in cases in which the disability arises chiefly from muscular stiffness and excessive flow of saliva. Improvement may also occur in tremor, in the frequency of oculogyric attacks and in various spasmodic symptoms. Under no circumstances does the parkinsonian syndrome completely disappear and unless the treatment is maintained and re-enforced by suitable environment, there is usually a rapid return to the pre-existing condition. The dosage begins with 0.5 mg. of atropine daily in the form of 0.5% solution of atropine sulphate given in two doses. This is increased by 0.5 mg. daily, spread over three doses, so long as any objective or

subjective improvement is produced; when this point is reached reduction should be gradual in order to fix the optimal dose on which improvement is maintained. In patients who have previously been for some time on tincture of belladonna, one may give 5 or even 10 mg. of atropine on the first day and increase by 2.5 mg. daily, not only without ill effects but, in suitable cases, with rapid benefit. Up to 54 mg. of atropine daily has been given in this way. After the optimal dose has been reached it is a convenience to prescribe the atropine in coloured tablets, e.g., pink tablets containing 4 mg., yellow only 1 mg. By this combination of strengths it is easy to obtain any required dose, the patient knows exactly how many he has to take of each colour for the required dose, and the coloration distinguishes them from other less potent tablets. There is an occasional rise of temperature during the taking of atropine in large doses, and the possibility of dangerous hyperpyrexia on exposure to heat considerably less than affects normals must not be overlooked.—A. J. Hall, *Brit. med. J.*, i/1937, 796.

SEASICKNESS. Tolerance to atropine can be developed by most people if the drug is given in gradually increasing doses. Thus, before long voyages, patients susceptible to seasickness are given atropine as follows: 4 days before embarking 1 mg. is given in 4 doses; the dose is increased by 1 mg. a day so that 4 mg. is taken during the day of departure, and this dosage is maintained throughout the voyage. In patients with pyloric ulcer, a dose as high as 19 mg. a day has been reached.—Danielopolou and Radulesco, per *Lancet*, i/1936, 909.

[P1-81] **Genatropine** (*Amido Laboratories, Paris; Wilcox, JozEAU, London*). The amino oxide of atropine ($C_{17}H_{23}O_4N$). Supplied in granules containing 0.5 g. (dose.—1 or 2 two or three times daily); in 1.5 in 1000 solution (dose.—20 drops = 1 mg. of Genatropine, two or three times daily); and in ampoules containing 2 mg. for subcutaneous injection. Therapeutic action and indications similar to atropine, but is much less toxic and is better tolerated.

[P1-81] **Chloroformum Atropinæ (B.P.C.).**

1 in 220 in chloroform coloured with alkanna. A rubefacient and anodyne application in neuralgia and rheumatism. Cleaner in use than Chloroformum Belladonnæ.

[P1-81] **Collodium Atropinæ (B.P.C.).**

1 in 220 in acetone and acetone collodion. A colourless substitute for belladonna plaster. Allays the irritation of chilblains.

[P1-81] **Unguentum Atropinæ (B.P.C.).** 1% in white soft paraffin.

[P1-81] **Atropinæ Sulphas (B.P., Fr. Cx., P. Helv. V, P. Jap. V, U.S.P. XI, etc.).** ($C_{17}H_{23}O_3N$)₂.H₂SO₄.H₂O = 694.8. P. Ned. V has 2H₂O.

Dose.— $\frac{1}{80}$ to $\frac{1}{60}$ grain (0.00025 to 0.001 g.). The dose may be increased to $\frac{1}{16}$, or in cases of acute mania $\frac{1}{8}$ grain. P. Dan. gives $\frac{1}{80}$ to $\frac{1}{40}$ grain. U.S.P. XI average dose $\frac{1}{160}$ grain. Fr. Cx. has maximum dose in 24 hours 0.002 g.; P.G. VI $\frac{1}{8}$ grain; P. Belg. $\frac{1}{40}$ grain.

Opaque white minute efflorescent crystals or granules.

Soluble 1 in less than 1 of water, 1 in 4 of alcohol 90%; insoluble in chloroform, ether and benzene.

Incompatible with bromides, iodides. Quinine hydrochloride is incompatible, but the acid hydrochloride does not precipitate in reasonable dilutions. See also under Atropina.

Atropine sulphate in simple aqueous solution (pH 6.54) may be sterilised at 120° for 20 minutes, but if the reaction is made faintly alkaline (pH 7.3) more than 50% is decomposed by this treatment. Homatropine hydrobromide solutions must not be heated.—S. A. Schou and P. B. Bjerregaard, *Dansk. Tidsskr. Farm.*, 1932, 10, 185.

[P1] **Caapi (Napp, London).** Tablets each containing atropine sulphate $\frac{1}{160}$ gr., caffeine 1 gr., phenacetin 2 gr., quinine alkaloid $\frac{1}{2}$ gr., powdered cinnamon 1 gr. Advocated for the abortion of coryza.

[P1-81] **Glycerinum Atropinæ** (*B.P.C., St. T. H.*).

Atropine sulphate, 1 in 400, with compound tincture of lavender and glycerin. This is more cleanly than Glycerinum Belladonnæ and does not stain. *U.C.H.* is similar.

The resinous matter in the compound tincture of lavender deposits. The following keeps better: Atropine sulphate 127½ gr., water 25 oz., spirit of lavender 2 m., spirit of rosemary 2 m., cinnamon oil 1 m., magenta solution *q.s.*, alcohol 90% 1 oz., glycerin to 100 oz.

[P1-81] **Granules de Sulphate d'Atropine** (*Fr. Cx.*) contain 1 mg.

[P1-81] **Guttæ Atropinæ** (*R.L.O.H.*). Atropine sulphate 1, 2, 4 or 8 gr. sterilised water to 1 oz.

St. T. H. has 0.5, 1 or 2%; *U.C.H.* and *St. M. H.* 0.5 or 1%; *W.H.* 1%.

[P1-81] **Gutt. Atropin. Dil.** (*N.I.F.*).

Atropine sulphate ½ gr., distilled water to 2 dr. [D-P1-81] If required with cocaine, add cocaine hydrochloride 1 gr.

Poisoning in a child of five following instillation into each eye of 2 drops of a 1% solution of atropine sulphate. There was restlessness, singing and shouting, and finally convulsions; a scarlatiniform rash developed, with dryness of mouth and dilatation of pupils. Recovery following morphine injections. Review of literature.—C. M. Scally, *Brit. med. J.*, i/1936, 311.

Mental disturbances in a boy of 10 following instillation into each eye of 5 drops of 1% solution of atropine sulphate.—P. J. Duggan, *Brit. med. J.*, i/1937, 918.

[D-P1-81] **Guttæ Atropinæ et Cocainæ** (*St. T. H.*).

Atropine sulphate 2% and cocaine hydrochloride 2% in sterilised water.

[P1-81] **Guttæ Atropinæ et Quininæ** (Liverpool Eye and Ear Infirmary).

Atropine sulphate 4 gr., quinine sulphate (bisulphate) 4 gr., distilled water 1 oz.

[P1-81] **Lamella Atropinæ** (*B.P.*).

Contain ४००० grain (0.000013 g.) of the sulphate in each, for dilating the pupil; others containing [P1-81] ४०० gr. (*R.L.O.H.*) paralyse the accommodation. Also prepared containing [D-P1-81] atropine sulphate १००० gr. combined with cocaine hydrochloride ५० gr. and [D-P1-81] cocaine ४०० gr. with atropine ५०० gr. *R.L.O.H.* has [D-P1-81] atropine ४० gr., cocaine १० gr.

[P1-81] **Linimentum Atropinæ.**

Atropine 1 (more or less, if ordered), oleic acid 15, castor oil 15, oil of lavender 1, alcohol (90%) *q.s.* to 100.

In lumbago and other rheumatic affections is very serviceable used with gentle friction; it is readily absorbed.

[P1-81] **Linimentum Atropinæ** (*St. T. H.*).

Atropine sulphate 38½ gr., compound tincture of lavender 100 m., industrial methylated spirit to 20 oz. A non-staining preparation of the same strength as *Lin. Belladonnæ*.

[P1-81] **Linimentum Atropinæ et Chloroformi** (*St. T. H.*).

Liniment of atropine (*St. T. H.*) 5, chloroform 1.

[P1-81] **Liquor Atropinæ Sulphatis** (*B.P.C.*).

Dose.—½ to 1 minim (0.03 to 0.06 ml.), or more.

Strength 1% *w/v.* Should be freshly prepared.

[P1-81] **Mistura Antidipsomania.**

Dose.—½ ounce (15 ml.).

Concentrated liquors of commerce of cinchona and gentian 10 m., of capsicum ½ m., solution of strychnine nitrate (4 gr. to the oz.) 1 m., of atropine sulphate (1 gr. to the oz.) 1 m., glycerin 1 dr., water to ½ oz. Has been found of great value with strychnine and atropine injections, gradually diminished in strength.

[P1-81] **Oculentum Atropinæ** (*B.P.*). 0.25% of atropine sulphate in simple eye ointment.

[P1-81] **Unguentum Atropinæ (R.L.O.H.).** Atropine 2, 4 or 8 gr., yellow soft paraffin to 1 oz. Dissolve atropine in chloroform and add to soft paraffin heated to 61°.

[P1] **Oculentum Atropinæ cum Hydrargyri Oxido (B.P.).**

0.125% of atropine sulphate and 1% of yellow mercuric oxide in simple eye ointment. It should be freshly prepared, since the mercuric oxide is very soon acted upon.

[P1-81] **Unguentum Hydrargyri Oxidi Flavi cum Atropina (R.L.O.H.).**

Atropine 2 or 4 gr., freshly precipitated yellow mercuric oxide 4 gr., yellow soft paraffin to 1 oz. Dissolve the atropine in chloroform, mix with the yellow soft paraffin heated to 61° and add the mercuric oxide while cooling.

CORNEAL ULCERS are well treated with an ointment containing atropine and yellow mercuric oxide of each 1%.—P. G. Doyné, *Lancet*, ii/1927, 132.

[D-P1-81] **Oculentum Atropinæ et Cocainæ (B.P.C.).** 0.25% of atropine sulphate and 0.5% of cocaine hydrochloride in simple eye ointment.

[D-P1-81] **Unguentum Atropinæ et Cocainæ (R.L.O.H.).** Atropine 4 gr., cocaine 8 gr., yellow soft paraffin to 1 oz. Proceed as under Unguentum Atropinæ (R.L.O.H.).

[P1] **Oculentum Iodoformi et Atropinæ (B.P.C.).**

5% of iodoform and 0.1% of atropine sulphate in simple eye ointment.

[P1-81] **Unguentum Iodoformi cum Atropina (R.L.O.H.).**

Atropine 2 gr., iodoform 60 gr., yellow soft paraffin to 1 oz. Prepare as Ung. Hyd. Ox. Flav. c. Atropin. (R.L.O.H.).

[P1-81] **Oleum Atropinæ.**

Atropine 1, castor oil g.s. to 100. Heat to dissolve (R.L.O.H. 4 grains in 1 ounce). Forms a stable solution.

[P1] **Pessaries of Atropine** are prepared (weight 120 grains) with gelatin mass or at times with oil of theobroma, containing generally $\frac{1}{16}$ gr. of the alkaloid in each.

[P1-81] **Atropinæ Methylbromidum. Syn. MYDRIASINE.**

$C_{17}H_{23}O_3N, CH_2Br = 384.3$.

Dose.— $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.001 to 0.002 g.).

An addition product of methyl bromide to the alkaloidal base.

White crystals soluble in water 1 in 1 easily. M.p. about 222°.

Uses. Internally similar to those of atropine. Subcutaneously in croupous pneumonia, dry pleurisy and appendicitis; dyspepsia with pyrosis (with sodium bicarbonate), and epilepsy (with bromide). As effect passes off rapidly it is useful in $\frac{1}{16}$ to 2% solution with cocaine hydrochloride 1% for dilating the pupil in suspected iritis to ascertain whether adhesions exist.

[P1-81] **Atropinæ Methylnitrates. Prop. Name. EUMYDRIN (Bayer Products, London).** $C_{17}H_{23}O_3N, CH_3NO_2 = 366.4$.

Dose.— $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.001 to 0.002 g.).

White crystals, soluble in water, obtained by the action of silver nitrate on atropine methylbromide.

A powerful mydriatic, and less poisonous than atropine. 1 or 2% solution dilates the pupil after 25 minutes; the maximum is reached in 50 minutes. Dilatation persists for 12 hours. Also given internally in congenital pyloric stenosis.

CONGENITAL PYLORIC STENOSIS. Eumydrin gives better results than surgery, gastric lavage, or atropine. It is given in the form of a 1 in 10,000 solution (solution does not keep) which is given in a dosage of 5 ml. (= 0.5 mg. per dose) 7 times a day half an hour before feeding; in many cases doses of 0.25 mg. may prove sufficient. The treatment is continued until the patient has not vomited

for a week or more. It is important not to give this treatment as long as the patient is in an extremely dehydrated condition, and not until the introduction of saline has produced satisfactory diuresis.—E. Svensgaard, *Arch. Dis. Childh.*, 1935, 443.

Since the publication of Svensgaard's paper, treatment by Eumydrin has been adopted as the routine treatment in the Children's Hospital of the Leicester Royal Infirmary, and although the results have not been as brilliant as Svensgaard's they compare favourably with those of surgical treatment, and there is reason to believe they will become progressively better. In the few cases in which Eumydrin is not successful it is possible that treatment with some other tropic acid derivative such as Syntropan will succeed.—J. V. Braithwaite, *Brit. med. J.*, i/1938, 334.

Apart from the precaution of overcoming dehydration before Eumydrin is started, there are other important details of treatment if success is to be obtained. If a start is made with 2 ml. it can be increased every second or third day until vomiting is no longer frequent and projectile. The dose ascertained in this way is continued for a few days, after which, if vomiting is still occurring, further increase is required. When vomiting has ceased and while no toxic symptoms are evident, the same dose is continued until the infant has been free from vomiting for 3 to 5 weeks. Subsequently the dose is gradually reduced until finally the drug is stopped. Too early or too rapid withdrawal may result in a return of projectile vomiting.—R. Lightwood, *Fractitioner*, ii/1938, 326.

Lately, attention has been drawn to the advantages of an alcoholic solution administered perlingually. One drop of a 0.6% solution is given on the tongue and is stated to be rapidly absorbed. Given in this way none of the drug is lost through vomiting, and the solution remains potent for a considerable time (in the dilute watery solutions the drug soon loses its activity).—*Lancet*, ii/1940, 203.

[P1-81] *Guttæ Methyilis Atropinæ Nitratis* (R.L.O.H.). *Syn.* GUTTÆ EUMYDRINÆ. Atropine methylnitrate 2 or 4 gr., sterilised water to 1 oz.

[P1-87] *Asmodrin* (Duncan, Flockhart, Edinburgh). An aqueous solution for the inhalation treatment of asthma, containing atropine methylnitrate, papaverine, sodium nitrate, anterior pituitary, and suprarenal medulla.

[P1-87] *Astevan* (Evans, Sons, Lescher & Webb, Liverpool). An aqueous solution for the inhalation treatment of asthma and hay fever, and containing atropine methylnitrate, papaverine hydrochloride, sodium nitrate, pituitary extract (anterior and middle lobes), adrenaline, chlorbutol and glycerin.

[P1] *Midriverin* (Richter, London). Tablets containing atropine methylnitrate $\frac{1}{2}$ gr., papaverine $\frac{1}{2}$ gr. *Dose.*—1 or 2 tablets three times daily. Antispasmodic and in asthma and dysmenorrhœa.

[P1-87] *Nebadrene* (Paines & Byrne, London). Nasal spray containing atropine methylnitrate 0.125%, pilocarpine nitrate 0.1%, papaverine sulphate 1%, adrenaline hydrochloride 0.25%, pituitary (posterior lobe) extract 0.5%, chlorbutol 1.5%, in an aqueous glycerin medium. For bronchial asthma and hay fever.

[P1-81] *Atropinæ Salicylas*. $C_{17}H_{15}NO_3, C_7H_5O_2 = 427.5$.
Deso.— $\frac{1}{2}$ grain (0.001 g.).

Deliquescent powder or crystals, stated to be superior to the sulphate as more rapid in effect. Soluble 1 in 20 of water.

[P1] *Liquor Atropinæ Salicylatis*. Atropine $\frac{1}{2}$ gr., salicylic acid $\frac{1}{2}$ gr., water 1 oz.

Homatropina. $C_{16}H_{21}NO_3 = 275.3$.

[P1] "Alkaloids, the following; their salts, simple or complex:—Homatropine."

[81] "Alkaloids, the following; their salts, simple or complex:—Homatropine except substances containing less than 0.15% of homatropine."

Dose.— $\frac{1}{4}$ to $\frac{1}{32}$ grain (0.001 to 0.002 g.).

Homatropine is the mandelic acid ester of tropine. In colourless crystals, *insoluble* in water, *soluble* in organic solvents and 1 in 100 of liquid paraffin; also soluble in vegetable oils.

Uses. Preferred to atropine as a mydriatic for examining the eye, because its action is more rapid and less prolonged. The effect is exerted in 15 to 30 minutes, and passes off in 6 to 24 hours. Mydriasis is readily controlled by physostigmine. Homatropine is rarely used internally. Large doses may cause, like atropine, staggering gait, and delirium in children. Homatropine slows the heart beats and renders them irregular in force and rhythm.

[P1-81] **Oleum Homatropinæ (R.L.O.H.).**

Homatropine 4 gr., dissolved in minimum quantity of chloroform and mixed with castor oil at 61° to 1 oz.; stir until cold.

[D-P1-81] **Oleum Homatropinæ et Cocainæ (R.L.O.H.)** contains 8 gr. of homatropine and 8 gr. of cocaine per oz. of castor oil. Prepared as the preceding. These oily solutions are not washed out by the tears.

The preparation of a solution in castor oil without the chloroform necessitates warming the alkaloids and oil on a water-bath for several hours.

[P1-81] **Homatropinæ Hydrobromidum (B.P., U.S.P. XI, P.G. VI, P. Helv. V, etc.).** $C_{16}H_{21}O_3N \cdot HBr = 356.26$.

Dose.— $\frac{1}{81}$ to $\frac{1}{32}$ grain (0.001 to 0.002 g.). U.S.P. XI average dose $\frac{1}{120}$ grain.

In minute trimetric crystals; m.p. about 214° (decomp.).

Soluble 1 in 6 of water, 1 in 18 of alcohol 90%, and 1 in 133 of dehydrated alcohol; slightly soluble in ether, insoluble in chloroform.

[P1-81] **Lamellæ Homatropinæ (B.P.)** contain $\frac{1}{100}$ gr. (0.0006 g.) of homatropine hydrobromide.

[P1-81] **Guttæ Homatropinæ (R.L.O.H.)** 4 or 8 gr. of homatropine hydrobromide per oz. of sterile water.

[P1-81] **Gutt. Homatropinæ. Dh. (N.I.F.).** Homatropine hydrobromide $\frac{1}{2}$ gr., distilled water to 2 fl. dr. [D-P1-81] If required with cocaine, add cocaine hydrochloride 1 gr.

[D-P1-81] **Guttæ Homatropinæ et Cocainæ (R.L.O.H.).** Homatropine hydrobromide 4 or 8 gr., cocaine hydrochloride 8 gr., sterilised water to 1 oz.

[P1-81] **Injectio Homatropinæ Hypodermica,** 1 in 120, is used.

Dose.—1 to 6 minims (0.06 to 0.4 ml.).

[P1-81] **Syntropan (Roche Products, Welwyn Garden City).** The phosphate of 3-diethyl-amino-2:2-dimethylpropanol ester of tropic acid. A synthetic antispasmodic. **Dose.**—1 tablet (0.05 g.) 3 or 4 times a day; or by injection 1 ml. (= 0.01 g.) 3 times a day. In all vagotonic states, e.g., vascular tension, coronary spasm, angina pectoris, gastric spasms, dysmenorrhœa.

The relationship between the action of Syntropan and atropine on various organs is found to be very different. While the spasmolytic action of Syntropan, particularly on the intestine, is comparable with that of atropine, it is found that the action on the pupil, on the salivary secretion, and on the vagus is more than 100 to 1000 times less than that of atropine. From this distinct difference of specificity, combined with the lower toxicity observed in man and the shorter duration of the action of Syntropan, it appears possible for the clinician to find therapeutic indications in which Syntropan would have definite advantages over atropine.—K. Fromberg, *J. Pharmacol.*, 1937, 60, 1.

SEA-SICKNESS. Tried out with success in twelve cases during a ten weeks voyage to S. America; it gave immediate relief.—Thos. North, *Lancet*, i/1936, 1263.

[P1] **Navigan (Roche Products, Welwyn Garden City).** Tablets for travel sickness containing 10 mg. of Syntropan and 50 mg. of dihydroxydiethylpiperidine, a mild sedative and hypnotic. **Dose.**—3 to 4 tablets at least 30 minutes before going on board, 2 to 3 tablets $2\frac{1}{2}$ to 3 hours later, preferably 30 minutes before a meal or before retiring, and a third dose of 2 tablets after a further 4 hours. Also available as [P1] **Suppositories** containing 40 mg. of Syntropan and 200 mg. of dihydroxydiethylpiperidine.

[P1-S1] **Trasentin** (*Ciba, Horsham*). Diphenylacetyl-diethylaminoethanolester hydrochloride, $(C_6H_5)_2CH \cdot CO \cdot O \cdot CH_2 \cdot CH_2 \cdot N(C_2H_5)_2 \cdot HCl$, occurring in white crystals readily soluble in water. Has an antispasmodic action similar to that of atropine but without side-effects on the heart, pupil, accommodation, or salivary glands; it resembles papaverine in having a marked action on smooth muscle tissue. The effect is exerted in about 30 minutes after oral or rectal administration and within 10 to 15 minutes of intramuscular injection, complete analgesia being obtained shortly afterwards. Of value in spasms of the gastro-intestinal system, of the urinary passages in lithiasis, and of the biliary ducts, also in dysmenorrhœic spasms. Available in tablets containing $1\frac{1}{2}$ gr., suppositories containing $1\frac{1}{2}$ gr. and ampoules of 1.7 ml. containing $1\frac{1}{2}$ gr. in 1.5 ml. *Dose*.—1 to 2 tablets twice or thrice daily, 1 or 2 suppositories daily, or $\frac{1}{2}$ to 1 ampoule daily for subcutaneous or intramuscular injection.

AURANTIUM

Aurantii Cortex Recens (*B.P.*) and **Aurantii Cortex Siccatus** (*B.P.*).

The fresh or dried outer part of the pericarp of the ripe or nearly ripe bitter-orange, the fruit of *Citrus Aurantium*.

U.S.P. XI includes dried bitter-orange peel and fresh sweet-orange peel. *Fr. Cx.* includes peel, flower and leaf from the bitter orange ("Bigaradier") and peel from the sweet orange ("Oranger Vrai").

Elixir Simplex (*B.P.C.*).

Dose.—1 to 2 drachms (4 to 8 ml.).

Tincture of orange about 1 in 13 with syrup and distilled water.

Extractum Aurantii Liquidum (*B.P.C.*).

Dose.—10 to 20 minims (0.6 to 1.2 ml.). About 1 in 1, from dried bitter-orange peel.

Infusum Aurantii Compositum Concentratum (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Dried bitter-orange peel, 1 in 5, with lemon peel and clove. It is approximately eight times the strength of the fresh infusion.

Infusum Aurantii Compositum Recens (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Dried bitter-orange peel, 1 in 40, with lemon peel and clove.

Infusum Aurantii Concentratum (*B.P.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). About 1 in $2\frac{1}{2}$. It is approximately eight times the strength of the fresh infusion.

Infusum Aurantii Recens (*B.P.*).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 20.

Syrupus Aromaticus (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Liquid extract of orange peel, 1 in 16, with cinnamon water and syrup.

Syrupus Aurantii (*B.P.*).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Tincture of orange 1, syrup 7.

Syrupus Aurantii (*U.S.P. XI*).

Tincture of sweet-orange peel 5, citric acid 0.5, talc 1.5, mixed with water sufficient after filtering to give 45, dissolving sucrose 82 in the filtrate in the cold, and adding water to produce 100.

Syrupus Citri Aurantii Amari Corticis (*Fr. Cx.*) is prepared by macerating dried orange peel 100 g., in alcohol 60% 100 g., for 12 hours; adding water heated to 70° 1000 g., filtering after 6 hours and dissolving 180 g. of sugar in every 100 g. of filtrate.

Tinctura Aurantii (B.P.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

1 of fresh bitter-orange peel in 4 of alcohol 90%. Mixtures containing salts of iron will become dark in colour with all preparations of orange peel.

Tinctura Aurantii Amari (U.S.P. XI).

Average dose.—80 minims (4 ml.).

Dried bitter-orange peel in 60% alcohol, 1 in 5.

Tinctura Aurantii Dulcis (U.S.P. XI).

Average dose.—80 minims (4 ml.).

Fresh outer rind grated from sweet-orange peel, in alcohol, 1 in 2.

Vinum Aurantii (B.P.C.).

Made by fermentation of a saccharine solution containing fresh bitter-orange peel. It contains 12 to 16% v/v of ethyl alcohol. In practice a boiling 25% sugar solution is poured on to the peel and allowed to stand for 24 hours. Yeast is added and the liquor fermented at 20° for 3 days.

Oleum Aurantii (B.P.C.). *Syn.* ESSENCE OF ORANGE, ESSENCE OF PORTUGAL (*Fr. Cx.*).

Dose.— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.).

Is obtained by expression of the fresh peel of either the sweet-orange (oil of sweet-orange) or the bitter-orange (oil of bitter-orange), chiefly from the former. The two oils are practically indistinguishable chemically. On keeping, a disagreeable terebinthinate taste develops, stated to be prevented by the addition of 10% of dehydrated alcohol to the freshly distilled oil.

Terpeneless Oil of Orange is prepared, being many times (about 65) more potent in flavour and soluble in 60% spirit.

Elixir Aromaticum (B.P.C.). *Syn.* ELIXIR AURANTII, ELIXIR AURANTII COMPOSITUM.

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Contains oils of orange, coriander and anise, in alcohol, syrup and water.

Elixir Aromaticum (U.S.P. XI).

Compound spirit of orange 1.2%, with syrup, alcohol and water, and clarified by filtration with 3% of talc.

Elixir Aurantii Amari (N.F. VI). *Syn.* ELIXIR OF CURASSAO.

Dose.—2 to 4 drachms (8 to 15 ml.).

Oil of bitter-orange 1, tincture of orange 20, alcohol 300, strong orange-flower water 20, syrup 400, distilled water to 1000. Filter through diatomite.

Spiritus Aurantii Compositus (U.S.P. XI).

Oils of orange 20%, lemon 5%, coriander 2% and anise 0.5%, in alcohol.

Oleum Neroli (B.P.C.). *Syn.* OLEUM AURANTII FLORUM (*Fr. Cx., P. Jap. V.*).

Obtained by distillation from the flowers of the bitter-orange tree. A pale yellow, slightly fluorescent oil, darkening on exposure to air. Is used largely in perfumery.

Aqua Aurantii Floris (B.P.C., U.S.P. XI, P. Jap. V). *Syn.* AQUA NAPHÆ (*P. Ned. V, P. Helv. V.*).

The triple water diluted immediately before use with twice its volume of distilled water.

Aqua Aurantii Floris Concentrata (B.P.C.).

About 1 in 170 of oil of neroli in diluted alcohol. Is approximately 40 times the strength of orange-flower water.

Aqua Aurantii Floris Triplex (B.P.C.).

The undiluted orange-flower water of commerce.

Syrupus Aurantii Floris (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains 15% v/v of the triple water with sucrose and syrup.

Syrupus Aurantii Florum (U.S.P. XI).

Orange-flower water 22.5, sucrose 85, water to 100.

Succus Aurantii (B.P.C.) is the expressed juice of the sweet-orange, *Citrus sinensis*. It may be concentrated *in vacuo* to one-seventh of its bulk without loss of vitamin C, and is usually supplied commercially as the concentrate.

Limonis Cortex (B.P.). The outer part of the fresh pericarp of *Citrus Limonia*.

The dried peel (**Limonis Cortex Siccatus**) is also used occasionally. It has been recommended instead of twice its weight of the fresh peel in making the official compound infusions of gentian.

Syrupus Limonis (B.P.).

A mixture of syrup with a solution of citric acid in a strong tincture of lemon peel prepared by maceration in alcohol 60%.

Syrupus Acidi Citrici (U.S.P. XI).

Tincture of lemon 1, citric acid 1, water 1, syrup to 100.

Sirope d'Acide Citrique (Fr. Cx.). *Syn.* SYRUPUS LIMONIS. Citric acid 10 g., simple syrup 970 g., tincture of lemon 20 g.

Tinctura Limonis (B.P.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

1 in 4, by maceration with alcohol 60%.

Tinctura Limonis (U.S.P. XI).

1 part of the outer grated rind of the fresh fruit macerated with 1½ volumes of alcohol and the residue washed with sufficient alcohol to produce 2 volumes of tincture.

Oleum Limonis (B.P.). *Syn.* OLEUM CITRI ÆTHEREUM (*Fr. Cx.*).

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

The oil expressed from lemon peel. Contains not less than 4% of aldehydes calculated as citral, $C_{10}H_{16}O$.

Oleum Limonis Deterpenatum (B.P.C.). *Syn.* TERPENELESS OIL OF LEMON. Is prepared by concentration *in vacuo*, and is both terpene- and sesquiterpene-free. It is about 20 times as strong as oil of lemon.

Succus Limonis (B.P.C., Fr. Cx.) is the expressed juice of ripe lemons. It may be preserved with 10% alcohol. It may be concentrated *in vacuo* without loss of vitamin C and is met with in commerce in this form. It contains 7 to 9% of citric acid.

Syrupus Succo Limonis (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

A lemon syrup prepared with about 50% v/v of lemon juice with a tincture of lemon peel added.

AURUM

Au = 197.2.

Auri Bromidum (B.P.C.) *Syn.* GOLD BROMIDE.

Dose.— $\frac{1}{80}$ to $\frac{1}{2}$ grain (0.001 to 0.012 g.), or up to $\frac{1}{2}$ grain (0.03 g.).

Consists of potassium bromaurate, $\text{KAuBr}_4 \cdot 2\text{H}_2\text{O} = 592.0$, and occurs as a blackish or brown powder or in brownish-red crystals.

Soluble 1 in 5 of water and in alcohol.

Uses. Has been used in epilepsy, hysteria, migraine, nervous dyspepsia, and whooping cough. Useful in alcoholic neurasthenia combined with hyoscyamine (or atropine) and strychnine.

WHOOPING COUGH. Good results obtained from treatment with $\frac{1}{2}$ gr. of gold bromide for adults and $\frac{1}{8}$ to $\frac{1}{4}$ gr. for children, according to age, given as an elixir. Considerable relief was obtained within a few days, and the duration of the illness was greatly decreased. 50 children treated with the usual remedies were sick on the average nearly three times as long as the 100 children receiving gold bromide.—J. Epstein, *Arch. Pediatr.*, N.Y., 1936, 52.

[P1-81] **Liquor Auri et Arseni Brominatus (B.P.C.).** *Syn.* LIQUOR AURI ET ARSENI BROMIDI, LIQUOR AURI BROMIDI ARSENIATUS.

Dose.—5 to 10 minims (0.3 to 0.6 ml.).

Contains in 10 m. the equivalent of about $\frac{1}{4}$ gr. of arsenic trioxide and $\frac{1}{2}$ gr. of auric bromide.

Liquor Auri et Hydrargyri Bromidi.

Dose.—5 to 10 minims (0.3 to 0.6 ml.).

Auric bromide, mercuric bromide, of each 1½ gr., distilled water to 1 oz. Has been used in neurasthenia, epilepsy, syphilis, and acne.

Auri et Sodii Chloridum (Fr. Cx.). *Syn.* AURI CHLORIDUM.

Dose.— $\frac{1}{100}$ to $\frac{1}{2}$ grain (0.001 to 0.012 g.), or up to $\frac{1}{2}$ grain (0.03 g.), in a pill massed with kaolin ointment. Hypodermically, $\frac{1}{16}$ grain (0.005 g.) has been given.

This consists of sodium chloraurate, $\text{NaAuCl}_4 \cdot 2\text{H}_2\text{O} = 398.1$, known commercially as "chloride of gold," and containing about 50% of Au. It is an orange-yellow crystalline powder, **soluble** 1 in 2 of water, only partially soluble in alcohol.

Incompatible with organic compounds and reducing agents.

It is sometimes used as a caustic, and has been given internally for cirrhosis of the kidney. Pills containing $\frac{1}{10}$ gr. have been found to retard the development of locomotor ataxia, given preferably in monthly courses alternating with arsenic. Combined with strychnine it is useful in neurosis.

Eye affections associated with leprosy, such as conjunctivitis and iridocyclitis, have been treated with this chloride of gold in $\frac{1}{10}$ gr. doses given intravenously at 10-day intervals for 2 to 4 injections.

LUPUS ERYTHEMATOSUS treated by gold salts intravenously. Of the chloride, 1 ml. of 0.1% once a month, increased to 5 ml. and if necessary to 10 ml. Results fully equal to those from complex compounds. The latter had annoying sequels not seen with gold chloride. The 0.1% is strongly bactericidal and does not need boiling.—*Brit. med. J. Epit.*, ii/1930, 46.

[P1-81] **Dipsomania Tablets (Parke, Davis, London).** Contain gold and sodium chloride $\frac{1}{4}$ gr., strychnine nitrate $\frac{1}{10}$ gr., nitroglycerin $\frac{1}{100}$ gr., atropine $\frac{1}{100}$ gr., tinct. digitalis 3 m., oleoresin of capsicum $\frac{1}{2}$ m. *Dose.*—1 to 2 tablets.

[P1-81] **Auri et Potassii Cyanidum.** $\text{KAu(CN)}_2 \cdot 2\text{H}_2\text{O} = 324.3$.

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.001 to 0.02 g.)—with caution.

White crystalline soluble powder.

Has been used in lupus and in syphilis. *Intravenously* the dose was found to be 0.02 to 0.05 g. for adults, and 0.0005 to 0.03 g. for children. To the dose in 1% solution, 50 ml. of normal saline solution are added, and given every second or third day to the extent of 12 injections. The injection is said to be quite painless. After 48 hours a local reaction occurs.

Auri et Sodii Thiosulphas (B.P.C.). *Syn. and Prop. Names.* AUROBIN (*Richter, London*), NOVACRYSIN (*Napp, London*), CRISALBINE (*Pharmaceutical Specialities (May & Baker) Ltd., London*), SODIUM AUROTHIOSULPHATE. $\text{Na}_3\text{Au}(\text{S}_2\text{O}_3)_2 \cdot 2\text{H}_2\text{O} = 526.5$.

(A foreign proprietary of similar composition was formerly issued under the Registered Trade Name SANOCRYSIN.)

Dose.— $\frac{1}{2}$ to 15 grains (0.025 to 1 g.). *Intravenously* initially 0.01 g., gradually increasing, if tolerated and no violent reaction, to 0.015 g. per kilo weight *i.e.*, a maximum of 1 g. per average adult's weight of 10 stone. Solutions must not exceed 5% strength. May also be given *intramuscularly* if intravenous method is inconvenient, *e.g.*, in children. In this case a 3% aqueous solution is used, or a 5 to 10% suspension in oil.

A double thiosulphate of gold and sodium occurring in colourless, odourless stable crystals with a sweet taste. Contains about 37% of Au.

Soluble very readily in water, insoluble in alcohol.

Toxic Reactions. These are typical of metallic poisoning, and consist of fever, diarrhoea and vomiting with albuminuria and skin reactions of various kinds. In severe cases there may be aplastic anaemia and, rarely, agranulocytosis. Treatment is by sodium thiosulphate, orally or by injection. Mild skin reactions such as localised rashes or papular eruptions usually yield to a few doses of sodium thiosulphate 10 gr. given thrice daily. No patient who has had the treatment should be exposed to bright sunlight, as it may result in lilac-coloured pigmentation of the parts exposed.

The reactions provoked by gold therapy may be prevented or checked by giving large doses (three or four times that usually considered the normal demand) of vitamins A, B₁, B₂ and C before and during treatment.—K. Secher, *Lancet*, i/1938, 996.

Uses. Introduced for the treatment of tuberculosis by H. Moellgaard, of Copenhagen, and, although found to have no bacterial action on tubercle bacilli *in vitro*, is of value, particularly in early exudative cases and as an adjunct to collapse therapy in bilateral cases. The chief contraindications to its use are diarrhoea, nephritis, eczema, cachexia and dense fibrosis. If an injection causes a severe febrile reaction the dose must be reduced.

Its most successful employment is in the treatment of lupus erythematosus; marked improvement or entire healing of the lesion occurs in about two-thirds of the patients, but it must be used with great care and in small dosage in the disseminate type. It has also been used with considerable success in rheumatoid arthritis, preferably administered intramuscularly in oily suspension in doses of 0.1 g., increased by 0.05 to 0.1 g. at intervals of two or three days. Toxic effects are frequent, however, and cases should be carefully selected. The blood sedimentation rate is a useful guide as to the suitability of the case (*see* Vol. II).

LUPUS ERYTHEMATOSUS. In 30 cases there were 27 clinical cures and improvement in the remainder. **Dose.**—0.025 g. in 2 ml. water once weekly intravenously, increased by 0.005 g. weekly, provided there are no toxic

symptoms, up to a maximum of 0.1 g.—A. J. Markley and O. S. Philpott, *J. Amer. med. Ass.*, ii/1929, 235.

Of 31 cases treated, 20 (64.5%) were cured. Dosage began with 0.05 to 0.1 g., a dose of 0.25 g. being seldom exceeded. Courses of 8 weekly injections followed by a month or two's rest. Toxic reactions in 18 cases.—J. L. Franklin, *Brit. J. Dermat.*, 1934, 66.

Of 76 cases treated 37% were cured, 34% almost cured or greatly improved, 13% improved slightly and 12% failed to respond favourably. The amount required for a cure varied from a minimum of 12 mg. in one patient to 2750 mg. in another. 24% of cases suffered a reaction of one type or another, the commonest being a scarlatiniform dermatitis. In subacute or quiescent cases initial dose 25 mg., second dose 50 mg., and subsequent doses 100 mg., at weekly intervals. In acute cases initial dose should not exceed 5 mg. In a few cases the dose was increased to 200 or even 300 mg.—C. S. Wright, *Arch. Derm. Syph., N.Y.*, 1936, 413.

RHEUMATOID ARTHRITIS. Gold treatment has been used for four years in 900 cases of arthritis; 750 were examples of rheumatoid arthritis. Apparent cure or striking improvement occurred in 80% of the cases of rheumatoid arthritis. Relapse may occur, especially after the first course, but if treatment is continued a second relapse is rare. All patients should have at least two full courses. Toxic reactions occurred in 40% of cases, but as a rule did not contraindicate further treatment. Gold treatment is of doubtful value in other forms of arthritis.—S. J. Hartfall, H. G. Garland and W. Goldie, *Lancet*, ii/1937, 838.

TUBERCULOSIS. About 50% of tuberculous patients having a stationary or downward progressive advanced tuberculosis of the "B" or "C" types, when given Sanocrysin in well-regulated doses, will show (1) a rather prompt cessation of symptoms, the changes tending to be permanent if the patient observes the usual measures of hygiene; (2) a clearing of tuberculous infiltration, with marked fibrosis and contraction of cavities; and (3) changes from unfavourable to favourable laboratory findings. Of the remainder, about a third show a temporary improvement for a few weeks or months, while the others show no favourable change or prove incapable of tolerating the drug at all. Gold therapy may often shorten the convalescent period, prolong life, or both. As to selection of cases, it does not seem a matter of duration or stage of disease, so long as the disease is not overwhelming and there are relatively recent discrete tubercles, all of which mean "reactability" on the part of the patient. The intravenous injection of gold salts should not be done shortly after a meal; and it is not enough to receive the assurance of the patient that the bowels are regular.—K. J. Henrichsen and H. C. Sweany, *Amer. Rev. Tuberc. (Suppl.)*, Oct., 1933, 28.

In a total of 1418 cases of pulmonary tuberculosis treated between 1928 and 1933, 60.6% were ameliorated. Gold, in any form yet known, cannot be accepted as a specific treatment—it is inconstant and irregular in its results and there is disparity of effect between one patient and another and even in the same patient at different times. At the same time it is a valuable treatment when carefully employed by experienced physicians. For the avoidance of untoward reactions it is important that the gold salts should be dissolved in a solution of calcium gluconate. It is unnecessary and unwise to stop the treatment after a total of 5 or 6 g. has been given: the amount may be increased up to a total of 20 or 30 g., advancing with small doses spaced at intervals of one week.—L. Bernard and C. Mayer, *Bull. Soc. méd. Hôp. Paris*, 1934, 50, 1163.

OTHER PROPRIETARY GOLD COMPOUNDS

Allochrysine (*Lumière, Lyons; Anglo-French Drug. Co., London*). Sodium aurothiopropionalsulphonate, $\text{CH}_3\text{SAu}\cdot\text{CHOH}\cdot\text{CH}_2\text{SO}_3\text{Na}$, containing 35% of gold, issued in concentrated solution containing in 2 ml. 0.2, 0.1 or 0.05 g., together with ampoules containing 8 ml. of saline diluent.

For use in all developing cases of rheumatoid arthritis or infective periarthritis. Also used in tuberculosis and other indications for chrysotherapy (*vide* Auri et Sodii Thiosulphas).

Dose.—A series of 3 intramuscular injections of 0.05 g. at 5-day intervals, followed (if no reaction) by weekly injections of 0.1 g. to a total of 1.5 or 2 g., then a rest of 6 or 8 weeks followed by a second series with the same rest interval at the end. Then continue by subsequent series of 10 to 20 weekly injections of 0.1 or 0.05 g. for a year or two.

RHEUMATOID ARTHRITIS. Good results obtained with gold salts, the salts employed being aurothiopropionol sulphonate of sodium, thiosulphate of gold and

sodium, thiomalate of gold and sodium, aurothioglucose and aurothioglycolate of calcium. With small doses at regular intervals and proper selection of cases severe reactions rare. In 500 cases followed up during periods of 2 to 5 years, early cases of under 2 years' duration were cured in the proportion of 50%, the remainder being greatly improved; cases of older standing improved in 80%, and cured in 20 to 30%.—Jacques Forestier (Aix-les-Bains), *Brit. med. J.*, i/1934, 350.

100 cases of chronic arthritis treated over a period of 5 years with various gold preparations—Allochrysine, Crisalbine, Myocrisin—12 cases cured, 38 very much improved, 38 improved, and 12 not improved. Few cases escape toxic signs or symptoms, though in the great majority they are slight.—H. S. Pemberton, *Lancet*, i/1935, 1037.

Severe reactions may be avoided by mixing the Allochrysine injection of 0.1 g. (given intramuscularly) with 10 ml. of 10% calcium gluconate.—H. J. Williams, *Brit. med. J.*, ii/1935, 1098. See also H. Roche, *ibid.*, i/1936, 31.

Lopion (Bayer Products, London) ("G.2949"). The sodium salt of aurothiosinamine benzoic acid. A water-soluble compound containing about 40% of gold.

Dose.—Initially intravenously 0.01 g.; routine, 0.1 increasing to 0.5 g.

The gold is concentrated in the liver instead of in the kidneys. Said to be 10 times less toxic than Krysolgan. Indications as for gold and sodium thiosulphate. In fresh or extensive disease smaller doses must be employed.

Myocrisin (Pharmaceutical Specialities (May & Baker) Ltd., London).

Sodium aurothiomalate in aqueous solution or oil suspension for intramuscular injection in tuberculosis, rheumatoid arthritis and lupus erythematosus, etc. Available in dry ampoules in various doses from 0.01 to 0.5 g. In rheumatoid arthritis an initial dose of 0.01 g. may be followed at weekly intervals by gradually increasing doses until a maximum dose of 0.2 g. is reached, which is continued until a total of 1.5 to 2 g. has been given.

Neo-Solganal (Schering, London). Calcium gold keratinate for intramuscular injection (in a series of seven graded doses ranging from 0.01 to 1.0 g.) in rheumatoid arthritis, lobar pneumonia, tuberculosis, lupus erythematosus, etc.

Parmanil (Bayer Products, London). A 2 or 5% oily suspension of a methylglucamide of aurothioglucolic acid, a water-soluble compound containing 50% Au advocated for intramuscular injection in rheumatoid arthritis, also in tuberculosis, lupus erythematosus, leprosy and lymphogranuloma inguinale. *Dose.*—The average dose in rheumatoid arthritis is 4 injections of 0.5 ml. of 5% solution, then 2 doses each of 0.75, 1.0, 1.25, and 2 ml., the injections being given weekly.

RHEUMATOID ARTHRITIS. Results in 50 cases treated over one year show that the effects of small doses of Parmanil are as good as, or better than, those obtained with large doses of any other gold salt (comparison with 690 cases). Toxic reactions occurred in one-quarter of the cases. Parmanil is one of the least toxic of gold salts. It is given intramuscularly starting with 0.5 ml. of the 5% suspension (0.025 g.) gradually increased up to 2 ml. (0.1 g.). A course usually consists of 12 weekly injections. Of the 50 cases treated, 19 had two courses of injections and 31 one course.—S. J. Hartfall, *Lancet*, ii/1938, 1410.

Solganal (Schering, London).

The di-sodium salt of 4-sulphomethylamino-2-auromeraptobenzol-1-sulphonic acid, $C_7H_5O_4N_2Na_2Au$. An organic compound of gold for intravenous injection for the treatment of tuberculosis, streptococcal infections, multiple sclerosis, infective arthritis, lupus erythematosus and psoriasis. Has also been used in leprosy. Available in dry ampoules, in conjunction with ampoules of solvent, in various doses from 0.01 to 1 g.

Solganal B and **Solganal B Oleosum** are, respectively, a solution and an oily suspension of aurothioglucose, $C_7H_5O_4SAu$, an organic compound of gold, for intramuscular injection. Used for the same purposes as the preceding.

Solganal Dragées are prepared containing 0.01 g. and 0.1 g. of Solganal for oral administration in the treatment of infective arthritis. *Dose.*—0.01 g. per day, increased by 0.01 g. each day until 0.1 g. is reached, then given on alternate days, each dose being increased by 0.1 g. to a maximum of 0.6 g. Total to be given in a course, 6 to 8 g.

Treatment of arthritis and rheumatism with Solganal B Oleosum intramuscularly. Of no great value in acute and sub-acute rheumatism in children

and contraindicated where severe carditis is present, but superior to other methods in rheumatoid arthritis.—G. Slot and co-workers, *Lancet*, 1/1934, 73.

It is not claimed that gold is a specific for every case of arthritis but there is no doubt that in certain groups of cases results are being obtained which are not secured by other means. The usual technique is to give a course not exceeding 1.5 g., at weekly intervals, of Oleosanocrysin, or Solganal B, then a month's holiday, then a second course, then 2 months' holiday, and then a third course. Reactions occur, especially a rash, but with small doses of gold serious results do not seem to occur. Collosol sulphur is used as an adjuvant. Description of 5 cases (osteo-arthritis and rheumatoid arthritis), resistant to other treatment, successfully treated.—G. Slot, *Proc. R. Soc. Med.*, Jan., 1936, 224.

As a result of the use of gold treatment (Crisalbine, Solganal B Oleosum, and Lopion) in 374 cases of rheumatoid arthritis, cure or marked improvement occurred in 78%, and slight improvement in a further 15%. Reduction in dosage followed by reduction in toxic reaction without sacrificing therapeutic effects. Maximum single dose should not exceed 0.1 g. and total for each course not more than 1.0 g., with at least two courses at an interval of not less than three months. Chrysotherapy the most important form of treatment for rheumatoid arthritis.—S. J. Hartfall and H. G. Garland, *Lancet*, 1/1936, 1459.

Chrysotherapy should only be undertaken when the case is severe enough to warrant such a very real risk (of accident), which should be explained to the patient before treatment is instituted.—G. J. V. Crosby, *Lancet*, 1/1936, 1463.

Triphal (Bayer Products, London). Sodium salt of aurothiobenzimidazo-carboxylic acid. Given in doses of 0.025 to 0.2 g. in tuberculosis.

Colloidal Gold.

Colloidal gold solution may be prepared by the following method:—Neutralise a gold and sodium chloride solution with dilute sodium carbonate solution and adjust the strength to 0.05% Au. With 10 parts of this solution mix 10 parts of a solution containing the calculated amount of formaldehyde required to reduce the gold, reckoning $3\text{H}\cdot\text{COH}$ to 2 molecules of the gold compound. Employ gelatin as protective. Warm to effect reduction. It can be boiled to sterilise. The finished red hydrosol is to contain 0.025% (1 in 4000) of gold and the same amount of protective.

Dose.—1 to 5 millilitres, 0.00025 to 0.00125 g. or $\frac{1}{800}$ to $\frac{1}{400}$ gr. approx. of gold, intramuscularly or intravenously. More may be given.

Uses. Has been used in the treatment of neurasthenia, alcoholism and morphine addiction. In epilepsy, alcoholic neurasthenia and migraine it has been given hypodermically four times daily (usually 2 ml. divided over the day, but this may be increased) with bitter tonics and digestives, every two hours, *per os*.

Oragol (Anglo-French Drug. Co., London). Ampoules of solution of colloidal gold (0.01%) and colloidal silver (0.09%) for intramuscular or intravenous injection. Used in bronchitis, endocarditis and acute articular rheumatism, and also, if used early, for cutting short an attack of pneumonia, influenza or erysipelas.

AZORUBRUM

(and other medicinal dyes)

Azorubrum (B.P.C.). *Syn.* BORDEAUX B.

$\text{C}_{20}\text{H}_{12}\text{N}_2\text{O}_7\text{S}_2\text{Na}_2 = 502.2$. Colour Index No. 88.

The sodium salt of α -naphthaleneazo- β -naphthol-3 : 6-disulphonic acid, occurring as a brown powder *soluble* in water and in alcohol.

Liquor Azorubri (B.P.C.). *Syn.* LIQUOR RUBER. 1% w/v in glycerin and chloroform water.

Used as a colouring agent for medicines, 5 m. per oz. usually being sufficient.

From a comprehensive review of 32 selected dyestuffs examined in detail, a general impression was gained that whilst Bordeaux B may be considered to be the most suitable all-round dyestuff for colouring pharmaceuticals, it is often possible in any particular case to find a dyestuff better suited to that particular preparation. It is suggested that more than one red dyestuff should be made officially available, the most suitable being acid magenta (Colour Index 692), amaranth (C.I. 184), Bordeaux B (C.I. 88) and lissamin red 6BS (C.I. 57). An improved formula for solution of Bordeaux B is given, and the paper also includes a scheme for the extraction and identification of dyestuffs.—C. L. M. Brown, *Quart. J. Pharm.*, 1939, 332.

Amaranth. *Syn.* BORDEAUX S. Colour Index No. 184.

The sodium salt of 4-sulpho- α -naphthaleneazo- β -naphthol-3:6-disulphonic acid. It is soluble in water, but sparingly soluble in alcohol.

Recommended as a colouring agent for medicines, and in some cases found to be preferable to Bordeaux B.

Congo Red. *Syn.* SODIUM DIPHENYLBISAZOBISNAPHTHYLAMINE-4-SULPHONATE.

Dose.—0.25 ml. of 1% solution per kg. body weight, by intravenous injection. Solutions should be prepared by adding the powder to sterile water, heating if necessary; they should be used as soon as possible after preparation since the dye hydrolyses slowly in solution.

A reddish-brown powder *soluble* in water. Administered intravenously in the treatment of hæmoptysis and as a diagnostic agent for amyloid disease. Amyloid tissue is readily stained by the dye and the proportion in the blood plasma rapidly falls.

In connection with clinical injections of congo red, only the purest brands of the dye should be employed, and the possibility of a thromboplastic effect should be borne in mind in the case of each patient.—D. I. Macht *et al.*, *J. Amer. pharm. Ass.*, 1939, 495.

RIGORS avoided by using Grubler's congo red (*Agents: Baird and Tatlock, London*), which is free from impurities, made up in freshly prepared solution.—J. E. Wallace, *Brit. med. J.*, ii/1934, 881. Preparation of solution with triple-distilled water and filtration through glass wool an important factor in prevention of rigor.—J. Libman, *ibid.*, 882.

Congo Red (biologically tested) (*British Drug Houses, London*) is a specially purified form for intravenous administration.

AMYLOIDOSIS, DIAGNOSIS OF. A comparatively accurate method for the diagnosis of amyloid disease is by intravenous injection of 0.25 ml. per kg. of a freshly prepared sterilised 1% solution of Grubler's congo red, the percentage decrease of the dye content of the plasma or serum over a period of one hour being estimated colorimetrically. In normal persons 10 to 30% disappears and in amyloid disease anything between 30 and 100%. Technique described.—J. E. Wallace, *Lancet*, i/1932, 391.

HÆMOPHTYSIS. 5 to 10 ml. of a 1% solution of congo red intravenously is a satisfactory hæmostatic.—A. J. Scott Pinchin and H. V. Morlock, *Prescriber*, ii/1933, 389.

Intravenously of value in hæmoptysis, the dose being 10 ml. of a 1% solution, repeated if necessary in 4 to 6 hours. The injection is often followed by a rigor of short duration which never gives cause for alarm. Congo red produces an increase in the monocytes, an increase in blood platelets, an increase in blood

fibrin content, and a reduction in clotting time.—H. V. Morlock and A. J. Scott Pinchin, *Brit. med. J.*, ii/1934, 763.

Treatment successful in 49 out of 58 cases of tuberculous hæmoptysis.—H. Diaz, per *J. Amer. med. Ass.*, ii/1935, 1228.

HÆMORRHAGE. Intravenous injection of 5 or 10 ml. of congo red is a valuable adjunct in the treatment of hæmorrhage from the urinary tract, e.g., in renal injury, bilateral renal and ureteral calculi, chronic pyelonephritis, vesical calculus, tumour of the bladder, urethral trauma, etc. No untoward effects have followed its use. It has also been employed with marked success in severe epistaxis and hæmorrhage after tooth extraction.—R. C. Graves and C. J. E. Kickham, *New Engl. J. Med.*, 1936, 214, 782.

Indicarminum (B.P.). *Syn.* INDIGO CARMINE, SODIUM INDIGOTINDISULPHONATE (*Fr. Cx.*). $C_{16}H_8O_8N_2S_2Na_2 = 466.2$.

Dose.—By intramuscular injection, $\frac{1}{2}$ to $1\frac{1}{2}$ grains (0.05 to 0.1 g.); by intravenous injection $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.008 to 0.016 g.).

The disodium salt of indigotin-5 : 5'-disulphonic acid, occurring as an odourless blue powder with a coppery lustre.

Soluble about 1 in 100 of water; almost insoluble in alcohol 90%. Used as a test for renal efficiency.—*See* Vol. II.

Magenta (B.P.C.). *Syn.* FUCHSINE, BASIC FUCHSINE, ROSANILINE HYDROCHLORIDE, ANILINE RED, RUBINE. Colour Index No. 677.

Dose.— $\frac{1}{2}$ to 4 grains (0.03 to 0.25 g.), in a pill.

Iridescent crystals consisting of a mixture of pararosaniline (Colour Index No. 676) (hydrochloride of triaminotriphenylcarbinol anhydride) and rosaniline (hydrochloride of triaminodiphenyltolylcarbinol anhydride).

Soluble in water, and 1 in 8 of alcohol 90%.

The aqueous solution is used as a colouring agent and, as carbol-fuchsin, as a stain for *B. tuberculosis* (*vide* Clinical and Bacteriological Notes, Vol. II).

Unguentum Fuchsin 5% in soft paraffin. Has been used in carbuncle and soft chancre. Also useful for impetigo.

[P2] **Pigmentum Carbol-Fuchsin (St. T. H.).**

Basic fuchsin (saturated solution) 10 ml., phenol 5 g., boric acid 1 g., resorcinol 10 g., distilled water 100 ml. Dissolve the phenol in the fuchsin solution, filter and add the boric acid. Stand two hours and finally add the resorcinol.

Fuchsin Paint (Castellani).

Epidermophytosis of the toes (Mango toe) and other forms of epidermophytosis well treated with a paint consisting of saturated alcoholic solution of basic fuchsin 10 ml., 5% phenol solution 100 ml. Filter and add boric acid 1 g.; after 2 hours add acetone 5 ml.; 2 hours later add resorcinol 10 g. Keep in dark-coloured stoppered bottles. Should be employed initially with care and in small amount.—A. Castellani, *Lancet*, ii/1928, 596.

Carbol-fuchsin paint, with 2.5% of salicylic acid added, the best treatment for epidermophytosis. Rub the nails thoroughly with the paint twice daily, even after the disease seems to have subsided. Three months' treatment is required for a cure.—J. Hasson, *Brit. med. J.*, ii/1934, 928.

PRURITUS ANI. Many patients obtained dramatic relief from the application of this paint, though without exception these patients all had typical "athlete's foot."—C. N. Morgan, *Practitioner*, ii/1939, 522.

Acid Fuchesine (Colour Index No. 692) is a mixture of the sodium or ammonium salts of di- and tri-sulphonic acids of magenta. Soluble in water and alcohol 90%.

Rosaniline (Syn. ROSEINE) Acetate. $C_{20}H_{19}N_2 \cdot C_2H_3O_2 \cdot 5H_2O = 451.3$.

Dark red crystals soluble in water and in alcohol. Both this compound and magenta are sometimes called "roseine."

Methylviola (*B.P.C.*, *P. Helv. V*, *P. Jap. V*). *Syn.* METHYL VIOLET, METHYL ROSANILINE, PYOKTANIN. Colour Index No. 680.

In green crystalline powder consisting of a mixture of the hydrochlorides of principally tetra-, penta-, and hexamethylparosanilines. There are numerous methyl violets, the particular shade depending on the degree of methylation.

Soluble 1 in 20 of water, 1 in 20 of alcohol 90%, 1 in 16 of glycerin, and in oleic acid. Insoluble in liquid paraffin.

Dilute solutions have been injected locally and applied for malignant growths, but crystal violet, a purified methyl violet, is now generally used.

Viola Crystallina (*B.P.C.*). *Syn.* CRYSTAL VIOLET, METHYL-ROSANILINE, MEDICINAL GENTIAN VIOLET (*vide infra*), HEXAMETHYLPAROSANILINE HYDROCHLORIDE. Colour Index No. 681.

Dose.—0.003 to 0.007 gramme per kilo body weight (=3 to 7 grains for a 10-stone man) intravenously in a $\frac{1}{4}$ to 1% aqueous solution.

GENTIAN VIOLET. According to the Colour Index, commercial gentian violet, as supplied in Gt. Britain, is a mixture of methyl violet and dextrin. For medicinal purposes it should be free from dextrin and in *N.N.R.* Gentian Violet Medicinal is described as a mixture of penta- and hexamethylparosaniline chlorides. Since the tetra-, penta- and hexa-compounds show no appreciable difference in therapeutic effect, while the hexa-compound, crystal violet, is most readily obtained pure, the latter is usually intended when gentian violet is required in medicine.

Greenish-bronze crystals or powder.

Soluble 1 in 20 of water, 1 in 16 of glycerin, 1 in 20 of alcohol 90%. The dye is precipitated from aqueous solution by sodium chloride and other electrolytes.

Uses. A powerful antiseptic with selective action on gram-positive organisms. It has been employed intravenously in staphylococcal septicæmia and endocarditis and has been tried in encephalitis.

For *direct application* a solution 1-1000 to 1-500 has been recommended; for instillation 1-10,000, and for *intravenous injection* 5 mg. per kilo-weight, injected in 0.5% solution.

Encouraging results have been obtained in acute infections of joints by lavage and direct medication. Also in post-influenzal empyema by intrapleural instillation of 1-10,000 to 1-1000 solutions.

A 1% aqueous solution, employed either alone in the form of a spray or as a jelly, or in association with tannic acid (*q.v.*), has been found valuable in the treatment of burns, and a 2% solution gives good results in chronic leg ulcers and mycotic skin affections.

Given internally in the form of enteric-coated pills or tablets, it is stated to be a specific for Strongyloides infestation. It is given in a dose of 2½ grains thrice daily after meals for ten days.

BLEPHARITIS. An effective method of treatment of chronic blepharitis of the squamous type in children consists in the application of the following paste ("Blue Compound") by means of a soft camel-hair brush to the roots of the eyelashes after the crusts have been removed with boric lotion:—gentian violet $\frac{1}{2}\%$, brilliant green $\frac{1}{2}\%$, wool fat to 100. The paste colours the skin temporarily but is easily washed off. It is applied twice daily morning and evening. All squamous cases were free of symptoms in eight weeks, but ulcerative cases showed little or no improvement.—A. T. Elder, *Brit. med. J.*, ii/1940, 185.

BURNS. A 1% solution gives excellent results. Without preliminary cleaning of burned area the dye is sprayed on at 2-hour intervals for the first few hours. No dressing applied but surface exposed to air and protected by a cradle. An eschar is rapidly formed and spraying is then performed every 4 to 6 hours during the day till healing is complete. Analgesia almost instantaneous.—*Lancet*, i/1933, 484.

A jelly prepared by the addition of 30 g. of tragacanth to 1000 ml. of 1% solution gives superior results to an aqueous solution in the treatment of burns.—J. H. Connell, *J. Amer. med. Ass.*, i/1933, 1220.

For extensive burns the following treatment closely approaches the ideal. After washing the burnt areas with tincture of soft soap, open blisters and remove loose skin. Then spray the burn with a 1% aqueous solution of gentian violet (methyl-rosaniline) and after a few minutes swab the entire area with 10% silver nitrate. The patient is then placed in a tent at 85° to 90°F. and the area re-sprayed with gentian violet every 15 minutes for about five times; after that the spray is applied once or twice every day. Fluids are forced by mouth, and saline solution given by hypodermoclysis as indicated by the patient's condition. The patient is moved about as soon as the crust is established and allowed to walk about when the period of shock is over.—H. E. Branch, *Ann. Surg.*, 1937, 35, 478.

Sepsis in burns usually begins in areas of the (tannic acid) coagulum which have cracked or become moist; to prevent these defects, the area is dehydrated with ether every four hours and then painted with 1% solution of gentian violet in spirit. Should the coagulum become moist, ether and gentian violet are applied more frequently.—W. M. Dennison, *Lancet*, ii/1939, 1108.

The following jelly is recommended in place of tannic acid jelly for the treatment of burns on the fingers and hands:—gentian violet (or methyl violet) 1%, quinine and urea hydrochloride 0.5% in a glycerin-tragacanth base (powdered tragacanth 2%, glycerin 10%, water to 100).—J. F. Heggie and R. M. Heggie, *Lancet*, ii/1940, 391.

In the Navy and R.A.F. a jelly containing gentian violet 1%, merthiolate 1 in 5000, has now been substituted for tannic acid jelly as a first-aid application.—*Lancet*, ii/1940, 627.

For first-aid treatment gentian violet jelly with Merthiolate (1 in 5000) is the best application. It is convenient in use and can be applied to the burnt area without any cleansing whatsoever. For hospital treatment, after the burnt area has been thoroughly cleansed, and blistered and dead epidermis removed (under a general anæsthetic), an aqueous solution of Triple Dye is sprayed on the surface; this consists of gentian violet 2%, brilliant green 1%, and neutral acriflavine 1%. This is dried and a second application applied; usually two applications are sufficient.—C. P. G. Wakeley, *Proc. R. Soc. Med.*, 1940, 34, 43.

W. C. Wilson now uses a single application of a 10% solution of silver nitrate, preceded and followed by a 1% solution of gentian violet.—*Proc. R. Soc. Med.*, 1940, 34, 52.

ENDOCARDITIS. Details of 7 cases of rheumatic carditis in children treated by intravenous injections. Dose.—25 to 50 ml. of a 0.25% aqueous solution (i.e., 0.005 g. per kilo). Injections given at weekly intervals. Definitely toxic effects occurred in the case of a 5-year old child. Of 10 cases, 8 were definitely improved. With caution as to dose and type of case, the method is safe and worth further trial in the treatment of blood infections.—William Gunn, *Lancet*, i/1927, 127.

LEG ULCERS. 15 cases of from 1 to 20 years' duration successfully treated with a 2% aqueous solution, after every other form of treatment had failed. The solution was applied from 3 to 5 times the first day and this procedure repeated for the next two or three days, or until a hard, firm, dry, adherent crust had formed. The solution was permitted to air-dry and the ulcers were not bandaged. As long as the violet-stained crust remained firm, dry, and adherent

it was not disturbed. Portions of crust becoming loose or pocketed were removed, the ulceration cleansed with dry sterile gauze and the solution re-applied as before. Ulcers heal in a comparatively short time and leave scars of a smooth, fine texture. With oedematous ulcers, the oedema must first be brought under control.—F. M. Thurmon and H. Chaimson, *New Engl. J. Med.*, 1935, 216, 11.

MYCOTIC SKIN AFFECTIONS. Infectious eczematoid dermatitis, impetigo, folliculitis and furunculosis. A 5% solution in water containing 20% alcohol, applied with a swab.—A. R. McFarland, *Arch. Derm. Syph.*, N.Y., Jan., 1928.

A 2% watery solution is of value in impetigo, impetiginised eczema, intertrigo, eczematoid ringworm of the feet and hands, paronychia (a slightly stronger solution may be used) and seborrhoeic dermatitis. In the deep-seated pustular conditions such as furunculosis or syccosis the dye is not of much avail as its action is too superficial.—F. C. Florence, per *Practitioner*, ii/1936, 122.

A highly satisfactory application in intertrigo is 1% gentian violet or malachite green in 25% spirit. This is painted on once a day. Relief is rapid and there is a gradual contraction of the inflamed areas. In some cases the spirit lotion is too drying, and in these cases an ointment containing equal parts of zinc and ammoniated mercury acts well.—R. Gibson, *Med. Pr.*, ii/1936, 566.

A formula consisting of 2% gentian violet and 10% salicylic acid in 95% alcohol is recommended as a local application for ringworm of the scalp due to microsporous of the animal type. The head is first shaved, cleared of all crusts with soap and water and then alcohol, and then painted with the mixture. The lesions are scrubbed clean and painted daily for ten days.—W. F. Spiller *et al.*, *Arch. Derm. Syph.*, N.Y., 1940, 41, 370.

OXYURIASIS. Gentian violet, in enteric-coated tablets was found superior to all the other methods of therapy in the treatment of pinworm infestation. The dosage of the drug for adults is two 32 mg. tablets three times a day before meals, and for children 10 mg. a day for each year of apparent age, the total daily amount being divided into three doses. Transient minor reactions, e.g., nausea, vomiting and diarrhoea, occur in some patients and the treatment is contraindicated where there is concomitant infestation with *Ascaris lumbricoides*, cardiac, hepatic or renal disease, alcoholism and diseases of the gastro-intestinal tract.—W. H. Wright and F. J. Brady, *J. Amer. med. Ass.*, i/1940, 861.

STAPHYLOCOCCAL SEPTICÆMIA. Startling results may be obtained, but failures are equally numerous. The cases reported total about 40% definitely improved, 20% possibly improved and 40% unimproved. Used in 1 in 200 solution in water, each ml. containing 0.005 g. of dye, a full dose being 45 ml. for a 7-stone patient. More concentrated solutions may cause thrombosis. Initial injection of 0.002 g. per kilo. Sharp temperature reaction, sometimes a chill, following injection. In favourable cases, following fall in temperature, improvement is marked. Value due to its bacteriostatic action in the blood stream.

THRUSH. The infection is easily got rid of by a 1% aqueous solution of gentian violet, which should be applied with a soft brush. Even the more serious conditions of thrush can be treated by liberal applications of the gentian violet solution to the mouth and subsequent swallowing of it by the infant.—John Craig, *Practitioner*, ii/1939, 611.

Methylrosaniline Chloridum (U.S.P. XI Supp. II). *Syn.* GENTIAN VIOLET, METHYL VIOLET, CRYSTAL VIOLET.

It is described as a mixture of hexa-, penta-, and tetra-methylparosaniline chlorides, soluble about 1 in 35 of water, in alcohol, glycerin and chloroform. Insoluble in ether.

Crystoflavine (Crookes' Laboratories, London). Burn lotion containing gentian violet, brilliant green and acriflavine.

Liquor Tinctorium (B.P.C.). *Syn.* BONNEY AND BROWNING'S SOLUTION, BLUE PAINT, SOLUTION OF BRILLIANT GREEN AND CRYSTAL VIOLET.

Crystal violet and brilliant green 0.5% w/v of each in equal parts of alcohol and water.

A non-irritant antiseptic for sterilising the skin. Stains may be removed with hypochlorite solution, e.g. eusol.

Liquor tinctorium is probably the most powerful skin disinfectant. Bonney's method of preparing the skin of an operation area consists in painting the part, usually six hours before, then applying a compress of lint soaked in the solution and covering with thin waterproof, which is kept in position until the time of operation.—C. H. Browning, *Practitioner*, ii/1940, 296.

BURNS. This mixture of dyes should replace tannic acid. Not only is it a perfect antiseptic lotion for deeper burns, but when applied on gauze to burns of the first three degrees it adheres as a firm case quite as occlusive as the tannic acid coagulum. This case separates gradually as the skin heals and leaves an even better scar than tannic acid. Besides sharing with tannic acid the valuable attributes of freedom from re-dressings and from pain it has the following further advantages: it is easier to apply, since it can be put on burns of all degrees, no re-spraying is necessary, and the toilet of the damaged area need not be so thorough; the gauze being bandaged on, the subsequent care of the case is easier; there is little or no risk of effusion beneath the dressing.—A. J. Hobson, *Lancet*, ii/1940, 249.

Pigment. Cæruleum (N.I.F.). Crystal violet and brilliant green, of each 2½ gr., industrial methylated spirit to 1 oz.

Methylthioninæ Hydrochloridum (B.P., U.S.P. XI). *Syn.* METHYLTHIONINE CHLORIDE, METHYLENE BLUE, METHYLENUM CÆRULEUM (*P. Helv. V, Fr. Cx., P. Jap. V*), TETRAMETHYLTHIONINI CHLORIDUM (*P. Belg. IV*). $C_{16}H_{18}N_2ClS = 319.8$.

U.S.P. XI, P. Helv. V, and Fr. Cx. have $3H_2O$.

Dose.—1 to 5 grains (0.06 to 0.3 g.) in pill, cachet or capsule. *U.S.P. XI average dose 2½ grains.*

It may also be employed intramuscularly or intravenously (*vide infra*), but hypodermically it may give rise to ulcers or abscesses.

Dull dark green crystals, forming an intense blue solution in water.

Soluble about 1 in 50 of water; soluble also in alcohol 90% and chloroform.

Incompatible with caustic alkalis.

Distinguish from the commercial compound with zinc.

Uses. Mildly antiseptic and excreted by the kidneys, hence has been used as a genito-urinary antiseptic in cystitis and gonorrhœa. Is also used in these conditions by injection, as 0.1 to 0.2% solution. It has also been given internally in malaria where quinine is not tolerated and in blackwater fever, but it is much inferior to the cinchona alkaloids. It is a feeble analgesic and was formerly advocated for rheumatism, migraine and painful nervous affections. Colonic lavage with the 1 in 5000 to 1 in 1000 solution has been used in dysentery and ulcerative colitis.

In chronic suppurative otitis media and conjunctivitis, 1 in 500 solution is instilled warm. In intertriginous eczemas, 3 to 5% solution. The 5% solution, injected intramuscularly in 1 ml. doses, is used as a test for renal efficiency. It colours urine blue, and faeces become blue on exposure to air. Solutions of methylene blue are largely used as stains for bacteria (*see Vol. II*).

Cyanide poisoning has been successfully treated by injecting intravenously 100 ml. of a 1% solution and the cyanosis due to sulphonamide treatment rapidly responds to methylene blue, either orally or intravenously (*see p. 937*).

CYANIDE POISONING. Methylene blue should be tried in every case of cyanide poisoning and should be part of emergency equipment. Amyl nitrite and sodium

tetrathionate may also be used, the former even in conjunction with methylene blue. The balance of evidence is against methylene blue being of any value in CO poisoning.—G. F. Copper, *U.S. Nav. med. Bull.*, 1935, 33, 364.

Tabellæ Methylthioninæ Hydrochloridi (B.P.C.). Contain 2 gr. (0.12 g.).

Phenothiazine (the parent substance of the thiazine dyes) has proved to be an effective urinary antiseptic when given orally for a limited period of time in daily doses of 1.5 to 2 g., especially when the pH of the urine is kept acid in a pH range of 4.5 to 5.5 by the administration of ammonium chloride. The maximum total dose should not exceed 15 g. without a rest period, but generally a therapeutic result will be obtained with much less, if benefit is to occur. It is capable of producing secondary anaemia when used continuously in excessive or extra therapeutic doses, and the blood should be examined periodically if medication is continued for long periods. No undesirable effects noted on the gastro-intestinal tract, circulation, kidneys or liver.—Floyd deEds *et al.*, *J. Pharmacol.*, 1939, 65, 371.

Novaurantia (B.P.C.). *Syn.* ORANGE G. $C_{14}H_{10}N_2O_7S_2Na_2 = 452.2$. Colour Index No. 27.

The disodium salt of benzeneazo- β -naphthol-6 : 8-disulphonic acid, occurring as a yellowish-red powder, soluble in water and in alcohol 90%, giving orange coloured solutions.

Viride Malachitum (B.P.C.). *Syn.* MALACHITE GREEN.

$2C_{23}H_{25}N_2, 3H_2C_2O_4$. Colour Index No. 675.

The oxalate of *pp*-tetramethyldiaminotriphenylcarbinol anhydride, in green crystals with metallic sheen. **Soluble** in water and alcohol 90%. Has antiseptic properties, especially for gram-positive organisms, but brilliant green is now usually preferred.

Stains on the hands with malachite green are easily removed by rubbing with a little cotton wool soaked in alcohol, dilute hydrochloric acid or dilute acetic acid.

Uses. Has been employed as an antiseptic dressing, especially in the form of a spray, and particularly in the treatment of war wounds. It should not be applied to mucous membranes. Is more active for gram-positive organisms.

Cheate's "Green Spray." *Syn.* SUBLIMATE MALACHITE GREEN SOLUTION.

Equal parts of 2% malachite green in 80% alcohol and 2% mercuric chloride in 80% alcohol. The two solutions are best kept separate and mixed as required.

The spraying must be thorough and the spirit allowed to evaporate before applying the dressing.

[P2-S1] **Pigmentum Viride** (St. J. H.).

Malachite green 5 gr., mercuric chloride 5 gr., industrial methylated spirit 6 dr. water to 1 oz.

Viride Nitens (B.P.C.). *Syn.* BRILLIANT GREEN.

$C_{27}H_{33}N_2, SO_4H$. Colour Index No. 662.

The sulphate of tetraethyldiaminotriphenylcarbinol anhydride, in small golden crystals soluble in water and alcohol 90%.

Uses. The dye is an antiseptic and disinfectant and has been much used for the same purposes as acriflavine.

These two dyes had the highest "T.C." (*v.* Acriflavine). Brilliant green differs, however, in that it is not advised to be introduced by injection into closed spaces, and its activity is reduced in the presence of serum. It is also less rapid in action. It differs from crystal violet in being strongly bactericidal to the coli-typhoid group. For wounds a 1 in 1000 to 1 in 2000 solution is used, promoting a vigorous growth of granulation tissue. It may also be used for continuous irrigation of wounds. Septic conditions of the

ears have been treated with brilliant green $\frac{1}{2}\%$, mercuric chloride $\frac{1}{2}\%$ in 90% alcohol, and the 0.1% aqueous solution with 0.25% of allantoin is used as ear drops to promote epithelisation after the radical mastoid operation.

It is a useful epithelial stimulant in various minor injuries and affections, e.g., impetigo, indolent ulcers of various kinds, blisters, etc.

Stains on the skin can be removed with spirit, those on clothes by spirit or washing with soap.

EPIDERMOPHYTOSIS. Painting of the affected part daily with 1% brilliant green in rectified spirit of value.—W. Lambert, *Brit. med. J.*, ii/1934, 798.

SYCOSIS. Remove crusts with 5% salicylic ointment, followed by epilation of loose pustule-encircled hairs and daily painting with 1% alcoholic solution of brilliant green in 70% alcohol. 53 cases cured after 12 to 25 applications, with no relapses.—*Lancet*, i/1932, 202.

Brilliant Green Ointment. Brilliant green 1 or 2% in twice the amount of alcohol 90%, and incorporated with soft paraffin. For superficial wounds.

Brilliant Green Paste (Hey's). Brilliant green 1, boric acid 275, French chalk 25, liquid paraffin 200. The dye is incorporated in solution in a little spirit. For filling wound cavities.

Methyl Green, syn. LIGHT GREEN, is chloromethylhexamethyl-*p*-rosaniline hydrochloride.

Rubrum Scarlatinum (B.P.C.). *Syn.* BIEBRICH SCARLET R MEDICINAL, SUDAN IV, *o*-TOLUENEAZO-*o*-TOLUENEAZO- β -NAPHTHOL. $C_7H_7N_2 \cdot C_7H_4N_2 \cdot C_{10}H_6OH$. Colour Index No. 258. A red dye, with m.p. between 165° and 185°.

Soluble in oils and fats, insoluble in water.

Uses. To regenerate skin and to hasten epithelisation, has been much employed in the form of an ointment containing 4 to 8% of the substance, though the latter strength is somewhat irritating and should be alternated with a soothing ointment. When used in the treatment of chronic ulcers it is important that the local circulation be good.

There has been some confusion regarding the nomenclature and constitution of the scarlet R dyes, and the above medicinal Biebrich should always be specified.

INDOLENT ULCERS. The following dressing applied at least twice daily recommended. Immerse lint for two days in a solution of 20 grains of Biebrich red in a pint of water with 2% powdered allantoin. Allow to dry without wringing or artificial heat and then iron out at low temperature. Cut to size and shape of ulcer.

[P1-31] **Oleum Scarlet et Atropinæ.** Corneal ulcers have been treated by a 5% suspension in castor oil containing 1% atropine.

Unguentum Rubri Scarlatini (B.P.C.). *Syn.* UNGUENTUM RUBRUM. 5% in simple ointment. Other strengths (from 2 to 8%) are sometimes used.

Epithedol (Wyleys Ltd., Coventry). Ointment of scarlet red 2%, containing also hydroxyquinoline sulphate and chlorbutol. For epithelial regeneration in burns, eczema, etc.

The following scarlet colours have been similarly employed:—

Oil Scarlet. *Syn.* CERASINE RED, BENZENEAZOBENZENEAZO- β -NAPHTHOL, SUDAN III.

This is also insoluble in water, moderately in alcohol, and very soluble in chloroform and ether and has been found quite satisfactory.

Non-Staining Scarlet. *Syn.* *o*-AMINOAZOTOLUENE.

Soluble in oils and fats, insoluble in water. Considered by some to be more efficacious than scarlet red.

"Ordinary" Biebrich scarlet is the sodium salt of *p*-sulphobenzeneazo-*o*-sulphobenzeneazo- β -naphthol, soluble in water making an orange-red solution.

Diacetylaminoozotoluol (*P. Helv. V, P.G. VI, P. Ned. V Supp. II, P. Spec. X*). *Prop. Name.* PELLIDOL (*Bayer Products, London*).

$\text{CH}_3 \cdot \text{C}_6\text{H}_4 \cdot \text{N} : \text{N} \cdot \text{C}_6\text{H}_4 \cdot \text{CH}_3 \cdot \text{N}(\text{CO} \cdot \text{CH}_3)_2 = 309.2$.

Red powder with slight acetous odour. Insoluble in water, soluble in alcohol, ether or chloroform, also in oils, fats, and soft paraffin. A non-staining compound used for the same purposes as scarlet red. Usually applied as a 2% ointment in soft paraffin.

Azodermin, the monacetyl derivative of aminoazotoluol, has also been used for promoting the growth of skin on wounds.

Trypan Red. *Syn.* SODIUM 3-SULPHODIPHENYLDISAZOBIS- β -NAPHTHYLAMINE-3 : 6-DISULPHONATE. Colour Index No. 438. A brown powder giving a red aqueous solution.

Is active against trypanosomes *in vitro*, but rarely used medicinally.

Trypan Blue. *Syn.* SODIUM DITOLYLDISAZOBIS-8-AMINO-*l*-NAPHTHOL-3 : 6-DISULPHONATE. $\text{C}_{24}\text{H}_{24}\text{O}_4\text{N}_6\text{S}_4\text{Na}_4$. Colour Index No. 477. A bluish-grey powder giving a violet solution with water. Insoluble in alcohol.

PARKINSONISM. Successfully treated by trypan blue 1% intravenously—2 injections of 1 ml. followed by 3 or 4 of 2 ml. with an interval of 3 or 4 days between each two injections and an interval of a month between courses. No ill effects and injections well tolerated.—*Lancet*, i/1932, 1319.

Tartrazine (B.P.C.). $\text{C}_{16}\text{H}_9\text{O}_6\text{N}_4\text{S}_2\text{Na}_2 = 534.2$.

Colour Index No. 640.

The sodium salt of 4-*p*-sulphobenzeneazo-1-*p*-sulphophenyl-5-hydroxypyrazole-3-carboxylic acid, occurring as an orange-yellow powder. Is used as a colouring for lemonade and lemonade powders, and, in conjunction with orange G, as a yellow colour for foods and medicines.

Liquor Tartrazinæ Compositus (B.P.C.). *Syn.* LIQUOR FLAVUS.

Tartrazine 0.75% *w/v* and orange G, 0.25% *w/v*, in glycerin and chloroform water. Used as a yellow colouring agent for mixtures, etc.; 5 m. per oz. is approximately equivalent to 12½ m. of fresh tincture of saffron.

Auramine. *Syn.* TETRAMETHYLDIAMINODIPHENYLKETONIMINE HYDROCHLORIDE. $\text{C}_{17}\text{H}_{23}\text{N}_4\text{Cl} \cdot \text{H}_2\text{O} = 303.7$.

Dose.—½ grain (0.02 g.) has been given *per os*.

A yellow powder soluble in water. The solution is decomposed on boiling or on long standing in the cold, the imino group of the compound being converted into a ketone group by hydrolysis, giving the insoluble Michler's ketone and ammonium chloride.

An antiseptic non-irritant dye for sterilising the skin prior to operation.

Glauramine (*British Drug Houses, London*) is a concentrated solution of auramine in glycerin and alcohol, to be diluted with water immediately before use.

Sudan Red III. AMINOAZOBENZENEAZO- β -NAPHTHOL.

$\text{C}_{22}\text{H}_{16}\text{N}_4\text{O} = 352.2$. A brown dye for colouring fats, and in histology.

Chrysoidine. DIAMINOAZOBENZENE HYDROCHLORIDE.

$\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_3(\text{NH}_2)_2\text{HCl} = 248.6$. An orange dye, slightly soluble.

Other Common Colouring Matters

Anchusa (B.P.C.). *Syn.* ALKANNA, ALKANET ROOT.

The dried root of *Anchusa tinctoria* (Boraginaceæ). Contains 3% red amorphous substance, alkanin. "Red oil" is obtained by macerating alkanna in liquid paraffin 1 in 7.

Coccus (B.P., Fr. Cx.). Syn. COCHINEAL, COCCUS CACTI.

The dried female insect *Dactylopius coccus* (Hemiptera) containing eggs and larvæ. The insects are reared on various species of *Nopalea* (Cactaceæ). If killed by sulphur or charcoal fumes the insects are silvery in colour ("silver grain") owing to deposit of wax on the surface. If killed by heat the wax is melted and "black grain" cochineal is produced.

Liquor Cocci (B.P.C.) contains the colouring matter of 10% w/v of cochineal.

Tinctura Cocci (B.P.). Dose.—5 to 15 minims (0.3 to 1 ml.). 1 in 10 of alcohol 45%.

Carminum (B.P.C., Fr. Cx., P. Helv. V).

Red colouring matter containing about 50% of carminic acid, $C_{17}H_{18}O_{10} = 382.1$, prepared from cochineal by precipitation with alum.

It is *insoluble* in water, but entirely soluble in aqueous ammonia.

Is used to colour medicinal and toilet preparations and for staining in microscopy.

Liquor Carmini (B.P.C.) contains 6% w/v of carmine in a weakly ammoniacal solution. For colouring mouthwashes, etc., 3 or 4 minims per fl. oz. is used.

Glycerinum Carmini (B.P.C.) is a similar solution prepared with potassium carbonate.

Liquor Rose Dulcis (B.P.C.) is a similar preparation of 4% w/v of cochineal containing oil of rose. Is useful for colouring and perfuming preparations.

Crocus (B.P.C., Fr. Cx., P. Jap. V, P. Helv. V). Syn. SAFFRON.

The dried stigmas and tops of the styles of *Crocus sativus* (Iridaceæ). Its preparations are used as colouring agents.

Saffron has been employed as an abortifacient for many years and several fatal cases have been recorded. The chief toxic symptoms are flushing of the face, epistaxis, vertigo, vomiting, bradycardia and stupor. Death (after profuse metrorrhagia and abortion) following use of 24 gr.—P. Fasal and G. Wachner, *Wien. klin. Wschr.*, 1933, 747.

Glycerinum Croci (B.P.C.). 1 in 40 in glycerin and alcohol 60%.

Syrupus Croci (B.P.C.). Glycerin of saffron 1, syrup 7. About 1 in 8 is sufficient for colouring mixtures.

Tinctura Croci. 1 in 5 of alcohol 60%.

BALSAMUM PERUVIANUM

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.

Dose.—5 to 15 minims (0.3 to 1 ml.).

A balsam exuded from the trunk of *Myroxylon Pereira* (U.S.P. XI, *Toluifera Pereira*), after beating and scorching. Occurs as a viscid liquid containing cinnamein and cinnamic acid.

Soluble in chloroform, partially soluble in ether, light petroleum and glacial acetic acid; soluble 1 in 1 of alcohol 90%, but solution becomes turbid on adding 2 of alcohol 90%. Insoluble in water.

Uses. Inhalation of the vapour from a few drops of a solution of balsam of Peru 1 in alcohol 2, in a little hot water, is useful in

pharyngitis. As a dressing to wounds, if aseptic, may be left for 20 days if necessary. Scabies has been treated with a paint of balsam 3, glycerin 1. But test for albumin in urine both before and during treatment.

[P.] **Lotio Balsami Peruviani.** In alopecia a preparation of Peru balsam 1 dr., spirit of rosemary 1 oz., tincture of cantharides 4 dr., pilocarpine nitrate 2 gr., almond oil 1 oz. has been employed. This is applied at night and washed off next morning with a borax and spirit lotion.

Unguentum Peruvianum (B.P.C.). 12½% in simple ointment.

Unguentum Balsami Peruviani. Balsam of Peru 20, trikresol 5, soft paraffin *q.s.* to 100. Mix warm.

For scabies an ointment containing Peruvian balsam and sublimed sulphur 4½% of each, in soft paraffin.

Ammoniacum (B.P.C., Fr. Cx.).

Dose.—5 to 15 grains (0.3 to 1 g.).

Gum-resin from *Dorema Ammoniacum* (Umbelliferae). In pale yellow tears or nodular masses with characteristic odour and acrid taste. Is used in chronic bronchitis with viscid secretion to facilitate expectoration.

Mistura Ammoniaci (B.P.C.).

Dose.—½ to 1 ounce (15 to 30 ml.).

Contains the equivalent of 13 gr. of ammoniacum per oz.

Balsamum Tolutanum (B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.).

Dose.—5 to 15 grains (0.3 to 1 g.).

Obtained from the trunk of the *Myroxylon Toluifera* (U.S.P. XI, *Toluifera Balsamum*) (Leguminosae). Recently prepared is soft, but becomes brittle in cold weather. It contains benzoic and cinnamic acids both free and esterified with benzyl alcohol.

Soluble 1 in 1 of alcohol 90%, and in acetone, ether, chloroform and solutions of fixed alkalis, usually leaving some residue.

Is antiseptic and expectorant.

Liquor Tolutanus (B.P.C.). 1 part mixed with 7 parts of syrup gives a preparation similar to syrup of tolu (B.P.).

Syrupus Tolutanus (B.P., Fr. Cx.). *Dose.*—½ to 1 drachm (2 to 4 ml.).

Made by digesting the balsam and water on the water-bath during ½ hour and dissolving sucrose in the filtered liquid.

Syrupus Balsami Tolutani (U.S.P. XI). *Syn.* SYRUPUS TOLU (U.S.P. X). *Average dose.*—2½ drachms (10 ml.). Tincture of tolu balsam 5, sucrose 82, water to 100.

Tinctura Tolutana (B.P.).

Dose.—½ to 1 drachm (2 to 4 ml.). 1 in 10. In mixtures the resin must be suspended with mucilage.

Tinctura Balsami Tolutani (U.S.P. XI).

Average dose.—30 minims (2 ml.).

Balsam of tolu in alcohol, 1 in 5. *Fr. Cx.* is similar, but made with 80% alcohol.

Balsamum Gurgune.—Gurjun Balsam, Wood Oil. *Dose.*—½ to 2 drachms. Obtained from *Dipterocarpus turbinatus* and other species. Contains from 40 to 80% of volatile oil, and is used in gonorrhœa and as an expectorant given with malt extract.

Styrax (B.P., U.S.P. XI, P. Helv. V). Syn. STYRAX PRÆPARATUS, BALSAMUM STYRAX LIQUIDUS (P. Dan., P. Jap. V), STYRAX DEPURATUM (Fr. Cx.).

Dose.—10 to 30 grains (0·6 to 2 g.).

The balsam obtained from the wounded trunk of *Liquidamber orientalis*, purified by dissolving in alcohol, filtering and evaporating. U.S.P. XI allows it to be obtained also from *L. styraciflua*. A thick brown liquid containing not less than 30% of balsamic acids. Contains cinnamyl cinnamate (styracin) and other cinnamic acid compounds together with a large proportion of storesin, $C_{38}H_{55}(OH)_3 = 538\cdot5$.

Soluble in alcohol 90%, ether, carbon disulphide, chloroform and glacial acetic acid.

Is used as an ointment containing 20 to 25% in scabies and parasitic skin diseases.

Pommade au Styrax (Fr. Cx.). Melt colophony 29, yellow beeswax 16, and elemi resin 16. Add styrax 16, and olive oil 29.

[P2] **Storaxol** (Parke, Davis, London). Storax, resorcinol, menthol, camphor, phenol (22 gr. per oz.), and precipitated sulphur in a wool fat and soft paraffin base. For use in acne, sycosis, etc.

BARBITONUM

B.P., P.G. VI, Fr. Cx., P. Helv. V, P. Jap. V, P. Ned. V, P. Svec. X, P. Dan., U.S.P. XI, P. Belg. IV, F.E. VIII, P. Ital. V.

Syn. and Prop. Name. 5 : 5'-DIETHYLBARBITURIC ACID, DIETHYLMALONYLUREA, MALONUREA, BARBITALUM, MALONAL.

VERONAL (Bayer Products, London).

[P1] "Barbituric acid; its salts; derivatives of barbituric acid; their salts; compounds of barbituric acid, its salts, its derivatives, their salts, with any other substance."

[S1] "Barbituric acid; its salts; derivatives of barbituric acid; their salts; compounds of barbituric acid, its salts, its derivatives, their salts, with any other substance."

[S4] "Barbituric acid; its salts; derivatives of barbituric acid; their salts; compounds of barbituric acid, its salts, its derivatives, their salts, with any other substance."

Dose.—5 to 10 grains (0·3 to 0·6 g.)—should be taken with a hot drink.

P.G. VI max. single dose 0·75 g., max. per diem 1·5 g.; Fr. Cx., P. Belg. IV, P. Jap. V and F.E. VIII, 0·5 and 1 g. respectively; P. Ital. V, 1 and 2 g. respectively.

NOTE.—The name "Barbitone" in Fr. Cx. is applied in error to phenobarbitone.

Caution.—5 grains is sufficient for an ordinary case of insomnia, 50 gr. might be regarded as the average minimum fatal dose, although as little as 10 gr. has proved fatal (*vide infra*).

Manufactured by condensing urea with ethyl diethylmalonate.

A white crystalline powder melting at 189° to 192° (U.S.P. XI 187° to 190°).

Soluble 1 in about 170 of water, 1 in 12 of boiling water, 1 in 8½ of alcohol 90%, 1 in 25 of ether, 1 in 35 of chloroform. Boiling with alkalis decomposes it. Also soluble in acetone and ethyl acetate.

Toxic Effects. Barbitone is excreted slowly, and bowels and kidneys should be functioning adequately. It is cumulative, and regular administration may cause chronic poisoning characterised by headache, visual disturbance and weakness, with anæmia and albuminuria. Acute poisoning is characterised by a brief period of headache, ataxia and muscular twitching, followed by sleep rapidly passing to coma. Later the breathing becomes slow and shallow, there is oedema at the bases of the lungs, and bronchopneumonia may set in. Nystagmus is frequently present, and there is complete suppression of urine. In a few individuals idiosyncrasy exists, and quite small doses produce skin eruptions of various kinds.

Barbitone taken every night is liable to produce mental and moral changes with suicidal tendencies, also diplopia with visual paralysis and the kind of speech found in G.P.I.: hæmatoporphyrinuria is a characteristic of phenobarbitone poisoning. Continued administration of these drugs produces pathological changes in the central nervous system, which, although they usually disappear when the drug is discontinued, may become permanent.

A man of 120 pounds (54 kg.) bodyweight survived a total dose of 18 g. (270 gr.) of sodium barbital, taken with suicidal intent. The poisoning was characterised by a deep coma of six days' duration, a very high temperature and rapid pulse and respiration, in contrast to the usual picture of severe depression of temperature and respiration.—D. K. Chang and M. L. Tainter, *J. Amer. med. Ass.*, i/1936, 1386.

The alleged dangers of the barbiturates. Statistical tables giving details of all fatalities associated with barbituric drugs recorded up to the end of 1932. Of the total of 5147 recorded suicides in 1931 only 13, or 0.26%, were attributed to barbiturates. Up to the end of 1932 there is no case on record in which barbiturates, either a single dose or repeated doses of therapeutic magnitude, have caused death in the absence of complicating factors.—R. D. Gillespie, *Lancet*, i/1934, 337.

"The Battle of the Barbiturates." A protracted and voluminous correspondence.—See *Lancet*, i/1934.

Toxicology of barbiturates.—H. T. Roper-Hall, *Proc. R. Soc. Med.*, Jan., 1936.

The margin of safety between the hypnotic dose and the lethal dose as represented by the ratio M.L.D./M.Th.D. is: Luminal 1.3; Barbitone 1.6; Soneryl, Nembutal and Phanedorm 2.4; Dial 2.5; Evipan 5. It would not appear very safe to employ Luminal in full hypnotic doses.—N. Mutch, *Brit. med. J.*, i/1934, 321.

Antidotes to Barbiturate Poisoning. Empty stomach by stomach tube, using 2 gallons of warm water, since emetics are probably of little use. Keep patient warm and try to keep him awake, but he must not be walked about. Give hot, strong coffee. Strychnine, ½ gr., nikethamide, 5 to 15 ml. of 25% solution, and alcohol, should be injected and repeated as required; alternatively,

microtoxin in doses of from 1 to 10 mg. intramuscularly or intravenously in 0.2% aqueous solution (for further details see page 934). Fluids must be given freely; if coma is prolonged, patient must be fed by stomach tube with coffee, dextrose, peptonised milk, etc. Dextrose in saline may be given by rectum, and saline intravenously. Artificial respiration should be started early and kept up for a long time. Oxygen with 7% carbon dioxide inhalations may be necessary. Lumbar and cisternal puncture and drainage to remove the poison may be carried out every 12 or 24 hours, especially if "veronal pneumonia" has set in.

Veronal is excreted slowly and unchanged in the urine: in cases of poisoning increase the efficiency of the kidneys by injection of large volumes of 5% to 10% dextrose solution. A woman who had taken 60 grains was given 1½ litres 5% dextrose 4 hours later. In 6 hours she passed 1100 ml. urine, and 11 hours later showed no symptoms of the drug.—*Amer. J. Pharm.*, 1930, 599.

A fatal case in which 0.62 g. of strychnine were given without any signs of intoxication by it.—L. Raymond and J. Delay, per *Lancet*, i/1934, 93.

Alcohol injections intravenously of value. A patient in a state of slight coma from having taken 1.5 g. of Gardenal was given 20 ml. of 30% alcohol intravenously once an hour, and awoke to complete consciousness on the fourth injection. Animal results confirmatory of clinical observations. Probably at least 30 ml. of 30% alcohol should be given hourly till patient wakes.—Prof. Carrière, C. Hunez and P. Willoquet, *Bull. Acad. Méd.*, No. 18, 1934, per *Lancet*, i/1934, 1243.

Treatment by large doses of strychnine, ½ to 5 gr., repeated hourly if necessary, with Coramine injections or carbogen (oxygen and carbon dioxide) inhalations as respiratory stimulants.—C. Flandin, F. Joly and J. Bernard, per *Brit. med. J.*, ii/1934, 263.

Treatment of acute barbiturate poisoning by washing out stomach with animal charcoal and sugar-lime; Coramine injected; camphor for convulsions; large doses of strychnine intravenously; oxygen inhalations; infusions with adrenaline and insulin.—Hans Fischer, *Schweiz. med. Wschr.*, 1935, 65, 441.

The third day in a severe case of Veronal poisoning is usually the turning point, the fate of the patient depending on the behaviour of the kidneys. During the first two days there is as a rule some excretion of urine, and it is only on the third day that anuria is apt to set in. This anuria is evidently connected with the inadequate intake of fluids, which may be repaired by giving from 2 to 4 litres a day of Ringer's solution subcutaneously, which usually results in a profuse excretion of urine within twelve hours and the tiding of the patient over the critical anuria.—G. Sack, *Dtsch. med. Wschr.*, ii/1936, 2082.

The intravenous injection of 4% sodium bicarbonate solution hastens excretion.—C. Henze, *Dtsch. med. Wschr.*, i/1936, 1878.

Contraindications, or indications for special caution, are old age, genito-urinary disease, liver disease, advanced disease of heart or lungs, severe toxæmia, and idiosyncrasy.

Owing to the risk of pneumonia in individuals receiving large doses of barbiturates, they should be withheld in the presence of inflammation of the lungs, operations for empyema and in catarrhal conditions of the bronchial and upper air passages. Also when efficiency of the liver or kidneys is affected by toxic blood conditions, by local inflammation of these organs, or by other diseases such as eclampsia or cirrhosis.—H. W. Featherstone, *Brit. med. J.*, i/1934, 326.

Uses. Sedative and hypnotic in nervous restlessness, insomnia and depression, for maniacs and in cardiac trouble. In therapeutic doses it does not affect temperature or respiration. Produces sleep without subsequent depression. Tolerance to it may be established in some cases, and prolonged use may lead to addiction and chronic poisoning. For insomnia it should be taken 2 hours before retiring.

Barbiturates do not relieve pain, and in insomnia due to this cause they are given in combination with an analgesic such as amidopyrine.

The barbiturates are effective against poisoning by strychnine and picrotoxin.

If a phenyl group, C_6H_5 , is used to replace one of the ethyl groups in barbitone, the drug seems to acquire special depressant power over the motor cortex (e.g., Luminal in epilepsy).

If sodium is added to the barbituric nucleus without disturbing the essential ring formation the product becomes soluble, giving greater speed in action and allowing of its injection (e.g., Sodium Soneryl, Sodium Amytal, Sodium Evipan).

The introduction of bromine into the barbituric nucleus (as in Pernocton) acts as a preventive to the state of excitement sometimes preceding narcosis. —N. Mutch, *Brit. med. J.*, i/1934, 321.

[P1-81-84] **Tabellæ Barbitoni** (B.P.C.). Contain 5 grains (0.3 g.).

[P1-81-84] **Tabellæ Barbitoni et Amidopyrinæ** (B.P.C.).

Dose.—1 tablet. Contains 2 gr. of barbitone and 4 gr. of amidopyrine.

[P1-81-84] **Veramon** (Schering, London). A combination in tablet form of amidopyrine and a molecular compound of amidopyrine with barbitone. Analgesic in neuralgias, migraines, dysmenorrhœa, biliary colic, and all forms of pain. **Dose.**—Adults, 1-2 tablets; children, $\frac{1}{2}$ -1 tablet. The effect sets in after about 20 minutes and lasts for 4-5 hours.

[P1-81-84] **Veropyron** (Richter, London). Tablets containing barbitone $1\frac{1}{2}$ gr., amidopyrine $3\frac{1}{2}$ gr., and tablets containing barbitone $2\frac{1}{2}$ gr., amidopyrine $5\frac{1}{2}$ gr. **Dose.**—1 or 2 tablets.

[P1-81-84] **Barbitonum Solubile** (B.P.). *Syn. and Prop. Names.* BARBITALUM SOLUBILE (U.S.P. XI, P. *Helv.* V, P. *Ned.* V, P. *Jap.* V), MEDINAL (Schering, London) (P.G. VI, P. *Svec.* X, P. *Ital.* V), VERONAL-SODIUM (Bayer Products, London). Graphically it may be represented thus:—

Dose.—5 to 10 grains (0.3 to 0.6 g.) dissolved in water either before or not less than 1 hour after meals. In most cases 5 grains is sufficient for an adult. P.G. VI has max. single dose 12 grains approx. (i.e., the same as for barbitone).

Hypnotic effect is also obtained by the use of suppositories medicated with 0.4 to 0.5 g.

Even small doses, e.g., 1 grain 3 times a day, in some instances, produce a lengthy sleep—at night.

It is stated that toxic signs do not appear with less than 15 grains daily, whilst an adequate sedative effect at the menopause is obtained with 1 to 2 grains 3 times a day, half an hour after meals.

White crystals **soluble** 1 in 6 of cold water; slightly soluble in alcohol 90%, insoluble in ether or chloroform. It has properties and uses similar to barbitone *antea*. It is useful in sea-sickness.

Incompatible with ammonium salts, e.g., the bromide, and with acids, also with chloral hydrate. In preference, give it alone.

Solutions of soluble barbitone decompose on heating, forming crystals of diethylacetyl urea, $(C_2H_5)_2CH \cdot CO \cdot NH_2 \cdot CO \cdot NH_2$. If the compound is prepared with more than the minimum quantity of alkali, solutions decompose below 100° , otherwise they will withstand short heating at 100° and can be sterilised by tyndallisation but not by autoclaving.—A. E. Bailey, *Pharm. J.*, i/1936, 620.

[P1-81-84] **Tabellæ Barbitoni Solubilis (B.P.C.)** contain 5 gr. (0.3 g.).

[P1-81-84] **Neurinase (Genetrier, Neuilly; Wilcox, JozEAU, London).** Preparation of soluble barbitone and extract of valerian. 1 dr. contains about 2 gr. of soluble barbitone and $\frac{1}{2}$ gr. of extract of valerian. *Dose*.—1 drachm in the morning and 1 to 4 drachms at bedtime. For nervous insomnia and neurasthenia. Also available in tablets, each containing 3.3 gr. of soluble barbitone.

[P1-81-84] **Valitone Elixir (Roberts & Co., London).** Elixir containing soluble barbitone $2\frac{1}{2}$ gr. and inodorous fluid extract of valerian 3m. per dr. In insomnia, delirium and as a pre-operative hypnotic. *Dose*.—1 to 4 drachms in a cupful of hot water.

[P1-81-84] **Veronigen (Hewlett, London).** *Dose*.—1 drachm (4 ml.) diluted, about 1 hour before going to bed. For nervous sleeplessness in children 10 to 20 minims diluted. A liquid preparation of barbitone as hypnotic.

[P1-81-84] **Butylethylbarbituric Acid.** *Syn.* BUTOBARBITAL.

Dose.—1 to 2 grains (0.06 to 0.12 g.) produces sleep in half an hour. It may be given at any time, but in no case less than $\frac{1}{2}$ hour after food. A larger dose, *e.g.*, 3 grains (0.2 g.) gives a deep sleep lasting some time. In pain from wounds 3 to 4 grains may be used. In delirium 2 grains. Max. in 24 hours, 6 grains.

A white, crystalline powder with slight bitter taste. Readily **soluble** in alcohol; soluble 1 in 300 of water. Sedative and hypnotic for use in insomnia and in nervous conditions. May also be used as a basal hypnotic. Said to be three times as active as barbitone.

[P1-81-84] **Etoval (Richter, London).** Butylethylmalonurea. Tablets contain $1\frac{1}{2}$ gr. *Dose*.—1 or 2 tablets. Sedative and hypnotic.

[P1-81-84] **Soneryl Tablets (Pharmaceutical Specialities (May & Baker) Ltd., London)** contain $1\frac{1}{2}$ gr. of butylethylbarbituric acid.

[P1-81-84] **Soneryl Sodium** is the sodium derivative of Soneryl, and is available in capsules containing 0.15 g. ($2\frac{1}{2}$ gr. approx.). For basal narcosis and in obstetrics.

A reliable basal hypnotic producing sleep or drowsiness in 95% of cases when administered by mouth one hour before the induction of general anaesthesia. Optimum dose varies from 0.6 to 0.9 g. *per os*. Depression of respiration in a few instances and restlessness in 10% of cases. Has not been given in senility, pulmonary disease, renal impairment or arteriosclerosis.—S. E. Birdsall, *Brit. med. J.*, i/1933, 871.

[P1-81-84] **Sonalgin (Pharmaceutical Specialities (May & Baker) Ltd., London).** Tablets containing Soneryl $1\frac{1}{2}$ gr. and phenacetin $3\frac{1}{2}$ gr.

[P1-81-84] **Pentobarbitalum Solubile (U.S.P. XI Supp. II).** *Syn. and Prop. Name.* PENTOBARBITAL SODIUM, SODIUM iso-AMYTAL, SODIUM ETHYLMETHYLBUTYLBARBITURATE, NEMBUTAL (Abbott Laboratories, London).

The acidic substance has the composition:

The sodium salt may be indicated thus:

A white, crystalline powder, with slightly bitter taste. Very **soluble** in water, freely in alcohol, practically insoluble in ether. Aqueous solutions are alkaline to litmus.

Dose.—As a hypnotic $1\frac{1}{2}$ gr. *per os* or *per rectum* is sufficient. As a pre-anæsthetic and basal hypnotic give one capsule ($1\frac{1}{2}$ gr.) the evening before and one or two 30 minutes before operation. In obstetrics, the usual dose is 4 or 5 capsules (6 to $7\frac{1}{2}$ gr.) in primipara, and 3 in multipara, given after there is definite dilatation of the cervix with definite and regular uterine contractions at not more than 5-minute intervals. For intravenous or intramuscular use to control convulsions in strychnine poisoning and tetanus, or in emergency operations, not more than $7\frac{1}{2}$ grains are dissolved at the time of use in 10 ml. of water, and injected at the rate of 1 ml. per minute.

Intravenous injections must be freshly made; aqueous solutions decompose on standing. On boiling, precipitation occurs.

When given as a pre-anæsthetic in young children, suppositories have been found better than oral or intravenous administration, the dosage, excluding children of 1 year, being 1 grain per year up to a total of 6 grains for children of 6-8. After 8 the drug may be given orally. The suppositories take from 2 to 4 hours to act. Used successfully in 200 cases with no unpleasant after-effects.—R. Jarman, *Brit. med. J.*, i/1936, 236.

ANTIDOTES TO SUBLETHAL AND LETHAL DOSES OF PENTOBARBITAL, CHLORAL HYDRATE AND AVERTIN. The order of practical usefulness of the several therapeutic measures, judged by the degree of improvement in respiration, circulation and reflex excitability, degree of shortening of the usual stages of recovery and the margin of safety of effective dosages of each agent, from high to low, is as follows: picrotoxin, Metrazol, ephedrine, artificial respiration, Coramine, Icoral, strychnine and caffeine sodio-benzoate. The most satisfactory therapeutic measures included combined medication with ephedrine and either picrotoxin, Metrazol or Coramine. Tolerance to these preparations parallels the degree of depression present, particularly with the convulsants. The dosage and frequency of administration of the antagonists must be gauged by the duration of the optimal response observed and the relative need for supportive treatment. Artificial respiration, especially with gas mixtures containing 5 to 10% of carbon dioxide, is highly effective as a single resuscitation measure against lethal doses of these hypnotics.—O. W. Barlow, *J. Pharmacol.*, 1935, 55, 1.

Nembutal is a renal poison. The kidneys stop excreting, with consequent suppression of urine. Four cases of fatal suppression of urine from doses of Nembutal of less than 10 grains. The only thing that will save a person with pneumonia due to barbituric acid drugs is lumbar puncture and the draining off of a good deal of cerebrospinal fluid.—Sir W. Willcox, *Brit. med. J.*, i/1933, 144.

It would appear to be extremely unwise to administer morphine or Omnopon in conjunction with basal narcotics. Two deaths: one with Avertin plus $\frac{1}{2}$ gr. of morphine and $\frac{1}{10}$ gr. of hyoscine, hypodermically, and one with Nembutal (orally) with morphine $\frac{1}{2}$ gr. and atropine $\frac{1}{100}$ gr.—J. M. McNeill Love, *Brit. med. J.*, i/1934, 327.

Danger almost non-existent if not more than $\frac{1}{2}$ gr. of morphine is given.—G. Keynes and C. L. Hewer, *ibid.*, 400.

Uses. Soluble pentobarbital is similar in action to barbitone, but is effective in smaller doses. It is mainly used as a basal narcotic in conjunction with inhalation anæsthesia, being the barbiturate of choice for this purpose owing to its brief duration of action and its high margin of safety. It has also been widely used in conjunction with chloral hydrate or hyoscine hydrobromide for alleviating the pains of childbirth.

Order of hypnotic efficiency (in conjunction with nitrous oxide)—Nembutal, Avertin, Phnodoform, Pernocton. Avertin safest, but efficiency decreased owing to short duration of narcosis.—O. W. Barlow and co-workers, *J. Pharmacol.*, Apr., 1931, 377.

Placed in the following order of merit as basal hypnotics—Nembutal, Sodium Amytal and Pernocton. Nembutal the most outstanding anæsthetic drug to date.—I. W. Magill, *Lancet*, i/1931, 353.

As basal pre-anæsthetic hypnotic Nembutal intravenously in 108 cases—better than Amytal or Pernocton. Effect can be increased by giving morphine simultaneously.—S. Rowbotham, *Lancet*, i/1931, 439.

Oral Nembutal is a great boon as a basal anæsthetic in children. The dose should be small (1 grain or less for a child of 4), given when possible at night, so that the child falls asleep in bed and general anæsthesia can be induced without waking him. The powder may be dissolved in a teaspoonful of syrup or cane sugar in warm water, to mask the bitter taste. If the barbiturate is not effective, or is vomited, a very small dose of Avertin (e.g., 0.05 g. per kilo) may be given. Of value for such procedures as the setting of fractures, repeated lavage of nasal sinuses, and multiple operations for cellulitis or pyæmia.—H. W. Featherstone, *Brit. med. J.*, i/1934, 324.

CHILD BIRTH. Combined oral use of Nembutal and chloral hydrate gave 62% of painless labours in 60 cases without ill-effects to mother or children. Initial dose (when os uteri is two-fifths dilated and regular pains present) Nembutal 3 gr., chloral hydrate 30 gr. (in 3 oz. of sweetened home-made lemonade). First "repeat" dose of 1½ gr. and 30 gr. respectively after 2 hours, and subsequent similar doses at 3-hourly intervals, to a total of 7½ and 120 gr., in 12 hours. Chloral given 10 minutes after Nembutal to obviate vomiting. Not contraindicated in heart disease or albuminuria. May be given by midwives.—J. V. O'Sullivan and W. W. Craner, *Lancet*, i/1932, 119.

Nembutal and chloral the most reliable means for obtaining complete amnesia in labour for the practitioner who cannot spend many hours with his patient.—A. M. Claye and D. W. Currie, *Lancet*, i/1932, 1175.

From an analysis of 100 cases it is concluded that Nembutal, given in combination with chloral, is of undoubted value, especially in placid women with strong distressing pains. Best given between 3 and 5 hours before delivery. Of very doubtful value in nervous or hysterical patients. Nembutal 3 gr. in capsules by the mouth, followed by chloral hydrate 22 gr. as a syrup, perfectly safe. Repeat dose, Nembutal 1½ gr. and chloral hydrate 22 gr., in 3 hours.—F. C. Kelly, *Lancet*, ii/1933, 693.

Combined use of pentobarbital sodium and scopolamine hydrobromide to allay the pain of labour in 1415 cases. When the patient is in labour, regardless of the amount of dilatation of the cervix, she is given 7½ gr. of pentobarbital sodium in 5 separate capsules with a pin hole in each (it is not so effective when given in one capsule as it may form an insoluble mass). Five minutes later give 2 g. of sodium bicarbonate in water to alkalise the stomach. When the pentobarbital sodium is given, scopolamine hydrobromide 1½ gr. is administered hypodermically. Patients smaller than the average have only 6 gr. of pentobarbital sodium initially, but the initial dose should be large and the patient must pass quickly through the excitement stage, and the condition maintained by an additional 1½ gr. every two or three hours. This additional amount is necessary because the drug is constantly oxidised in the body. The initial dose for large women is 9 gr. Constant supervision is necessary, and the nurse must not leave the bedside until about five hours after delivery. In the case of extreme restlessness between pains a little more pentobarbital sodium may be administered, but never more than 3 gr. additional; if she is still restless no other drugs are administered. When the patient is ready for delivery she is given ethylene. If the patient is restless after coming out of the gas she may be given ½ gr. of morphine hypodermically. The treatment is contraindicated if the patient is in rapid labour, and in the presence of a full stomach, infection of the respiratory tract, prematurity or heart disease. Maternal mortality and morbidity are not increased, and infant mortality is not increased. It is a hospital procedure only, and should not be used in the home.—C. E. Galloway et al., *J. Amer. med. Ass.*, ii/1936, 1707.

The following combination of drugs administered according to the technique outlined is efficient and safe. The patient is sent to the hospital as early in labour as possible, and enemas are given to cleanse the bowels. She is told she can have medication as soon as she begins to feel uncomfortable as the result of

contractions. The initial dose of Nembutal in capsules will be $4\frac{1}{2}$ to 6 gr., depending on the weight of the patient, and will be accompanied by $\frac{1}{16}$ gr. of scopolamine hypodermically. The patient is then placed in a quiet darkened room with a competent attendant who will remain with her until she is roused following delivery, and will remain in constant touch with the physician. One hour following the initial medication another dose of Nembutal may be given, depending on the patient's condition. A maximum of 3 gr. is usually all that is necessary; this will be given by rectum, the capsules being punctured by a needle to facilitate absorption. Another dose of scopolamine will be given at this time, $\frac{1}{16}$ gr. (if a marked flushing or a distinct rise in the pulse rate followed the initial dose this will be omitted). From then on Nembutal is given in $1\frac{1}{2}$ gr. doses when indicated. The total dose during labour should probably not exceed $10\frac{1}{2}$ gr. If marked restlessness occurs it is advisable to use paraldehyde or ether by rectum, 8 to 16 ml. of the former or 60 ml. of the latter. When the patient is ready for delivery a nitrous oxide and oxygen mixture is used with the addition of what ether is necessary.—B. F. Cornwall, *New Engl. J. Med.*, ii/1939, 853.

MENTAL CONDITIONS.—NEMBUTAL SUPPOSITORIES. Of value in all types commonly seen in a mental hospital. Individual response tested by preliminary dose of 2 gr. at bedtime—usually resulting in 6 hours sleep. In certain mania states the dose needs to be increased to 6 grains, which is safe and usually effective. Most valuable in the treatment of acute anxiety states and good results in agitated melancholia and senile confusion.—J. S. Horsley, *Brit. med. J.*, 1936, 283.

TETANUS. Several cases of tetanus have been controlled by intravenous Nembutal: at least two with a successful cure.—H. W. Featherstone, *Brit. med. J.*, i/1934, 325.

[P1-81-84] **Pentothal** (*Abbott Laboratories, London*). *Syn.* PENTOTHAL ACID. (Supplied in 4 gr. tablets.)

Dose.—4 to 8 grains (0.25 to 0.5 g.).

Pentothal is ethyl-(1-methylbutyl)-thiobarbituric acid.

Uses. Small doses are sedative, medium doses hypnotic, and large doses anæsthetic. It is employed as a basal anæsthetic, and has been found suitable for producing surgical anæsthesia of short duration, and for inducing analgesia and amnesia during childbirth. Respiration is lessened by full anæsthetic doses, but is almost unaffected by the doses recommended for basal anæsthesia. Its chief practical advantage is its certainty of action when given by the mouth.

The main chemical difference between the acid and the salt (Pentothal Sodium) is in the much greater solubility of the latter, so that the acid is relatively stable. The dosage, however, needs careful arrangement and the best results are achieved by giving 8 gr. three hours before operation, repeating the dose at intervals of an hour, either once or twice according to the effect. Doses of 8 gr. given three and two hours before operation give better results than a single dose of 16 gr. The drug is rapidly eliminated.—*Lancet*, ii/1938, 1072.

CHILDBIRTH. Pentothal acid has been given to a series of 200 women with very good results. The patient sleeps between pains and there is a reasonable degree of analgesia and some amnesia. No harm comes to mother or child and labour is not prolonged. The patient is given 6 to 8 gr. of pentothal acid when the pain begins to cause genuine discomfort. This is repeated 45 minutes later, and from then a dose of 2 to 4 gr. is repeated every half to one hour up to as near delivery as is convenient. By the time delivery takes place the patient has usually had 25 to 35 gr. and is in a drowsy, placid state.—G. C. Steel, *Lancet*, ii/1939, 251.

[P1-81-84] **Pentothal Sodium** (*Abbott Laboratories, London*). $C_{11}H_{17}N_2O_2SNa = 264.3$. (Supplied in 0.5 or 1 g. ampoules with ampoules of water.)

Dose.— $1\frac{1}{2}$ to $2\frac{1}{2}$ grains (0.1 to 0.15 g.) as a 5% solution for intravenous injection.

The sodium salt of ethyl-(1-methylbutyl)-thiobarbituric acid, occurring as a yellow, crystalline powder, with a sulphur-like odour.

Soluble in water giving an alkaline gaseous solution (it is important to see there is no precipitate); also soluble in alcohol, but insoluble in benzene and ether.

Contraindications. It is not employed where there is any marked interference with the respiratory function; it is rarely employed for patients under 15 and seldom for patients below 10 years of age; it is contraindicated in the presence of cardiac dysfunction to the point of dyspnoea and where there is varicosity central to the point of injection; manipulations disturbing pharyngeal and laryngeal reflexes preclude its advisability; it should be employed with caution where there is definite deviation from normal in the oxygen-carrying capacity of the blood (*e.g.*, in severe anaemia) and its use is inadvisable in the presence of gross hepatic damage.

Uses. The action and uses of Pentothal sodium are similar to those of soluble pentobarbital, except that Pentothal sodium is effective in smaller doses and the action is of briefer duration. It is employed intravenously as a rapidly acting general anaesthetic for use in short operations. It is not recommended for use in major operations.

It is used as an intravenous anaesthetic, 3 ml. usually being sufficient for minor operations. It may be given either as a single dose (for an operation likely to last 10 to 20 minutes), in repeated doses (a second or even third dose may be given), or by continuous intravenous infusion. The induction period is as dramatic, smooth and pleasant as with Evipan, without the twitching or jactitation seen with the latter, and with less fall in blood pressure. The main disadvantage is that it is more depressant to the respiratory centre. The recumbent position is the safest for administration. Pre-medication with barbiturates not advisable. Coramine the most reliable antidote in case of collapse. Used in over 1000 cases.—R. Jarman and A. L. Abel, *Lancet*, i/1936, 422.

Analysis of 100 cases. Administered at the rate of 1 ml. per 20 seconds, the quantity required to reach the stage at which questions were not answered varied from 1.5 to 4.5 ml.; quantities required for surgical anaesthesia varied from 2 ml. to more than 10 ml. Induction was smooth and pleasant. Respiratory depression was more marked than with Evipan sodium, but recovery is more rapid than with any other barbiturate. Its administration requires constant attention and care must be taken not to inject it into the tissues.—O. J. Murphy, *Brit. med. J.*, ii/1936, 1308.

Pentothal is probably the most powerful barbiturate yet produced. In experienced hands it seems to be quite as safe as Evipan, and is certainly a great deal safer than chloroform and its mixtures. Used with care in the selection of cases and technique of administration, there can be no possible doubt that it is one of the most valuable advances in the science of anaesthesia that has been made in recent times.—F. B. Mallinson, *Lancet*, ii/1937, 1070.

Pentothal given intravenously has gradually gained ground at the expense of Evipan. Its use results in an extremely smooth and pleasant induction to anaesthesia, marked relaxation and freedom from the muscular twitching occasionally seen with Evipan. If Pentothal is injected rapidly the desired depth of anaesthesia can be attained by a smaller dose than if it were given slowly. The rapid injection method is used with advantage in two groups of cases, (a) for orthopaedic manipulation in which transient deep anaesthesia is required, and (b) in dentistry. If Pentothal 0.15 to 0.2 g. is injected rapidly an average adult will lose consciousness, allowing for the patient to be given nitrous oxide without his knowledge.—R. R. Macintosh, *Practitioner*, ii/1939, 539.

With careful administration respiratory depression is rare. Post-anaesthetic

headache, nausea and vomiting are rare, and the fall in blood pressure is minimal. Sloughing of tissue and irritation at the site of injection may be prevented by the injection of a 2.5% solution and a maximum dose of 1 g. seldom needs to be exceeded. The injection must be given slowly, taking from 1 to 2 minutes.—H. S. Ruth *et al.*, *J. Amer. med. Ass.*, ii/1939, 1864.

Thrombosis following intravenous injection of 0.5 g. of a 5% solution.—F. Evans, *Lancet*, ii/1939, 252.

FRACTURES. The ideal anæsthetic for use in the reduction of fractures in ambulatory patients, because it produces sufficient muscular relaxation for reduction, can be continued as long as necessary, has short induction and emergence times, is easily administered and has an adequate margin of safety with few contraindications. It is the agent of choice in fractures with an associated head injury.—P. S. Marcus, *New Engl. J. Med.*, i/1940, 137.

[P1-S1-84] **Amytal (Lilly, London)** is isoamylethylbarbituric acid,

Supplied in tablets containing $1\frac{1}{2}$ or $\frac{3}{4}$ gr., also in crystal form.

A white, crystalline powder, with slightly bitter taste; *soluble* in alcohol and ether; very slightly in water; insoluble in paraffin hydrocarbons. M.p. 153° to 155° . Saturated aqueous solutions are acid to litmus.

Dose.—As sedative, $\frac{1}{2}$ to $\frac{3}{4}$ grain (0.02 to 0.04 g.) at 2-hour to 4-hour intervals, with water or hot milk. As hypnotic, $1\frac{1}{2}$ to 5 grains (0.1 to 0.3 g.), 1 to $1\frac{1}{2}$ hours before retiring. As local or general anæsthetic, 3 to 10 grains (0.2 to 0.6 g.) according to age, etc. As antispasmodic in tetanus to control convulsions, 6 to 12 grains (0.4 to 0.8 g.).

Uses. A sedative and hypnotic in the control of insomnia and as a preliminary to surgical anæsthesia. It is stated not to be excreted in the urine and not to affect the kidneys. It also exerts an antispasmodic action and has been employed in the treatment of various types of convulsions of nervous origin and in acute cocaine poisoning.

A hypnotic rather than a true anæsthetic. May be combined with spinal anæsthesia.—J. T. Mason and J. E. Baker, *Lancet*, i/1930, 1302.

In *obstetrics*, 30 mg. per kilo body weight per rectum produces effective anæsthesia and amnesia, with little, if any, effect on the baby.—D. L. Drabkin, *J. Amer. med. Ass.*, ii/1929, 1175; see also *ibid.*, 1339.

[P1-S1-84] **Amytal Compound (Lilly, London)**. Capsules containing amytal $1\frac{1}{2}$ gr. and amidopyrine $3\frac{1}{2}$ gr. Sedative and analgesic.

[P1-S1-84] **Sodium Amytal (Lilly, London)** is the sodium salt of isoamylethylbarbituric acid.

Supplied in capsules containing 1 gr. or 3 gr., and in ampoules containing 0.125, 0.25, 0.5 or 1 g.

This ureide is isomeric with Nembutal. It is a white, friable, hygroscopic, odourless, granular powder with slightly bitter taste; very *soluble* in water, about 1 in 1 of alcohol 90%, and practically insoluble in ether.

Dose.—As sedative or hypnotic in capsules containing 3 grains

(0.2 g.), *per os*, repeated if necessary at 6-hour intervals. As antispasmodic in tetanus, 6 to 12 grains (0.4 to 0.8 g.) to control convulsions.

It is also given by the following methods:

Rectally not exceeding 15 grains (1 g.), with a maximum of 1.5 g. in 3% aqueous solution, followed immediately by injection of 1 or 2 ounces of water.

Intravenously has been given in dose of 5 to 15 grains (0.3 to 1 g.) in 10% solution at rate of 1 ml. per minute. Blood pressure has to be watched continuously. There are many contraindications, and should only be given by this route when oral administration is not feasible.

Intramuscularly not more than 5 ml. of 10% solution should be injected at any one point.

As a pre-anæsthetic the dose is from 3 to 10 grains (0.2 to 0.6 g.)—but only safe for use for this purpose (and in tetanus) by experienced workers familiar with the literature.

Uses. Primarily, as hypnotic for basal narcosis. Also as general hypnotic and in obstetrics, and as an antispasmodic in the treatment of tetanus.

Average fatal dose orally for dogs 125 mg. per kilo; rectally and intravenously in 10% solution, 200 and 70-75 mg. per kilo respectively.—E. E. Swanson and H. A. Shonle, *J. Pharmacol.*, Feb., 1931, 305.

Causes marked drop in blood pressure intravenously. Unconsciousness lasts 3 to 6 hours. Safer *per os* or *per rectum*. In medicine, useful for the control of convulsions in unmanageable cases and as a specific for strychnine poisoning (extensive American bibliography).—L. G. Zervas, *Brit. med. J.*, ii/1930, 897; *Lancet*, ii/1930, 693.

Risk of insufficient pulmonary ventilation in period of sleep (24-48 hours) after operation, and a large number require catheterisation.—J. T. Mason and J. E. Baker, *per Lancet*, i/1930, 1302.

LABOUR. Best procedure in women of average weight $\frac{1}{2}$ to $\frac{3}{4}$ gr. of morphine, $\frac{1}{16}$ to $\frac{1}{8}$ gr. of scopolamine, and 6 to 9 gr. of Sodium Amytal intramuscularly, when contractions are regular and occurring at less than 10-minute intervals—injections repeated as indicated. Intravenous injections given at beginning of second stage of 6 to 10 gr. during several pains, and stopped when patient is well controlled. Rapid in action and has a wide range of safe dosage. No harm to mother and labour not delayed.—A. R. Robbins, *J. Amer. med. Ass.*, ii/1929, 1251.

Amytal and Sodium Amytal as analgesics in confinements. 3 grains at first, late in first stage of labour. If necessary repeat in 4 hours.—*Lancet*, ii/1930, 1086.

Sodium Amytal in labour not well spoken of. Morphine and nitrous oxide or rectal Avertin in preference.—J. Riddell, *Lancet*, i/1931, 162.

Some patients can take enormous doses of Sodium Amytal ingested orally. One patient was taking 30 capsules a day of the 3 grain capsules. She could not go on without it and, if suddenly deprived of it, suffered from severe convulsions. This patient was incoherent in speech and inco-ordinate in her muscular actions; her face was so changed from its normal expression that she looked like a wild idiotic type of person, although normally of a fine character. This patient was deprived of her drug, has remained free from it, and is living a happy, normal life.—A. Lambert, *New Engl. J. Med.*, ii/1936, 74.

Benzedrine sulphate is effective in preventing or counteracting the narcosis produced by the intravenous administration of Sodium Amytal. This action, and the fact that Benzedrine sulphate causes a rapid and prolonged rise in blood pressure, may be found useful in certain medical or surgical cases in which it seems desirable to overcome severe side effects of the narcosis produced by the barbiturates, particularly respiratory embarrassment and pronounced decrease in blood pressure.—A. Myerson *et al.*, *New Engl. J. Med.*, ii/1939, 1015.

[P1-81-84] **Venesetic** (*Parke, Davis, London*). Sodiumisoamylethylthiobarbiturate in dry ampoules containing 1.5 g. with 20 ml. ampoules of sterile water. For intravenous anaesthesia. Anaesthesia occurs in 20 to 60 seconds and lasts for 20 to 30 minutes.

It is employed by intravenous injection as a short-acting barbiturate for basal narcosis immediately preceding general anaesthesia, or as a complete anaesthetic for short operations when given in repeated doses. A freshly prepared 7.5% solution in distilled water (1.5 g. in 20 ml.) is injected intravenously in exactly the same way and observing the same precautions as in the case of Evipan sodium and Pentothal sodium, and it would appear that the results are almost indistinguishable from those obtained with the latter preparations.—C. Langton Hewer (Therapeutic Trials Committee), *Brit. med. J.*, i/1939, 109.

[P1-81-84] **Phanodorm** (*Bayer Products, London*). CYCLOHEXYNylethylbarbituric acid; known in U.S.A. as PHANODORN.

Dose.—Average dose 1 tablet (3 grains). In mild insomnia, 1½ grains; obstinate insomnia, 3 to 6 grains. Larger dose not repeated in less than 12 hours.

A white, crystalline powder, with bitter taste; **soluble** in alcohol and ether, only slightly soluble in water.

Uses. Sedative in nervous conditions and insomnia. In nerve affections to be taken in warm water. Is stated to be more rapidly eliminated than barbitone, and hence its action is of shorter duration.

[P1-81-84] **Phanodorm Calcium** (*Bayer Products, London*). Tablets containing Phanodorm and calcium. **Dose.**—As for Phanodorm.

[P1-81-84] **Hebaral Sodium** (*Parke, Davis, London*). Known as Ortol-Sodium in U.S.A. The sodium salt of normal hexylethyl barbituric acid. **Average dose.**—1 to 2 capsules of 3 grains each. Hypnotic and sedative.

[P1-81-84] **Hexobarbitonum** (*B.P. Add. III*). **Syn. and Prop. Names.** HEXOBARBITAL, METHEXENYL, HEXANASTAB-ORAL (*Boots, Nottingham*), EVIPAN (*Bayer Products, London*); known in U.S.A. as EVIPAL.

Dose.—4 to 8 grains (0.25 to 0.5 g.).

Hexobarbitone is 5-Δ¹-cyclohexenyl-5-methyl-N-methylbarbituric acid, occurring as a colourless, crystalline, odourless powder with a slightly bitter taste; m.p. 145° to 147°.

Sparingly **soluble** in water, but soluble in alcohol, acetone and other organic solvents; also soluble in alkali hydroxides, but not in solutions of alkali carbonates.

Uses. A rapidly absorbed hypnotic with immediate intensive action of short duration. It is employed for the relief of insomnia not due to pain, sleep following within ten minutes of administration. It is rapidly excreted and is said to be free from habit formation.

[P1-81-84] **Hexobarbitonum Solubile** (*B.P. Add. III*). **Syn. and Prop. Names.** SOLUBLE HEXOBARBITAL, METHEXENYL SODIUM, CYCLONAL SODIUM (*Pharmaceutical Specialities (May & Baker)*

Ltd., London), EVIPAN SODIUM (Bayer Products, London), HEXANASTAB (Boots, Nottingham).

Dose.—3 to 15 grains (0.2 to 1 g.), as a 10% solution, for intravenous or intramuscular injection; $\frac{1}{2}$ to 1 drachm (2 to 4 g.), *per rectum*.

Soluble hexobarbitone is the mono-sodium salt of hexobarbitone, occurring as a white, odourless, very hygroscopic powder.

Readily **soluble** in water, alcohol and acetone; slightly soluble in chloroform and ether; insoluble in benzene. The aqueous solution is not stable for more than two or three hours and should be freshly prepared before use, since it absorbs carbon dioxide from the air with the deposition of hexobarbitone. Before use it is important to ensure that the powder is completely dissolved and the resulting solution clear.

Toxic Effects. Muscular twitchings of the arms and face, and sometimes extending over the whole body, are of fairly frequent occurrence; premedication with morphine and scopolamine tends to prevent their occurrence. Respiratory depression occurs during operation; this is usually only temporary, but fatal respiratory failure has occurred in a few cases. In cases of collapse following administration an injection of from 5 to 10 ml. of nikethamide is of value. Excitement or restlessness after operation is sometimes a cause of trouble and occasionally a dose of morphine may be found necessary. Apparent overdose or delayed recovery is best treated by an intravenous injection of 2 ml. of a 0.3% solution of picrotoxin.

Details of 6 fatalities.—G. Slot and A. H. Galley, *Brit. med. J.*, ii/1934, 204.

A case of late paralysis due to Evipan administration.—J. V. Landon and M. Salleh, *Brit. med. J.*, ii/1934, 940. See also F. B. Mallinson, *ibid.*, 1025.

Most authorities lay stress on the advisability of slow injection.—J. Blomfield, *Med. Annu.*, 1935, 21.

Preliminary Report of the Council on Pharmacy and Chemistry of the A.M.A.—Evipal soluble (Evipan sodium) was introduced as a general anæsthetic to be injected intravenously before adequate studies had been made of it under a great variety of conditions. It probably has a narrow field of usefulness in which it may be employed with relative safety, provided it is used with skill and with due regard for its limitations. It is believed that the anæsthetic is wholly or partly responsible for forty-three deaths (listed in the report), though several of these would have occurred with any anæsthetic, and in the absence of any.—*J. Amer. med. Ass.*, i/1937, 1172.

Contraindications. It should not be employed in patients with impaired liver function, in acute inflammatory conditions of the respiratory tract or where any respiratory obstruction exists or may arise; its use is not advisable in patients with asthma. It is also contraindicated in advanced cardiac disease, in septicæmia, and in the presence of general debility and low blood pressure. It should be used with care in patients with diseases of the central nervous system, and its employment is not advised in old and feeble persons.

Uses. Soluble hexobarbitone is a convenient anæsthetic for surgical and dental operations of short duration. Its action is remarkably evanescent, consciousness returning within ten to twenty minutes after administration of a full dose. It may be used

either alone or as a preliminary to an inhalation anaesthetic, and is usually employed by intravenous injection, though it has also been used intramuscularly and *per rectum*. With the patient lying down the solution should be introduced slowly into the vein through a small needle. Injection at the rate of 1 ml. in 3 seconds is made of 2.5 or 3 ml.; this is followed by a pause of 30 seconds; if unconsciousness follows this will last for 2 to 3 minutes, but if unconsciousness does not follow 2 or 3 more ml. are injected, and anaesthesia should then last for 5 minutes; for anaesthesia lasting 10 to 20 minutes, from 5 to 7 ml. are given without a pause. A single dose of 10 ml. should never be exceeded. It should never be administered single-handed nor to patients in the upright position.

In addition to its use in surgery, soluble hexobarbitone has also been employed for the relief of pain in childbirth, and has been used with success in the treatment of tetanus and cocaine poisoning.

A method of minimising respiratory depression when using soluble barbiturates (e.g., Evipan or Nembutal) intravenously, by the incorporation of a respiratory stimulant in the same solution with the anaesthetic. Starting with a solution of the barbiturate, made so that each 1 ml. of the solution contains 100 mg. of barbiturate, 25 mg. of the stimulant (Coramine) is added to each 1 ml. of the solution. The needle is kept in the vein throughout the operation, and the same principle of intermittent administration is utilised as is employed in the semi-open method of administration of ethyl ether. To ensure that respiratory exchange is taking place a fluffy piece of cotton is fastened to the upper lip by a narrow piece of adhesive tape. Patency of the airway must be maintained by sustaining the lower jaw. Encouraging results obtained.—J. S. Lundy, *Proc. Mayo Clin.*, 1935, 791.

A splendid addition to anaesthetics if we realise its limitations, and that what is gained by steadiness of anaesthesia may be lost by restricted flexibility. It is a light anaesthetic, having the advantage of ease of induction over gas and oxygen, but it is doubtful if it is really better than the older methods, and in the case of really extensive operations there are no advantages. It is now recognised that its use should be restricted to those with a sound knowledge of drugs and general anaesthetic routine, and its simplicity should not tempt the operator to give his own injections. All the advantages may be offset by chest complications caused by respiration depression, and occasionally there is excitement necessitating supervision for many hours, while the stupor which sometimes follows makes it difficult to judge as to the rallying of the patient, thus making excessive demands upon the nurses, as the patient must be watched continuously to avoid obstruction of the breathing.—H. T. Roper-Hall, *Proc. R. Soc. Med.*, Jan., 1936, 276.

DELIRIUM TREMENS. The intravenous injection of 2 ml. of a 10% solution produced striking effects in three cases. The patients suddenly stopped struggling and relaxed, and then dropped into a deep sleep. A further injection of 1 ml. was then given. The pulse and respiration rates returned to normal and sweating ceased. Sleep lasted for 18 to 24 hours and the patients woke free from delirium and with no recollection of it.—P. Sperber, *New Engl. J. Med.*, 1/1937, 1065.

Rectal Anaesthesia. Evipan sodium was successfully employed *per rectum* as a basal anaesthetic in 518 cases. The patient receives 0.2 ml. of a 10% aqueous solution per pound body weight, i.e., a total of 30 ml. for a man weighing 150 lbs. A preliminary enema of sodium bicarbonate is given two hours before administration; no soap-suds enema is required. From 40 to 60 minutes before the Evipan sodium is administered morphine or Dilaudid is injected hypodermically. The solution of Evipan is prepared by dissolving 3 g. in 30 ml. of distilled water which is then drawn into a 30 ml. glass syringe with a very small catheter attached, the calibre fitting the syringe exactly. The entire contents of the syringe are then rapidly injected and the catheter clamped and left *in situ* until the patient falls asleep. It is a practical and satisfactory method, eliminating the dangers inherent

in intravenous use. In none of the cases was there any untoward symptoms during operation, and in only 2% was there post-operative excitement.—A. E. Jones, *J. Amer. med. Ass.*, i/1938, 1419.

[P1·S1·S4] **Narconumal** (Roche Products, Welwyn Garden City). $C_{11}H_{12}O_3N_2Na = 229.2$.

Dose.—5 to 30 grains (0.3 to 2 g.) as a 10% solution for intravenous injection.

The sodium salt of 1-methyl-5:5-allylisopropylbarbituric acid, supplied in 1 g. ampoules together with 10 ml. ampoules of distilled water.

Contraindications are the same as those for soluble hexobarbitone.

Uses. As a basal hypnotic for the induction of anæsthesia, or for producing full surgical anæsthesia of long or short duration. The patient should be prepared as for an inhalation anæsthetic. As a basal narcotic up to 10 ml. of a 10% solution is given intravenously, the anæsthesia being completed with ether or gas and oxygen followed by ether. For the induction of short anæsthesia from 4 to 5 ml. is injected in four to five minutes, followed by a pause of 30 seconds, and then by the injection of 2 ml. per minute up to an average of 7 ml. for women and 9 ml. for men. For prolonged anæsthesia 11 ml. is injected during the first 15 minutes and then a maintenance dose of 2 ml. every quarter of an hour up to a total of 20 ml. if required. The recovery period is from 20 to 25 minutes after a dose of 4 ml. and about 1½ hours after a dose of 8 to 10 ml. After returning to bed an airway must be maintained until full consciousness returns, and the patient must not be left unattended.

[P1·S1·S4] **Phenobarbitonum** (B.P.). *Syn. and Prop. Names.* 5-PHENYL-5-ETHYLBARBITURIC ACID, PHENYLETHYLMALONYL UREA (*Fr. Cx.*), PHENOBARBITALUM (U.S.P. XI, *P. Helv. V*, *P. Jap. V*), ACIDUM PHENYL-ÆTHYLICOBARBITURICUM (*P. Ned. V*, *P.G. VI*, *P. Svec. X*, *F.E. VIII*, *P. Dan.*), LUMINAL (*Bayer Products, London*), GARDENAL (*Pharmaceutical Specialities (May & Baker) Ltd., London*), SOMONAL (*Richter, London*).

NOTE.—The name "Barbitone" is applied in error in *Fr. Cx.* as a synonym for Phenobarbitone.

Dose.—½ to 2 grains (0.03 to 0.12 g.). More is sometimes given; where there is much excitement, 5 to 6 grains up to 12 grains (0.8 g.), the maximum dose as given in *P. Belg.*; *U.S.P. XI*, average dose ½ grain. *Fr. Cx.* has maximum single dose 3 grains, maximum in 24 hours 7½ grains.

A white powder, melting at 173° to 177°.

Soluble about 1 in 1000 of water, 1 in 15 of alcohol 90%, 1 in 40 of ether, 1 in 50 of chloroform. Readily soluble in aqueous alkali hydroxides and carbonates.

Toxic Effects. These are similar to those produced by barbitone, the most common symptom of intoxication being the formation of a rash, especially where there is an idiosyncrasy to the drug.

The treatment of acute poisoning is the same as for barbitone.

A patient who had taken 18 gr. of Amytal and 60 gr. of phenobarbitone failed to respond to strychnine in convulsive doses. A voluntary motion of the head was made after the first injection of picrotoxin (dose not stated), and uneventful recovery followed the injection of a total of 131 mg. of picrotoxin during 48 hours.—S. J. Cohen and R. Kohn, *J. Pharmacol.*, 1937, 60, 102.

Contraindications. Pulmonary and cardiac disease, arteriosclerosis, nephritis and parkinsonism.

Phenobarbitone and probably other barbiturates are contraindicated in parkinsonism; they cause a marked aggravation of the rigidity.—E. and E. S. Ziskind, *J. Amer. med. Ass.*, ii/1937, 20.

Uses. Phenobarbitone and soluble phenobarbitone are employed for their hypnotic and sedative action. They have a greater intensity of action than barbitone and a smaller margin of safety. The range of uses is similar to that of barbitone except that phenobarbitone is used more especially in the treatment of epilepsy, though tolerance may follow its prolonged use in these cases.

EPILEPSY treated by Luminal. Doubtful whether 5 or 6 grains should be exceeded as a single dose *per os*. Rashes and poisoning symptoms—headaches, vertigo, lethargy, etc. Also of use in migraine, insomnia (1 to 1½ grains at bedtime), aurial vertigo. Recurrent attacks well treated. Also in cutaneous affections with a neurotic factor.—W. Russell Brain, *Lancet*, ii/1929, 867.

At the David Lewis Colony, treatment is instituted with 2 gr. of soluble phenobarbitone dissolved in ½ oz. of water and given each morning. At the end of 2 weeks any nausea or sleeplessness should have disappeared. The case is reviewed at the end of a month and appropriate alterations made (e.g., alteration of dose, time of giving, etc.). The drug may be stopped at the end of 6 months if no change has been produced or is expected. Administration is safe over long periods. In 1933 over 400 patients were taking the drug regularly: some had taken it daily for more than 12 years. No knowledge of a single case of phenobarbitone addiction in an epileptic, and no instance of Luminal skin rash has been observed.—R. Handley, *J. ment. Sci.*, 1934, 80, 526.

PAINFUL CONDITIONS. Hypodermic injection of 1½ grains effective in severe pain, such as tabetic crises and herpes zoster. Relief in 20 to 30 minutes.—L. Gunther and H. M. F. Behneman, *per J. Amer. med. Ass.*, ii/1928, 832.

VOMITING OF PREGNANCY completely controlled by ½ to 1 grain of Luminal nightly, but tends to recur if drug is omitted. Non-toxic in this dose over long periods.—A. Elliott, *Brit. med. J.*, ii/1931, 1119.

WHOOPIING COUGH. To control the severity of paroxysms which are threatening life by their mechanical violence or by imminent secondary complications, Luminal Sodium is of proved value. In the presence of vomiting, the amount of drug administered by the mouth is probably not absorbed, but two or three doses given intramuscularly appear to act as a specific in checking the vomiting, when oral administration may be resumed. Careful adjustment of dosage to bodyweight, and constant observation of its action in controlling the spasms short of producing undue somnolence, make it a valuable therapeutic weapon apparently free from risk even in infants.—William Gunn, *Practitioner*, ii/1936, 521.

[P1-81-84] **Elixir Phenobarbitoni (B.P.C.).**

Dose.—1 to 2 drachms (4 to 8 ml.).

A flavoured preparation containing ½ gr. of phenobarbitone per drachm (0.5%) and coloured yellow. To avoid waste the quantities of each of the volatile oils should be reduced by 25%.

[P1·81·84] **Elixir Phenobarbitali** (N.F. VI) contains 0·4% of phenobarbital, and coloured red.

[P1·81·84] **Tabellæ Phenobarbitoni** (B.P.C.) contain $\frac{1}{2}$ gr. (0·03 g.).

[P1·81·84] **Tabellæ Phenobarbitoni et Theobrominæ** (B.P.C.). *Prop. Names.* TAB. XANTHARBIN (*Thackray, Leeds*), THEOBA (*Burroughs Wellcome, London*), THEOGARDENAL TABLETS (*Pharmaceutical Specialities (May & Baker) Ltd., London*), THEOTONE TABLETS (*Allen & Hanburys, London*), THEOMINAL TABLETS (*Bayer Products, London*).

Dose.—1 or 2 tablets.

Phenobarbitone $\frac{1}{2}$ gr. and theobromine 5 gr. For high blood pressure, angina pectoris and menopausal disorders.

[P1·81·84] **Alepsal** (*Genecrier, Neuilly; Wilcox, Jozseau, London*). Tablets containing phenobarbitone $1\frac{1}{2}$ gr., powdered belladonna $\frac{1}{8}$ gr., and caffeine $\frac{1}{2}$ gr. Also issued in medium and weak strengths. In epilepsy, migraine and spasmodic affections.

[P1·81·84] **Cafinal** (*Bayer Products, London*). Tablets of Luminal $\frac{1}{2}$ gr., and caffeine $\frac{1}{2}$ gr. *Dose.*—1 to 3 tablets daily. In migraine, epilepsy, dysmenorrhœa, etc. [P1·81·84] **Cafinal Compound** tablets, containing Cafinal with scopalamine hydrobromide, ephedrine, papaverine hydrochloride, atropine methylobromide and strychnine nitrate. For travel sickness. *Dose.*—3 half an hour before starting.

[P1·81·84] **Optinoktin** (*Richter, London*). Phenobarbitone 0·1 g., bromoisovalerylurea 0·2 g., amidopyrine 0·2 g. *Dose.*—1 or 2 tablets nightly. Neuralgia, migraine, etc.

[P1·81·84] **Nulepsi** (formerly known as **Salepsi**) (*Coates & Cooper, London*). Each pill contains phenobarbitone 0·05 g., solanaceous alkaloids 0·00005 g., cascara sagrada 0·1 g., valerian 0·04 g. *Dose.*—1 to 4 daily. Also available in solution. For epilepsy.

[P1·81·84] **Theobromal** (*Richter, London*). Tablets contain theobromine calcium salicylate $4\frac{1}{2}$ gr., phenobarbitone $\frac{1}{2}$ gr. *Dose.*—1 tablet three times daily. Hypertension, angina pectoris.

[P1·81·84] **Phenobarbitonum Solubile** (B.P., P.G. VI, P. Ned. V Supp. II, P. Helv. V, P. Svec. X, P. Dan.). *Syn.* SODIUM PHENOBARBITONE, PHENOBARBITALUM SOLUBILE (U.S.P. XI, P. Helv. V, P. Jap. V), GARDENAL-SODIUM (*Pharmaceutical Specialities (May & Baker) Ltd., London*), LUMINAL-SODIUM (*Bayer Products, London*), SOMONAL SODIUM (*Richter, London*).

Dose.— $\frac{1}{2}$ to 2 grains (0·03 to 0·12 g.). It has also been given hypodermically in doses of $\frac{1}{2}$ to 3 grains (0·03 to 0·2 g.) daily in 20% solution, e.g., in epilepsy. P.G. VI states max. single dose 6 grains, max. daily dose 12 grains; P. Helv. V has 3 and 5 grains approx. respectively.

It is the mono-sodium derivative of phenobarbitone, and occurs as a white hygroscopic powder with bitter taste.

Soluble readily in cold water and in alcohol 90%; insoluble in ether or chloroform. Aqueous solutions should be freshly prepared with recently boiled and cooled water.

Incompatible with ammonium salts as they decompose quickly, also with acids and acidic substances which precipitate phenobarbitone. In preference give it alone. Solutions should not be

heated, since phenylethylacetylurea is precipitated. The same decomposition may occur on long standing.

DECOMPOSITION IN AQUEOUS SOLUTION. Soluble phenobarbitone slowly hydrolyses in solution with production of CO_2 and a precipitate of phenylethylacetylurea. A 10% solution (pH 9.4) decomposes only to the extent of 1% at 20° in three weeks. The more strongly alkaline solutions decompose somewhat more rapidly than those containing less alkali.—L. Nielsen, *Dansk. Tidsskr. Farm.*, 1933, 7, 137.

PHENOBARBITONE SOLUTION FOR INJECTION. The instability and alkalinity of solutions of soluble phenobarbitone make it unsuitable for injection. The following solution has been found satisfactory:—Phenobarbitone 20 g., amylene hydrate 38 g., ethyl urethane 35 g., water 7 ml. Sterilise by filtration using pressure rather than suction in order to avoid evaporation.—E. V. Christensen, *Arch. Pharm. Chem.*, 1932, 89, 529.

An aqueous solution of soluble phenobarbitone is unstable, but the following solution can be heated to 60° to 65° for 30 minutes on two successive days without any appreciable decomposition occurring. Phenobarbitone 10 g., diethylamine 2.75 g.; dissolve and add a sufficient quantity of a mixture containing alcohol 26 g., glycerin 31 g. and water to 100 ml., to produce a 5% or 20% solution.—C. J. Blok, *Pharm. Weekbl.*, 1935, 1221.

Phenobarbitone 3.0 g., soluble phenobarbitone 6.72 g., urethane 2.5 g., alcohol 95% 15 g., glycerin 12.5 g., water to 100 ml. In 3 months at 12° only 0.55% of the phenobarbitone decomposes, the loss being only $\frac{1}{2}$ that in aqueous solutions. If sterilised at 80° for 2 hours the loss is about 0.75%. No precipitation of phenylethylacetylcarbamide occurs until the decomposition amounts to 12%.—L. Nielsen, *Dansk. Tidsskr. Farm.*, 1937, 65.

[P1-S1-84] **Mistura Phenobarbitoni** (Gt. Orm. H.). (Dose for 1 year old child). Soluble phenobarbitone $\frac{1}{2}$ gr., potassium bromide 2 gr., elixir of gluside $\frac{1}{2}$ m., chloroform water to 1 dr.

[P1-S1-84] **Tabellæ Phenobarbitoni Solubilis** (B.P.C.). Contain $\frac{1}{2}$ gr. (0.03 g.).

[P1-S1-84] **Elixir Phenobarbital Co.** (Duncan, Flockhart, Edinburgh). Each fl. dr. contains soluble phenobarbitone $\frac{1}{2}$ gr., potassium bromide 5 gr. Dose.—1 to 2 fluid drachms. Hypnotic and sedative.

[P1-S1-84] **Epilamin** (Richter, London). Tablets containing sodium phenobarbitone $\frac{1}{2}$ gr., potassium bromide 10 gr., calcium glycerophosphate $\frac{1}{2}$ gr., calcium formate 3 gr., vitamin D 300 units. Dose.—1 to 5 tablets daily. Epilepsy.

[P1-S1-84] **Lubrokral** (Coates & Cooper, London). Tablets of potassium bromide 9 gr., and soluble phenobarbitone $\frac{1}{2}$ gr. Dose.—1 tablet 3 times daily. Convulsions and nervous insomnia.

[P1-S1-84] **Pheimitonum** (B.P. Add. III). Prop. Name. PROMINAL (Bayer Products, London). $\text{C}_{13}\text{H}_{14}\text{O}_3\text{N}_2 = 246.1$.

Dose.— $\frac{1}{2}$ to 6 grains (0.03 to 0.4 g.).

N-methyl-5-phenyl-5-ethylbarbituric acid, occurring as a white, crystalline powder; m.p. 178° to 181°.

Almost insoluble in cold water, but freely soluble in hot water; also soluble in organic solvents and alkali hydroxides.

Uses. Anti-epileptic and spasmodic with hypnotic action.

EPILEPSY. Led to a striking reduction in the incidence of fits in 10 cases and patients were more bright, cheerful and contented. In four cases Prominal was substituted for Luminal with improved results. The usual dose was 3 grains once or twice daily. A daily dose showed no cumulative effect.—L. G. M. Page, *Brit. med. J.*, i/1936, 531. Results corroborated in four cases.—L. Barber, *ibid.*, 666.

Experience with 39 mentally defective epileptics showed that the frequency of fits while patients were under treatment with Prominal was only one-third the frequency during treatment with Luminal. Dosage was adjusted to individual requirements, adults usually receiving 3 gr. three times a day, which can be taken without ill effects for long periods. A large proportion of cases showed improvement in the non-convulsive manifestations of epilepsy.—C. Guy Millman, *Brit. med. J.*, ii/1937, 61; see also *ibid.*, 63.

[P1-81-84] **Protheonal** (*Bayer Products, London*). Tablets containing Prominal 1 gr., theobromine $7\frac{1}{2}$ gr., and iodo-calcium-triethanolamine $2\frac{1}{2}$ gr. equivalent to $1\frac{1}{2}$ gr. of iodine. For raised blood-pressure, arteriosclerosis, angina pectoris and menopausal vasomotor symptoms. *Dose*.— $\frac{1}{2}$ to 1 tablet three times a day.

[P1-81-84] **Phenylmethylbarbituric Acid** (*P. Ned. V Supp. II*). *Prop. Name* RUTONAL (*Pharmaceutical Specialities (May & Baker) Ltd., London*). A white, crystalline powder, slightly soluble in water and soluble 1 in 54 of alcohol. M.p. 226° .

Dose.—On the first day one 3-grain tablet in the morning and one at night to test the patient's tolerance, increasing to 4 or 5 tablets in 24 hours. Hypnotic and sedative; specially indicated in epilepsy.

[P1-81-84] **Allobarbitonum** (*B.P.C.*). *Syn.* ALLOBARBITALUM (*P. Helv. V*), 5:5-DIALLYLBARBITURIC ACID, DIALLYLMALONYLUREA.

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.18 g.). *P. Helv. V* has max. single dose 3 grains, max. in 24 hours 5 grains.

A white, odourless, crystalline powder with a slightly bitter taste. M.p. 171° to 172° . Prepared by the condensation of ethyl diallylmalonate with urea.

Soluble in alcohol and ether, and in alkaline solutions; slightly soluble in water.

Uses. A sedative and hypnotic for nervous insomnia and to induce narcosis in conditions of severe agitation. It is said to be more readily absorbed than barbitone. Death may be caused by 30 gr., but the average fatal dose is more than double this quantity. Idiosyncrasy, with a rash and fever, may occur.

[P1-81-84] **Cibalgin** (*Ciba, Horsham*).

A compound of amidopyrine with Dial (0.25 g. = 0.22 g. of amidopyrine and 0.03 g. of Dial).

Tablets 4 grains (0.25 g.): *Dose*.—1 to 4. Liquid for oral use, 1 ml. contains Cibalgin 0.25 g. (4 grains), urethane 0.28 g. ($4\frac{1}{2}$ grains), monoethylurea 0.28 g. ($4\frac{1}{2}$ grains): *Dose*.—1 to 4 ml. Also supplied in ampoules each containing 2.3 ml. of liquid: *Dose*.— $\frac{1}{2}$ or 1 ampoule daily. The tablets and liquid should be taken with a little warm water or tea, but not in coffee. In neuralgia, migraine, and other types of pain, e.g., dysmenorrhœa, articular and muscular pain.

[P1-81-84] **Dial** (*Ciba, Horsham*). Allobarbitone, supplied in tablets, each containing $1\frac{1}{2}$ grains (0.1 g.). Liquid for oral use; 1 ml. contains Dial $1\frac{1}{2}$ grains (0.1 g.), urethane 6 grains (0.4 g.), and monoethylurea 6 grains (0.4 g.). Also supplied in ampoules each containing 2.3 ml. of the liquid.

[P1-81-84] **Dialacotin** (*Ciba, Horsham*). Tablets contain 4 gr. of allyl-p-acetamino-phenol and $1\frac{1}{2}$ gr. of Dial. For use as combined hypnotic, analgesic and antipyretic. *Dose*.—As hypnotic, 1 to 2 tablets with hot drink one hour before bedtime. As sedative, $\frac{1}{2}$ to 1 tablet one to three times a day.

Nocturnal fits in epilepsy often respond to this ($\frac{1}{2}$ to 1 tablet at night, or twice daily) when other remedies fail.

[P1-81-84] **Didial** (*Ciba, Horsham*). Tablets contain $\frac{1}{2}$ gr. of ethylmorphine and $1\frac{1}{2}$ gr. of Dial. A powerful hypnotic for severe insomnia. *Dose*.—1 tablet. For the induction of "twilight sleep," one to three tablets.

[P1-81-84] **Somnifaine** (*Roche Products, Welwyn Garden City*). A water-glycerin-alcohol solution of the diethylamine salts of diethylbarbituric acid (barbitone) and allylisopropylbarbituric acid, containing the equivalent of 0.1 g. (about $1\frac{1}{2}$ gr.) of each acid per ml. Available as a flavoured oral solution in drop bottles or in ampoules for injection.

Dose.—Orally, 20 to 40 drops (about 8 to 16 m.) 30 minutes before retiring; may be increased up to 60 drops (25 m.). To be taken in water or other vehicle. By injection, 1 ampoule (2 ml.) intramuscularly. In case of urgency, 2 to 3 ampoules by very slow intravenous injection.

Uses. A powerful sedative and hypnotic indicated in all conditions of excitement, ravings, or convulsions, in eclampsia, status epilepticus, tetanus, strychnine and cocaine poisoning. Also used in the "twilight sleep" treatment of certain mental disorders.

PSYCHOSES. Treatment of psychoses by prolonged narcosis—intramuscular injection of Somnifaine in 2 ml. doses, sufficient to ensure continuous sleep for 10 to 12 days, feeding with fluids being carried out before each injection and at intervals when possible; largest daily dose usually 8 ml. The treatment is dangerous (3 deaths in 60 cases) but often produces definite, and sometimes dramatic, improvement. The concurrent administration of insulin with glucose made for smoother treatment.—D. N. Parfitt, *Lancet*, i/1936, 424.

As this high mortality rate (5%) might well dissuade others from carrying out this valuable form of treatment it should be pointed out that it is not in accord with experience at Cardiff City Mental Hospital. When Somnifaine alone was used there were 2 deaths in 86 treatments (2.3%); but since glucose and insulin have been used to combat toxic symptoms 154 cases have been treated without a single fatality. With careful nursing in a darkened single room, it is rarely found necessary to give more than 4 ml. of Somnifaine in the 24 hours.—P. K. McCowan, *Lancet*, i/1936, 508.

In spite of the attractive theory of disturbed carbohydrate metabolism after Somnifaine, the fact must be faced that the use of insulin in prolonged narcosis is purely empirical. The danger of relying upon insulin as a preventive, and the urinary analysis as an indication of toxæmia, is that the physician may be tempted to neglect that close clinical observation of the patient which is the only efficient safeguard. It cannot be too strongly emphasised that the patient's life may be jeopardised without a trace of acetone appearing in the urine.—D. Menzies, *Lancet*, ii/1937, 713.

STATUS EPILEPTICUS. Somnifaine intramuscularly advocated as an efficient remedy. Lumbar puncture and free drainage of spinal fluid, with Sodium Luminal, 6 grains intravenously, also recommended as immediate measures for checking seizures. A 50% solution of magnesium sulphate *per os* cleans alimentary tract and reduces intracranial pressure.—F. McLaughlin, *Practitioner*, ii/1932, 714.

[P1-S1-S4] **Allonal** (*Roche Products, Welwyn Garden City*). A combination of allylisopropylbarbiturate of amidopyrine 0.126 g. (approx. 2 gr.) and amidopyrine 0.034 g. (approx. $\frac{1}{2}$ gr.), equivalent to about 1 gr. of allylisopropylbarbituric acid and $1\frac{1}{2}$ gr. of amidopyrine.

Dose.—1 to 2 tablets as sedative or hypnotic in simple cases of insomnia, 2 to 4 as analgesic and hypnotic.

2 tablets quickly relieve pain in neuralgia, neuritis, rheumatism, sciatica, etc. Is not habit-forming, and has low toxicity. *Not more than 4 or 5 tablets daily advised until patient's susceptibility is ascertained.*

Death of a woman who had taken 10 tablets a day for more than a year.—*Pharm. J.*, i/1932, 117, 139.

[P1-S1-S4] **Ipral Sodium** (*Squibb, New York; Savory & Moore, London*). Sodium ethylisopropylbarbiturate. A hypnotic and sedative for oral use in pre-anæsthetic medication. **Dose.**—8 gr. (2 tablets) the night before operation and repeated the next morning 2 hours prior to anaesthesia. Also supplied in the form of an elixir. **Ipral-Aspirin Tablets** contain 5 gr. of aspirin and 1 gr. of Ipral, and are employed for the relief of pain and insomnia. **Ipral-Calcium Tablets** 2 gr., are employed as a sedative for ordinary insomnia.

[P1-S1-S4] **Pernocton** (*Riedel-de-Haen, Berlin; Endocrines-Spicer, Watford*). *Syn.* BUTYL- β -BROMALLYL-BARBITURIC ACID; known as PERNOSTON in U.S.A. $C_{11}H_{15}O_3N_2Br = 303.16$.

Issued in ampoules containing $3\frac{1}{2}$ grains in 2.2 ml. Average hypnotic dose intravenously 3 ml. (containing $4\frac{1}{2}$ grains), given

at the rate of 1 ml. per minute. Also available in 5 ml. ampoules, and in tablets containing 3 gr.

Resembles Sodium Amytal in action, but is a more powerful hypnotic. In addition, there is less restlessness during recovery period, and no fall in blood pressure.

DENTAL WORK. Pernocton intravenously. A good anæsthetic, conducting operation under gas and oxygen through a Magill tube. Nembutal and Avertin also suitable, but no advantage over Pernocton.—R. R. Macintosh, *Brit. dent. J.*, Feb. 15, 1932.

MORPHINISM. A cure obtained in from 4 to 5 days, in the patient's own home, in all but one of 12 cases. Twilight sleep is induced during this period by three injections at 8 a.m., 4 p.m. and midnight, Pernocton 2 ml. intravenously and 2.2 ml. intramuscularly being injected thrice daily. To the intramuscular injection is added 0.002 g. of atropine to obviate the disorders of abstinence. Food in fluid form given prior to each injection, and fruit juice and glucose in between.—L. König, *Med. Klinik*, 1935, 246.

[P1-81-84] **Sandoptal** (*Sandoz, London*). *iso*Butylallylbarbituric acid. Tablets contain 3 grains. *Dose*.—In simple insomnia 1 tablet; in persistent insomnia 2 tablets.

[P1-81-84] **Optalidon** (*Sandoz, London*). Sandoptal 0.05 g., amidopyrine 0.125 g., caffeine 0.025 g. *Dose*.—2 tablets several times daily as required. Sedative and hypnotic.

[P1-81-84] **Noctal** (*Riedel-de-Haen, Berlin; Endocrines-Spicer, Watford*). Known as NOSTAL in U.S.A. *iso*Propylbromallylbarbituric acid. *Dose*.—1 or 2 tablets before retiring. Narcotic and sedative.

[P1-81-84] **Seconal** (*Lilly, London*). Sodium propylmethylcarbinyllallylbarbiturate, a rapidly effective barbiturate with short duration of action. *Dose*.—In the first stage of labour the dose is 3 to 4½ gr. initially, followed by doses of 1½ to 3 gr. at intervals when the pains are severe. For pre-operative medication in surgery, 3 to 4½ gr. ½ to 1 hour before operation. For insomnia 1½ gr. or more as required. Supplied in capsules containing 1½ gr.

Sodii Diphenylhydantoinas. *Prop. Names.* DILANTIN SODIUM, EPANUTIN (*Parke, Davis, London*) (1½ gr. capsules), EPTOIN (*Boots, Nottingham*) (1½ gr. capsules), SOLANTOIN (*Glaxo Laboratories, London*) (1½ gr. tablets).

Dose.—1½ grains (0.1 g.) two to four times daily.

Sodium diphenylhydantoinate is the sodium salt of 5:5-diphenylhydantoin. It is an odourless, white or cream-coloured powder with a bitter taste.

Soluble in water, slightly soluble in alcohol, but insoluble in ether or benzene. In aqueous solution it is hydrolysed to the base, and the latter only dissolves if the reaction of the solution is adjusted to pH 11.7.

Toxic Effects. The margin between the therapeutic and the toxic dose is very small and toxic reactions are of not infrequent occurrence; these include dizziness, tremor, ataxia, diplopia, nausea, fever, dermatitis, and swelling of the gums.

Uses. An anticonvulsant for use in the treatment of epileptic patients who fail to benefit under barbiturates and bromides. It appears to be more effective in controlling seizures of the grand

mal type than in those of the petit mal. The initial dosage for adults and children over six years of age is $1\frac{1}{2}$ gr. three times daily. If the seizures are not controlled by this dose in 7 days a further $1\frac{1}{2}$ gr. should be given at bedtime, and the dose may be further increased, if necessary, up to a maximum of 9 grains in 24 hours. Infants and children up to five should be started on a dose of $1\frac{1}{2}$ to 3 gr. daily, increased up to $4\frac{1}{2}$ to 6 gr. daily. If favourable results are not obtained in two or three weeks it is probable that the treatment will not be effective. The drug is more rapidly effective if given before meals, but where it causes gastric irritation it should be given immediately after meals. If the patient is already taking phenobarbitone or bromides, the transition to sodium diphenylhydantoinate should be made gradually, with some overlapping in dosage, thus avoiding the danger of phenobarbitone or bromide withdrawal symptoms and lessening the toxic reactions incident to the commencement of administration of the new drug. It should be used with caution in debilitated patients or in the presence of cardiorenal disease.

In 142 patients with frequent convulsive seizures not relieved by other modes of therapy, the use of sodium diphenylhydantoinate in doses of from 0.2 to 0.6 g. a day over periods varying from 2 to 11 months, gave relief from "grand mal" attacks in 58% with greatly decreased frequency in a further 27%, and relief from "petit mal" attacks in 35% with greatly decreased frequency in a further 49%. There were no fatalities. A toxic dermatitis occurred in 10 patients, nonthrombocytopenic purpura in one patient and minor toxic reactions in 15%.—H. H. Merritt and T. J. Putnam, *J. Amer. med. Ass.*, ii/1938, 1068.

In the treatment of 75 cases mental improvement was observed in the majority. The importance of the toxic action of the drug is emphasised. Many cases exhibited toxic nervous symptoms, but only one developed a rash. These toxic symptoms often developed after an increase in the dose.—D. Blair *et al.*, *Lancet*, ii/1939, 363.

Results sufficiently favourable to warrant an extended trial, and in the younger and less deteriorated epileptics it seems that tolerance to the drug and the benefits therefrom are at least as good as with the other barbiturates. The drug provides in some cases the means of reducing for a time the total of seizures, and given in non-toxic doses it leads to amelioration in some cases where other drugs have not.—J. P. Steel and E. S. Smith, *Lancet*, ii/1939, 367.

Seems to be of value in the treatment of epilepsy in some cases, when other forms of treatment have failed, but there are no indications that it should supersede the less toxic anti-convulsants in the initial stages of treatment. Treatment of 91 chronic epileptics.—D. Williams, *Lancet*, ii/1939, 678.

Of use in the younger and better preserved patients, but on account of its toxic effects it is advisable not to maintain it for more than a few weeks at a time.—S. Davidson and J. D. Sutherland, *Brit. med. J.*, ii/1939, 720.

Will probably prove helpful in some cases of epilepsy, but it shows no promise of surpassing or even equalling phenobarbitone and it is a dangerous remedy, requiring particular circumspection in its use.—M. Critchley, *Practitioner*, ii/1939, 491.

Clinical observations on a group of 38 epileptic patients indicate that the drug possesses high therapeutic activity as an anticonvulsant. It has, however, marked side reactions, and should only be used if milder medication fails.—J. L. Fatterman, *J. Amer. med. Ass.*, i/1940, 396.

Out of 43 epileptics treated, 27 derived benefit in regard to both incidence of fits and psychological outlook. The margin between the therapeutic and the toxic dose is very small.—A. J. M. Butter, *Brit. med. J.*, i/1940, 483.

In the treatment of 60 epileptics the results were on the whole favourable and often striking in comparison with those obtained with other anticonvulsants. Improvement in general physical and mental condition and in the incidence of major and minor attacks. Mild toxic symptoms developed in 12 patients.—R. Coope and R. G. R. Burrows, *Lancet*, i/1940, 490.

Phenylethylhydantoin. (A foreign proprietary was formerly available under the Registered Trade Name NIRVANOL).

[P1] "*Phenylethylhydantoin; its salts; its acyl derivatives; their salts.*"

[S1] "*Phenylethylhydantoin; its salts; its acyl derivatives; their salts.*"

[S7] *Medicines made up ready for the internal treatment of human ailments containing phenylethylhydantoin; its salts; its acyl derivatives; their salts, must be labelled with the words "Caution. It is dangerous to take this preparation except under medical supervision" instead of the word "Poison."*

Dose.—In chorea, the usual daily dose is 0.2 g. to 0.5 g. spread over 2 or 3 doses.

A tasteless crystalline powder, slightly soluble in water.

Uses. Hypnotic and sedative for use in the treatment of chorea. It must only be given under most careful supervision, and treatment must be stopped on the appearance of a rash or an increase in temperature. It should not be administered over lengthy periods.

In chorea, 0.3 g. *per os* daily for a child of 9 to 14 years. In most cases 8 to 14 days after beginning of treatment there is a well marked morbiliform rash accompanied by pyrexia. The drug is then stopped. It causes a change in the blood, *viz.*, a true eosinophilia reaching its maximum just before appearance of the rash. In addition there is generally a leucopenia. Conjunctivitis and oedema of the eyelids should be watched for and treatment stopped immediately. Report of 6 cases with beneficial results.—F. J. Poynton and B. Schlesinger, *Lancet*, ii/1929, 267.

Symptoms improved and attack sometimes cut short in a dramatic way. Only to be used under constant supervision.—C. F. T. East and E. R. Cullinan, *Lancet*, ii/1930, 190.

Purpura hæmorrhagica, nephritis, and a fatal case of dermatitis exfoliativa have followed its use in chorea. Effective, but catastrophe can neither be seen, foreseen nor prevented.—*Lancet*, ii/1931, 545.

No permanent benefit in three obstinate cases of chorea, and one patient suffered a dangerous reaction.—T. D. Jones and J. L. Jacobs, *J. Amer. med. Ass.*, ii/1932, 21.

Only used in severe and stubborn cases. The chief danger is temporary mental derangement and it is not advisable to give it to a mentally deficient child. The drug is stopped when the rash and large glands appear or if there is no reaction on the twelfth day. It is a drug that needs discretion but has been found very serviceable.—*Per Brit. med. J.*, i/1933, 903.

BARIUM

Ba = 137.36.

[P1] "*Barium, salts of, other than barium sulphate and the salts of barium specified in Part II of this List.*"

[P2] "*Barium, salts of, the following:—Barium carbonate, barium silicofluoride.*"

[S1] "*Barium, salts of.*"

[S3] "*Barium, salts of—in witherite other than finely ground witherite.*"

[S6] "*Barium, salts of—specify proportion as the proportion of one particular barium salt which the preparation would be calculated to contain on the assumption that the barium (Ba) in the poison had been wholly converted into that salt.*"

Rule 10 of the Poisons Rules, 1935, exempts from the application of the Pharmacy and Poisons Act, 1933, and of the Rules made under that Act, all articles containing barium carbonate and prepared for the destruction of rats and mice.

[P1-S1] **Barii Chloridum.** *Syn.* BARIUM CHLORATUM (*P.G. VI*).
 $\text{BaCl}_2 \cdot 2\text{H}_2\text{O} = 244.31$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.). *P.G. VI* max. single dose 3 grains; or 9 grains *per diem*.

Colourless crystalline plates, with bitter saline taste. *Soluble* 1 in $2\frac{1}{2}$ of water. Solution is destructive to bacteria. *Incompatible* with sulphates, phosphates, tartrates and carbonates.

Antidotes. Empty stomach by emetic or by stomach tube, using 2 oz. of magnesium sulphate in 2 gallons of water. Give 1-oz. doses of sodium or magnesium sulphate, well diluted, and repeated if necessary. Keep patient warm and give demulcent drinks. Stimulants for collapse.

Uses. It resembles digitalis in action and increases blood pressure by vasoconstriction, but is seldom used in therapeutics owing to its toxicity. It is used principally as a chemical reagent.

1% solution has been used as eye-wash in scrofulous inflammation.

Typhoid has been treated with barium chloride *per os* with good results in 33 out of 35 cases. *Dose.*—1 to $1\frac{1}{2}$ grains, increased progressively to $7\frac{1}{2}$ grains thrice daily for 6 to 7 days with intervals of 3 to 5 days.—*Prescriber*, 1929, 224. No bad results except vomiting. 1.5 g. each day in divided doses for 5 days, with 5-day interval, then repeated for further 5 days.—E. Petrina, *Brit. med. J. Epit.*, 1/1931, 96.

Barii Sulphas (*B.P., Fr. Cx., P.G. VI, U.S.P. XI, etc.*).
 $\text{BaSO}_4 = 233.4$.

Dose.—For X-ray work only, 2 to 5 ounces (60 to 150 g. approx.) in a cornflour or other "meal" of about 6 to 15 ounces.

A white powder *insoluble* in water and acids.

For outlining portions of the alimentary tract, instead of bismuth carbonate and subnitrate (*q.v.*).

Barium sulphate suspensions in olive oil 10, 20%, etc., have been used for bladder examination.

[P1-S1] **Barium Thiosulphate** inadvertently administered in place of barium sulphate has caused death.

Caution.—*Barium carbonate* is also soluble and hence poisonous. Confusion with bismuth carbonate has occurred.

Sulfate de Barium Gelatineux (*Fr. Cx.*) is in paste form, containing 55 to 58% of water.

Pulvis Barii Sulphatis Compositus (*B.P.C.*). *Syn.* BARIUM MEAL, SHADOW MEAL.

Contains 75% of barium sulphate in a cocoa-flavoured powder.

Dose.—4 to 8 ounces (120 to 240 g.) mixed immediately before use with sufficient boiling water poured directly on to the powder.

Emulsio Barii (*Brompton H.*). Barium sulphate 4 oz., tragacanth 40 gr., water to 12 oz.

Emulsio Barii Sulphatis (*C.X.H.*). Barium sulphate 10 oz., essence of raspberry 60 m., soluble saccharin 1 gr., mucilage of tragacanth to 20 oz.

Gt. Orm. H. has barium sulphate 2 oz., dried milk 1 oz., sugar $\frac{1}{2}$ oz., cocoa 40 gr., compound powder of tragacanth 30 gr.

R.I. Edin. has barium sulphate 1 oz., sugar half a teaspoonful, oatflour 2 teaspoonfuls, suspended in milk. This is given at 5 a.m. on the day of examination. At 10 a.m., shortly after the first series of radiographs has been taken, a second meal is given consisting of barium sulphate 4 oz., mucilage of acacia *q.s.*, water to 10 oz.

St. Mark's H. has barium sulphate 5 oz., tragacanth 45 gr., alcohol 90% 30 m., elixir of saccharin 30 m., vanillin $\frac{1}{2}$ gr., water to 10 oz.

U.C.H. has barium sulphate 10 oz., mucilage of starch q.s., vanillin $\frac{1}{2}$ gr., saccharin $\frac{1}{2}$ gr., alcohol 90% 1 dr., chloroform 5 m., water to 1 pint. (For average dose.)

Enema Barii Sulphatis (*C.X.H.*). Barium sulphate 8 oz., mucilage of tragacanth to 20 oz. *U.C.H.* has barium sulphate 40 oz., tragacanth powder 1 dr., water to 80 oz.

Barolac (*Burroughs Wellcome, London*). A 30% suspension of finely divided barium sulphate containing no mucilaginous suspending agent.

Fotamilko, Fotamealo and Fotonemal (*Evans, Sons, Lescher & Webb, Liverpool*). Barium sulphate meals in powder form; the first contains dried full-cream milk and forms a thin, lemon-flavoured fluid; the second forms a thick cream containing tragacanth and flavoured with cocoa and sugar, and the third forms a simple, lemon-flavoured suspension.

Nov-Umbrose (*Allen & Hanburys, London*). Ready-mixed barium meal containing 75% of barium sulphate. Also supplied as a cream (a 1 in 1 preparation). **Umbrose** is a similar preparation.

Shadoform (*British Drug Houses, London*). Flavoured barium sulphate powder. **Shado-cream**. A 50% suspension ready for use.

[P1-S1] **Baryta Sulphurata** (*B.P.C.*). *Syn.* BARIUM SULPHIDUM. $BaS = 169.4$.

Dose.— $\frac{1}{2}$ to 1 grain in pills coated so as to be more likely to dissolve in the intestines than in the stomach.

A greyish yellow powder, partially soluble in water, the solution decomposing slowly with loss of hydrogen sulphide. Has been given as an alternative in syphilitic affections, but its main use is as a depilatory.

[P1-S1] **Barium Sulphide Depilatory**. *Syn.* CAUSTICUM BARIUM.

Barium sulphide, in fine powder from 1 to 3, wheat starch 3.

When required for use, make into a cream with water, spread on the part and let it remain five or ten minutes, then remove with a blunt knife. It temporarily reddens the skin.

[P1-S1] *Another formula* is barium sulphide 5, powdered soap 1, French chalk 7, starch 7. One part of this mixed with 3 of water is applied and, to avoid possible dermatitis, is washed off after 5 minutes. May be used from time to time.

Strontium Sulphide, $SrS = 119.7$, is also used. A patented German preparation contained strontium sulphide 12, corn starch 40, talc 35, dextrin 7, nerolin 1, and essential oil 5 parts. It was claimed that the dextrin protects the skin and hair papilli and prevents the bad odour during use.

BELLADONNA

Syn. DEADLY NIGHTSHADE.

[P1] "Alkaloids, the following; their salts, simple or complex:—*Belladonna, alkaloids of.*"

[S1] "Alkaloids, the following; their salts, simple or complex:—*Belladonna, alkaloids of, except substances containing less than 0.15% of the alkaloids of belladonna calculated as hyoscyamine.*"

[S6] "Alkaloids—*Belladonna, alkaloids of—specify proportion as the proportion of any one alkaloid of belladonna that the preparation would be calculated to contain on the assumption that all the alkaloids of belladonna in the preparation were that alkaloid.*"

By Rule 10 of the Poisons Rules, 1935, machine-spread plasters are exempt from the provisions applying solely to substances in the First Schedule to the Rules.

All parts of the plant *Atropa Belladonna* (Solanaceæ) yield the alkaloids hyoscyamine and atropine. The root contains from 0.3 to 0.8% of total alkaloids—chiefly hyoscyamine. Doubtful whether any atropine is present. Dried leaves of good quality contain 0.4 to 1%, principally hyoscyamine.

Antidotes. Treat as for poisoning by atropine, see p. 237.

[P1-S1] **Belladonnæ Folium** (B.P., U.S.P. XI, Fr. Cx., F.E. VIII, P. Belg. IV (as *Belladonnæ Pulvis*), and P. Helv. V) contains not less than 0.3% of total or mydriatic alkaloids calculated as hyoscyamine.

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.).

Uses. To check action of secretory glands. Powerful antispasmodic in intestinal colic, spasmodic asthma and bladder spasm due to calculi or prostatic irritation. Full doses of extract or tincture are useful in whooping cough and false croup, e.g., 3 m. of the tincture for a child of one year, gradually increased to 10 m. *Belladonna* is often of value in enuresis; no rule can be fixed as to the quantity for any given age, but a child three or four years old may have 3 m. of the tincture in the afternoon and again in the evening before bedtime, and this may be increased gradually to 10 m. Broncho-pneumonia is sometimes well treated in the early stages by 4 to 5 m. doses of tincture or $\frac{1}{4}$ gr. of extract every 3 or 4 hours, combined with diuretics and diaphoretics. In dyspepsia, belladonna reduces gastric secretion and inhibits spasmodic contractions. Large doses of tincture or extract are of value in post-encephalitic parkinsonism, e.g., commencing with 7 m. of the tincture thrice daily for a week, increased to 10 m. for the second week, then to 15 m. and then to 20 m. (see also under *Belladonnæ Radix*).

[P1-S1] **Belladonna Pulverata** (B.P.). *Syn.* PULVIS BELLADONNÆ.

Dose.— $\frac{1}{2}$ to 3 gr. (0.03 to 0.2 g.).

Consists of belladonna leaf in fine powder adjusted with exhausted belladonna leaf to contain 0.3% of alkaloids calculated as hyoscyamine. It is officially required to be dispensed when *Belladonnæ Folium* is prescribed.

[P1] **Collyrium Belladonnæ** (B.P.C.). Green extract of belladonna 0.5% w/v.

[P1] **Collyrium Belladonnæ Compositum** (K.C.H.).

Boric acid 15 gr., quinine hydrochloride $7\frac{1}{2}$ gr., liquid extract of belladonna 10 m., distilled water to 1 oz.

[P1-S1] **Emplastrum Belladonnæ Viride** (B.P.C.).

Contains dry extract of belladonna equivalent to 0.25% of alkaloids in rubber adhesive plaster. The machine-spread plaster is usually made with about four ounces of mass per square yard of bleached cotton cloth of plain weave. Perforations allow ventilation

and a covering of loosely attached muslin protects the adhesive surface.

[P1-S1] *Fr. Cx.* has belladonna extract (*Fr. Cx.*) 1, elemi 1, diachylon plaster (*Fr. Cx.*) 2.

[P1] **Emplastrum Belladonnæ et Capsici.**

A spread rubber-base plaster containing about 0.1% of belladonna alkaloids, and 0.25% of oleo-resin of capsicum.

[P1] **Emplastrum Belladonnæ, Capsici et Methylis Salicylatis.**

Similar to spread belladonna and capsicum plaster, but containing about 2% of methyl salicylate.

[P1-S1] **Extractum Belladonnæ Siccum (B.P.).** *Syn.* EXTRACTUM BELLADONNÆ ALCOHOLICUM.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.).

This is prepared from the leaf—it is a mixture of alcoholic extract and powdered leaf, containing 1% of alkaloids. The more powdered leaf present in the extract the better it keeps. *P. Ital. V* is 1% total alkaloids made by means of 95% alcohol.

[P1-S1] **Extractum Belladonnæ (U.S.P. XI).**

Average dose.— $\frac{1}{4}$ grain (0.015 g.).

Two forms, pilular extract and powdered extract are official. They are of approximately the same strength as Extractum Belladonnæ *I.A.*

[P1-S1] **Extractum Belladonnæ (I.A.).** A "solid" extract (containing about 10% of water) prepared by means of alcohol 70% from the leaf, and containing 1.3% of the alkaloids of belladonna leaf.

[P1-S1] **Extractum Belladonnæ Viride (B.P.C.).**

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.).

A soft extract standardised to 1% w/v of alkaloids.

[P1-S1] **Glycerinum Belladonnæ (R.P.C.).**

Green extract of belladonna 50% w/w with boiling distilled water, and glycerin.

To check pain and inflammation, is often painted on boils, abscesses and carbuncles, and covered with a poultice; also applied on lint to the breasts to disperse milk.

[P1] **Linctus Belladonnæ (T.H.).** *Dose.*—1 drachm (4 ml.).

Tincture of belladonna 24 m., bismuth carbonate 24 gr., tincture of lemon 80 m., glycerin 80 m., water to 1 oz.

[P1] **Mist. Bellad. (N.I.F.).**

Potassium iodide 3 gr., liquid extract of ipecacuanha $\frac{1}{2}$ m., tincture of belladonna 5 m., arsenical solution 2 m., chloroform water to $\frac{1}{2}$ oz.

[P1] **Tinctura Belladonnæ (B.P., I.A.).**

Dose.—5 to 30 minims (0.3 to 2 ml.).

Prepared with about 10% of dried leaf, and standardised to contain 0.03% of alkaloids. *Fr. Cx.*, *P. Ital. V*, *P. Ned. V*, and *U.S.P. XI* are similar.

A fatal case of (most probably) chronic belladonna poisoning, in which 1 to 2 drachms of the tincture had been taken every day for 6 years.—J. Spears, *Brit. med. J.*, i/1927, 1105.

POST-ENCEPHALITIC PARKINSONISM well treated with tincture of belladonna, 45 minims daily.

A man who had been taking 1½ dr. of tincture of belladonna daily for many months with considerable benefit, began to lose ground. Suddenly he showed great improvement, which could not be accounted for until he admitted he had been taking double doses of his medicine. Many patients now take as large or larger doses without any toxic symptoms.—A. J. Hall, *Lancet*, i/1934, 595.

[P1-S1] **Bellafit** (*Richter, London*). Contains the total levorotatory alkaloids of the belladonna root. *Solution* for oral use contains 1 in 2000; *ampoules* contain 0.5 mg. in 1 ml.; *tablets* contain 0.25 mg. of total alkaloid. *Dose*.—1 or 2 tablets or 10 to 20 drops of solution three times daily, or 0.5 to 2 ml. daily by injection.

[P1-S1] **Bellafoline** (*Sandoz, London*). Preparations containing the natural alkaloids of belladonna leaf: *l*-hyoscyamine is present in an invariable and constant proportion with the secondary belladonna alkaloids (hyoscyne, atropamine and belladonine). *Tablets* contain $\frac{2}{25}$ gr. total alkaloids; *solution* 1: 2000; 1 ml. ampoules = $\frac{1}{16}$ gr.

[P1-S1-S4] **Belladrenal Tablets** (*Sandoz, London*). Contain $\frac{2}{25}$ gr. of Bellafoline and $\frac{1}{2}$ gr. of phenobarbitone. In angina pectoris, migraine and epilepsy.

[P1-S1-S4] **Bellergal Tablets** (*Sandoz, London*). Contain Bellafoline 0.0001 g., Femergin 0.0003 g., phenobarbitone 0.02 g. In diseases of the autonomic nervous system.

[P1] **Jocigares** (*Wilcox, Joseau, London*). Cigarettes containing extracts of belladonna, stramonium and digitalis. *Dose*.—4 to be smoked daily. For asthma and hay fever.

[P1-S1] **Belladonnæ Radix** (*B.P., U.S.P. XI, P. Helv. V*).

Dose.— $\frac{1}{2}$ to 2 gr. (0.03 to 0.12 g.).

Contains not less than 0.4% of alkaloids calculated as hyoscyamine. *U.S.P. XI* and *P. Helv. V* require 0.45% of total alkaloids of belladonna.

Uses. Is used for the same purposes as the leaf, but chiefly in preparations for external use.

Relieves the pain of rheumatism, neuralgia, lumbago, chordee, and local inflammations, as of the breast. Also applied in phlebitis and to relieve the pain due to adhesions following pleurisy.

The "Bulgarian Cure." Good results are claimed to have been obtained in the treatment of post-encephalitic parkinsonism by the "Bulgarian Cure," an empirical method introduced by a Bulgarian apothecary, and consisting essentially of the administration of a decoction of Bulgarian belladonna root in white wine. The treatment had a considerable vogue on the Continent, especially in Italy, but clinical trials in this country have failed to show any specific therapeutic advantage in the use of Bulgarian root as compared with English root.

It has been established that Bulgarian belladonna root differs hardly at all from ordinary commercial root, except that its alkaloidal content seems to be considerably lower. The clinical trials, however, have indicated that administered in the form of a 5% extract, extremely large doses of belladonna alkaloids can be tolerated. The original decoction was prepared by boiling the root in white wine for fourteen minutes, filtering and cooling. Neuwahl and Fenwick (*Lancet*, ii/1937, 619), described the following method: 30 g. of root are macerated in 600 ml. of dry white wine containing 10 to 12% of alcohol for 5 to 6 hours. The resultant liquid is boiled for fourteen minutes, strained through cotton wool and stored in a refrigerator. The dosage recommended is initially 1 to 3 ml., increased daily by 1 to 3 ml. until an optimum dosage is achieved. Throughout the treatment the strictest clinical control is necessary.

Alkaloidal Content.

A sample of "Bulgarian" belladonna root differed hardly at all from ordinary

commercial root. Its alkaloidal content was lower, but tests seemed to indicate that the chemical constituents are the same.—A. E. Bailey, *Pharm. J.*, i/1938, 77.

In view of the potency and the large daily dosage of the decoction, it is important to realise the wide variation which may occur in the alkaloidal content of the drug. Reports so far received show that the limits may vary from 0.238 to 0.58% of alkaloids. The B.P. percolation process using 12% alcohol is a more suitable way of preparing a galenical than the hitherto described decoction processes, since it gives a more reliable preparation.—R. H. Henrikson, *Pharm. J.*, i/1938, 240.

The alkaloids of the Bulgarian root appear to be identical with those of other belladonna roots of commerce, and all these roots yield extracts with similar properties. It is suggested that simple maceration for 24 hours yields a preparation which represents the maximum amount of alkaloids available from the root. The white wine may be replaced by 1% acetic acid, with the addition of a small amount of alcohol or chloroform as preservative.—A. E. Bailey, *Pharm. J.*, i/1938, 567.

The pharmacognosy of the Bulgarian drug is essentially that of the official belladonna root, and its alkaloidal content is consistently lower. The nature of the alkaloids is probably the same. The following method of preparing an extract is recommended. Macerate 50 g. of drug in No. 60 powder for 24 hours in 1000 ml. of a menstruum consisting of lactic acid 2, syrup 5, alcohol 90% 16, water to 100. Strain and add 0.5% of chloroform.—S. A. Taylor and F. G. Hobart, *Pharm. J.*, ii/1938, 49.

Clinical Reports.

Excellent symptomatic results in post-encephalitic parkinsonism are claimed for the "Bulgarian treatment." It is stated to give better results than atropine and to be at the same time less toxic and very cheap. Description of two cases.—F. J. Neuwahl and C. C. Fenwick, *Lancet*, ii/1937, 619.

Clinical trials suggest that patients suffering from the parkinsonian syndrome can tolerate extremely large doses of belladonna alkaloids when administered in the form of a 5% extract in white wine or other menstruum. Such doses are well tolerated, and the dosage may safely reach and be maintained at an equivalent of 0.24 gr. of atropine.—A. E. Bailey, *Pharm. J.*, i/1938, 567.

14 patients suffering from post-encephalitic parkinsonism were treated with decoction of Bulgarian belladonna. Improvement was found in 10 patients. On substituting English belladonna the improvement in the parkinsonism was maintained, and the patients did not at first notice the substitution. There is no evidence that the therapeutic properties of Bulgarian belladonna differ from those of its English equivalent.—D. Hill, *Lancet*, ii/1938, 1048.

Treatment with an extract of Bulgarian belladonna was used in 123 cases of post-encephalitic parkinsonism over a period of 1½ years. The results were remarkably good in the majority of cases and no relapse was recorded. The original technique of preparing the decoction was discarded in favour of a method of cold extraction (method described). The activity of this preparation was found not to decline after a few weeks as did the wine decoction, and whereas the wine decoction varies in alkaloid content the content of the cold extraction is precisely known. Equally good results can be obtained, however, if English root is substituted for the Bulgarian. Toxic reactions result from the administration of high doses, and can be avoided by beginning with small doses gradually increased. The treatment is contraindicated and useless in cases of chronic encephalitis lethargica.—F. J. Neuwahl, *Lancet*, i/1939, 693.

As the result of a trial of the comparative effect of Bulgarian belladonna root, English belladonna root, and stramonium in five cases of post-encephalitic parkinsonism, it was concluded that there does not appear to be any advantage in using the Bulgarian belladonna in preference to the English, and that there was no appreciable difference between belladonna given as a decoction and belladonna given as the standard B.P. tincture.—N. S. Alcock and E. A. Carmichael, *Quart. J. Med.*, 1938, 565.

The claims that have been advanced in favour of the enhanced value of Bulgarian belladonna root in the therapeutic treatment of post-encephalitic conditions have not been confirmed.—*Rep. med. Offr Minist. Hlth, Lond.*, 1938.

[P1-81] Chloroformum Belladonnæ (B.P.C.).

Contains the equivalent of 50% v/v of liquid extract of belladonna. Applied as a paint or on lint for neuralgia and rheumatism.

[P1-81] **Colloidum Belladonnæ (B.P.C.).** *Syn.* LIQUID BELLADONNA PLASTER.
Liquid extract of belladonna 50% *v/v* and camphor 1.5% *w/v* in a colloidion basis. For application to joints, or where a plaster is unsuitable.

[P1-81] **Emplastrum Belladonnæ (B.P.).**

Contains 0.25% of the alkaloids of belladonna root, the aqueous-alcoholic percolate being evaporated and incorporated in plaster of colophony. Brown spread plasters usually consist of this colophony base plaster spread on bleached glazed calico of plain weave. Spread plasters prepared with a green mass in a rubber basis are also supplied and both forms are regarded as coming within the somewhat ambiguous official description.

Bee and wasp stings are well treated by belladonna plaster—if slight, left on short time; if severe (e.g., entered vein), several days may be necessary—gives considerable relief. Probably good for mosquito stings also.

Must not be applied by the midwife to mothers too ill to feed their babies, where there is heart disease, on account of paralysing effect of atropine on the vagus, with consequent quickening of heart's action.—W. H. F. Oxley, *Brit. med. J.*, i/1931, 7.

[P1-81] **Emplastrum Belladonnæ (U.S.P. XI).**

A standardised spread plaster prepared with adhesive plaster and an extract of belladonna root.

[P1-81] **Extractum Belladonnæ Liquidum (B.P.).**

Dose.— $\frac{1}{4}$ to 1 minim (0.015 to 0.06 ml.).

Prepared from belladonna root by a percolation process, adjusting so that the extract contains 0.75% of alkaloids.

P. Ital. V contains 0.25% *w/v*.

[P1-81] **Fluidextractum Belladonnæ Radicis (U.S.P. XI).**

Average dose.— $\frac{1}{2}$ minim (0.05 ml.). Contains about 0.45% of alkaloids and is therefore about two-thirds the strength of the *B.P.* liquid extract.

[P1-81] **Linimentum Belladonnæ (B.P.).**

Prepared from belladonna root by percolation with a mixture of alcohol 90% (or I.M.S.) and water, and adjusted to contain 0.375% *w/v* of alkaloids, 5% *w/v* of camphor being added. A useful sedative for neuralgia and rheumatism.

Sprinkled on impermeable piline relieves lumbago.

[P1-81] **Linimentum Belladonnæ cum Chloroformo (B.P.C.).**

Chloroform, 1 in 8, with liniment of belladonna.

[P1] **Suppositorium Belladonnæ (B.P.).**

Contains $2\frac{1}{2}$ m. (0.15 ml.) of liquid extract of belladonna in 1 g. of theobroma oil, *i.e.*, 0.001 g. of root alkaloids.

[P1] **Pessaries** (60 grains weight) may also be made containing the same or double the quantity of extract.

Unilateral convulsions have been produced by their use, together with dryness of throat and dilated pupils (special idiosyncrasy).

[D-P1-81] **Suppositoria Belladonnæ** $\frac{1}{2}$ grain, et **Morphinæ Hydrochloridi** $\frac{1}{2}$ grain.

These possess a useful sedative effect, and are valuable in irritated and painful conditions of the rectum and prostate, and for chordee.

[P1-81] **Unguentum Belladonnæ (B.P.C.).**

Contains the equivalent of 80% *v/w* of liquid extract of belladonna, or 0.6% *w/w* of alkaloids, in a basis of wool fat and benzoinated lard.

Said to be too strong for general use and may cause unpleasant symptoms.

To lessen excessive secretion in nasal catarrh, this ointment has been employed diluted 5 to 10 times with soft petroleum and a small proportion of tannin or gallic acid added.

[P1-81] **Pommade Belladonnée** (*Fr. Cx.*). Extract of belladonna 10%, in glycerin and benzoated lard. It contains about 0.25% of belladonna alkaloids.

[P1] **Unguentum Belladonnæ** (*U.S.P. XI*).

Contains about 0.125% of belladonna alkaloids, and is prepared with 10 parts of pilular extract of belladonna rubbed down with 5 parts of diluted alcohol and incorporated with a melted mixture of wool fat 5, yellow wax 5, and petrolatum 75.

[P1] **Unguentum Populi** (*P. Belg. II*). Macerate dry belladonna leaves 125, dry henbane leaves 125 and dry poplar buds 200 (all bruised) in alcohol 90% 150 for 2 hours; warm on a water-bath with lard 1000 for 3 hours, stirring until the alcohol has evaporated. Strain, press and stir until the ointment sets.

Zanthoxylum (*B.P.C.*). *Syn.* XANTHOXYLUM, PRICKLY ASH BARK, TOOTH-ACHE BARK.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ drachm (1 to 2 g.).

The dried bark of *Z. americanum* or *Z. Clava-Herculis*. Carminative and gastro-intestinal stimulant producing diuresis and diaphoresis. A liquid extract has been used in the treatment of alcoholism.

BENZENUM

B.P.C., Fr. Cx.

$C_6H_6 = 78.11$.

Syn. BENZOLUM (*P. Jap. V*).

Dose.—5 to 10 minims (0.3 to 0.6 ml.), in capsule or oily solution.

A colourless liquid obtained from light coal-tar oil. Sp. gr. 0.880 to 0.887. It solidifies at 0° and does not re-melt entirely below 4°.

Distinguish from **Petroleum Benzine** or **Benzoline**, the fraction of crude petroleum distilling below 150°. Light petroleum (petroleum ether) and petroleum benzine are used for heating cauteries for nævi, etc. Benzene is not suitable for this purpose—it burns with a smoky flame. It is, however, better for removing grease stains.

Antidotes. Empty stomach by emetic, or by stomach tube, using a suspension of 10 oz. of medicinal charcoal in 2 gallons of water. Keep patient in fresh air, apply artificial respiration and give oxygen, or oxygen with 7% carbon dioxide, inhalations. Stimulants, e.g., $\frac{1}{2}$ dr. of aromatic spirit of ammonia in water. Atropine, $\frac{1}{100}$ gr., hypodermically. Nikethamide intravenously is said to be of value—5 to 10 ml. of 25% solution.

When swallowed it usually produces a sensation of burning in the stomach. It is a narcotic which, when swallowed or inhaled, produces vertigo, delirium and tonic convulsions, followed by deep sleep; 30 ml. has proved fatal.

Benzene poisoning, both acute and chronic, is an important

industrial hazard, especially in the rubber industry. The concentrated vapour is markedly toxic and may cause death. Workers suffering from chronic poisoning develop leucopenia, aplastic anaemia and purpura hæmolytica.

Nine cases of poisoning (with three deaths) in female workers employed in Belgian mirror factories to varnish mirrors which have been silvered; the second protective coat of varnish applied after silvering is a solution of gum-resins in benzol. The clinical picture is one of wasting, hæmorrhages and severe aplastic anaemia.—D. Gilbert, per *Brit. med. J.*, i/1937, 1157.

Uses. It quickly destroys pediculi capitis or pubis, applied freely; one application sufficient. For seborrhœa, should be brushed on the skin.

Leukæmia has been treated by large doses, e.g., 3 to 4 g. (45 to 60 minims approx.). Give small doses at first and note effects. It is advisable to discontinue the treatment as soon as the leucocytes start to decline, or at least when they have fallen to 20,000. The best results are obtained when the benzene is preceded by or continued with X-ray treatment.

The use of benzene is contraindicated in the presence of faulty functioning of the liver, kidneys, or intestines.

Benzol is a mixture of hydrocarbons obtained from light tar oil containing about 70% of benzene with toluene, $C_6H_5 \cdot CH_3$, and other hydrocarbons. Various grades are obtainable, e.g., 90% benzol, 50% benzol, etc., the figures indicating the proportion distilling below 100° .

Cyclohexane. *Syn.* HEXAMETHYLENE, HEXAHYDROBENZENE. C_6H_{12} . Is a colourless mobile liquid obtained by the hydrogenation of benzene. B.p. 81° . Is used as a solvent.

Cyclohexanol. $C_6H_{11}OH$. Is prepared by the catalytic hydrogenation of phenol, using nickel at about 180° . It is solvent for fats, waxes, resins, rubber, celluloid, etc., but is principally used in conjunction with soaps as a detergent, in laundry and textile work.

Its derivatives, cyclohexanyl acetate and cyclohexanone (SEXTONE, *Howards, Ilford*), and also methylcyclohexanol (SEXTOL; METHYLHEXALIN), produced by hydrogenation of the mixed cresols, and its acetate (SEXTATE), etc., are similarly employed.

Benzoyl Chloride. $C_6H_5 \cdot COCl = 140.5$. Prepared from phosphorus pentachloride and benzoic acid. Distils between 190° and 200° , sp. gr. 1.218. Distinguish from monochlorobenzene (*syn.* benzol chloride), $C_6H_5Cl = 112.56$, sp. gr. 1.106, b.p. 132° , and benzyl chloride, $C_6H_5CH_2Cl = 126.5$, sp. gr. 1.106, b.p. 178° ; also benzal chloride (*syn.* benzylidene chloride or benzyl dichloride), $C_6H_5CHCl_2 = 161.0$, sp. gr. 1.288, b.p. 206° .

Paradichlorbenzenum (B.P.C.). $C_6H_4Cl_2 = 147.0$.

Colourless shining crystals with characteristic odour, m.p. 53° to 54° , slowly volatile in air. **Soluble** in benzene, ether and hot alcohol.

Wood-Beetle Insecticide. Paradichlorbenzene 92%, soap 3%, paraffin wax 3%, cedar wood oil 2%. Used in Westminster Hall.

Paradichlorbenzene when vaporised is effective for killing lice in clothing. Moles can be banished effectively by a teaspoonful placed in the runs at 6 to 8 feet intervals.

Orthodichlorbenzene, a heavy colourless liquid with characteristic odour, has also been used as wood and furniture preservative. A mixture of *o*-dichlorbenzene 9, soap 7, and oil of cedar wood 1 is effective against the death-watch beetle.

Nitrobenzenum (*B.P.C.*). *Syn.* NITROBENZOL, OIL OF MIRBANE.
 $C_6H_5O_2N$ = 123.0.

[P2] "Nitrobenzene."

[S3] "Nitrobenzene—in substances containing less than 0.1% of nitrobenzene; soaps containing less than 1% of nitrobenzene; polishes."

Pale yellow liquid with an odour similar to benzaldehyde. Used as an insect repellent and as preservative in polishes, etc. Largely used in chemical manufacture. Poisoning may occur from absorption through the skin or by inhalation of the vapour. It is a dangerous poison if used in sweetmeats.

Antidotes. Empty stomach by emetic or stomach tube. Give stimulants, but no alcohol or oils. Artificial respiration and oxygen with 7% carbon dioxide inhalations, if necessary. Strychnine $\frac{1}{2}$ gr. hypodermically. Blood transfusion.

Toluenum (*B.P.C.*). *Syn.* TOLUOL, METHYLBENZENE.
 $C_6H_5 \cdot CH_3$ = 92.13.

A product of the distillation of coal tar, occurring as a colourless, mobile, highly inflammable liquid. B.p. about 111° , flash-point about 7° , sp. gr. about 0.87. Is used as a preservative of urine before chemical examination, and for sterilising catgut.

Xylenum (*Fr. Cx.*). *Syn.* XYLOL, XYLOLUM (*P. Helv. V*). A mixture of about 10% of *o*-, 70% of *m*-, and 20% of *p*-dimethylbenzenes, $C_6H_4(CH_3)_2$ = 106.1. B.p. about 140° . Has chemical and physical properties allied to benzene. The 1 : 2 xylene boils at 141° , 1 : 3 xylene boils at 139° , 1 : 4 xylene boils at 138° . Used as a microscopic cleaning agent and for sterilising catgut.

In dose of 5 to 15 minims in capsules, enteric-coated, has been employed in respiratory affections and in dyspepsia, and has also been suggested for use in certain skin diseases.

Solvent Naphtha consists of xylenes and trimethylbenzenes, b.p. 140° to 180° . Used as a solvent.

BETANAPHTHOL

B.P., U.S.P. XI, Fr. Cx., etc.

$C_{10}H_7OH$ = 144.2.

Syn. NAPHTHOL, β -HYDROXYNAPHTHALENE.

Dose.—5 to 10 grains (0.3 to 0.6 g.) in cachet. *Fr. Cx.* has max. single dose 15 grains, max. during 24 hours 45 grains approximately. *U.S.P. XI* average dose 4 grains.

Occurs in white or nearly white crystalline lamellæ or powder with a faint phenolic odour.

Soluble about 1 in 1000 of water, 1 in 2 of alcohol 90%, 3 in 4 of ether, 1 in 17 of chloroform, 1 in 24 of benzene, 1 in 12 of olive oil and lard, 1 in 80 of soft paraffin; also soluble in glycerin and in solutions of alkali hydroxides. Addition of boric acid increases solubility in water.

Incompatible with camphor, ferric chloride, menthol, phenazone and phenol.

Uses. Internally as intestinal antiseptic in enteric fever and putrefactive diarrhoea; safe and efficient, but sometimes causes too much gastric disturbance. In dilated stomach, dyspepsia and other

disorders. In cholera, as preventive, and in treatment of early stages. Is a vermifuge in ankylostomiasis; tablets containing betanaphthol 5 gr., and phenolphthalein 3 gr., are a useful combination for this purpose. It has also been found effective in ascariis infection and tapeworm. Large doses may cause toxic effects with symptoms of phenol poisoning. In kidney disease it is contraindicated.

It is a powerful antiseptic and germicide. In advanced scabies, an ointment of 10 to 15% cures the eczema as well as destroys the parasite, but the Compound Ointment is preferred. Useful also in psoriasis and other chronic skin diseases.

Betanaphthol 5, alcohol 100, glycerin 10, is a remedy for hyperhidrosis of palms, soles and axillæ.

TRACHOMA treated by "Oxidised Naphthol Camphor." The remedy should be freshly prepared, 2 parts of camphor and 1 of naphthol warmed gently and filtered, and the mixture allowed to oxidise in a clear glass vessel to syrup consistence and brown mahogany colour. The application is made with a small brush well soaked in the solution and then wiped nearly dry. Four to 10 applications suffice.

Tabellæ Betanaphtholis (B.P.C.). Contain 5 gr. (0.3 g.).

Unguentum Betanaphtholis Compositum (B.P.C.). *Syn.* KAPOSI'S COMPOUND OINTMENT, UNGUENTUM NAPHTHOL COMPOSITUM.

Betanaphthol about 1 in 11½, with chalk, in lard and soft soap. *L.H.* is practically identical.

Unguentum Naphtholis (St. J.H.). Betanaphthol 22 gr., sesame oil 6 dr., hard paraffin 30 gr., soft paraffin to 1 oz.

Carbo Naphtholatus (P. Ital. V): Betanaphthol 30, charcoal 40, magnesium oxide 30, mix, add alcohol 95% 50, and heat to form a coarse granular powder. Given in doses of 1 to 2 dr. in ailments of the stomach and intestines.

Alphanaphthol (F.E. V'III). *Syn.* α -HYDROXYNAPHTHALENE.

$C_{10}H_7 \cdot OH = 144.2$.

Dose.—2 to 5 grains (0.12 to 0.3 g.). Larger doses are sometimes given.

In colourless crystals, m.p. about 94°. Is said to have greater antiseptic power, but given internally causes more irritation.

A solution of 1 in 3500 of water is used to wash out the intestines by rectal injection.

Aluminii Naphtholsulphonas. *Prop. Name.* ALUMNOL (*Bayer Products, London*). A whitish powder soluble 1 in 1½ of water, and in alcohol or glycerin. A mild antiseptic in ½ to 5% solutions. Used in solution or ointment, ½ to 2%, in rhinitis, ozæna and gonorrhœa.

Naphtlithin (Wyleys, Coventry). The lithium salt of β -hydroxynaphthalene- α -monosulphonic acid, a brownish-white odourless powder with a taste at first bitter, afterwards sweetish. Soluble in water (1 in 4), glycerin and alcohol. Incompatible with quinine salts. For gout, rheumatism, sciatica and lumbago. *Dose.*—5 to 15 grains, maximum 60 grains per day.

Betanaphthylis Benzoas (B.P.C., Fr. Cx., P. Ital. V, P. Belg. IV, P. Helv. V). *Syn.* BENZONAPHTHOL, BENZOYL-NAPHTHOL, NAPHTHOL BENZOATE. $C_{10}H_7 \cdot COOC_{10}H_7 = 248.3$.

Dose.—5 to 15 grains (0.3 to 1 g.) in cachet or suspended.

A tasteless white crystalline powder. **Soluble** in alcohol, ether, and chloroform, almost insoluble in water. An intestinal antiseptic and diuretic, e.g., in typhoid. May be combined with bismuth salicylate. Externally is used 3 to 10% in ointments.

Benzonaphthol Varnish. Benzonaphthol 6, acetannin 10, salol 20, alcohol (90%) 30, ether 100, has been recommended as a varnish for pills to render them insoluble in the stomach, but no better results are obtained with it.

Betanaphthylis Salicylas (*B.P.C.*, *Fr. Cx.*). *Syn.* BETOL, NAPHTHALOL, NAPHTHOL SALICYLATE. $C_6H_4(OH) \cdot COOC_{10}H_7 = 264.3$.

Dose.—5 to 10 grains (0.3 to 0.6 g.) in cachets or pills, or suspended in mixtures or in almond emulsion or milk.

In small tasteless white crystals.

Insoluble in water, slightly soluble in cold alcohol 90%, soluble 1 in 3 of boiling alcohol, 1 in 15 of ether, and in benzene. Useful in rheumatism, cystitis, and intestinal catarrh.

Naphthalenum (*B.P.C.*, *P. Ned. V*, *P. Ital. V*, *P. Helv. V*). $C_{10}H_8 = 128.1$.

Dose.—3 to 12 grains (0.2 to 0.8 g.) in cachets.

2 g. administered in the course of two days has proved fatal to a six-year-old child.

A hydrocarbon formed in the manufacture of coal gas. In white crystalline plates (m.p. 80°) with persistent odour.

Soluble 1 in 3 of ether, 1 in 23 of alcohol, 1 in 8 of olive oil, and 1 in $1\frac{1}{2}$ of chloroform; insoluble in water.

Antidotes. Empty stomach by emetic or stomach tube. Give purgative dose of magnesium sulphate. Demulcent drinks, but *not* oils or fats.

The principal synthetic waxes are chloro-naphthalenes and chloro-diphenyls; they are made by passing chlorine through naphthalene or diphenyl. In the manufacture of monochlorodiphenyl, known as arachlor, and the chloro-naphthalenes, or halowax, the workers are liable to contract acne from exposure to fumes, and even symptoms of systemic poisoning, with digestive disturbances, hæmaturia, and finally death from yellow atrophy of the liver.—*L. Schwartz, Amer. J. publ. Hlth*, 1936, 26, 586.

Uses. As an intestinal disinfectant for the diarrhœa of consumption and of typhoid, and for dysentery, 8-grain enemata are useful. Internally, *e.g.*, in malt extract, with success to lessen fœtor of urine and stools. A vermifuge in tænia and ascarides (for tapeworms a dose of 1 g. is given followed by castor oil). Suppository and ointment (10%) are used for pruritus ani. A 10 to 20% solution in oil is successful as a parasiticide in scabies.

N.C.I. Naphthalene of commerce 96, creosote 2, iodoform 2. Lice repellent.

Naphthaleni Tetrachloridum (*B.P.C.*). *Syn.* NAPHTHALIN HYDROCHLORIDE. $C_{10}H_6Cl_4 = 289.9$.

Dose.—3 to 12 grains (0.2 to 0.8 g.).

White crystals, m.p. 185° to 187° , insoluble in water.

Used for the same purposes as betanaphthol.

BISMUTHUM

Bi = 209.0.

Metallic Bismuth Preparations for Injection.

Bismuth metal has been largely used in conjunction with, and in some quarters instead of, the arsenicals in the treatment of

syphilis and yaws. The effectiveness of the antisyphilitic action of bismuth may be said to be intermediate between arsphenamine and mercury. The preparations used are summarised.

Bismuthum Præcipitatum (B.P.).

Dose.— $1\frac{1}{2}$ to 3 grains (0.1 to 0.2 g.) by intramuscular injection.

Prepared by the reduction of bismuth trichloride in hydrochloric acid solution by means of hypophosphorous acid. A dull grey powder containing no particles greater than 15 microns in diameter.

Injectio Bismuthi (B.P.). *Prop. Names.* BISGLUCOL (*Pharmaceutical Specialities (May & Baker) Ltd., London*), BISMOSTAB (*Boots, Nottingham*).

Dose.—8 to 15 minims (0.5 to 1 ml.).

Contains 20% w/v of precipitated bismuth with 0.5% v/v of cresol in isotonic dextrose solution.

For bismuth injections an all-glass syringe should be used, since nickel poisoning has been known to occur from the use of a syringe with a nickel-plated piston.

Bismuth injections are given intramuscularly. Intravenous injections are too dangerous, and hypodermic injections too irritant.

Toxic Effects. With intramuscular injections serious toxic effects are rare if administration is stopped at the first warning symptoms, namely, foul breath, blue line on the gums and mild stomatitis. If these warnings are ignored, however, serious ulcerative stomatitis may result, together with other toxic effects such as nausea, loss of appetite, headache, depression, diarrhoea, albuminuria, skin reactions, possibly exfoliative dermatitis, and even jaundice. The mouth, digestion, skin and urine should be watched and oral hygiene insisted on. Septic conditions of the mouth are contraindications.

Severe stomatitis from injection of metallic bismuth may be treated by intravenous injections of 5 ml. of 10% sodium thiosulphate solution on alternate days.

BISMUTH JAUNDICE. Although jaundice from bismuth injections has been largely unrecognised it does occur. The incidence of bismuth jaundice over a period of 5 years at one clinic has been one attack for 2242 injections of bismuth compounds (the incidence of jaundice from nearsphenamine during the same period being one attack for each 951 injections). A report of 32 cases of bismuth jaundice.—R. Nomland, *J. Amer. med. Ass.*, ii/1938, 19.

For details of a suggested course of combined treatment of syphilis with arsenic and mercury or bismuth, see under Arsphenamina, p. 231.

Bicreol (Burroughs Wellcome, London). *Dose.*—1 to 2 millilitres intramuscularly, alternating with nearsphenamine injections. Contains bismuth metal 0.15 g. per ml. in a Creol-Camph base.

Bismoid (Lilly, London). Bismuth metal suspension in an aqueous medium containing approximately 5% of carbohydrate and dextrose derivatives (1 ml. = 0.025 g. of bismuth).

Bi-Liposol (Modern Pharmaceuticals, London). Oily solution of camphor-carbonate of bismuth (1 ml. = 4 ctg. Bi). *Dose.*—2 ml. intramuscularly twice a week. In syphilis and yaws.

Biscam (*Modern Pharmaceuticals, London*). A suspension of bismuth camphorate in olive oil. *Dose*.—2 ml. intramuscularly every 3, 5, or 7 days for 12 to 18 injections. In syphilis and yaws.

Bivatol (*Laboratoire Français de Chimiothérapie, Paris; Anglo-French Drug Co., London*). Basic bismuth α -carboxethyl- β -methylnonoate. A lipo-soluble bismuth compound supplied in ampoules containing 2 ml. (=0.07 g. of bismuth), for intramuscular injection in syphilis. (*This preparation is marketed in U.S.A. under the name Biliposal.*)

Neo-cardyl (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Bismuth butylthiolaurate in oily solution (1 ml. = 0.05 g. Bi). *Dose*.—1.5 ml. intramuscularly at 5-day intervals for 12 doses. Syphilis.

Stabismol (*Boots, Nottingham*). Basic bismuth α -carbethoxy-cyclo-hexanyl acetate. 10% bismuth in olive oil. *Dose*.—When given alone, from 1 to 2 ml. weekly intramuscularly in doses of 0.5 to 1 ml. at intervals of 2 or 3 days, for from 4 to 8 weeks. Also given concurrently with the arsenamines.

Bismuth Salts and Compounds.

The absorbent action of the preparations of bismuth taken internally is increased by combination with antiseptic compounds. These combinations have been much recommended in those disorders of the digestive tract in which several infectious diseases make their early manifestation. Thus the salicylate, and naphthol, phenol, pyrogallol and bromophenol compounds have been brought into use. These check the fermentative processes forming ptomaines, yet, it is said, do not interfere with intestinal digestion.

Owing to the limited gastro-intestinal absorption, oral administration of bismuth does not give rise to toxic effects, except that large doses of the subnitrate may cause nitrite poisoning.

Bismuth compounds are in general *incompatible* with potassium iodide, the insoluble brown bismuth tri-iodide being formed.

Bismuthi Benzoeas. *Syn.* BISMUTH OXYBENZOATE. $C_6H_5 \cdot COO(BiO) = 346.0$. *Dose*.—5 to 20 grains (0.3 to 1.2 g.) thrice daily.

A white powder insoluble in water, containing the equivalent of about 65% of Bi_2O_3 . Antiseptic, internally in gastro-intestinal diseases, externally to chancre, indolent and sloughing ulcers.

Benzo-Bismuth (*Anglo-French Drug Co., London*). Sodium salt of trioxo-bismuthbenzoic acid. Ampoules contain 0.2 g. (0.04 g. of Bi). *Dose*.—1 ampoule intramuscularly twice weekly for 7 to 8 weeks, allowing a rest of 3 to 6 weeks between each series of 15 injections. In syphilis.

Neo-Olesal (*Bayer Products, London*). 10% solution of bismuth dimethyl-endomethylene-hexahydrobenzoate in oil. *Dose*.—2 ml. intramuscularly 2 or 3 times weekly up to a total dosage of 25 or 30 ml. In all stages of syphilis.

Bismuthi Carbonas (*B.P., U.S.P. XI, Fr. Cx., P. Helv. V, etc.*). *Syn.* BISMUTH OXYCARBONATE OR SUBCARBONATE. Composition varies slightly, but it approximates to $(Bi_2O_2CO_3)_2 \cdot H_2O = 1038.1$.

Dose.—10 to 30 grains (0.6 to 2 g.).

A white, odourless, tasteless powder, stable in air. The light varieties need no suspending agent.

Insoluble in water and organic solvents; soluble in acids with effervescence.

Uses.—Internally in dyspepsia, gastric inflammation and diarrhoea, forming a protective coating on the walls of the stomach and intestines; also with alkalis in the treatment of gastric and duodenal ulcer. Is also stated to be effective in the treatment of ascaris and

thread-worms. Externally, is sedative and astringent, in ointments and dusting powders. Has been used as a contrast medium in X-ray work.

DYSENTERY. Bismuth subcarbonate is a most useful adjunct in acute dysenteric cases. Subnitrate of bismuth is not used because of possible untoward nitrite effects, such as methæmoglobinæmia and methæmoglobinuria, following the administration of excessive amounts of the drug in susceptible individuals.—H. A. Anderson, *J. trop. Med. (Hyg.)*, 1935, 271.

THREAD-WORMS. Bismuth carbonate, as suggested by Loeper, a specific. For an adult 3 doses of 20 gr. at intervals of 4 hours, and for a child under 7 years 10 to 40 gr. per dose. Simple and instantaneous cure.—G. Simpson, *Brit. med. J.*, ii/1929, 604. Correspondence on treatment.—*Brit. med. J.*, ii/1931, 517.

X-RAY DIAGNOSIS. Bronchoscopic insufflation with bismuth carbonate of value in radiography of the lungs. One ounce can be safely used in adults.

Enema Bismuthi (B.P.C.). Dose.—20 ounces (600 ml.). Bismuth carbonate or subchloride 30% w/v in mucilage of starch.

Glycerinum Bismuthi Carbonatis (B.P.C.).

Dose.—10 to 60 minims (0.6 to 4 ml.).

Bismuth carbonate 50% w/v, in distilled water and glycerin.

Mist. Bismuth. (N.I.F.). Syn. MIST. BISMUTH. C. SODA.

Bismuth carbonate 5 gr., sodium bicarbonate 10 gr., light magnesium carbonate 10 gr., peppermint water to $\frac{1}{2}$ oz.

Mistura Bismuthi cum Catechu (P.E.H.C.). For 1 year old child.

Bismuth carbonate 5 gr., sodium bicarbonate 2 gr., tincture of catechu 3 m., compound tincture of cardamom 5 m., spirit of chloroform 1 m., glycerin 15 m., water to 1 dr.

[P1] **Mistura Bismuthi et Pancreatini (B.P.C.).**

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Bismuth carbonate 10 gr., sodium bicarbonate 10 gr., pancreatin 4 gr., dilute hydrocyanic acid 2 m., in chloroform water to 1 oz.

Mistura Bismuthi et Sodii Bicarbonatis (B.P.C.).

Syn. MISTURA BISMUTHI CUM SODA.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains 10 grains each of bismuth carbonate, sodium bicarbonate and light magnesium carbonate in 1 oz.

Mist. Bismuth. Fort. (N.I.F.).

Bismuth carbonate 10 gr., sodium bicarbonate 10 gr., heavy magnesium carbonate 10 gr., peppermint water to $\frac{1}{2}$ oz.

[P1] **Mist. Bismuth. Sed. (N.I.F.).**

Bismuth carbonate 5 gr., sodium bicarbonate 10 gr., chalk 5 gr., tincture of chloroform and morphine 10 m., water to $\frac{1}{2}$ oz.

[P1] **Mist. Bismuth. Sed. Fort. (N.I.F.).**

Bismuth carbonate 10 gr., sodium bicarbonate 10 gr., solution of morphine hydrochloride 5 m., chloroform water to $\frac{1}{2}$ oz.

Pasta Bismuthi (B.P.C.).

Bismuth carbonate 30% in white soft paraffin.

Pulvis Bismuthi Compositus (B.P.C.). Caution.—This name was formerly applied to Ferrier's smuff.

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 g.).

Bismuth carbonate 1, calcium carbonate 3, heavy magnesium carbonate 3, sodium bicarbonate 1.

For the treatment of gastric and duodenal ulcer. This is usually

supplied for MacLean's powder. *N.I.F.* has the same proportions but specifies chalk instead of the purer calcium carbonate, thus agreeing with MacLean's original Formula II (for hospital use). Formula I contained bismuth carbonate 2, sodium bicarbonate 1, heavy magnesium carbonate 2. Administration of alkaline powders must be accompanied by dietary control, as in the following scheme (H. MacLean and co-workers, *Lancet*, i/1928, 14; *Brit. med. J.*, i/1928, 619):

First Week. A teaspoonful in a little water or milk 6 or 7 times daily (preceded by a glass of milk with 10 grains sodium citrate added to prevent coagulation), with double dose last thing at night and extra powder during night if patient wakes. If bowels disturbed excessively, adjust powder or add magnesia cream. *Second Week.* If discomfort and symptoms still persist continue as first week for a few days, otherwise reduce powder to 4 or 5 doses daily and reduce milk, adding beaten up eggs and gradually increasing diet so that by end of week patient is receiving toast, butter, eggs, custard, and cream. Dose immediately before retiring and during night as before. *Third Week.* Reduce to 3 or 4 doses daily and one at bedtime and increase food to include fish and potatoes and cereal puddings. *4th to 6th Weeks.* Powder 3 times daily, with dose at bedtime and reduce or give up milk. A small amount of meat may be taken the 5th week. *After-treatment.* Continue powder two or three times daily for further 6 weeks, with a dose at bedtime for a long time afterwards, and return to milk or light diet with powder 4 or 5 times daily if symptoms return at any time. Smoking and alcohol should be avoided.

Two cases in which the regular taking of an alkaline mixture, associated with an ulcer dietetic régime, was responsible for the formation of primary phosphatic renal stones. The most important part of the medical treatment of peptic ulcer must always be somewhat small and oft-repeated meals. This fact is unfortunately little recognised by medical practitioners, who regard the alkaline mixture as the *sine qua non* of ulcer treatment. The profession should be warned of the intimate relation of the formation of calculi to the consumption of large doses of alkaline powders.—T. Moore, *Lancet*, ii/1939, 1118.

Tabellæ Bismuthi Carbonatis (B.P.C.) contain 5 gr. (0.3 g.).

Tabellæ Bismuthi et Sodii Bicarbonatis (B.P.C.). Dose.—1 to 3 tablets. Contain 2 gr. of bismuth carbonate and 3 gr. of sodium bicarbonate.

Trochisci Alkalini Compositi (B.P.C.). Each lozenge contains 12 gr. of compound bismuth powder.

Trochiscus Bismuthi Compositus (B.P.). Contains 2½ gr. each of bismuth carbonate and heavy magnesium carbonate and 4½ gr. of calcium carbonate.

Unguentum Bismuthi (B.P.C.).

Bismuth carbonate 12½% in white soft paraffin.

[P2] **Ung. Bismuth. c. Camph. (N.I.F.).** For hæmorrhoids.

Liquefied phenol 20 m., camphor 4 gr., bismuth carbonate 120 gr., ointment of zinc oxide 240 gr., white soft paraffin to 480 gr.

[D-P1-81] **Unguentum Bismuthi Morphine et Cocaine (Allingham).** Bismuth carbonate 20, morphine hydrochloride ½, cocaine hydrochloride 3, soft paraffin to 100. Useful as astringent in hæmorrhoids and for allaying irritation.

Antacid Lozenges (Parke, Davis, London). Takadiastase, bismuth carbonate, magnesium carbonate, oleoresin of ginger and oil of peppermint. Dose.—1 to 3 lozenges. To neutralise gastric acidity.

Crema-Carbonates (Sharp & Dohme, London). Each fluid ounce contains bismuth carbonate 20 gr., magnesium carbonate 20 gr., calcium carbonate 10 gr., chloroform 1 m.

Sanusin Sempules (British Drug Houses, London). Suppositories containing resorcinol, boric acid, balsam of peru, zinc and bismuth carbonate. Useful in treatment of hæmorrhoids.

Bismuthi Citras (B.P.C.).

Dose.—2 to 5 grains (0.12 to 0.3 g.).

A white crystalline powder, yielding from 55 to 59% of Bi_2O_3 .

It is probably a monobismuthylcitric acid, $\text{H}_2\text{C}_6\text{H}_5\text{O}_7(\text{BiO})$. Insoluble in water and alcohol 90%, but soluble in ammonia. It is astringent and stomachic.

Bismuth Citrate Gauze. May replace iodoform gauze, being non-toxic and without odour. May be left in uterine cavity at least five days and still be free from offensiveness. For use after curettings, in nasal and aural surgery and for burns.

Bismuthi et Ammonii Citras (B.P.C.).

Dose.—2 to 5 grains (0.12 to 0.3 g.).

In soluble shining pearly or translucent scales containing 46 to 50% of Bi_2O_3 .

Liquor Bismuthi Concentratus (B.P.C.).

Dose.— $\frac{1}{4}$ to $\frac{1}{2}$ drachm (1 to 2 ml.).

Is twice the strength of Liquor Bismuthi et Ammonii Citratis, containing the equivalent of 10 to 12% w/v of Bi_2O_3 .

Liquor Bismuthi et Ammonii Citratis (B.P.C.).

Syn. LIQUOR BISMUTHI, LIQUOR BISMUTHI CITRATIS.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains the equivalent of 5 to 6% w/v of Bi_2O_3 . May be prepared by dissolving bismuth citrate 10% w/v in solution of ammonia and diluting to volume, filtering if necessary.

If prepared with the minimum amount of ammonia (as in B.P.C.) the solution will give a precipitate when dispensed with sodium bicarbonate; if slightly alkaline no precipitate is produced.

When prescribed with glycerin of phenol, the mixture quickly develops a blue coloration if exposed to light.—*Pharm. J.*, ii/1933, 73.

[P1] Mistura Bismuthi Composita (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

1 dr. contains $\frac{1}{2}$ dr. of concentrated solution of bismuth, $7\frac{1}{2}$ m. of tincture of nux vomica, and 2 m. of dilute hydrocyanic acid.

Is also available with pepsin 1 gr. per drachm (**Mistura Bismuthi Composita cum Pepsino B.P.C.**) and with 1 gr. of pepsin and $\frac{1}{16}$ gr. of morphine hydrochloride per drachm (**Mistura Bismuthi Composita cum Pepsino et Morphina B.P.C.**).

Mist. Bismuth. et Ammon. Cit. (N.I.F.). Solution of bismuth and ammonium citrate 40 m., strong solution of ammonium citrate 4 m., sodium bicarbonate 10 gr., solution of bordeaux B $2\frac{1}{2}$ m., chloroform water to $\frac{1}{2}$ oz.

[P1] Bisedia (Giles, Schacht, Bristol). *Dose.*—1 drachm (4 ml.) containing bismuth and pepsin with $\frac{1}{16}$ gr. of morphine hydrochloride, 2 m. of hydrocyanic acid, and 5 m. of tincture of nux vomica.

Bismuthi et Cinchonidinæ Iodidum. $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O} \cdot \text{HI} + \text{BiI}_3 = 1011.9$.

Dose.— $\frac{1}{4}$ to 1 grain (0.01 to 0.06 g.).

Yellowish-red powder insoluble in ordinary solvents, containing about 20% bismuth, 40% each iodine and cinchonidine.

Bismuthi et Sodii Tartras (B.P.C.).

Syn. SOLUBLE BISMUTH TARTRATE, ACID BISMUTH SODIUM TARTRATE.

Caution. This is the acid compound; to be distinguished from Bismuthi et Sodii Tartras (B.P. Add. I) which is a neutral bismuthyltartrate. The acid compound is not suitable for injection.

Dose.—2 to 5 grains (0.12 to 0.3 g.) per os.

Colourless scales with acid reaction containing 38 to 44% of Bi.
Soluble in water.

Uses. For digestive complaints, in conjunction with pepsin, the acid solution favouring the action of the enzyme with which it is compatible in moderate amount.

Liquor Bismuthi Acidus (B.P.C.).

Dose.— $\frac{1}{2}$ to $\frac{1}{2}$ drachm (1 to 2 ml.).

A solution of acid bismuth sodium tartrate, containing the equivalent of 9 to 10% w/v of Bi_2O_3 .

[P.] **Mistura Bismuthi Composita Acida cum Pepsino (B.P.C.).**

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

One drachm contains acid solution of bismuth equivalent to about 5 gr. of bismuth sodium tartrate, 1 gr. of pepsin, and $\frac{1}{2}$ m. of liquid extract of nuxvomica.

The acidity of the mixture maintains the activity of the pepsin.

Mist. Bismuth. c. Pepsin. (N.I.F.). Compound acid mixture of bismuth with pepsin 30 m., water to $\frac{1}{2}$ oz.

Bismuthi et Sodii Tartras (B.P. Add. I).

Syn. and Prop. Name. BISMUTH SODIUM TARTRATE, SODIUM BISMUTHYL TARTRATE, SODIUM TARTROBISMUTHATE, SOBITA (*Howards, Ilford*).

Caution. This is the neutral compound; to be distinguished from Bismuthi et Sodii Tartras (B.P.C.) which is an acid bismuthyltartrate.

Dose.—1 to 3 grains (0.06 to 0.2 g.) by intramuscular injection.

A white powder or yellowish scales containing 35 to 42% of Bi.

Soluble 1 in less than 1 of water.

Uses. Is administered intramuscularly in the treatment of syphilis. May be dissolved in water, saline or dextrose solutions, or suspended in oil. Oily suspensions are commonly preferred because less painful, and more slowly absorbed, hence less likely to cause toxic symptoms. Employed as a 1.5% solution, or stronger in suspension. The injections exert a marked diuretic action.

DIURESIS. In doses of 0.03 g. intramuscularly bismuth sodium tartrate has a powerful diuretic action, more effective than Novasurol and with no ill effects except occasionally a local abscess at site of injection.—Clifford Hoyle, *Practitioner*, ii/1933, 428. See also P. J. Hanzlik and co-workers, *J. Amer. med. Ass.*, i/1929, 1416.

SYPHILIS, AORTIC. Pain, the most common symptom in 100 cases of aortic syphilis, was relieved in all but one case by sodium bismuth tartrate intramuscularly in doses of 2 ml. of a 1.5% solution twice a week in courses of 10 injections.—L. M. Blackford and J. H. Boland, *J. Amer. med. Ass.*, ii/1932, 1902.

Bismuthi et Potassii Tartras (U.S.P.XI). **Syn.** POTASSIUM BISMUTH TARTRATE, POTASSIUM BISMUTHYL TARTRATE.

Average dose.— $2\frac{1}{2}$ grains (0.15 g.) by injection.

A white powder **soluble** 1 in 2 of water. Contains the equivalent of 71 to 75% of Bi_2O_3 (about 64 to 67% of Bi). Given intramuscularly in syphilis in solution or suspension, as the sodium

compound. It is stated to disappear completely from the site of injection, usually in 2 weeks.

Potassium Bismuthyl Saccharate has been prepared by the addition of freshly precipitated bismuth hydroxide to a solution of potassium acid saccharate. It was obtained as a white solid, soluble in water, but insoluble in organic solvents.

It has been shown to be a more stable complex than the corresponding tartrate and gluconate, and since its solution appears to be stable indefinitely, it is of interest as a drug for the treatment of those diseases for which bismuth is used.—G. O. Doak, *J. Amer. pharm. Ass., Sci. Edn.*, 1940, 108.

Injected intramuscularly it is gradually absorbed and excreted. Bismuth is present in all the organs and tissue fluids within 24 hours, resulting in fairly uniform blood bismuth levels for five days.—C. W. Sondern *et al.*, *J. Amer. pharm. Ass., Sci. Edn.*, 1940, 346.

Sodium Potassium Bismuthyltartrate. *Syn.* SODIUM POTASSIUM TARTROBISMUTHATE.

Dose.— $1\frac{1}{2}$ to 3 grains (0.1 to 0.2 g.) intramuscularly, in solution in saline, or in suspension in 1 to 2 ml. of vegetable oil. Is injected once or twice weekly until 30 to 45 gr. has been given.

A white powder **soluble** about 1 in 2 parts of water, giving a neutral solution.

Used in syphilis and yaws, but the difference in effect between it and a body without the potassium compound is no doubt negligible.

RELAPSING FEVER. Sodium potassium bismuth tartrate brings fever down. Given intramuscularly—for an adult, 2 injections of 0.2 g. in 2 ml. water, for a child of 2 to 10 years 2 injections each of 0.1 g. For a baby under 2 years, 1 injection of 0.1 g.—J. Todd, *Brit. med. J.*, i/1930, 312.

Sodium Bismuthate. A yellow-brown, hygroscopic powder containing about 85% of NaBiO_3 , with bismuth oxide and water. It slowly decomposes on keeping.

Insoluble in water. Boiled with water it decomposes into bismuth oxide and sodium hydroxide, and liberates oxygen.

Medicinally it is used in the preparation of sobisminol mass (*q.v.*).

Sobisminol Mass.

Dose.—25 to 34 grains (1.5 to 2.25 g.) thrice daily.

It is supplied in capsules, each containing 0.75 g., equivalent to 150 mg. of Bi.

Sobisminol mass is a complex substance obtained by the interaction of sodium bismuthate, triisopropanolamine and propylene glycol. It contains about 20% of Bi, and occurs as a chocolate-coloured pasty mass with a bitter taste.

During 1933 P. J. Hanzlik undertook to develop a soluble bismuth preparation intended for oral as well as intramuscular administration in the treatment of syphilis. A patent was applied for by Hanzlik in 1936, and later three manufacturers (E. R. Squibb & Sons; Cutter Laboratories; and Eli Lilly & Co.) were licensed by the Board of Trustees of Stanford University of California to manufacture the preparation, the word "Sobisminol" being decided on as a suitable non-proprietary designation by Hanzlik, the manufacturers and the Council on Pharmacy and Chemistry of the A.M.A.—*J. Amer. med. Ass.*, ii/1939, 2235.

Soluble in water and alcohol, but less soluble in ether and acetone. The pH of a 10% *w/v* aqueous solution should not be above 11.9.

Uses. For use in the treatment of syphilis by the oral route. It is particularly indicated for those patients unable to undergo intramuscular bismuth therapy, and to supplant therapy by that route for patients compelled for a time to be out of contact with their physicians. It may also be indicated in congenital and latent syphilis. It should be employed only under medical supervision. The patient should be watched for evidence of gastro-intestinal upsets and bismuth intoxication.

The adult dosage is from 2 to 3 capsules three times a day, taken with plenty of water at 10 a.m., 3 p.m. and 8 p.m. Unless contraindications arise this therapy may be continued for 10 to 12 weeks, and represents a course of bismuth therapy. For children the dosage may be cut down to one capsule three times a day or a 75 mg. capsule three times a day for a very young child.

Daily doses of 6 capsules by the mouth brings about involution of active syphilitic lesions of the skin in periods comparing favourably with those when preparations for intramuscular administration are used. The time required in cases of primary and secondary syphilis is only slightly greater than when neoarsphenamine is used. A similar dosage brings relief from the symptoms of late neuro-syphilis (particularly tabetic) in a high percentage of cases, and appears to offer a definite advantage over any other drug hitherto used. It is well tolerated by most patients and can be used daily for many months without cumulative toxic effects.—J. R. Scholtz *et al.*, *J. Amer. med. Ass.*, ii/1939, 2219. A valuable addition to anti-syphilitic therapy deserving of further clinical trial.—W. M. Meininger and C. W. Barnet, *ibid.*, 2214.

Sobisminol Solution.

Dose.—15 to 30 minims (1 to 2 ml.) by intramuscular injection twice weekly.

It consists of a solution of sobisminol mass in a mixture of propylene glycol and water. 1 ml. contains about 20 mg. of bismuth and 0.5 ml. of propylene glycol. Sobisminol solution is dark red in colour and is miscible with an equal volume of water or alcohol. pH 11.1 to 11.5.

Uses. Sobisminol solution is proposed for use in all types of syphilis, and is claimed to be free from unusual discomfort (see *J. Amer. med. Ass.*, ii/1939, 2238). It is given intramuscularly in a dose of 1 to 2 ml. twice a week for a series of 20 to 25 injections. In cases of arsenical sensitisation the injections may be continued for a much longer period.

Sobisminol (*Lilly, London*). A solution containing sodium bismuthate 3% in a mixture of triiso-propanolamine 8%, propylene glycol 50%, and water, a 1 ml. dose containing approximately 20 mg. of Bi. Capsules (**Sobisminol Mass**) containing 150 mg. of Bi in 0.75 g. are also available for oral administration.

[P1-81] **Bismuthi Arsanilas.** $\text{BiO} \cdot \text{O} \cdot \text{AsO}(\text{OH}) \cdot \text{C}_4\text{H}_9 \cdot \text{NH}_2 = 441.0$.

A white powder containing the equivalent of 53% of Bi_2O_3 and 17% of As. Prepared by interaction between bismuth sodium tartrate and sodium aminarsenate. It is best given as a suspension of the freshly precipitated compound containing 1 grain (0.06 g.) in 15 minims (1 ml.).

Dose.—Intramuscularly for adults 2 to 3 ml., for grown-up children 1 ml., for young infants 0.5 ml.

For use in syphilis and yaws.

Quinine Iodobismuthate (*Fr. Cx., P. Belg. IV, F.E. VIII*). $(\text{BiI}_3)_2 \cdot \text{C}_{20}\text{H}_{24}\text{N}_2\text{O}_2 \cdot 2\text{HI} = 1759.74$

A bright red powder *insoluble* in water. Decomposed slowly on prolonged contact with water. Contains about 23% of Bi, 57% of I and 18% of quinine.

For intramuscular injection as a suspension in sterile oil in syphilis, usually in conjunction with arsenicals. Its action is less rapid and more prolonged than that of other bismuth injections. It is especially indicated in cases with a persistent Wassermann reaction resistant to the arsphenamines. Contraindicated in pulmonary tuberculosis and the following when *not* due to syphilis: advanced diseases of the heart and nervous system, nephritis, severe diabetes, cachexia.

Suspension d'Iodobismuthate de Quinine (Fr. Cx.).

Sterilise the pestle and mortar by burning a little spirit in the latter, and incorporate quinine iodobismuthate 17 g. with anhydrous wool fat 5 g., and neutral olive oil 87 g., making up to 100 ml. 1 ml. contains approx. 0.04 g. of Bi.

Bismosalvan (Richter, London), Quinostab (Boots, Nottingham), Spirobismol (Candlen Chemical Co., London) and Rubyl (Pharmaceutical Specialities (May & Baker) Ltd., London) are 10% suspensions of quinine iodobismuthate in olive oil. *Average dose*.—3 ml. by intramuscular injection once or twice weekly for a course of 15 to 24 injections.

Neobismosalvan (Richter, London) and Spirobismol S.S. (Candlen Chemical Co., London) are similar preparations containing also lecithin.

Sodium Iodobismuthite. Syn. SODIUM BISMUTH IODIDE.

A red crystalline compound consisting chiefly of hydrated Na_2BiI_4 . Prepared by the interaction of bismuth iodide or chloride with dry sodium iodide in anhydrous ethyl acetate solution. Contains about 21% of Bi. *Soluble* 1 in 1 of water, giving a black precipitate of bismuth iodide on diluting and a red precipitate of oxyiodide on further diluting. For use in syphilis. It is claimed that it appears in the spinal fluid and penetrates the brain tissue.

Preparation of sodium iodobismuthite.—P. J. Hanzlik *et al.*, *J. Amer. med. Ass.*, 1/1932, 537.

Iodobismutol with Saligenin (Squibb, New York; Savory & Moore, London). 2 ml. ampoules containing a solution of sodium iodobismuthite 0.12 g., sodium iodide 0.24 g., saligenin 0.08 g. (as local anæsthetic), in propylene glycol. *Suggested dose*.—2 ml. intramuscularly two or three times weekly for 12 injections.

Found as efficacious as any bismuth compound hitherto tried.—G. C. Johnson *et al.*, *J. Pharmacol.*, 1932, 45, 469.

In laboratory animals the bismuth enters the brain in from 90 to 100% of cases, and it is claimed that it will penetrate the brain in significant quantity in a great majority of persons, though this requires further confirmation.—*N.N.R.*, 1940.

Bismuthi Hydroxidum. Syn. BISMUTHUM HYDROXYDATUM, HYDRATED BISMUTH OXIDE.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

A yellow (partly hydrated) or white (hydrated) bismuth oxide usually containing a large proportion of carbonate.

Insoluble in water. Soluble in acids and in alkalis in presence of glycerin.

Uses. A substitute for bismuth carbonate; also injected intramuscularly in syphilis.

Mistura Bismuthi Hydroxidi (B.P.C.). *Syn.* MAGMA BISMUTHI.

Dose.—1 to 2 drachms (4 to 8 ml.).

A suspension of freshly precipitated hydrated oxide, free from carbonate, containing the equivalent of 10% w/v of Bi_2O_3 . The precipitated hydrate loses water when stored for a few weeks and becomes yellow and dense.

Does not liberate carbon dioxide in the stomach.

Mistura Bismuthi et Magnesii Hydroxidum (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Equal parts of mixture of bismuth hydroxide and mixture of magnesium hydroxide.

The magnesium hydroxide counteracts the constipating effect of the bismuth hydroxide.

Bismosal (Arnfield & Sons, Stockport). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). Children 5 to 20 minims (0.3 to 1.2 ml.). Contains bismuth as hydroxide in suspension with salol. In diarrhoea.

Casbis (Bayer Products, London). Oily suspension of bismuth hydroxide (10% Bi). *Dose.*—0.5 to 1 ml. by intragluteal injection.

Muthanol (Bengé, London). Suspension of bismuth hydroxide and mesothorium bromide in olive oil for intramuscular injection in syphilis.

Thio-bismol. *Syn.* SODIUM BISMUTH THIOGLYCOLLATE.

Dose.—3 grains (0.2 g.) intramuscularly, dissolved in 1 ml. of sterile distilled water.

Thio-bismol is obtained by the interaction of sodium thioglycollate and bismuth hydroxide. It has the approximate formula $\text{Bi}(\text{SCH}_2\text{CO}_2\text{Na})_3$, and contains about 38% of Bi. Thio-bismol is a yellow, hygroscopic, granular substance with an alliaceous odour.

Freely *soluble* in water, but the solution is unstable and must be prepared immediately before use.

Uses. For the treatment of those cases of syphilis in which it is desirable to saturate the patient with bismuth quickly. It is stated to produce little or no pain at the site of injection and to be rapidly absorbed. The usual dose, given by deep intramuscular injection, is 0.15 to 0.2 g., the injections being given twice weekly for ten to twelve doses.

THERAPEUTIC MALARIA. Thio-bismol is a reliable drug in the treatment of therapeutic malaria, and by its use many untoward malarial results can be avoided. Moreover, where it is desired to terminate a course of therapeutic malaria without shock to the patient, it will be found that an intramuscular injection of thio-bismol, plus quinine or Atebrin by the mouth, will accomplish this.—H. N. Cole *et al.*, *J. Amer. med. Ass.*, ii/1940, 422.

Sodium bismuth thioglycollate may be usefully employed to smooth the shock of therapeutic malaria while increasing its non-specific therapeutic effect, by means of sharp paroxysms properly spaced, and permits of an increase in the total number that may be given. The general strength of the patient is thus conserved and his period of convalescence shortened. Experience shows that single doses of 0.1 g. intramuscularly exert a definite controlling influence on the sequence of the malarial spasms.—L. A. Brunsting and W. R. Love, *Proc. Mayo Clin.*, 1940, 285.

Bismuthi Naphtholas (B.P.C.). *Syn.* NAPHTHOL-BISMUTH, BASIC BISMUTH BETANAPHTHOLATE. $\text{Bi}_2\text{O}_3(\text{OH})\text{C}_{10}\text{H}_7\text{O} = 610.1$.

Dose.—5 to 15 grains (0.3 to 1 g.) in a cachet.

A pinkish-brown almost tasteless odourless powder, insoluble in water, slightly soluble in alcohol 90%.

A useful antiseptic and astringent for the stomach and intestines. Externally as a dusting powder for skin diseases and ulcers.

Bismuthi Nitratis Crystallisatus (*Fr. Cx., P.G. VI*). *Syn.* BISMUTHI NITRAS NEUTRUS (*F.E. VIII, P. Ital. V*).

$\text{Bi}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O} = 485.1$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

In colourless deliquescent crystals, which, if dissolved in a small quantity of water, give a solution with an acid reaction; this on further dilution throws out basic bismuth subnitrate. It is practically insoluble in alcohol 90%, but soluble in cold glycerin, *cf.* Glycerinum Bismuthi Nitratis *infra*. It is astringent and antiseptic, and useful for the diarrhoea of phthisis.

Glycerinum Bismuthi Nitratis.

Bismuth nitrate in crystals 1, glycerin to 4. Diluted 4 or 5 times with glycerin is a stimulant application in eczema and for chapped hands.

Bismuthi Oxidum (*B.P.C.*). $\text{Bi}_2\text{O}_3 = 466.0$.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

Is prepared by boiling bismuth subnitrate in solution of sodium hydroxide, washing and drying the deposited yellowish bismuth oxide. May be precipitated with acid from an alkaline solution containing glycerin.

Anderson's Ointment.

Bismuth oxide 1, oleic acid 8, white wax 3, white soft paraffin 9. In pruritus.

Bismuthi Oxyiodogallas (*B.P.C., P. Jap. V, P. Helv. V, P. Ned. V, P.G. VI*). $\text{C}_6\text{H}_2(\text{OH})_3\text{COOBi} \cdot \text{OH} \cdot \text{I} = 521.7$.

Syn. and Prop. Name. BISMUTH OXYIODOSUBGALLATE, AIROL (*Roche Products, Welwyn Garden City*), AIROFORM, AIROGEN.

A light greyish-green powder, odourless, tasteless, and non-irritant. It darkens on exposure to air. *Insoluble* in water, alcohol and ether. Used as ointment for ulcers, boils, whitlows, chancres, and intertrigo. Also as dusting powder, *e.g.*, for gonorrhoeal ophthalmia.

Anusol Suppositories (*Warner, London*). Oil of theobroma 5.87, wool fat 7.86, magnesium stearate 0.5, boric acid 18.38, zinc oxide 10.91, kaolin 2.33, bismuth resorcinate 1.77, bismuth oxyiodogallate 2.25, methyl violet B 0.04, castor oil 3.98, balsam of Peru 3.10, soft paraffin to 100. For hæmorrhoids.

Bismuthi Phenasis. *Syn.* PHENOL-BISMUTH.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

A white powder, insoluble, containing a variable amount of phenol, combined with bismuth oxide. Acts slowly on the digestive tract and does not cause carboluria.

The exact formula of the compound is uncertain. Products with the highest phenol content are obtained by precipitation from neutral solution in the cold. The figures do not agree with $\text{Bi}(\text{OH})_3 \cdot \text{C}_6\text{H}_5\text{O}$.

Bismuthi Salicylas (*B.P., U.S.P. XI, P. Helv. V, P.G. VI, P. Ital. V, P. Dan., P. Belg. IV, P. Ned. V, P. Jap. V, Fr. Cx.*).

Syn. BISMUTH OXYSALICYLATE, or SUBSALICYLATE. The formula approximates to $\text{C}_6\text{H}_4 \cdot \text{OH} \cdot \text{COO} \cdot \text{BiO} = 362.0$.

Dose.—10 to 30 grains (0.6 to 2 g.) orally; 1 to 2 grains (0.06 to 0.12 g.) by intramuscular injection.

A white, micro-crystalline powder, *insoluble* in water, alcohol, and glycerin, yielding on incineration about 64% of Bi_2O_3 . It is decomposed in the presence of alkali bicarbonates with effervescence. Useful internally *per os* in some forms of diarrhoea, typhoid fever and gastric catarrh, and as a substitute for iodoform. A good intestinal antiseptic. Is given intramuscularly in syphilis in oily suspension, and has been advocated in the treatment of yaws, eight injections at weekly intervals being usually sufficient to effect a cure.

Injectio Bismuthi Salicylatis (B.P.).

Dose.—10 to 20 minims (0.6 to 1.2 ml.) by intramuscular injection.

Contains 10% *w/v* of bismuth salicylate suspended in a sterile solution of camphor 1%, and phenol 1%, in olive oil.

B.P. Add. III allows the use of arachis oil, in place of olive oil, in making injection of bismuth salicylate.

LICHEN PLANUS. Usually cured by a course of 10 to 12 weekly intramuscular injections of $1\frac{1}{2}$ grains bismuth salicylate in olive oil.—H. D. Grossman, *per J. Amer. med. Ass.*, ii/1932, 1203.

Bisantol (Pharmaceutical Specialities (May & Baker) Ltd., London). Suspension of bismuth salicylate in oil for intramuscular injection containing 0.057 g. of Bi per ml.

Mesuroil (Bayer Products, London). Basic bismuth methoxyhydroxybenzoate. Administered intramuscularly as a 20% emulsion in the treatment of syphilis.

Bismuthum Subsalicylicum, Basic (Fr. Cx.).

$\text{C}_6\text{H}_4\text{OH-COO-Bi(OH)}_2 = 380.1$.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

An amorphous anhydrous insoluble white powder neutral to litmus, incompatible with acids.

Bismuthi Oxychloridum (B.P. Add. I).

Syn. BISMUTH SUBCHLORIDE (B.P.C.). $\text{BiOCl} = 260.4$.

Dose.—10 to 30 grains (0.6 to 2 g.); by intramuscular injection, $1\frac{1}{2}$ to 3 grains (0.1 to 0.2 g.).

An amorphous or minutely crystalline powder *insoluble* in water, soluble in dilute acids. Pearl white or "*blanc de perle*" is bismuth subchloride precipitated by adding hydrochloric acid to a solution of the nitrate; "*blanc d'Espagne*" or flake white is precipitated with sodium chloride.

Given internally it produces a coating on the irritated parts of the stomach or bowels. As insufflation to the larynx $\frac{1}{4}$ to 1 gr.

Intramuscular injections have given good results in the treatment of lupus erythematosus.

LUPUS ERYTHEMATOSUS. The best tolerated salt of bismuth is the oxychloride suspended in water, with chlorbutol added to relieve pain on injection. The patient should be kept under a heavy bismuth dosage for 10 or 12 weeks, injections equivalent to 0.2 or 0.3 g. of bismuth being given once or twice weekly to a total of 3 or 4 g. in a series of 10 or 12 injections. After an interval of 6 weeks another course may be given.—R. M. B. MacKenna, *Med. Pr.*, 1935, 248.

SYPHILIS. Bismuth oxychloride preferred in syphilitic treatment. It is probably reduced to metal. Course of 4 g. in 10 injections. Give *concurrently*

with arsphenamine, rather than bismuth or mercury to follow. Quinine iodo-bismuthate has disadvantage of low bismuth content.—L. W. Harrison, *Lancet*, i/1930, 764.

Injectio Bismuthi Oxychloridi (B.P. Add. I).

Dose.—15 to 30 minims (1 to 2 ml.), by intramuscular injection.

Bismuth oxychloride 10% w/v with dextrose and cresol in sterilised water.

Mucilago Bismuthi. For X-ray diagnosis.

Bismuth oxychloride $1\frac{1}{2}$ to 2 or 3 ounces or more made into a thick paste with acacia mucilage for a dose, for determining condition of the oesophagus and for examining shape, position and motor function of the stomach. A special bismuth oxychloride free from nitrate is made for X-ray work. It is inert in the stomach.

Bismuth in bread and milk in proportion of $1\frac{1}{2}$ oz. of bismuth oxychloride to $\frac{1}{2}$ pint of bread and milk to form a thick paste—not a liquid—is also employed and is in some respects more suitable.

In tuberculous joints bismuth injections are useful for diagnosis and treatment.

See also Bismuthi Carbonas *antea*, and *Radiology*, Vol. II.

Unguentum Bismuthi Oxychloridi.

Bismuth oxychloride 1, white soft paraffin 15.

Is useful for anointing the speculum for vaginal examinations.

B.C.C. Dusting Powder (*Blythswood Chemical Co., Glasgow*) contains bismuth oxychloride, talc, light magnesium carbonate and boric acid. For nursery and general use.

Bismurung (*Blythswood Chemical Co., Glasgow*). An ointment of bismuth oxychloride 10% in colloidal dispersion, for chronic lupus erythematosus, rubbed in for at least 2 minutes twice daily. Also for general use as a sedative and antiseptic ointment. Also issued as pessaries and suppositories. **Bismurung-Tropical** is the same as Bismurung, but has the melting point of the base adjusted to make it suitable for tropical climates. It is of value in "prickly heat." **Suspensol Bismuth Cream.** A colloidal bismuth preparation containing $7\frac{1}{2}\%$ of Bi, for the administration of bismuth by inunction. *Dose.*—20 to 40 grains daily for 30 to 40 days. For the treatment of congenital syphilis in infants, 5 to 10 grains daily.

Pustular folliculitis cleared up; tinea unguium and chancroids also treated. May be of value in yaws.—R. M. B. MacKenna, *Lancet*, i/1931, 126.

Bisoxyl (*British Drug Houses, London*). A suspension of bismuth oxychloride in chlorbutol solution containing 0.1 g. per ml. Initial dose 0.1 g., increased to 0.2 g., corresponding to 0.01 and 0.02 g. of the bismuth salt. For syphilis and yaws.

Chlorostab (*Boots, Nottingham*). Bismuth oxychloride suspension in isotonic glucose solution in two strengths: 1 ml. = 0.16 g. of Bi metal and 1 ml. = 0.2 g. *Dose.*—1 injection (= 0.40 g. of Bi) intramuscularly per week for 10 weeks; or 2 injections (each = 0.20 g. of Bi) per week for 10 weeks. *Dose* for children according to age and body weight, e.g., from 1 to 4 years the equivalent of 0.05 g. of Bi metal; from 4 to 8 = 0.06 to 0.07 g. Bi metal; over 8 years = 0.10 to 0.20 g. In syphilis, congenital syphilis, etc.

Bismuthi Subgallat (*B.P.C., U.S.P. XI, P. Helv. V, Fr. Cx., etc.*). $C_6H_2(OH)_3COO \cdot O \cdot (BiO)_2H_2O$ or $Bi(OH)_2C_7H_5O_5 = 412.1$. *Syn. and Prop. Name.* BISMUTH OXYGALLATE, BASIC BISMUTH GALLATE, DERMATOL (*Bayer Products, London*).

Dose.—10 to 30 grains (0.6 to 2 g.).

Manufacture. Bismuth carbonate 258 and gallic acid 188 are heated in presence of water 2000, until interaction has occurred.

The *Fr. Cx.* method is also satisfactory: Dissolve bismuth nitrate *cryst.* 100 g. in glacial acetic acid 200 g. Dilute with water 500 ml. and add with stirring gallic acid 37 dissolved in water 1500 ml. Wash the ppt. until the liquor is no longer acid to litmus. Dry at not exceeding 60°. *P. Ital.* method is similar. It may also be prepared by the action of gallic acid on freshly precipitated bismuth hydroxide.

An odourless, yellow, **insoluble**, non-irritant antiseptic dusting powder, employed alone or with starch.

Incompatible with alkaline sulphur compounds.

Uses. Given internally for diarrhoea in doses of 30 to 90 grains daily. Emulsion of bismuth subgallate 2, acacia 2, water 25, has been used in gonorrhoea, with good results.

In ulcerative colitis an emulsion may be used to adhere to the mucosa and a 5% suspension in olive oil is also stated to give good results; also of value after pile operations. Promotes healing.

Collapsible tubes, with catheter attachment, of bismuth subgallate ointment (10%), with paraffin basis, are useful in gonorrhoea; this ointment is also good for burns and eczema.

DYSENTERY. Rectal injections of bismuth subgallate 5%, in olive or cod-liver oil are much used in amoebic and chronic bacillary dysentery. In the preparation, suspending agents must not be used, and slow and thorough grinding is the best method. Before use the suspension must be thoroughly stirred and then well shaken. The dose varies between 4 and 10 ounces daily.—O. Turner, *Trans. R. Soc. trop. Med. Hyg.*, 1940, 34, 112.

Carbasus Bismuthi Subgallatis. BISMUTH SUBGALLATE GAUZE.

To prepare, use an emulsion of bismuth subgallate, $\frac{1}{2}$ to 1 of glycerin to 2 of alcohol (90%) and proceed in the customary manner—the final strength being 10 to 20% of bismuth in the gauze as required. For packing cavities.

Suppositorium Bismuthi Subgallatis (B.P.C.). 5 grains.

Suppositorium Bismuthi Subgallatis Compositum

(*B.P.C.*). *Syn.* SUPPOSITORIIUM BISMUTHI ET RESORCINI COMPOSITUM.

Bismuth subgallate 3 gr., resorcinol 1 gr., zinc oxide 2 gr., and balsam of Peru 1 m. in each suppository.

[P1] B.F.L. (*Sharp & Dohme, London*). Bismuth-formic-iodide compound. Bismuth-formic-iodide 70 gr., acetanilide 30 gr., zinc sulphocarbolate 10 gr., bismuth subgallate 20 gr., powdered alum 3 gr., boric acid 128 gr. Antiseptic dusting powder for wounds, eczema, etc.

E.D.P. (*Evans, Sons, Lescher & Webb, Liverpool*). Bismuth formic iodide as surgical dusting powder.

Bismuthi Subnitrates (B.P.C., P. Ned. V, P. Helv. V, P. Ital. V, P.G. VI, P. Dan., U.S.P. XI, P. Jap. V, Fr. Cx.). *Syn.* BISMUTH OXYNITRATE, MAGISTERIUM BISMUTHI.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

A white microcrystalline powder, containing 79 to 81% of Bi_2O_3 , obtained by precipitating a bismuth nitrate solution with alkali. Composition corresponds to $6\text{Bi}_2\text{O}_3 \cdot 5\text{N}_2\text{O}_5 \cdot 9\text{H}_2\text{O}$. The oxysalt, $\text{BiONO}_2 \cdot \text{H}_2\text{O}$, obtained by precipitation of bismuth nitrate solution with water, contains about 76% of Bi_2O_3 .

Insoluble in water and alcohol; soluble in nitric and hydrochloric acids.

Incompatible with alkaline carbonates, also decomposes potassium iodide, and incompatible with tannin and sulphur.

Best suspended in aqueous vehicle by compound tragacanth powder, 1 dr. to 8 oz., or by powdered acacia or with half its weight of starch powder.

Uses. In gastric ulcer and dysentery as an intestinal antiseptic, and occasionally as a dusting powder in eye work. By virtue of its continuous nitrite action it has been suggested for use in hypertension, in a dose of 10 grains three times daily. For the treatment of wounds it is used with iodoform in the form of "B.I.P.P."

Gastric ulcer may be treated by bismuth subnitrate rubbed into a paste with liquid paraffin. Decomposition into nitrite in the stomach is avoided, *cf.* Bismuth Carbonate.

HYPERTENSION. Following the administration of bismuth subnitrate by mouth, the nitrite content of the blood is increased by three or four times the normal concentration. This increase in nitrite concentration is associated with a fall in the arterial tension. Reduction of the arterial tension does not invariably follow taking bismuth subnitrate by mouth, but in such instances there is no increase in the nitrite content of the blood. Thus a parallelism between the nitrite content of the blood and the arterial tension has been shown. The experimental evidence confirms the clinical impression that following the oral administration of bismuth subnitrate, small amounts of nitrite are slowly and continuously absorbed from the bowel.—E. J. Stieglitz and A. E. Palmer, *J. Pharmacol.*, 1936, 56, 222.

SYPHILIS. Bismuth subnitrate as effective as any other bismuth compound. Good results with following injection: Bismuth subnitrate 10 g., Novocaine nitrate 1 g., sterile almond oil 100 g., the dose being 1 ml. (0.07 g. of bismuth) every third day.—E. Sonnenberg, *per Prescriber*, 1926, 329.

Enema Bismuthi et Sodii Salicylatis.

Bismuth subnitrate 3 dr., sodium salicylate 2½ dr., psyllium seed mucilage to 1 pint.

COLITIS, the treatment of, by Revelliod's method (modified).

Empty the bowels by enemata of warm water twice daily for three days—on the fourth day inject the above. Action of the bowels must be discouraged after the injection, as the medicament should be retained for two days, if possible, to permit of absorption.

During the injection the patient should lie upon the left side with the pelvis raised 2 or 3 inches. This treatment has, of course, no effect upon enteritis alone or complicating (? originating) colitis; consequently a modification is necessary.

D-P1-§1] *Insufflatio Bismuthi et Morphinae (B.P.C.).*

Syn. FERRIER'S SNUFF.

Bismuth subnitrate 75% and morphine hydrochloride 0.4% in powdered acacia.

From 1 to 2 drachms may be used in 24 hours as snuff for catarrh. For acute coryza add powdered cubebs. It may cause drowsiness for some hours in susceptible patients.

Injectio Bismuthi Subnitratis.—BECK'S BISMUTH PASTE. For X-ray examination of fistulae (*cf.* also Bismuthi Subchloridum).

It sometimes causes toxic symptoms after application. If this occurs, remove dressing, wash out wound. Give morphine, ½ gr. hypodermically, if cramps in limb are severe.

(a) For DIAGNOSIS AND EARLY TREATMENT. Place bismuth subnitrate 1 in a mortar sterilised by burning a little spirit in it and add in portions hot melted white soft paraffin 2.

(b) For LATE TREATMENT. Bismuth subnitrate 6, white wax 1, hard paraffin 1 (m.p. 120°F.), white soft paraffin 12. Prepare on similar lines to the last.

The (a) form was originally injected to diagnose the extent of chronic tuberculous sinuses. It was found also to have curative effect. It is melted before use. The (glass) syringe must be sterilised dry and the plunger dipped in sterile oil before charging.

The following is a modification:—Bismuth oxychloride 1, white soft paraffin 1½, liquid paraffin 1½, for injection into sinuses.

By X-ray examination, sinuses can be localised. Large quantities should not be left *in situ*.

Three ounces of (a) injected at the knee, and later 4 ounces further caused poisonous effects. Caution is necessary when using for diagnostic purposes.

The bismuth is bactericidal, chemotactic and astringent. Mechanical action is also good.

Pasta Bismuthi et Iodoformi (B.P.C.). Syn. B.I.P.P.

Bismuth subnitrate 25, iodoform 50, liquid paraffin 25 (by weight).

Large infected wounds have been treated without special drainage, the paste being applied as a thin covering over the wounded surface, which is then dressed in the usual way. Wounds can be closed by sutures at any period and the dressings can be left on one to six weeks. It is said to give excellent results in the treatment of acute osteitis.

POISONING in a girl of 8 following the use of 1 ml. of the paste after swabbing the wound with ether. Rapid pulse-rate, high temperature and dry skin, vomiting, diarrhoea and delirium. Recovery after irrigations of wound with 10% sodium bicarbonate solution, glucose per rectum and salines intravenously.—R. C. Shaw, *Lancet*, i/1933, 250.

OSTEITIS. Gives excellent results in the treatment of acute osteitis. There is a low mortality rate, complications are few and the average period of hospitalisation short. The late results concerning growth and function are excellent. Frequent dressings are avoided and the dressings themselves are painless.—J. H. Saint, *Lancet*, i/1937, 1263.

TROPICAL ULCER well treated.—T. R. E. Kerby, *Lancet*, i/1932, 237.

B.I.P.P. modified. Bismuth subnitrate 1, iodoform 2, and soft paraffin 13. Good in appendicitis operations, but some say it should never be introduced into the vagina.—R. A. Stoney, *Brit. med. J.*, ii/1930, 737.

The following formula is an improvement on the one containing 25% paraffin: bismuth subgallate 4 oz., iodoform 8 oz., liquid glucose 3½ oz., balsam of Peru 4 dr. During the war of 1914-1918 this was used with almost never-failing success. The process is: (1) a clean dissection of the damaged and infected tissues, (2) a liberal smearing or filling up with B.I.P.P. The wound granulates from below upwards and needs no further dressing.—A. Priestman, *Brit. med. J.*, ii/1939, 1164.

[D-P1-81] Unguentum Bismuthi et Cocainæ (*St. Mark's H.*).

Bismuth subnitrate 120 gr., cocaine hydrochloride 8 gr., white soft paraffin to 1 oz.

Bismocarbon (*Richter, London*). Tablets contain bismuth subnitrate 4 gr. and charcoal 4 gr. In dysentery, gastro-enteritis, etc.

Bisodol (*Bisodol, London*). Bismuth subnitrate, magnesium carbonate, sodium bicarbonate, carica papaya, diastase, oil of peppermint. *Dose*.—One level teaspoonful in water. Antacid.

Bismuthi Tannas. Syn. BISMUTUM BITANNICUM (P. Helv. V).

Dose.—5 to 30 grains (0.3 to 2 g.).

A brownish-yellow powder insoluble in water. Is astringent, and useful in diarrhoea and dysentery.

BROMUM

B.P.C., P. Jap. V.

Br = 79.9.

A dark brown liquid, sp. gr. about 3.14, with penetrating odour.

Soluble 1 in 30 of water *w/w*; readily soluble in organic liquids with gradual decomposition of the solvents. Is not used as such medicinally.

Antidotes. Emetics sometimes useful. Inhalations of very dilute ammonia, also of alcohol. Keep patient in fresh air. Give milk, white of egg or starch mucilage. Steam inhalations sometimes useful. Oxygen inhalations. Atropine, $\frac{1}{100}$ gr., hypodermically. Venesection and blood transfusion may be necessary.

Bromal Hydras. $\text{CBr}_3 \cdot \text{CH}(\text{OH})_2$ = 298.8.

Dose.—2 to 5 grains (0.12 to 0.3 g.) at bedtime.

In large colourless crystals, which melt on the hand, soluble in water 1 in 2½. Applied externally it irritates the skin. It has been tried in epilepsy, chorea and insomnia.

Brom-Albumen. *Syn.* BROMO-PROTEIN.

Dose.—10 grains (0.6 g.) = ½ gr. of bromine approx.—increased as desired.

Contains 7% of bromine, combined with albumen. Made by interaction of bromine with egg albumen, in form of a light brown powder. As a substitute for alkali bromides in epilepsy, where larger doses than the above may be required. It is hardly soluble in 0.2% hydrochloric acid, even in presence of pepsin, but is readily dissolved in 0.5% sodium bicarbonate in the presence of pancreatin, hence absorption takes place in the intestines.

Multibral (*Napp, London*). Sodium monobromoleate. Coated pellets contain 0.03 g. of bromine. *Dose.*—1 to 3 pellets thrice daily. For intensified bromine action with freedom from secondary effects.

Bromoformum (*B.P.C., P. Helv. V, Fr. Cx., P. Ital. V, P. Ned. V, P. Belg. IV, F.E. VIII*). *Syn.* TRIBROMOMETHANE. CHBr_3 = 252.8.

Dose.—½ to 2 minims (0.03 to 0.12 ml.) or more. *P.G. VI* and *Fr. Cx.* have maximum single dose 0.5 g.; maximum during 24 hours 1½ g. (= 8 minims approx.). Children as many drops as years old—up to 6.

A heavy, limpid, colourless, sweet liquid, with an agreeable odour; sp. gr. about 2.63. Distils mainly between 148° and 155°.

Soluble 1 in 800 of water, 1 in 80 of glycerin. Miscible with alcohol 90%, chloroform, ether and fixed and volatile oils. It should be preserved by addition of 0.5 to 1% alcohol. *B.P.C.* contains 3 to 4%. Is a powerful sedative, useful in insane cases. Capsules contain ½ minim (0.03 ml.) dissolved in oil. Has been employed as an antispasmodic in whooping-cough in a dose of 1 to 3 minims on a piece of sugar.

Elixir Bromoformi (*B.P.C.*). *Syn.* MISTURA BROMOFORMI COMPOSITA.

Dose.—½ to 2 drachms (2 to 8 ml.).

Bromoform 1 in 50, with alcohol 90%, tincture of orange, compound tincture of cardamom and glycerin.

Syrupus Bromoformi.

Dose.—½ to 1 ounce (8 to 30 ml.) = ½ to 2 minims of bromoform. To be diluted with an equal quantity of water or more, at time of taking.

Bromoform 2 m., alcohol (90%) 80 m., syrup 160 m., glycerin $\frac{1}{2}$ oz.

The Sirop of the *Fr. Cx.* is bromoform 1, alcohol (90%) 9, glycerin (90), syrup 180.

Uses. In whooping cough diminishes number, duration and severity of attacks, and mucous secretion is more easily got rid of.

[P1] **Syrupus Bromoformi Compositus (B.P.C.).**

Dose.—1 to 4 drachms (4 to 16 ml.).

1 dr. contains about $\frac{1}{11}$ m. of bromoform, $\frac{1}{8}$ gr. of codeine and $\frac{1}{8}$ m. of tincture of aconite.

[P1] **Syrupus Bromoformi Compositus (P. Ital. V).**

20 g. contains 0.02 g. of bromoform, 0.01 g. of codeine, and 0.04 g. of aconite tincture. *Fr. Cx.* is similar but contains 0.1 g. of aconite tincture in 20 g.

Alcohol Tribromoethylicum (B.P. Add. III).

$\text{CBr}_3 \cdot \text{CH}_2 \cdot \text{OH} = 282.8$.

[P1] and [81] "**Tribromethyl alcohol.**"

Dose.— $\frac{1}{2}$ to $\frac{3}{4}$ grain per pound bodyweight (0.075 to 0.1 g. per kilogramme bodyweight), by rectal injection as a basal anæsthetic.

Tribromoethyl alcohol is a white, crystalline powder obtained by reducing tribromoacetaldehyde and into which it decomposes on heating.

Soluble about 1 in 35 of water; readily soluble in amylene hydrate and light petroleum. Aqueous solutions are unstable. Solutions in amylene hydrate are used as basal anæsthetics (*see Bromethol*).

[P1-81] **Bromethol (B.P. Add. III). Syn. and Prop. Name.**
SOLUTION OF TRIBROMOETHYL ALCOHOL, AVERTIN (*Bayer Products, London*).

Dose.— $\frac{1}{2}$ to $\frac{3}{4}$ minim per pound bodyweight (0.075 to 0.1 ml. per kilogramme bodyweight) *per rectum*.

Bromethol is administered in a 2.5% solution in distilled water, prepared by warming the requisite quantity of distilled water to about 37°, adding the measured amount of bromethol slowly and shaking until dissolved. The temperature must not be allowed to rise above 40°. Solutions should be freshly prepared before use and tested by the addition of a few drops of congo-red indicator to a small portion of the solution. Only those solutions giving a red or orange-red colour should be used; if a blue colour develops the solution must be discarded.

Bromethol is tribromoethyl alcohol 66.7 g., amylene hydrate 33.3 g. 1 ml. contains 1 g. of tribromoethyl alcohol.

Soluble 3 in 100 of water at 37°.

Stability of Solutions. They may be used up to 4 days if kept at room temperature. When dispensed in vacuum flasks, should be used in a few hours. Solutions to be stored should be prepared below 38° and allowed to cool immediately.—E. H. Watson, *Pharm. J.*, i/1938, 643.

Storage. In a well-stoppered bottle protected from light, and at a temperature between 11° and 30° to prevent crystallisation or evaporation.

Caution. Bromethol is inflammable and volatile; care must be taken not to employ it near a flame.

Toxic Effects. In anæsthetic doses it has no effect on the cardiovascular system, but in larger doses it slows the rate and weakens the force of the heart-beat—the coronary vessels dilate and blood pressure falls. Toxic doses cause death by respiratory paralysis, but except for a slight transient cyanosis and a tendency to shallow breathing it has little or no effect on respiration in the doses necessary to produce narcosis. Headache and nausea and a feeling of malaise may persist for some days, but vomiting is not common.

In eight years Avertin with amylene hydrate was used at the Massachusetts General Hospital in 3934 cases. Though the use of the drug waxed and waned in this period, it was never used in more than 10% of the cases in which anaesthesia was employed. Eight factors have been chiefly responsible for the lessened use of the drug, as follows: (1) variability of response, (2) rectal irritation, (3) prolonged induction period when an inhalation anæsthetic is used as a supplement, (4) alarming immediate depression, (5) delayed effects, (6) the numerous contraindications, (7) the impossibility of efficiently removing the agent once toxic effects become evident, (8) the fatalities. Of these causes, the most important is the last—7 deaths were associated with its use. According to the mortality rate it appears to be more toxic than chloroform.—H. K. Beecher, *J. Amer. med. Ass.*, ii/1938, 122.

Antidotes. As an antidote for overdosage high rectal irrigation with warm hypertonic sodium thiosulphate solution acts as a restorative if applied before cardiac failure occurs. Carbon dioxide and oxygen is also of value to overcome the profound respiratory depression. Ephedrine sulphate, $\frac{1}{2}$ to $1\frac{1}{2}$ gr., intramuscularly or intravenously, is said to be specific, or nikethamide, 2 to 3 ml. intramuscularly. Picrotoxin, in a dose of 3 mg., is also of value.

Contraindications. Bromethol is contraindicated in renal disease and in cases with impaired liver function, in operations on the rectum, anus or vagina, and in the presence of inflammatory conditions of the colon and rectum. It is also contraindicated in very young or cachectic children (though children generally tolerate the drug extremely well). It should not be used in combination with respiratory depressant drugs such as morphine (except in obstetrics *vide infra*).

Three definite contraindications to the use of Avertin are: (1) whenever it is impracticable either to obtain or accurately to estimate the weight of the patient; (2) the presence of pathological condition of the rectum or colon; and (3) operations on the rectum or colon. The trend of clinical evidence seems increasingly to be that Avertin may be used with safety even in the presence of grossly damaged liver function.—H. K. Ashworth, *Arch. Dis. Childh.*, 1936, 63, 159.

Uses. Bromethol is mainly employed as a basal narcotic in general surgery, the requisite dose, based on the patient's weight and general condition, being run into the rectum thirty minutes before operation, from five to ten minutes being taken over the injection. The lower bowel should be emptied by an enema the night before the operation and an injection of atropine is given an hour before operation.

Generally speaking the average healthy adult is given 0.1 ml. of bromethol in 2½% solution per kilo bodyweight, but patients with high metabolic rates, such as healthy children and patients suffering from exophthalmic goitre, may be given up to 0.12 ml. per kilo bodyweight. In obese or decrepit patients, or in those

with a low blood pressure or low metabolic rate, a reduction in dose, e.g., to 0.075 ml. per kilo bodyweight, is necessary.

The patient is usually unconscious by the time administration of the solution is complete. The narcosis produced lasts for about two hours, but adequate surgical anaesthesia is usually attained by the supplementary use of nitrous oxide and oxygen. Bromethol alone rarely produces anaesthesia and it is unwise to push the dose too far. It is imperative to maintain a clear airway throughout the whole time the patient is under the effects of bromethol.

In addition to its use as a basal narcotic, bromethol is also employed for the production of "twilight sleep." For this purpose it is given at the termination of a pain in a dose of 0.075 ml. per kilo bodyweight. In the case of a primipara the os must be fully dilated and in a multipara at least three-quarters dilated, the administration being preceded by an enema to empty the rectum.

Bromethol has also been found of value, in association with tetanus antitoxin, in the control of the muscular rigidity and convulsions of tetanus.

In thyroidectomy it may be successfully employed, in the usual dose, given about 50 minutes before the operation, but it should not be given unless the pulse has previously been slowed by rest and digitalis.

BASAL ANAESTHESIA. For reduction of fractures, in combination with local anaesthesia it is ideal.—B. Hughes, *Brit. med. J.*, i/1929, 898; *Lancet*, ii/1929, 1220.

Where there is serious pulmonary disease, Avertin advised; in combination with local anaesthetic or gas and oxygen it is said to be ideal.—Sir F. E. Shipway, *Brit. med. J.*, ii/1930, 663.

Basal narcosis in children. (Based on a series of 5918 administrations at the Booth Hall Hospital, Manchester.) The children are admitted the day before the operation. In non-abdominal cases no aperient is necessary. A simple enema is administered about 6 p.m. The evening meal should include glucose, either in the form of jam or syrup, or, each child may be given $\frac{1}{2}$ lb. of boiled sweets. Four hours before operation a simple rectal wash-out is administered. Three hours before operation each child receives a plate of porridge or gruel, together with a liberal helping of syrup. The weight of each patient should be entered on the temperature chart, and the name, weight and required dosage of Avertin for each patient should be sent to the dispensary in writing. The usual dosage for cases in which operations are to be undertaken on the air passages, and in which a rapid return of the cough-reflex is consequently desirable, is 0.075 or 0.08 g. per kilo bodyweight. For operations other than those on the respiratory passages, a full dose of 0.1 g. per kilo should be prescribed. The bottle containing the prepared solution for each patient should bear a label stating the name and weight of the patient, the quantity of Avertin fluid and water used, and the date and hour of preparation. These particulars should be checked by the ward-nurse against those on the temperature chart before the actual administration is begun. Rigid adherence to these rules is the only adequate safeguard against the possibly disastrous results of administering the wrong dose to the wrong patient. Thirty minutes before the operation, the child is placed in the left lateral position, and the solution is run slowly into the rectum by means of a small catheter, tube and funnel. Administration should be slow, taking up to ten minutes to complete. Immediately afterwards, the child should receive a dose of atropine, graduated according to age as follows:—0-3 months, nil; 3 months-1 year, $\frac{1}{100}$ gr.; 1-2 years, $\frac{1}{50}$ gr.; 3-5 years, $\frac{1}{25}$ gr.; 5-12 years, $\frac{1}{10}$ gr.; 12 years or over, $\frac{1}{5}$ gr. The child should then be left quiet, when it usually drops off to sleep within fifteen minutes. It is then transported to the ante-room of the operating theatre to await operation. At this stage, it can easily be roused by light stimulation, such as pinching the skin, and will invariably resist the application of a mask when the administration of ethyl chloride or

ether is begun, but amnesia is always complete.—H. K. Ashworth, *Arch. Dis. Childh.*, 1936, 63, 160.

Comparing paraldehyde and Avertin as basal narcotics for children, paraldehyde requires more patience in its administration, is less certain in its action, and requires the addition of ether to nitrous oxide and oxygen to obtain the same plane of anaesthesia as is obtained by Avertin and nitrous oxide and oxygen alone. The difference in the fall in blood pressure produced by either of the drugs is so small as to be negligible.—R. Binning, *Lancet*, ii/1937, 852.

GENERAL ANÆSTHESIA. Avertin can be given to children as a complete anæsthetic with safety, and approaches more nearly the ideal anæsthetic than any other. It is better than basal anæsthesia followed by inhalation anæsthesia, and is safer in children than adults. The best method is to combine 0.175 g. per kilo bodyweight with morphia and atropine according to age and 20 to 30 ml. of Novocain as a field block. A 3% solution of Avertin is better retained than a 2½%. The fall in blood pressure is not of serious moment.—J. Boyd, *Brit. med. J.*, i/1935, 1122.

ASTHMA. In severe asthmatic crisis, when all other methods have failed to give relief, Avertin fluid per rectum gives muscular relaxation within ten minutes (though the effect may be occasionally delayed for an hour). The patients sleep for one to six hours and on waking are usually relieved of asthma, remain so for several days or weeks, and recover their ability to respond to adrenaline injections. The dose of Avertin fluid, which is injected rectally, using a syringe or a male catheter, is 50 to 70 mg. per kilo bodyweight.—A. M. Fuchs, *J. Allergy*, 1937, 8, 340.

GYNÆCOLOGY. A safe drug in a dosage of 0.08 to 0.1 g. per kilo. 2000 gynæcological operations conducted without mortality or morbidity traceable to its use. Reduction of pre-anæsthetic morphine from ½ to ¼ grain resulted in immediate lessening of respiratory depression.—J. Young and N. S. Fraser, *Brit. med. J.*, i/1934, 455.

OBSTETRICS. In childbirth advocated for safety, ease of administration, and mitigation of pain. It is given at second stage pains after morphine ½ grain at first (sometimes a further ½ grain). There must be 2 hours' interval between morphine and Avertin. Should be given when the cervix is fully half dilated, if the contractions are strong and regular. Some excitement may follow for 5 minutes. Dose.—0.075 ml. *Avertin Fluid per kilo weight, e.g., 4.5 ml. for a person of 9 stone (60 kilos), given per rectum in 1000 ml. warm water—milk has been used in preference.*—Prof. Martin. The method eases pains of labour.—J. S. M. Connell, *Lancet*, ii/1930, 184.

Pleasant for the patient. Harmless to the infant. Not dangerous, but uncertain in action. More experience required to compare its merits with paraldehyde.—Gertrude M. B. Morgan, *Brit. med. J.*, ii/1932, 12.

Avertin is a dangerous drug. It should never be employed except by an expert anæsthetist. Its major drawback is its profoundly depressant action on the respiratory centre; in this respect it is even more dangerous than chloroform. In doses of over 5 mg. per kilo bodyweight it may produce uterine atony with resultant post-partum hæmorrhage. Individual variations in rate of absorption are marked, and dangerously deep narcosis may result from a moderate dose. Avertin has no place in obstetrics.—B. F. Cornwall, *New Engl. J. Med.*, ii/1939, 851.

BUCHU

(with AGROPYRUM, etc.)

B.P., Fr. Cx.

The dried leaves of *Barosma betulina* (Rutaceæ); contain volatile oil and mucilage. *Fr. Cx.* allows also *B. crenulata* and similar species. Carminative and diuretic. Buchu has antiseptic action in irritability of bladder and in gonorrhœa.

Extractum Buchu Liquidum (B.P.C.).

Dose.—5 to 20 minims (0.3 to 1.2 ml.). 1 in 1, with alcohol 90%.

Infusum Buchu Concentratum (B.P.).

Dose.—1 to 2 drachms (4 to 8 ml.). 1 in 2½.

A concentrated infusion is pharmaceutically unsound, and it has been recommended that its use should be discontinued when an infusion of buchu is prescribed.

Infusum Buchu Recens (B.P.).

Dose.—1 to 2 ounces (30 to 60 ml.). 1 in 20.

In preparing this the leaves must be lightly broken and not bruised, otherwise percolation is prevented by the mucilage.—B. A. Bull, *Pharm. J.*, 1/1932, 318.

[P.] **Mist. Buchu et Hyosc. (N.I.F.).**

Potassium bicarbonate 15 gr., liquid extract of hyoscyamus 2½ m., concentrated infusion of buchu 15 m., chloroform water to ½ oz.

Tinctura Buchu (B.P.C.). *Dose.*—½ to 1 drachm (2 to 4 ml.). 1 in 5.

Agropyrum (B.P.C., Fr. Cx., P. Helv. V). Syn. COUCH GRASS.

The dried rhizome of *Agropyron repens* (Gramineæ). Contains tritacin, a carbohydrate similar to inulin. Diuretic and aperient. Useful in gonorrhœa.

Decoctum Agropyri (B.P.C.). *Syn.* DECOCTION OF TRITICUM.

Dose.—½ to 2 ounces (15 to 60 ml.). 1 in 20.

Extractum Agropyri Liquidum (B.P.C.). *Syn.* LIQUID EXTRACT OF TRITICUM.

Dose.—1 to 2 drachms (4 to 8 ml.). 1 in 1.

Extractum Agropyri Repentis (Fr. Cx.) is a soft aqueous extract.

Ammi Visnaga. *Syn.* KHELLA. The fruits of *Ammi Visnaga* have diuretic properties. Preparations relax all smooth muscle, and have been given in ureteric spasm and to assist the passage of small kidney stones. Has been administered as a decoction (1 in 40, *dose.*—½ to 2 oz.) and as a tincture (1 in 10 by maceration in alcohol 90%, *dose.*—1 to 3 dr.), given thrice daily before food.

Activity is due to a crystalline principle, visammin.—K. Samaan, *Quart. J. Pharm.*, 1932, 16. *See also ibid.*, 1930, 25; 1931, 14; 1932, 186.

See also F. A. Upsher Smith, *J. Amer. pharm. Ass.*, 1933, 184.

Chimaphila (B.P.C.). Syn. PIPSISSEWA.

Dose.—15 to 45 grains (1 to 3 g.).

The dried leaves of *C. umbellata* (Pyrolacæ). Has diuretic properties, and is used in cardiac and renal disease, being administered as Extractum Chimaphilæ Liquidum, 1 in 1, either alone or mixed with 3 parts of syrup.

Lappa (B.P.C.). Syn. BURDOCK, BARDANE (Fr. Cx., F.E. VIII).

Roots of *Arctium majus*, or other species of *Arctium*. Has diuretic, diaphoretic and alterative properties. On the Continent called Bardana, e.g., *Inf. Bardanæ Spirituos.* (external): Bardana 2, water (boiling) q.s. to 15, strong alcohol 5; to be rubbed into the scalp. Liquid extract 1 = 1 by diluted alcohol. *Average dose.*—30 minims. Decoction, 1 in 20. In skin affections and gout.

The use of a tincture of the seeds has largely replaced that of the root in U.S.A., especially in the treatment of psoriasis, acne and prurigo.—*Chem. & Drugg.*, 1/1925, 216.

Maidis Stigmata (*P. Helv. V*). *Syn.* CORN SILK.

The dried stigmas and styles of maize, *Zea Mays* (Gramineæ). Demulcent and diuretic. Used in cystitis and nocturnal incontinence of urine.

Extractum Maidis Liquidum. *Dose.*—1 to 2 drachms. 1 in 1.

Syrupus Maidis. *Dose.*— $\frac{1}{2}$ to $\frac{1}{2}$ drachm. Liquid extract 1, syrup 9.

Uva Ursi (*B.P.C., P. Jap. V*). *Syn.* BEARBERRY LEAVES, BUSSESOLE (*Fr. Cx., P. Dan.*).

The dried leaves of *Arctostaphylos Uva-ursi* (Ericaceæ). Contains a crystalline glycoside, arbutin, $C_{12}H_{16}O_7, \frac{1}{2}H_2O$, m.p. about 168° . Bearberry is diuretic and astringent and exerts an antiseptic effect on the urinary tract. It is employed in urethritis, cystitis, etc.

The precipitate which forms in liquid extracts of bearberry consists of ellagic acid formed by enzymic hydrolysis of ellagi-tannin. The precipitation can be prevented by heating the crude drug in an autoclave at 110° (5 lb. pressure) for 30 minutes on three successive days before preparing the extract. The arbutin content is only slightly affected by this procedure.—L. M. Farks and C. O. Lee, *J. Amer. pharm. Ass.*, 1937, 702, 706.

Infusum Uvæ Ursi Concentratum (*B.P.C.*). 1 in 2 $\frac{1}{2}$. *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Infusum Uvæ Ursi Recens (*B.P.C.*). *Dose.*— $\frac{1}{2}$ to 1 ounce. 1 in 20.

CAFFEINA

B.P., U.S.P. XI, P.G. VI, P. Ned. V, Fr. Cx., P. Jap., P. Ital. V, P. Helv. V, P. Dan., F.E. VIII, P. Belg. IV.

$C_8H_{10}O_2N_4, H_2O = 212.2$.

Syn. THEINE, GUARANINE, TRIMETHYLXANTHINE.

Dose.—2 to 5 grains (0.12 to 0.3 g.) or more—as much as 18 grains being recommended—given in solution, or in pills. *Fr. Cx.* has max. single dose 0.5 g., max. in 24 hours 2 g.

Caffeine is 1:3:7-trimethyl-2:6-dioxypurine, a crystalline alkaloid, m.p. about 235° to 237° after drying at 100° , usually obtained from the dried leaves of *Camellia Thea*, or dried coffee-seeds—*Coffea arabica*; also contained in guarana, maté and kola. Caffeine and theobromine (*q.v.*) can be prepared from xanthine. These are purine derivatives.

Soluble 1 in 80 of water, 1 in 2 of boiling water, about 1 in 40 of alcohol 90%, 1 in 9 of chloroform, 1 in 154 of benzene, and scarcely in light petroleum and ether; acids render it more soluble in water, but it is a feeble base, and on concentrating the solution of the salts they are apt to split up, and the caffeine crystallises out by itself. Is rendered soluble in less water by the addition of an equal quantity of phenazone, sodium salicylate, etc. *See also* Caffeine-Sodio-Salicylate, etc.

Antidotes. Empty stomach by emetic or by stomach tube, using 60 gr. of potassium permanganate in 2 gallons of water.

Give brandy, $\frac{1}{2}$ oz., or aromatic spirit of ammonia, $\frac{1}{2}$ dr., in water freely. Keep patient warm, especially extremities. Morphine, $\frac{1}{2}$ gr., with atropine $\frac{1}{16}$ gr. hypodermically. (The fatal dose of caffeine is so large that no fatal case of poisoning is on record, but doses of more than 1 g. may produce alarming symptoms.)

Uses. Caffeine is used as a mental, muscular and respiratory stimulant, and as a cardiac tonic and diuretic. It wards off fatigue, and is of value in nervous headache and some forms of nervous dyspepsia. It is employed as a cardiac and renal stimulant in cardiac failure, chronic nephritis and dropsy. In the form of strong black coffee it acts as an antidote against acute poisoning by morphine and alcohol.

Bronchial asthma of adults is relieved by 2 to 5 grain doses of the citrate before bedtime and again during the night.

Neuralgic Powders. Caffeine 1 gr., quinine hydrochloride 5 gr., phenazone 10 gr. (or phenacetin 5 gr.).

Drugs of the caffeine series have a most complex effect on the circulation of animals. They tend to raise blood pressure by stimulating the vasomotor centre, tend to lower it by dilating peripheral vessels, and also cause tachycardia through direct action on the heart muscle. In man, the net results are remarkably slight and inconstant: indeed, one of us, working with the late Prof. Cushny some years ago, found no demonstrable effects upon either the pulse rate or blood pressure of patients from even intravenous injections of caffeine citrate in ordinary doses. Such evidence shows how slight is the foundation for the wide belief in its virtues as a circulatory stimulant.—C. Hoyle and J. W. Linnell, *Practitioner*, i/1936, 96.

[P1] **Caffeine-Chloral.**

Small white granular crystals, freely soluble in water, with the taste of chloral. Is analgesic and laxative, and in hypodermic injections of 3 to 8 grains useful in constipation, painful gastric distension, sciatica, and rheumatism.

Caffeine Citras (*B.P.C.*, *P. Helv. V*, *F.E. VIII*).
 $C_8H_{10}O_2N_4 \cdot C_3H_4(OH)(COOH)_2 = 386.3$. *Syn.* CAFFEINA CITRATA (*U.S.P. XI*).

Dose.—2 to 10 grains (0.12 to 0.6 g.).

A white odourless powder obtained by combining caffeine 1 and citric acid 1 in a small quantity of distilled water and evaporating to dryness on a water bath.

Soluble 1 in 4 of hot water, dissociating on further dilution, with separation of caffeine, which re-dissolves in 32 of water; 1 in 22 of alcohol 90%.

Incompatible with potassium iodide and Spiritus Ætheris Nitrosi, iodine being liberated. The following, however, does not darken:—Potassium iodide 5 gr., caffeine base $2\frac{1}{2}$ gr., Spiritus Ætheris Nitrosi (neutralised with ammonium carbonate) 30 m., water to 1 oz.

Also incompatible with sodium salicylate. A little sal volatile or sodium hydroxide will prevent the salicylic acid being thrown out.

Uses. See Caffeine.

Caffeine Citras Effervescens (*B.P.C.*).

Dose.—1 to 2 drachms (4 to 8 g.).

Contains 4% of the citrate, or about $2\frac{1}{2}$ grains in a drachm.

Caffeina et Sodii Benzoas (B.P.). *Syn.* CAFFEINÆ SODIO-BENZOAS (*P. Jap. V, P.G. VI, U.S.P. XI, P. Belg. IV, P. Ital. V, P. Helv. V, P. Dan.*).

Dose.—5 to 15 grains (0.3 to 1 g.); 2 to 5 grains (0.12 to 0.3 g.) by injection, usually hypodermically. *U.S.P. XI* average doses 5 grains and 3 grains respectively.

Contains from 47 to 50% of caffeine. *P. Ned. V* requires 50%; *P. Ital. V* must yield 43 to 46% of anhydrous caffeine.

Soluble 1 in 4 of water, 1 in 40 of alcohol 90%. Warm water dissolves about 1 in 1, but caffeine separates on cooling.

Uses. This (and the sodium salicylate preparation *v. infra*) is employed for the parenteral administration of caffeine owing to its ready solubility.

It improves breathing and circulation and, following its use, the mind and depressed vital reflexes become active and normal. Coma, shock, collapse under anæsthesia, and poisoning from morphine and other depressant drugs treated. As stimulant for desperately ill patients 2 grain doses, *intravenously*.

HÆMOGLOBINURIC FEVER has been well treated with caffeine sodio-benzoate intramuscularly, 3 grains twice daily for 7 days and once daily for further 5 days.

SHOCK. For use in the event of severe Novocain reaction; caffeine 3 gr., sodium benzoate 7 gr., strychnine $\frac{1}{10}$ gr.

Ampulla Caffeinæ et Sodii Benzoatis (L.C.C.). Caffeine and sodium benzoate 0.3 g. (5 gr.), sterilised water to 2 ml. (34 m.).

[P1] **Labat's Cardiac Stimulant** (*Anglo-French Drug Co., London*).

Caffeine 0.25 g., sparteine sulphate 0.05 g., sodium benzoate 0.30 g., strychnine sulphate 0.001 g., distilled water to 2 ml. For counteracting fall of blood pressure during regional anæsthesia.

Caffeina et Sodii Salicylas (B.P.C., P. Helv. V, P. Dan., P. Jap. V). *Syn.* CAFFEINÆ SODIO-SALICYLAS.

Dose.—2 to 5 grains (0.12 to 0.3 g.) hypodermically, or 5 to 15 grains (0.3 to 1 g.) orally. Max. single dose *per os* 1 g., or in 24 hours, 3 g.

Evaporate to dryness caffeine 50, sodium salicylate 50, water sufficient to form a smooth paste. A white amorphous powder, containing 47 to 50% of caffeine.

Soluble 1 in 1 of water, 1 in 28 of alcohol 90%.

The addition of camphor to injections of caffeine sodium salicylate has been suggested. Thus to 3 ml. of pure sterile glycerin add a solution of caffeine and sodium salicylate of each 0.25 g. in water 1 ml.; then add spirit of camphor (10%) 1 ml.; 5 ml. contain caffeine 0.25 g., and camphor 0.1 g.

This salt and the corresponding cinnamate and benzoate act like digitalis, but more rapidly.

Iritis of rheumatic origin has been treated by injection into the median cephalic vein of caffeine 0.05 g. with sodium salicylate 0.5 g.

Caffeinæ Hydrobromidum (B.P.C.).

$C_8H_{10}O_2N_4 \cdot HBr \cdot 2H_2O = 311.1$.

Soluble 1 in 50 approx.

L*

The hydrochloride, $C_8H_{10}O_2N_4.HCl.2H_2O = 266.6$, and the hydriodide (unstable) are in use.

Dose of each.—1 to 4 grains (0.06 to 0.25 g.) or more. In transparent crystals.

Has been employed in migraine and nervous headache.

Caffeina Iodidum. *Syn.* CAFFEINE TRI-IODIDUM, CAFFEINE DI-iodo-HYDRIODIDE. $C_8H_{10}O_2N_4I_3.HI.H_2O = 593.9$.

Dose.—1 to 3 grains (0.06 to 0.2 g.).

In prismatic black iridescent crystals, slightly soluble in water (with decomposition) and in alcohol 90%.

Has been used with success in rheumatism and gout, and for the relief of asthmatic attacks.

[P1-81] **Pilula Caffeinae Tri-Iodidi Composita** (*Billimoria*).

Dose.—1 early in the morning, 1 about 3 or 4 p.m., and 1 at bedtime with water, to be lessened to 2 or 1 a day as required.

Caffeine tri-iodide 2 gr., sodium aminarsonate $\frac{1}{2}$ to $\frac{1}{3}$ gr., valerianic acid 2 m., green extract of belladonna $\frac{1}{2}$ to $\frac{1}{3}$ gr., jalap extract *q.s.* (if constipated), reduced iron 1 gr. (in asthma only). For one pill or preferably gelatin capsule.

Asthma has been well treated with this compound, as also has whooping cough, using proportionately smaller doses.

Caffeina et Sodii Iodidum. *Syn.* IODO-CAFFEINE, SODIUM-CAFFEINE IODIDE.

Dose.—2 to 10 grains (0.12 to 0.6 g.).

A white odourless powder with a bitter saline taste. It may be prepared by triturating equal weights of caffeine and sodium iodide with water to form a smooth paste, and drying. Thus prepared it contains about 50% of anhydrous caffeine.

Soluble in cold water, more soluble in warm water.

Uses. It is a good diuretic, especially for prolonging the diastole in cases of enfeebled heart. It is also useful in cardiac dropsy and pleurisy with effusion, and is said not to upset digestion.

Elixir Caffein. Iodidi (*N.I.F.*). Caffeine and sodium iodide 5 gr., sodium iodide 5 gr., liquid extract of liquorice 5 m., chloroform $\frac{1}{2}$ m., decoction of coffee (1 in 10 with water; boil for 1 minute, filter and adjust to volume) to 1 dr.

Elixir Caffeinae Iodidi (*B.V.H.*). *Syn.* CAFFEINE. Caffeine sodium iodide 5 gr., sodium iodide 5 gr., dilute hydriodic acid 5 m., decoction of coffee (3 oz. in 1 pint) 40 m., water to 1 dr. Given in asthma.

Elixir Ephedrinae et Caffeinae (*B.V.H.*). *Syn.* EPICAFFEINE. Is the same as the above, containing also $\frac{1}{2}$ gr. of ephedrine hydrochloride per drachm.

Caffedrin (*Duncan, Flockhart, Edinburgh*). Preparation containing per fl. drachm caffeine iodide 5 gr., ephedrine hydrochloride $\frac{1}{2}$ gr., in infusion of coffee. For asthma and chronic bronchitis.

Eupinal (*Cuxson Gerrard, Oldbury*). Preparation containing iodide of caffeine for use in the treatment of asthma.

Eupnine Vernade (*Darrasse, Nanterre; Wilcox, Jozeau, London*). Stable standardised solution of caffeine iodide (1 dr. = 0.5 g.).

Dose.—1 teaspoonful 2 or 3 times daily before meals. Asthma, emphysema and arteriosclerosis.

Spiroline (*British Drug Houses, London*). Elixir containing in each drachm 3 gr. of di-iodo-caffeine hydriodide with the soluble constituents of $7\frac{1}{2}$ gr. of coffee. In asthma and as a cardiac stimulant.

Caffeinae Salicylas. $C_8H_{10}O_2N_4.C_6H_4OH.COOH = 332.2$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

White crystalline powder slightly soluble in water. Useful in migraine associated with rheumatism.

Caffeinae Valerianas. $C_8H_{10}O_2N_4 \cdot C_8H_{10}O_2 = 296.2$.

Dose.—1 to 3 grains (0.06 to 0.2 g.). In irregular crystals or powder, of somewhat variable constitution, usually consisting of a mixture of caffeine and valerianic acid, preferably in the proportion of 4 parts to 1. It controls hysterical symptoms, and is useful in pertussis.

Catha Edulis. *Syn.* KAT, KHAT, ARABIAN or ABYSSINIAN TEA.

Dose.—1 drachm to $\frac{1}{2}$ ounce (4 to 15 g.) infused in about 6 to 8 ounces of hot water as required. A sprig of about 10 leaves weighing about 10 grains is chewed at a time by natives.

The shrub grows wild in Abyssinia and is cultivated for native use in Arabia.

Three alkaloids were isolated by Stockman—*Cathine* (*d*-norisoephedrine), very soluble in water, *cathinine* (less soluble) and *cathidine* (insoluble). In man they all act chiefly on the cerebrum and spinal cord, causing stimulation or much excitement according to dose, and cathine alone induces slight drowsiness at first.

The herb is a stimulant narcotic. It has been known for generations for its sustaining power. The leaves when used in an infusion in the same manner as tea or coffee, or when chewed (as by the Arabs), are stated to increase "staying power," and produce wakefulness and refreshment.

Extractum Cathæ. *Dose.*— $2\frac{1}{2}$ to 10 grains (0.15 to 0.6 g.). A solid extract made with 60% alcohol, 1 = 4 of leaves.

Extractum Cathæ Liquidum. *Dose.*—1 to 5 minims (0.06 to 0.3 ml.). Strength 2 = 1, prepared with alcohol 60%.

Guarana (*B.P.C.*, *P. Helv. V*, *P. Hung.*).

Dose.—10 to 60 grains (0.6 to 4 g.) in powder, or infused in a cup of boiling water.

The seeds of *Paullinia Cupana* (Sapindaceæ), roasted and moistened with water, made into a hard paste, rolled into cylinders, and dried. Imported from Brazil. The drug contains 2.5 to 5% of caffeine (guaranine), together with tannin, gum, etc. Is recommended for sick headache and has been employed for its astringent properties in diarrhœa and dysentery. A nerve tonic.

Elixir Guaranae (*B.P.C.*). *Dose.*— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). Contains 80% *v/v* of tincture of guarana flavoured with cinnamon.

Tinctura Guaranae (*B.P.C.*). *Dose.*—1 to 2 drachms (4 to 8 ml.). 1 in 4.

Kola (*B.P.C.*, *P. Helv. V*).

Dose.—15 to 45 grains (1 to 3 g.).

Seeds of *Cola vera* (Sterculiaceæ), containing about 1½% of caffeine and traces of theobromine. Tonic and diuretic.

Fr. Cx. allows seeds of other varieties of *Cola* providing they contain at least 1.5% caffeine.

Extractum Kolæ Liquidum (*B.P.C.*, *Fr. Cx.*).

Dose.—10 to 20 minims (0.6 to 1.2 ml.). 1 in 1.

Elixirium Colæ (*Fr. Cx.*).

Liquid extract of kola 5%, alcohol (60%) 10%, simple syrup 10%, in a sweet wine.

[P1] Syrupus Kolæ Compositus (Martindale).

Dose.—1 to 2 drachms (4 to 8 ml.) twice daily.

Iron, quinine and strychnine citrate 3, citric acid 0.3, sodium glycerophosphate 5, liquid extract of kola 50, alcohol 90% 5, syrup of orange to 100. Finished product to be slightly acid. In anorexia, and as a general "tonic."

Tinctura Kolæ (B.P.C.).

Dose.—1 to 1 drachm (1 to 4 ml.). 1 in 5. *Fr. Cx.* is similar.

Vinum Kolæ (Fr. Cx.). Macerate powdered kola 60, in liqueur wine 1000, for 10 days.

Vinum Kolæ (Martindale).

Kola in coarse powder 1, in sherry 25, macerate for 7 days, filter and flavour with essence of vanilla.

[P1] Revitone (Roche Products, Welwyn Garden City). Contains per oz. "Ext. Kola glycerin sacch." (= Sem. Kolæ 88 gr.), "Arsylen" brand of sodium allylarsenate 0.088 gr., dried extract of nux vomica 0.28 gr., sodium acid phosphate 16.22 gr., manganese chloride 0.09 gr. *Dose.*—1 or 2 teaspoonfuls 3 times daily. General tonic.

Vitabene Brand Tablets (Eno, London). Tablets each weighing about $7\frac{1}{2}$ gr. and containing tricalcium phosphate 30.9, stabilised kola powder 26.0, potassium carbonate 14.0, anhydrous sodium carbonate 14.0, magnesium carbonate 3.2, caffeine alkaloid 1.6, manganese carbonate 3.2, cupric sulphate 0.1, orange flavouring powder 0.6, excipient 8.4. Advocated in convalescence, etc. *Dose.*—For adults, 2 tablets thrice daily after meals; children, 1 tablet.

Maté. Syn. and Prop. Name. YERBA, PARAGUAY TEA, JESUIT TEA, HERVEA (*H. J. Lee, London*). The dried leaves of *Ilex paraguayensis* (Ilicaceæ). Contain 0.2 to 2% of caffeine. It is less astringent than tea and as a beverage has no disagreeable after-effects.

More than 18,000,000 people in S. America drink maté. Thought to ward off rheumatism, and produces exhilarating yet soothing effect on nerves and has very sustaining properties. Principal beverage of rural working classes in the Argentine, Paraguay and Brazil.—*J. trop. Med. (Hyg.)*, 1925, 320.

CALCIFEROL

(with VITAMIN A)

B.P. Add. I.

Syn. and Prop. Name. VITAMINA D (*Fr. Cx.*), VIOSTEROL, RADIOSTOL (*British Drug Houses, London*).

Dose.—Prophylactic (daily) for an infant $\frac{1}{2400}$ to $\frac{1}{1200}$ grain (0.025 to 0.05 mg.), approximately equivalent to 1000 to 2000 units. Therapeutic (daily) for an infant $\frac{1}{1200}$ to $\frac{1}{600}$ grain (0.05 to 0.075 mg.), approximately equivalent to 2000 to 3000 units.

Calciferol is vitamin D₂, prepared by the ultra-violet irradiation of ergosterol, and possessing a potency of 40,000 i.u. of anti-rachitic activity per mg. It occurs in colourless, odourless crystals, melting at 115° to 119° *in vacuo*.

Insoluble in water, but readily soluble in alcohol 95%, ether, chloroform and acetone; less soluble in vegetable oils.

For full details of the chemistry and assay of calciferol, see Vol. II.

Vitamin D.

Under the term "vitamin D" are included several substances possessing the property of preventing or curing rickets. These substances are derivatives of sterols which acquire anti-rachitic properties when exposed to ultra-violet light. The two most important are those produced by the irradiation of ergosterol and of 7-dehydrocholesterol.

Ergosterol is present in ergot, some fungi and moulds and in yeast. When irradiated with ultra-violet light of certain wavelengths, it undergoes a series of changes resulting in the formation of calciferol, generally spoken of as vitamin D. The conversion is never quantitative, and even under the best conditions the product contains only about 50% of calciferol. If the irradiation is carried further, especially if the calciferol is dissolved in alcohol, some of the calciferol is decomposed to form a compound which has been termed "substance 248" or toxisterol. Some of the toxic effects reported by the administration of vitamin D in the form of irradiated ergosterol, when this was first used clinically, were undoubtedly due to the presence of this product of over-irradiation. Toxisterol is not formed if the irradiation is conducted with ether as the solvent.

Cholesterol is present in many animal fats and associated with it in the natural state are small quantities of 7-dehydrocholesterol. This substance has been prepared synthetically, and both the natural and the synthetic compounds can be "activated," *i.e.*, rendered anti-rachitic, by ultra-violet light. Activated 7-dehydrocholesterol is the chief form of vitamin D present in fish-liver oils. This substance is termed *vitamin D₃* to distinguish it from calciferol. The term *vitamin D₁* was at one time applied to a mixture of lumisterol and calciferol, which was then believed to be the pure vitamin D.

Vitamin D in the form of calciferol, dissolved in olive oil, cod-liver oil, halibut-liver oil or in liquid paraffin is unchanged, or at most only slightly changed, after fifteen to twenty months' storage. The same is true of the natural vitamin D content of both halibut-liver oil and cod-liver oil.

Hypervitaminosis D. Although the toxic dose of vitamin D is many times the therapeutic dose, there is evidence that 10,000 to 20,000 units is on the borderline of toxicity and it would appear safer not to exceed a maximum therapeutic dose of 5000 units, reduced to 3000 units for infants under 2 years. A single large dose is not likely to give rise to any permanent ill-effects, but continued overdosage may cause abnormal deposition of calcium in various tissues of the body due to hypercalcaemia. This may lead to the formation of renal calculi, osteoporosis and arteriosclerosis, and there is now no question but that at a certain dosage even pure crystalline vitamin D may prove fatal to man. The symptoms of overdosage are loss of appetite, lassitude, pallor, polyuria, profuse sweating, nausea, vomiting, headache and loss of weight. Elevation of the calcium content of the blood serum

above 12 mg. per cent. is an indication of toxic effect. Even with therapeutic dosage an adequate amount of calcium salts and phosphorus compounds in the diet is essential during the administration of vitamin D.

Different species of animals vary markedly in resistance to excess dosage. Whereas toxic effects in rats only occur after giving several thousand times the therapeutic dose, in dogs 20 times the curative dose causes death. The human subject may share this high susceptibility with the dog and clinical evidence points that way.—*Brit. med. J.*, ii/1931, 352.

A fatal case of hypervitaminosis D in a baby of 11½ months. Young infants may have idiosyncrasy to the vitamin D contained in cod-liver oil as well as to artificially prepared calciferol. The present-day tendency to increase the vitamin D potency of cod-liver oil is undesirable and unnecessary; that to which the public is accustomed, and upon which popular dosage is based—*viz.*, about 100 i.u. per g.—is sufficient for all purposes. There is no reason whatever to administer cod-liver oil to infants during the summer months when diet and hygienic conditions are satisfactory and there is no evidence of rickets.—*L. Thatcher, Lancet*, i/1936, 20.

Irradiated ergosterol given by the mouth in very large doses causes the formation of urinary calculi. It is suggested that this is dependent on an increased absorption of calcium and phosphate from the gut and their excretion by the kidneys.—*W. E. Dixon and J. C. Hoyle, Brit. med. J.*, ii/1928, 883.

When vitamin D is introduced into the food by irradiation this process influences not only the sterols but also each chemical element present in the food thus treated. The complex carbohydrates are hydrolised; the proteins are transformed, their properties becoming changed; the amino-acids are also affected; the fats become viscous and are oxidised; the ferments and vitamins A and C are destroyed. Although accidents of D-hypervitaminosis are less frequent than they were, with our growing experience of these questions we must lay it down that the increasing and uncontrolled use of food (flour, biscuits, butter, chocolate, milk, etc.), the vitamin D content of which has been artificially increased by irradiation, cannot be recommended.—*G. L. Randoin, Quart. Bull. Hlth Org. L.O.N.*, 1936, 493.

While calcium is essentially necessary in pregnancy there seems to be some factor or factors when viosterol is used with it which render it either more assimilable, its retention and deposition more pronounced, or which produce an irregular mobilisation regardless of whether the calcium is given as inorganic adjuncts or by its ingestion in foods. Following the routine use in obstetric cases of 5 drops (0.3 ml.) of viosterol three times a day for 2 weeks, alternated with 5 grains of calcium every day for 2 weeks, calcified areas in the placentas and a decrease in the size of the fontanelles with fusion of the cranial sutures, which could be shown by the roentgenogram before delivery, were noted. This was easily demonstrated after delivery with a consequent lessened moulding of the fetal head and an increase in the length of labour. Marked calcification was found in the kidneys of 3 stillborn infants without any other apparent aetiology. Considerably more research work is advised before the promiscuous use of viosterol is continued, and cod-liver oil seems preferable.—*W. Brehm, per J. Amer. med. Ass.*, ii/1937, 1490.

The death of a man is recorded which was undoubtedly the result of over-dosage of a concentrated solution of activated ergosterol; a doctor administered to himself 2,300,000 units daily for 18 days, *i.e.*, 18,000 units per kilo, or ten times what he had intended to take.—*Brit. med. J.*, i/1937, 1269.

A case of congenital parathyroid deficiency controlled by oral administrations of vitamin D₂ (Calciferol) in oil, 500,000 units weekly. Despite the continued administration of this large dosage for nearly six years no signs of hypervitaminosis D have appeared.—*H. P. Himsworth and M. Maizels, Lancet*, i/1940, 959.

Uses. The following summary of "Allowable Claims," drawn up by the Council on Pharmacy and Chemistry of the A.M.A. (*N.N.R.* 1940), serves as a useful indication of the present position of vitamin D therapy.

Vitamin D is recognised as a specific in the treatment of infantile

rickets, spasmophilia and osteomalacia, diseases which are manifestations of abnormal calcium and phosphorus metabolism. Vitamin D is valuable in the preventive as well as curative treatment of these diseases. Complications such as certain renal diseases or glandular malfunction may preclude normal response to vitamin D therapy. During acute infections, especially of the gastro-intestinal tract, vitamin D may prove ineffective because poorly absorbed. There is clinical evidence to justify the statement that vitamin D plays an important role in tooth formation and maintenance of normal tooth structure, but there is no warrant for the claim that adequate vitamin D intake will ensure normal tooth structure or will prevent dental caries. Animal experimentation has shown that correction of an inadequate intake of vitamin D results in the more economical utilisation of calcium and phosphorus, and also that the undesirable effects of improper ratios of calcium and phosphorus in the diet can largely be overcome by normal intake of vitamin D. The importance of these observations in their application to man is not entirely apparent, but it may be stated that vitamin D has a favourable influence on calcium and phosphorus metabolism. The vitamin D requirement is greatest during the period of infancy. Beyond the age of infancy the exact vitamin D requirement of man under any specified conditions is not known, but it appears that the requirement during pregnancy and lactation is increased. Clinical evidence does not warrant the claim that massive doses of vitamin D are of benefit in chronic arthritis, in allergic disorders, or in psoriasis.

Apart from its use in rickets it is the proper remedy for infantile tetany (which is due directly to hypocalcemia), osteomalacia, coeliac disease (as a safeguard against rickets), and it is essential to nursing and expectant mothers, not so much to protect the young as to improve the calcium assimilation of the mother herself and help her to replace the minerals lost to the child or in her milk.—L. J. Harris, *Brit. med. J.*, ii/1933, 371.

CARIES. The influence of vitamin D on the structure of the teeth.—May Mellanby, Pt. I, *Spec. Rep. Ser. med. Res. Coun., Lond.*, No. 140, 1929; Pt. II, *ibid.*, No. 153, 1930; Interim Report on "The Influence of Diet on Caries in Children's Teeth," *ibid.*, No. 159, 1931; Pt. III, *ibid.*, No. 191, 1934; *Brit. med. J.*, i/1932, 507; ii/1932, 749.

Vitamin D deficiency, dental caries, and tonsillar enlargement. A clinical investigation of some late effects of rickets.—H. M. M. Mackay, *Lancet*, i/1931, 1230.

The influence of diet on caries in children's teeth.—Final Report of the Committee for the Investigation of Dental Disease, *Spec. Rep. Ser. med. Res. Coun., Lond.*, No. 211, 1936.

DERMATITIS. Good results in the treatment of dermatitis from a wide variety of causes by injection of vitamins, intramuscular injections of 2 ml. of an oily solution of vitamins A and D at a concentration of 10,000 i.u. per ml. being given three times weekly, with, in some cases an external application of an oil solution of vitamin D. This treatment not only cured the dermatitis in nearly every case but also seemed to convey immunity.—Dainow, per *Mfg Chem.*, 1940, 213.

ECZEMA. In a group of eczema cases of both endogenous and exogenous origin, it was shown that the administration, in large doses, of vitamin D and a mixture of vitamins A and D proved useful in the great majority of cases. It accelerated the recovery, and the results were equally good in cases of internal and external origin. The treatment was more efficacious in young subjects and where there was an absence of endocrine disturbances.—M. Comel, per *Brit. J. Derm.*, 1935, 47, 490.

OSTEOMALACIA which occurred in field workers in India, in spite of their being exposed to strong sunlight, yielded to the administration of 4 drachms of sun-irradiated dried brewers' yeast daily for 4 weeks.—D. C. Wilson, *Lancet*, i/1932, 1142.

RICKETS. The dose of pure concentrated vitamin D₂ required for the complete cure of florid rickets is 12 to 15 mg. given in a single dose, which corresponds almost exactly with the total amount given in the ordinary therapeutic course comprising daily dosage for 2 to 3 months.—H. U. Kottgen, per *Brit. med. J. Epit.*, i/1938, 58.

The number of units required for the prevention of rickets lies between 500 and 1500 daily, the daily requirement varying with age, rate of growth, presence or absence of infection, and the diet of the child. During the first few years 1000 to 1500 units should be given daily, and this should be continued right through the summer.—C. Asher, *Practitioner*, ii/1940, 61.

The course of healing in 12 infants and children with active rickets was studied, 6 being given vitamin D₂ and 6 vitamin D₃ in amounts equivalent to 2000 i.u. daily. The results revealed no significant difference between the therapeutic effects of these two vitamins.—N. Morris and M. M. Stevenson, *Lancet*, ii/1939, 876.

The therapeutic effects of pure specimens of vitamin D₂ from irradiated ergosterol and of vitamin D₃ from irradiated 7-dehydrocholesterol were compared in 13 pairs of patients with osteomalacia, and in two pairs with late rickets, among Indians aged 6 to 70 in the Punjab. The results showed the two preparations to be equally effective, a dose of 21,000 i.u. causing improvement in a week.—D. C. Wilson, *Lancet*, i/1940, 961.

Emulsio Calciferolis (I.H.). *Syn.* D EMULSION.

Solution of calciferol 5 m., arachis oil 10 m., chloroform $\frac{1}{10}$ m., benzoic acid $\frac{1}{10}$ gr., vanillin $\frac{1}{10}$ gr., mucilage of acacia 10 m., water to 1 dr. For a child of one year.

Ergosterol Activatum in Oleo (U.S.P. XI Supp. II). *Syn.* LIQUOR ERGOSTEROLIS IRRADIATI, VIOSTEROL IN OIL.

Average dose.—5 minims (0.3 ml.).

A solution of activated ergosterol in an edible vegetable oil, containing not less than 10,000 units of vitamin D per g.

Liquor Calciferolis (B.P. Add. I).

Dose.—Prophylactic (daily) for an infant, 5 to 10 minims (0.3 to 0.6 ml.), approximately equivalent to 1000 to 2000 i.u. Therapeutic (daily) for an infant, 10 to 15 minims (0.6 to 1 ml.), approximately equivalent to 2000 to 3000 i.u.

A solution of calciferol in a suitable oil, such as arachis oil, containing 3000 i.u. per gramme. It replaces irradiated solution of ergosterol B.P., which was permitted to contain other products of the irradiation, together with unchanged ergosterol, in addition to calciferol.

Liquor Vitamini D Concentratus (B.P. Add. II).

Dose.— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.), approximately equivalent to 250 to 1500 units of vitamin D.

A solution of vitamin D containing 10,000 i.u. per gramme. It consists either of fish-liver oils or of a solution of a source of vitamin D in a vegetable oil such as arachis oil.

Solutum Vitamine D cum Oleo (Fr. Cx.) contains the equivalent of 10,000 units of vitamin D per ml. in olive oil.

Tab. Calc. c. Vit. D (N.I.F.). Each tablet contains calciferol $\frac{1}{1000}$ gr., calcium sodium lactate $7\frac{1}{2}$ gr., calcium phosphate $2\frac{1}{2}$ gr. Vitamin D content 500 units.

Calcium c. Vitamin D (Crookes Laboratories, London). Liquid for injection in 1 ml. ampoules, each containing calcium 1 in 2000, vitamin D 5000 i.u. Also as liquid for oral use, 1 drachm containing calcium 1 in 2000, vitamin D 250 i.u., and as capsules, containing the equivalent of 1 drachm of liquid.

Calcivitan (*Richter, London*). Tablets contain calcium gluconate $7\frac{1}{2}$ gr. with vitamin D 800 i.u. *Dose*.—1 or more tablets daily before meals. During pregnancy and lactation and wherever calcium is indicated.

Calcydic (*Allen & Hanburys, London*). Chocolate-flavoured granules containing per dr. $7\frac{1}{2}$ gr. of dicalcium phosphate, 1500 i.u. of vitamin D, and 30 gr. of dextrose. *Dose*.— $\frac{1}{2}$ to 2 drachms.

Calfo-Rayol Capsules (*Squibb, New York; Savory & Moore, London*). Contain $4\frac{1}{2}$ gr. dicalcium phosphate, 3 gr. calcium gluconate and 330 i.u. vitamin D.

Calstimil (*British Drug Houses, London*). Tablets containing 5 gr. of calcium sodium lactate and 500 i.u. of vitamin D.

Calssolact D (*Allen & Hanburys, London*). Tablets containing $7\frac{1}{2}$ gr. of calcium sodium lactate with 1000 units of vitamin D.

Davitamon D (*Organon Laboratories, London*). Solution and 1 ml. ampoules containing 5000 i.u. of vitamin D per ml. **Davitamon D Forte** contains 12,500 i.u. per ml.

Decufer (*Organon Laboratories, London*). Uncoated tablets each containing vitamin D 500 i.u., iron 20 mg., and copper 0.2 mg.

Ostelin Preparations (*Glaxo Laboratories, London*). **LIQUID**. A glycerin suspension of calciferol containing 5000 i.u. of vitamin D per ml. **TABLETS**. Calcium glycerophosphate 2 gr., with 500 i.u. of vitamin D. **EMULSION**. 3000 i.u. of vitamin D per oz. **Colloidal Calcium with Ostelin**. A preparation of vitamin D for injection containing per ml. 5000 i.u. of vitamin D and 0.5 mg. of colloidal calcium. For urticaria, angioneurotic oedema, chilblains and other allergic states, also for delayed union of fractures. *Dose*.—1 ampoule (1 ml.) at 3-day intervals, or daily for delayed union. **High Potency Ostelin Tablets** contain 50,000 i.u. of vitamin D. *Dose*.—1 to 6 daily, or more. Parathyroid tetany, chronic arthritis, rickets, hay-fever, etc.

Ostocalcium (*Glaxo Laboratories, London*). Tablets contain $7\frac{1}{2}$ grains of calcium sodium lactate, $2\frac{1}{2}$ grains of calcium phosphate and 500 i.u. of calciferol. *Dose*.—1 to 12 tablets daily.

Radiostol Solution (*British Drug Houses, London*). A brand of **Liquor Calciferolis**. **Radiostol Pellets** contain calciferol equivalent to 3000 i.u. in each. A solution in liquid paraffin for external application in the treatment of wounds, etc., is also available.

Viozin (*Glaxo Laboratories, London*). An ointment of calciferol (500 i.u. per g.) with zinc oxide in a wool fat and paraffin base. Promotes healing of wounds and varicose ulcers.

Dihydrotachysterol. *Syn.* A.T.10 (*Merck, Darmstadt; Savory & Moore, London*).

An oil-soluble fraction of irradiated ergosterol (isolated by Holtz and Windaus), which does not contain vitamin D but has a specific effect on the calcium content of the serum. Taken by the mouth it causes hypercalcaemia in animals and men, and is employed in the treatment of post-operative tetany and parathyroid insufficiency. Dosage is controlled by estimation of the blood calcium.

No other preparation gives such excellent results in the treatment of parathyroid tetany, but it is a very potent preparation and should not be used indiscriminately. Excessive doses have been shown to result in decalcification of bone of experimental animals and greatly increased urinary calcium, metastatic calcification, severe gastro-intestinal upsets, and bleeding from the bowel. It seems advisable to give small doses of calcium simultaneously, and frequent determination of serum calcium is necessary. Of four patients (all unsuccessfully treated for years by other methods) treated by dihydrotachysterol two have had approximately normal blood calcium and no symptoms for 9 months and the other two for 3 months each. The drug must be continued in small maintenance doses to keep the blood calcium at normal level. The dose ranges from 0.25 to 0.75 ml. daily, with a calcium intake ranging from 2 to 10 g. of calcium lactate or gluconate. There seems no necessity to order severe restriction of the

phosphorus intake. The cumulative effect of the drug is important; it exerts its action over a period of days or weeks and takes several days for any marked effect to appear.—C. M. MacBryde, *J. Amer. med. Ass.*, i/1938, 767.

Dihydrotachysterol has certain very definite advantages over parathyroid extract in the treatment of chronic tetany; (1) the effect is more prolonged, (2) it is taken orally, (3) no tolerance is developed, (4) it is less expensive, (5) it is stable and retains its potency when kept at ordinary room temperature. Six women suffering with chronic hypoparathyroidism following thyroidectomy and one with idiopathic tetany were completely relieved by treatment with dihydrotachysterol. The previous duration of the symptoms of tetany ranged from 3½ to 17 years, and all previous therapy had been comparatively ineffective except for temporary relief afforded by injections of parathyroid extract and calcium.—C. M. MacBryde, *J. Amer. med. Ass.*, ii/1938, 304.

A.T.10 was effective in controlling the parathyroid deficiency in a case of congenital parathyroid deficiency, but appeared less reliable in its action than vitamin D₂.—H. P. Himsworth and M. Maizels, *Lancet*, i/1940, 959.

Vitamin A. $C_{40}H_{56}O$ = 286.44.

Vitamin A has been isolated from the unsaponifiable fraction of fish-liver oils in the form of pale yellow crystals. In structure it is closely related to the plant pigment carotene which exists in three isomeric forms all of which are converted to some extent into vitamin A in the livers of man and animals. Of the three isomers, the *beta* compound is considered to be the most active, and it is probable that the molecule of *beta*-carotene undergoes hydrolysis with the formation of two molecules of vitamin A. *Alpha* and *gamma* carotenes each yield only one molecule of vitamin A for one molecule of carotene and have only half the vitamin A activity of the *beta* compound. Carotene is a dark yellow or orange, crystalline substance, nearly tasteless and possessing a slight aromatic odour; almost insoluble in water, slightly soluble in alcohol, more soluble in ether, light petroleum, fats and oils, and freely soluble in chloroform and benzene. Carotene occurs in blood in colloidal combination with albumin; it exists in the spleen, liver, bone marrow, retina of the eye, corpus luteum, kidneys and subcutaneous fat. The vitamin A of plants is due to the presence of *alpha*, *beta* and *gamma* carotenes and to kryptoxanthine; that of animal tissues is due to both vitamin A and carotene, while fish-liver oils contain vitamin A but no carotene.

Vitamin A and its precursors are stable to heat in the absence of oxidising agents, and the ordinary cooking processes do not destroy the vitamin A activity of vegetables. Frozen foods retain their vitamin A content over long periods of storage, but rancid fats have a catalytic effect on vitamin A destruction. Light also accelerates the destruction of vitamin A, hence cod-liver oil and other fish-liver oils should be stored in bottles of amber-coloured glass.

For full details of the chemistry and assay of vitamin A see Vol. II.

Human Requirements. The exact daily requirement of vitamin A by human beings has not been determined, but an optimal intake of from 3000 to 5000 i.u. daily has been recommended for healthy adults, and from 6000 to 8000 i.u. daily for

pregnant and nursing women. No toxic effects have been recorded from excessive dosage.

The vitamin A requirement of the human adult has been assessed at 2500 to 3000 i.u. per day of preformed vitamin, or some 5000 i.u. of carotene in oily solution. If the daily intake of vitamin A in milk and vitaminised margarine is assessed at about 1000 i.u., then the equivalent of some 1500 i.u. of preformed vitamin must be made up by vegetables. Of these, the carrot is the most valuable, a mature carrot containing an average of 200 i.u. of carotene per g. On this basis about 2 oz. of carrots would be needed to make up the daily requirement in the absence of other vegetables. Assuming other green vegetables to supply half the total requirement over the year, an allowance of about 1 oz. of carrots per day should meet the normal requirements.—*Nature, Lond.*, i/1941, 132.

Dark-Adaptation Test. Since it is known that vision at low illumination is dependent on the presence of visual purple in the retina and the content of this pigment in the retina is decreased in avitaminosis A, and since night-blindness is an early symptom of vitamin A deficiency, an examination of the ability of the eyes to adapt themselves to vision in light of low intensity is employed to ascertain the presence of incipient vitamin A deficiency. For this purpose the Birch-Hirschfeld photometer is usually employed, by means of which it is possible to measure the sensitivity to light of the eyes following partial dark-adaptation.

Dark-adaptation as an index of adequate vitamin A intake. Technique and preliminary results.—J. R. Mutch and H. D. Griffith, *Brit. med. J.*, ii/1937, 565.

Among poor-class children attending elementary schools in London and Cambridge, examined by the dark-adaptation test, roughly 40 to 50% of the total were normal, 20 to 30% slightly below normal and a further 20 to 30% were definitely deficient. Among 30 better-fed boys at a public school none were definitely deficient and only 3 were "border line." Children found subnormal returned slowly to normal after treatment with large amounts of vitamin A, whereas an equal number of controls left untreated remained subnormal. The test is only capable of detecting deficiency and not of assessing different levels of normality. Deficiency seems less common among adults than in children.—L. J. Harris and M. A. Abbasy, *Lancet*, ii/1939, 1355.

Uses. The following summary of "Allowable Claims," drawn up by the Council on Pharmacy and Chemistry of the A.M.A. (*N.N.R.*, 1940), serves as a useful indication of the present position of vitamin A therapy.

Vitamin A is specific for nyctalopia, or night-blindness due to vitamin A deficiency, but not when the condition is due to congenital defects or to diseases other than avitaminosis A. The claim that the administration of vitamin A to drivers of motor-cars will diminish the chance of accidents from driving at night is not accepted.

Vitamin A is reported to be effective in the treatment of certain types of hyperkeratosis of the skin of persons suffering from severe deficiency of vitamin A.

Present indications are that vitamin A is an aid towards establishing the resistance of the body to infections in general only when there has been an exhaustion of body reserves of the vitamin and the ingestion of vitamin A is inadequate. It has not been shown to be specific in the prevention of colds, influenza and such infections, nor has it been demonstrated that ingestion of vitamin A far in excess of that necessary for normal body function, and readily obtained from a properly selected diet, is an aid in preventing

various types of infections. A deficiency of vitamin A results in a retardation of growth when body stores of the vitamin have been depleted, but it must be borne in mind that vitamin A is not more important in promoting growth than other food essentials. There is at the present time inadequate evidence to warrant the claim that the ingestion of sufficient vitamin A will prevent the formation of renal calculi in man, or that it is useful in the treatment of hyperthyroidism, anaemia, degenerative conditions of the nervous system, sunburn, or ulcerative conditions of the skin.

Is not a general anti-infective agent; it is anti-infective only in a limited way and vitamin A therapy has failed to have any effect as a prophylactic in respiratory diseases, in the common cold in infants, on the incidence of common infections generally, or in treatment of pneumonia. The local infections to which vitamin A deficiency gives rise are of quite a special type, being caused by structural breakdown of membranes; there is no change in the general immunity.—L. J. Harris, *Brit. med. J.*, ii/1933, 231.

An experiment consisting in the administration over a period of 6 months of a concentrate of vitamins A and D, in daily doses equivalent in vitamin A to rather more than 1 oz. of high-grade cod-liver oil, to 294 poor schoolchildren of Peterhead, with 281 contemporaries acting as controls, showed the rate of growth of the treated children as only slightly better than that of the controls and *susceptibility to infection and resistance to established disease were apparently unaffected*. The results compared unfavourably with milk experiments. Evidence suggested that the cause of the failure was that the vitamin supplements made good only one dietary deficiency and left uncorrected associated deficiencies of equally essential constituents of the diet. The public must be educated that vitamin supplements do not constitute a short cut to health, but that a well-balanced diet is essential.—R. Sutherland, *Brit. med. J.*, i/1934, 791.

Perfectly calcified and regularly arranged teeth can be produced by including in the maternal diet during pregnancy and lactation, and in the diet of the offspring at the time of dental development, substances containing much fat-soluble vitamin, calcium and phosphorus. Cereals, especially oatmeal, tend to produce badly developed (hypoplastic) teeth and call for a correspondingly larger supply of calcifying foods. The teeth of the majority of children in the British Isles are imperfect in structure and have a roughish surface; dental caries is more likely to attack such teeth than perfect teeth with normal enamel and dentine and a comparatively smooth surface. The resistance of teeth to caries can be increased independently of their original structure by giving a diet of high calcifying activity, while resistance is decreased by a diet rich in cereals and of low calcifying properties. Deficiency of vitamin A or carotene plays an important part in development of periodontal tissues and control of onset of periodontal disease, including pyorrhoea.—May Mellanby, *Spec. Rep. Ser. med. Res. Coun., Lond.*, No. 191, 1934; *Brit. med. J.*, i/1934, 252.

Liquor Vitamini A Concentratus (B.P. Add. II).

Dose.—1 to 5 minims (0.06 to 0.3 ml.), approximately equivalent to 2500 to 12,500 i.u. of vitamin A.

A solution of vitamin A possessing 50,000 units of vitamin A activity per g., and consisting of fish-liver oils or of a solution of a source of vitamin A in a vegetable oil such as arachis oil.

Vitamin A is of value as a local application in certain ophthalmic conditions, in particular in the herpetic forms of corneal disease and other corneal lesions and in injuries and burns of the conjunctiva. Because of its analgesic and lubricating effect it is invaluable for injuries from gases used in industry and warfare. It not only helps epithelialisation, but is a protective agent for the epithelium.—*Brit. med. J.*, i/1940, 354.

Liquor Vitamine-A (B.P.C.).

Dose.—5000 to 50,000 units.

A solution in arachis or other suitable vegetable oil of a concentrate of mammalian or other livers. It contains 60,000 units of vitamin A per g.; a small amount of vitamin D may also be present.

Vitamina A Naturalis in Oleo (U.S.P. XI Supp. II).*Average daily dose.*—5 minims (0.3 ml.).

A solution of vitamin A containing 50,000 to 60,000 units of vitamin A and not more than 1000 units of vitamin D per gramme. It consists of either fish-liver oil, plain or diluted with a vegetable oil, or of a solution of a vitamin A concentrate obtained from animal sources, in fish-liver oil or vegetable oil.

Avoleum (British Drug Houses, London). A concentrated preparation of vitamin A, without admixture of vitamin D, containing 30,000 i.u. per g. In liquid or capsules containing 3 m. *Dose.*—3 to 9 minims daily.

Davitamon A (Organon Laboratories, London). Solution of vitamin A containing 6000 i.u. per ml. **Davitamon A Forte** contains 60,000 i.u. per ml., and is also issued in 1 ml. ampoules for injection.

Essogen (Trufood, London). A vitamin A preparation with a blue value of 2000. Supplied in capsules of 2 m.

Eubion (E.ans, Sons, Lescher & Webb, Liverpool). Chocolate tablets containing vitamin A equivalent to one tablespoonful of best cod-liver oil.

Planavit A (Pharmaceutical Specialities (May & Baker) Ltd., London). Standardised solution of vitamin A, prepared from fish-liver oils and containing 25,000 i.u. per ml.

Prepalin (Glaxo Laboratories, London). A vitamin A concentrate. Each ml. contains 72,000 i.u. and each 3-minim capsule 24,000 i.u.

Vulnovitan (Richter, London). Vitamin A dressing for wounds. Ointment contains 1000 i.u. per gramme; oil contains 2000 i.u. per ml.

Liquor Vitaminorum A et D Concentratus (B.P. Add. II).

Dose.—1 to 5 minims (0.06 to 0.3 ml.), approximately equivalent to 2500 to 12,500 i.u. of vitamin A and 250 to 1250 i.u. of vitamin D.

A solution of vitamin A 50,000 i.u. and vitamin D 5000 i.u. per gramme. It consists of either fish-liver oils or of a solution of sources of vitamins A and D in vegetable oil such as arachis oil.

Oleum Vitaminatum (B.P. Add. II).

Dose.—Prophylactic, 15 to 30 minims (1 to 2 ml.), approximately equivalent to 1000 to 2000 i.u. of vitamin A and 100 to 200 i.u. of vitamin D. Therapeutic, 45 to 90 minims (3 to 6 ml.), approximately equivalent to 3000 to 6000 i.u. of vitamin A and 300 to 600 i.u. of vitamin D.

A solution of vitamin A 1000 i.u. and vitamin D 100 i.u. per gramme. It consists of either fish-liver oil or of a solution of sources of vitamins A and D in a vegetable oil such as arachis oil.

Emulsio Olei Vitaminati (B.P. Add. II).

Dose.—30 to 60 minims (2 to 4 ml.), approximately equivalent to 1000 to 2000 i.u. of vitamin A and 100 to 200 i.u. of vitamin D.

Vitaminised oil 50% v/v. An efficient substitute for emulsion of cod-liver oil.

Vitaminæ A et D Naturales in Oleo (U.S.P. XI Supp. II).*Average daily dose.*—5 minims (0.3 ml.).

A solution of vitamin A 50,000 to 65,000 units and vitamin D 10,000 to 13,000 units per gramme. It consists of either fish-liver oil, plain or diluted with vegetable oil, or of a solution of a vitamin A concentrate obtained from animal sources in fish-liver oil or vegetable oil.

Vitamins A and D in Oil for Animal Feeding Purposes (B.S.S. No. 909-1940) consists of a mixture of vitamins A and D with a suitable marine or vegetable oil, and contains not less than 1000 i.u. of vitamin A and 100 i.u. of vitamin D per g. It must be described as unsuitable for poultry feeding unless the amount of vitamin D declared is fully effective for poultry when tested by the Chick Test.

POLYVITAMIN PREPARATIONS

A.B.D. Capsules (*Abbott Laboratories, London*). Contains vitamins A, B₁, B₂, and D. Each capsule is equivalent to 3 dr. of cod-liver oil (*U.S.P.*), 15 oz. of milk in B₁ potency and 2 oz. of milk in B₂ potency.

A.B.D.G. Capsules (*Squibb, New York; Savory & Moore, London*). Each capsule contains vitamin A 6600 i.u., B₁ 33 i.u., B₂ 22 microgrammes of riboflavin and D 1320 i.u. *Dose*.—1 to 3 daily.

Abidon (*Parke, Davis, London*). Capsules, each containing vitamins A and D equivalent to three drachms of cod-liver oil, vitamin B₁ equivalent to 10 oz. of milk, and vitamin B₂. **Abidon with Vitamin C**. Capsules, each representing vitamin A 6200 i.u., B₁ 50 i.u., B₂ 20 Sherman units, C 200 i.u. and D 900 i.u.

Adexolin (*Glaxo Laboratories, London*). Each 3 m. capsule contains 6000 i.u. of vitamin A and 1000 i.u. of vitamin D, equivalent to 10 ml. of cod-liver oil. Also as emulsion containing 18,000 i.u. of vitamin A and 3000 i.u. of vitamin D per oz.

Calvitone (*Martindale, London*). Contains per oz. calcium acid phosphate 5 gr., iron and copper citrate 10 gr., sodium and manganese glycerophosphate 5 gr., vitamin A 16,000 units and vitamin D 800 units. *Dose*.—2 teaspoonfuls repeated. General tonic.

Davitamon AD (*Organon Laboratories, London*). Liquid preparation containing vitamin A 6000 i.u., and vitamin D 5000 i.u. per ml. **Davitamon AD Cornfits** are spherical, red, sugar-coated tablets each containing vitamin A 1500 i.u., and vitamin D 1000 i.u. **Davitamon 5**. Sugar-coated tablets each containing vitamin A 1000 i.u., vitamin B 50 i.u., vitamin C 10 mg., vitamin D 200 i.u., P-P factor 0.5 mg.

Dekadexolin (*Glaxo Laboratories, London*). A concentrate of vitamins A and D for intramuscular injection. Each ml. contains 60,000 i.u. of vitamin A and 10,000 of vitamin D in oily solution. *Dose*.—1 ml. daily intramuscularly every other day or at longer intervals. Local and general infections, pyrexia, sloughing bedsores, etc.

F.C.V.D. (*Crookes Laboratories, London*). Each teaspoonful contains 250 i.u. of vitamin D, 1 mg. of colloidal iron, $\frac{1}{16}$ mg. of colloidal copper, with orange juice and malt extract. For use in all forms of debility. *Dose*.— $\frac{1}{2}$ to 2 teaspoonfuls three times daily.

Grecoosan (*Bencard, London*). (Known as Spinatin in Denmark.) Vegetable extracts in tablet form, each 0.3 g. tablet containing chlorophyll 0.003 g. organic iron 0.01 g., lecithin 0.003 g., iodine (combined) 0.005%, with Ca, Mn, Mg, Cu and K in natural organic combination, vitamin A 33 i.u., vitamin C about 27 i.u., and vitamins B₁, B₂, D and E. For all conditions due to hypovitaminosis. Stated to be markedly more effective than equal dosage of the vitamins given alone.

Halcova (*Crookes Laboratories, London*). A preparation of malt, milk, eggs and chocolate with vitamins A and D.

Halisterin (*Richter, London*). Capsules each containing vitamin A 2500 i.u., and vitamin D 1250 i.u. *Dose*.—One thrice daily.

Hepicoleum (*Lilly, London*). Capsules ("globules") each containing 8500 i.u. of vitamin A and 1700 i.u. of vitamin D. **Hepicoleum Compound Globules** contain in each not less than 6200 i.u. of vitamin A, 900 i.u. of vitamin D, 200 i.u. vitamin C (10 mg. ascorbic acid), 50 i.u. of vitamin B₁ and 10 Sherman units of vitamin B₂.

Irradex (*Parke, Davis, London*). Liver oil containing vitamins A and D, vitamin B extract, iron and ammonium citrate, and manganese citrate in malt extract base. *Dose*.— $\frac{1}{2}$ to 4 teaspoonfuls. Malnutrition and debility.

Multivite (*British Drug Houses, London*). Chocolate-coated pellets containing in standardised amounts vitamins A, B, C, and D.

Nestrovite (*Roche Products, Welwyn Garden City*). Preparations containing vitamins A, B₁, C and D, available as an emulsion or in tablets. The emulsion contains per teaspoonful 5000 i.u. of vitamin A, 83.5 i.u. of vitamin B₁, 300 i.u. of vitamin C, and 500 i.u. of vitamin D. The tablets each contain 5000 i.u. of vitamin A, 166 i.u. of vitamin B₁, 400 i.u. of vitamin C and 500 i.u. of vitamin D. *Dose*.—Infants, 1 teaspoonful of emulsion daily; older infants, increase to $\frac{1}{2}$ to 2 teaspoonfuls, or 1 tablet, daily; children and adults, 3 teaspoonfuls of emulsion, or 2 tablets daily.

Parivitan (*Richter, London*). Syrup containing per fl. oz. vitamin A 15,000 i.u., vitamin D 3000 i.u., organically combined iron 14 gr., calcium, sodium and potassium hypophosphites, of each $2\frac{1}{2}$ gr., with manganese and copper of each $\frac{1}{2}$ gr., in a syrup of liquid glucose base. *Dose*.—2 teaspoonfuls 2 to 3 times daily.

Penta-Kaps (*Abbott Laboratories, London*). Capsules each containing 6200 i.u. of vitamin A, 900 i.u. of vitamin D, 75 i.u. of vitamin B₁, 20 Sherman units of vitamin B₂ and 200 i.u. of vitamin C.

Polyvitamin Co. (*Hewlett, London*). Emulsion contains vitamins A, B, C and D. Oil contains A, D and E. Capsules, 5 m., also contain an oily solution of A, D and E.

Priovit (*Bayer Products, London*). Pellets containing vitamin B₁ 0.5 mg.; vitamin B₂ 0.25 mg.; vitamin C 25.0 mg.; factor P (citrin) 5.0 mg. Advocated for conditions associated with increased metabolism, e.g., febrile diseases, endocrine disorders, hypovitaminosis during pregnancy and lactation.

Radiostoleum (*British Drug Houses, London*). Preparations of vitamins A and D. Liquid contains per g. 15,000 i.u. of vitamin A and 3000 i.u. of vitamin D. Capsules 3 m. contain the equivalent of 6 m. of the liquid. A 10% emulsion is also available for administration to infants. **Concentrated Radiostoleum for Injection** contains 75,000 i.u. of vitamin A and 15,000 of vitamin D in each g., and is used in ampoules of 1 ml. for intramuscular injection.

Rayolex Tablets (*Squibb, New York; Savory & Moore, London*). Tablets contain 3300 i.u. vitamin A and 660 i.u. vitamin D.

Syrup Minadex (*Glaxo Laboratories, London*). Each fl. oz. contains vitamin A 18,000 i.u., vitamin D (calciferol) 3000 i.u., iron and ammonium citrate $13\frac{1}{2}$ gr., calcium glycerophosphate 2 gr., potassium glycerophosphate $\frac{1}{2}$ gr., sodium glycerophosphate $\frac{1}{10}$ gr., manganese glycerophosphate $\frac{1}{25}$ gr., copper sulphate $\frac{1}{16}$ gr. *Dose*.— $\frac{1}{2}$ to 2 teaspoonfuls thrice daily.

Vitapex (*Paines & Byrne, London*). Vitamin A in oil, available as liquid (35,000 i.u. per g.) or capsules each containing 3500 i.u.

Vitmar (*Vitmar, London*). *Dose*.—An egg-spoonful after meals every day. Described as a food containing vitamins A, B, and C, suitable for backward and delicate children. It is stated to have a food value of 400 calories per 100 g.

CALCIUM

Ca = 40.08

Calcii Carbonas (*B.P., U.S.P. XI, Fr. Cx., P. Helv. V, etc.*). $\text{CaCO}_3 = 100.08$. *Syn.* CALCII CARBONAS PRÆCIPITATUS, PRECIPITATED CALCIUM CARBONATE, PRECIPITATED CHALK, CRAIE PRÉPARÉE, GEFÄLLTES CALCIUM CARBONAT.

Dose.—15 to 60 grains (1 to 4 g.).

White insoluble powder.

Uses. Much employed in diarrhoea and dysentery and as an ingredient in tooth powders. A valuable antacid in gastric hyperacidity and in gastric and duodenal ulcer.

Diarrhoea of gastric origin is well treated by calcium carbonate and calcium phosphate equal parts, a teaspoonful thrice daily.

Its chief use in ulcer treatment is to relieve pain and heartburn, and for this purpose should be given in doses of from 60 to 90 gr. If the gastric acidity is known to be exceptionally high a big dose may be given at bedtime or more often. The constipation which it causes may be met by increasing the dose of magnesia.—T. L. Hardy, *Practitioner*, 1/1937, 436.

Creta (*B.P., U.S.P. XI*). *Syn.* CRETA PRÆPARATA.

Dose.— $\frac{1}{4}$ to 1 drachm (1 to 4 g.).

A native calcium carbonate purified by elutriation. Consists of the tests of cretaceous foraminifera such as *Globigerina* and

Textularia, together with minute rounded bodies (morpholites), and contains when dried not less than 97% of CaCO_3 .

Insoluble in water or alcohol.

Blair's Tooth Powder. Dissolve 3 of soap in about 4 of water, mix intimately with about 25 of precipitated chalk and dry at moderate heat. Dissolve catechu 1 in alcohol 5 and mix intimately with precipitated chalk 25. Mix equal parts of oil of wintergreen and oil of sassafras with a further 25 of precipitated chalk, using 6 drops of mixed oils for each 100 g. of powder. Mix the three portions and sift.

Creta cum Camphora (B.P.C.). *Syn.* CAMPHORATED CHALK. Camphor 10%, in calcium carbonate. It loses camphor readily and should be stored in well-closed containers; the freshly prepared mixture may contain less than 10% of camphor.

Mistura Cretæ (B.P.C.). Chalk Mixture.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains 3% with sugar 6% and a little tragacanth, in cinnamon water. The powders are generally kept mixed in a dry condition, and cinnamon water added as required.

Mistura Cretæ (U.S.P. XI).

Average dose.— $\frac{1}{2}$ ounce (15 ml.).

Compound chalk powder 20, cinnamon water 40, in water to 100.

[P1] **Mist. Cret. c. Opio (N.I.F.).** Chalk 40 gr., compound powder of tragacanth 5 gr., tincture of opium 5 m., chloroform water to $\frac{1}{2}$ oz.

[P1] **Mist. Cret. Aromat. c. Opio (N.I.F.).**

Aromatic powder of chalk 20 gr., compound powder of tragacanth 5 gr., tincture of catechu 10 m., tincture of opium 5 m., chloroform water to $\frac{1}{2}$ oz.

[P1] **Mistura Cretæ Composita (B.P.C.).**

Dose.—For adults, 1 ounce (30 ml.); for a 12 year old child, $\frac{1}{2}$ ounce (15 ml.); for a 7 year old child, 2 drachms (8 ml.).

1 oz. contains 9 gr. of aromatic powder of chalk, 9 gr. of chalk, $\frac{1}{2}$ dr. of tincture of catechu and 3 m. of tincture of opium.

Closely resembles the mixture formerly known as Board of Health Cholera Mixture.

Pulvis Cretæ Aromaticus (B.P.).

Dose.—10 to 60 grains (0.6 to 4 g.).

Contains 25% of chalk, with cinnamon, nutmeg, clove, cardamom and sucrose.

Pulvis Cretæ Compositus (U.S.P. XI).

Average dose.—30 grains (2 g.).

Prepared chalk 30, acacia 20, sucrose 50.

Sys Specific. An Indian cure for sprue, dysentery and diarrhoea. It consists of "powders" containing principally calcium carbonate—one to be mixed with 12 ounces of water and laudanum to be added, if necessary.

Trochisci Antacidi (B.P.C.) contain calcium carbonate $3\frac{1}{2}$ gr., heavy magnesium carbonate $2\frac{1}{2}$ gr. and sodium chloride 1 gr.

Unguentum Cretæ (B.P.C.). 20% in spermaceti ointment.

Os Sepiæ (B.P.C.). Cuttle Fish Bone. The internal shell of *Sepia officinalis* (Cephalopoda). Contains 80 to 85% of calcium carbonate, and is used as a mild abrasive in tooth powders.

Sepia is prepared from the fluid in the ink gland of the cuttle fish by drying dissolving in alkali and reprecipitating with acid. Is used in homœopathy.

Calcii Gluconas (*B.P. Add. I, U.S.P. XI, Fr. Cx., P. Ned. V⁹ Supp. II*). $[\text{CH}_2\text{OH}\cdot(\text{CHOH})_4\cdot\text{COO}]_2\text{Ca}\cdot\text{H}_2\text{O} = 448.4$.

Dose.—30 to 60 grains (2 to 4 g.). *U.S.P. XI* average doses—oral, 75 gr.; intravenous, 15 gr.

A white crystalline and granular powder, *soluble* 1 in 30 of water, 1 in 5 of boiling water; insoluble in alcohol and ether. Contains 8.9% of calcium. Gluconic acid, $\text{C}_6\text{H}_8(\text{OH})_5\text{COOH}$, is formed by oxidation of glucose, sucrose, dextrin or starch. Quantitative yields are obtained by the action of *Bact. suboxydans* on glucose. It is a syrupy compound soluble in water.

It is administered parenterally in an approximately 10% solution prepared by dissolving 10 g. of calcium gluconate in 95 ml. of water, filtering whilst hot and autoclaving. The solution should be stored in sealed ampoules and must be free from all solid particles, otherwise it will crystallise. Proprietary concentrated solutions of calcium gluconate are supersaturated solutions stabilised by patented methods.

The presence of calcium glucoheptonate increases the solubility of calcium gluconate, and the following solution has been proposed for use as an injection:—Calcium gluconate 73.35 g., calcium glucoheptonate 30 g., water to 1000 g. Boil, filter, fill into ampoules and sterilise for 1 hour at 100°.

A 10% solution which will not crystallise may be prepared by adding 2020 g. of boiling distilled water to 200 g. of calcium gluconate, filtering through a hard filter paper in a covered funnel, heating the filtrate in an autoclave for 30 minutes at 112°, filtering through a No. 4 sintered glass filter and transferring to washed and dried ampoules which are then sealed and heated to 112° for 30 minutes on three successive days.—*L. Bracaloni, per Quart. J. Pharm.*, 1937, 117.

Solutions containing an amount of calcium methionate equal to or greater than calcium gluconate yielded relatively stable solutions containing from 7 to 70% of gluconate.—*G. L. Jenkins, J. Amer. pharm. Ass.*, 1938, 484.

10% solutions can be prepared by the addition of camphorsulphonic acid 1%.—*G. Lusignani, Boll. Chim. farm.*, 1940, 79, 137.

Uses. Taken by the mouth, it is well absorbed. Intravenously it is better tolerated than calcium chloride. The acid-base factor is eliminated. Intramuscularly it is painless and non-irritant. It influences many respiratory diseases, relaxing bronchial spasm and decreasing secretion of mucosa of the respiratory tract. Intramuscularly it is of value in serum sickness, urticaria; spasmodic croup and infantile convulsions. Also used in debility, malnutrition and neurasthenia. Injections of calcium gluconate should not be given during the course of treatment with the digitalis group.

ECLAMPSIA. Hyperguanidinæmia is associated with hypocalcæmia. 7 g. (total) of calcium gluconate intravenously, intramuscularly and subcutaneously, cured in 24 hours. Eclamptic syndrome yields to calcium medication.—*Brit. med. J. Erit.*, ii/1930, 42.

MILK FEVER cured by injecting calcium gluconate: also prophylactic.—*Lancet*, ii/1930, 411.

CEDEMA of children suffering from rickets treated.—*Brit. med. J. Erit.*, i/1931, 102.

SERUM SICKNESS. The following treatment was given in 15 cases as soon as a rash developed. 10 or 20 ml. of 20% calcium gluconate intravenously, supplemented by 10 ml. of 10% calcium gluconate intramuscularly, and the intramuscular injection repeated 12-hourly till rash or symptoms subsided;

the solution for intravenous injection was warmed to body temperature and injected slowly (10 ml. in 2 or 3 minutes). As compared with 15 control cases (treated with adrenaline subcutaneously, ephedrine *per os*, calamine lotion locally, and sedatives), the rash in those treated with calcium lasted only 2.9 days against an average of 5.4 days, and subjective symptoms (itching, arthralgia, headache, cramps, nausea, etc.) 3.3 against 7.1 days.—T. J. Curphey and S. Solomon, *New Engl. J. Med.*, 1936, 214, 148.

Calcium L-B (*Allen & Hanburys, London*). Calcium lactobionate. Supplied in solution in ampoules, 2 g. in 5 ml. For intramuscular or subcutaneous injection in calcium deficiency. Also combined with parathyroid in tablets and elixir.

Calcium Sandoz (*Sandoz Products, London*). Preparations of calcium for oral, intramuscular or intravenous administration. Oral preparations contain calcium gluconate and are available as powder, chocolate-flavoured tablets (25 gr.), effervescent tablets (60 gr.) or syrup (60 gr. in $\frac{1}{2}$ oz.). Preparations for injection contain calcium glucono-gallacto-gluconate, which is soluble in water to form a perfectly stable solution. It is available in 2, 5 or 10 ml. ampoules of a 10% solution for intramuscular use, or in 5 or 10 ml. ampoules of a 20% solution for intravenous use.

Glucocalcium (*Lilly, London*). Combination of calcium with glucose degradation products. *Dose*.—3 to 5 ml. intramuscularly and 5 to 20 ml. intravenously. Tuberculosis, asthma, hay fever, etc.

Percalcin (*Evans, Sons, Leitch & Webb, Liverpool*). A stable solution of calcium in organic combination containing the equivalent of 4% w/v of calcium hydroxide ($2\frac{1}{2}$ times the strength of 10% calcium gluconate). It may be administered either intravenously or intramuscularly in the treatment of calcium deficiency. Intravenously the dose is 4 to 25 ml. of warm solution given slowly; intramuscularly, 2 to 4 ml. daily. For pulmonary tuberculosis the dose is 5 ml. intravenously 2 to 3 times per week, increased gradually to 20 ml.

Selvorol (*Bayer Products, London*). Calcium salt of glucohexacetic acid containing 8.5% of Ca. Administered orally in doses of 30 gr. twice daily. Asthma, hay fever, urticaria and calcium deficiencies.

Calcii Lævulus. *Syn.* CALCIUM LÆVULINATE.
($\text{CH}_3 \cdot \text{CO} \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{COO}$)₂Ca, $2\text{H}_2\text{O} = 306.2$.

Dose.—15 grains (1 g.) by intravenous injection in a 10% solution. 5 grains (0.3 g.) by intramuscular injection in a 15% solution.

A white, crystalline, almost odourless powder with a slightly bitter taste. Its calcium content is 50% higher than that of calcium gluconate.

Soluble 1 in 2.5 of water.

Levu-Calcin (*Glaxo Laboratories, London*). Calcium levulinate solution for injection either intravenously (10%) in 10 ml. ampoules or intramuscularly (15%) in 2 ml. ampoules.

Tetanol (*Crookes' Laboratories, London*). A solution of calcium levulinate. *Dose*.—Intravenously, 5, 10, or 20 ml. 13% solution; intramuscularly, 2 ml. 20% solution.

Calcii Hydroxidum (*B.P., U.S.P. XI, Fr. Cx.*). *Syn.* CALCIUM HYDRAS. $\text{Ca}(\text{OH})_2 = 74.10$. Should be recently made by action of water on calcium oxide. Is more soluble in cold water than in hot.

Linimentum Calcii Hydroxidi (*B.P.C.*).

Solution of calcium hydroxide 1, olive oil 1.

Linimentum Calcii Hydroxidi cum Oleo Lini (*B.P.C.*).

Syn. CARRON OIL.

Solution of calcium hydroxide 1, linseed oil 1. Eucalyptus oil 1 to 2% is sometimes added as antiseptic.

Carron oil was at one time extensively used for the treatment of burns, but with the introduction of tannic acid therapy it fell into disuse. With the recent re-introduction of oily preparations for burn dressings there is a possibility of its return to favour. In a series of controlled animal experiments Thomson (*Lancet*, i/1941, 341) has shown that healing is promoted and regeneration of damaged tissue occurs with greater ease when burns are treated with carron oil than when treated with tannic acid.

Liquor Calcii Hydroxidi (B.P.). *Syn.* LIQUOR CALCIS, AQUA CALCIS (*Fr. Cx.*), LIME WATER.

Dose.—1 to 4 ounces (30 to 120 ml.).

Contains not less than 0.15% *w/v* of Ca(OH)_2 . It is given with milk to infants to prevent formation of large clots.

Liquor Calcii Hydroxidi Saccharatus (B.P.C.). *Syn.* LIQUOR CALCIS SACCHARATUS.

Dose.— $\frac{1}{4}$ to 1 drachm (1 to 4 ml.).

Contains the equivalent of 2.4% *w/v* of Ca(OH)_2 with sucrose and water.

Liquor Calcii Hydroxidi (U.S.P. XI).

Average dose.— $\frac{1}{4}$ ounce (15 ml.).

Same as B.P., but made with 3 g. of calcium hydroxide for each litre of solution.

Calcii Oxidum (Fr. Cx.). *Syn.* QUICKLIME, CALCARIA USTA (*P. Jap. V*).

White or greyish-white masses. Used as a caustic, e.g., in *Pasta Londinensis (q.v.)*. Soda-lime is prepared by slaking quicklime with sodium hydroxide solution and heating to redness.

LIME BURNS. A 4% solution of ammonium chloride is more effective than any solutions hitherto generally employed, and has been tried out in a series of cases with considerable success. It is no more painful to the eye than other irrigating fluids. The preliminary application of an analgesic solution and the removal of large particles by means of a camel-hair brush dipped in a mixture of Vaseline and paraffin, should also form part of the first-aid treatment.—G. C. Pether, *Brit. med. J.*, i/1939, 668.

Calcii Saccharas. *Syn.* CALCIUM MONOSACCHARATE.

$\text{C}_{12}\text{H}_{22}\text{O}_{11}\text{CaO} = 398.2$.

Dose.—8 to 30 grains (0.5 to 2 g.).

In colourless tufts, soluble in water. An antacid for dyspepsia, specially for children; also as an antidote to carbolic acid poisoning in 10 times above doses.

Calcii Sulphas Exsiccatus (B.P.C., P. Helv. V, P. Jap. V). *Syn.* PLASTER OF PARIS, CALCIUM SULPHATE (*Fr. Cx.*).

$\text{CaSO}_4, \frac{1}{2}\text{H}_2\text{O} = 145.1$. A white, hygroscopic, odourless powder. Two pounds require about 1 pint of water; this sets rapidly and firmly.

Moistening with 5% dextrin solution makes a strong dressing but sets slowly. Sodium chloride 1% added hastens setting but 2% retards.

Ligamentum Calcii Sulphatis (B.P.C.). Plaster of Paris bandages consist of bleached cotton cloth impregnated with the plaster and suitable adhesives.

Calx Sulphurata (B.P.C.). *Syn.* CALCII SULPHIDUM CRUDUM, CANTON'S PHOSPHORUS. Contains not less than 50% of $\text{CaS} = 72.14$.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.) in pill.

Is prepared by reducing calcium sulphate with charcoal. A greyish powder with odour of hydrogen sulphide. Sparingly *soluble* in water with decomposition.

Uses. Largely used for boils, carbuncles, acne and scrofulous sores. Continued administration is stated to act as a prophylactic against puerperal sepsis. It rarely purges even in 2 grain doses thrice daily. Some give small doses *every hour*. In strumous ophthalmia, as well as in periostitis and alveolar abscesses, has been found of service. Also in follicular tonsillitis. For boils give 1 grain *t.d.*, increased to 8 grains *p.d.*

ACNE. Good results claimed with doses of not less than 2 grains 3 times a day.—A. Whitfield, *Brit. J. Derm.*, 1934, 257.

PUERPERAL SEPSIS. Calcium sulphide in doses varying from $1\frac{1}{2}$ to 12 grains per 24 hours reduced the death-rate from sepsis in the County Maternity Hospital, Bellshill, Lanark, from 5.3 per 1000 in cases confined within the institution from 1927 to 1933 inclusive (5421 cases) to 0.7 per 1000 for 1933 to 1935 inclusive (2518 cases). Used either as a prophylactic previous to confinement or even during the puerperium, it not only prevents the incidence of puerperal infection, but also does much to curtail the mortality.—H. J. Thomson, *Brit. med. J.*, ii/1935, 1070.

Calcium sulphide usually given as a pill in doses of 3 gr. twice daily, increased to four times a day in complications such as toxæmia of pregnancy, hæmorrhage, etc. Only 14 cases of puerperal sepsis and 11 of puerperal pyrexia with 1 death in more than 2000 unselected confinements, of which about 40% were admitted as emergencies.—H. J. Thomson, *Brit. med. J.*, ii/1936, 70.

Liquor Calcis Sulphuratæ (B.P.C.). *Syn.* LOTIO CALCIS SULPHURATÆ, VLEMINCKX'S SOLUTION, CALCIUM SULFURATUM SOLUTUM (*P. Helv. V*).

Prepared by boiling sulphur with calcium hydroxide and water, and contains polysulphides of calcium equivalent to 4 to 5% *w/v* of sulphur.

Valuable in Dhobie's itch; at first used diluted 3 or 4 times.

For eczematous itching, baths of the solution, 1 tablespoonful to every 7 gallons of water, have been used.

Colloidal Calcium. Preparations of colloidal calcium usually contain the metal in the form of a compound. The usual strength is 1 in 2000.

Dose.—8 to 15 minims (0.5 to 1 ml.) hypodermically; $\frac{1}{2}$ to 1 drachm (2 to 4 ml.) orally. Is used for the general purposes of calcium therapy.

CAMPHORA

B.P., U.S.P. XI, Fr. Cx., P. Helv. V, etc.

Dose.—2 to 5 grains (0.12 to 0.3 g.); 1 to 3 grains (0.06 to 0.2 g.) by subcutaneous injection.

Camphor is a white crystalline substance obtained from *Cinnamomum Camphora* (Lauraceæ) in Formosa and Japan (natural camphor), or obtained synthetically from the pinene of oil of turpentine (synthetic camphor). *M.p.* 174° to 177°; *b.p.* 204°.

Natural camphor is dextrorotatory, whilst synthetic camphor is optically inactive. Both forms are official.

Camphor is sold in balls, and in $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, 1 and 4 ounce cubes, also as **Flowers of Camphor**. The latter is a convenient form for dissolving.

Soluble 1 in 700 of water, 1 in $1\frac{1}{2}$ of alcohol 90% (more soluble in dehydrated alcohol), 12 in 7 of ether, about 4 in 1 of chloroform, 2 in 1 of glacial acetic acid, 1 in 3 of olive oil, and 1 in 1.5 of oil of turpentine. Also soluble in other fixed and volatile oils, but insoluble in glycerin.

Camphor, when mixed in certain proportions with many crystalline substances, causes mutual liquefaction of the two—e.g., camphor 4, phenol 12, and water 1; camphor 1 and chloral hydrate 1; camphor 2 and menthol 3; camphor 1 and thymol 1; camphor 2 and β -naphthol 1; camphor 2 and salol 3; camphor and butyl-chloral hydrate liquefy when heated, but solidify on cooling; so will camphor 84 and salicylic acid 65. Camphor is powdered by rubbing with a few drops of alcohol.

Antidotes. Empty stomach by emetic or stomach tube. Give purgative dose of magnesium sulphate in plenty of water. Keep patient warm, and give inhalations of ether or dilute ammonia. Stimulants, e.g., digitalin $\frac{1}{2}$ gr., strychnine $\frac{1}{8}$ gr., caffeine sodium benzoate 2 gr., hypodermically.

Caution. It is dangerous to place camphor or menthol, e.g., a 20% ointment, into the nostrils of an infant. A small quantity applied in this way may cause immediate collapse with signs of a severe syncopal attack.

Poisoning from 75 grains of camphor as camphorated oil. Recovery: Stomach washed out and several ounces concentrated magnesium sulphate solution left in.—J. Cottrell, *Brit. med. J.*, i/1931, 96.

Uses. Internally it is sedative, anti-spasmodic, carminative, expectorant, diaphoretic, anaphrodisiac and antipyretic. It is given internally to abort colds in the head, to relieve hiccough, for whooping cough, chordee and lumbago. For arteriosclerosis and for old patients with heart trouble continued use of camphor internally is of value. Is injected as a stimulant for patients *in extremis*, though its action on the circulation is inconstant and unreliable.

It is no exaggeration to say that experienced pharmacologists would find great difficulty in supporting the claims of clinicians that camphor in oil is a powerful stimulant of respiration and circulation. It is difficult to assess the value of its use in collapsed and moribund patients.—E. C. Dodds, *Proc. R. Soc. Med.*, 1936, 29, 656.

Natural camphor and certain synthetic products are definitely depressant upon the heart and circulation in experimental animals. If, however, weak concentrations of camphor are kept in contact with the heart or other living tissue for a certain length of time and then used for injection, a slight but definite stimulant effect is obtained. It is suggested that when camphor comes in contact with a living tissue certain slow biochemical changes take place, so that the clinical effect of cardiac stimulation is observed. It is probable that the chemical change occurs in the liver.—R. N. Chopra, J. S. Chowhan and N. De, *Indian J. med. Res.*, 1936, July, 249.

ENGORGEMENT OF BREASTS. Intramuscular injections of $1\frac{1}{2}$ grains of value. Has inhibiting action on milk secretion. Give two injections the first day and

one for each of next three days.—W. Philphot, *J. Amer. med. Ass.*, ii/1929, 65.

Camphor in oil does not inhibit lactation or hasten the process of involution in the rat or the guinea-pig. Until more adequately controlled and more objectively measured experiments on the human being are presented, the advisability of the use of such a substance is open to question.—R. R. Greene and A. C. Ivy, *J. Amer. med. Ass.*, i/1938, 641.

Camphor Ball. Spermaceti 4, white wax 12, almond oil 5; melt in a water-bath and add flowers of camphor 4. Dissolve, and when nearly cold pour into moulds. Useful for chapped skin.

Aqua Camphoræ (B.P.). *Syn.* CAMPHOR JULEP, MIST. CAMPHORÆ. 1 in 1000. 60 minims of spirit of camphor added to 12 oz. of water gives a solution of approximately the same strength. Camphor water (*U.S.P. XI*) is a saturated solution.

Aqua Sedativa. *Syn.* EAU SÉDATIVE, LOTION AMMONIACALE CAMPHRÉE (*Fr. Cx.*). Spirit of camphor (10%) 10, sodium chloride 60, solution of ammonia 60, distilled water 1000, all by weight.

As a compress for migraine and rheumatism, and to contusions.

Aqua Camphoræ Concentrata (B.P.C.).

Dose.—5 to 15 minims (0.3 to 1 ml.). 1 part equals 40 parts of camphor water.

Elixir Camphoræ. *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Spirit of camphor 10, syrup 5, distilled water 1. Contains 1 in 16. It mixes and diffuses well in water.

Injectio Camphoræ (B.P.C.). *Syn.* HUILE CAMPHRÉE STÉRILISÉE INJECTABLE (*Fr. Cx.*).

Dose.—8 to 30 minims (0.5 to 2 ml.).

10% w/v in olive oil.

In pneumonia 25 minims has been given as a general rule to start with, but much larger doses have been employed—even 12 ml. of a 20% solution.

Injectio Camphoræ Ætherea (B.P.C.). *Syn.* CURSCHMANN'S SOLUTION.

Dose.—4 to 15 minims (0.25 to 1 ml.).

Camphor 20% w/v and ether 30 v/v in olive oil.

Caution. Various amounts (30 to 300 ml.) of 1 to 10% solution have been injected. A case recorded of acute poisoning from 170 ml. of 10% solution after an operation. 1% may be safe and not more than 300 ml. of this solution. Urticaria has followed the use of injections.

Injectable Camphoræ Æthereus (P. Helv. V). *Syn.* ÆTHER CAMPHORATUS. Camphor 1 g., anæsthetic ether to 10 ml.

[P1] **Linctus Camphoræ Compositus (B.P.C.).**

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Camphorated tincture of opium, 1 in 4, in a wild cherry, squill and senega menstruum.

Linimentum Camphoræ (B.P.). *Syn.* CAMPHORATED OIL, OLEUM CAMPHORATUM (*P. Dan., P. Jap. V*).

Camphor 20% w/w in olive oil. Olive oil is not the most satisfactory oil for this liniment. It congeals and is often rancid, and could, with advantage to suppliers and users, be replaced with arachis oil.

B.P. Add. II allows the use of either arachis, cottonseed, or sesame oil, in place of olive oil, in making liniment of camphor.

Huile Camphrée (Fr. Cx.) is 10% in olive or arachis oil.

Linimentum Camphoræ (U.S.P. XI). 20% *w/w* of camphor in cottonseed oil.

Cottonseed oil unsatisfactory for camphor liniment. Likely to congeal to consistence of cheese.—J. J. Blackie, *Pharm. J.*, i/1931, 17.

[P2] *Linimentum Camphoræ Ammoniatum (B.P.). Syn. LINIMENTUM CAMPHORÆ COMPOSITUM.*

Camphor 12.5% *w/v*, strong solution of ammonia 25% *v/v* and oil of lavender in alcohol or methylated spirit.

Linimentum Camphoræ et Saponis (U.S.P. XI).

Camphor 4.5% and hard soap 6%, with oil of rosemary, in alcohol and water.

[P1] *Pigmentum Camphoræ Chloral et Menthol.*

Camphor, chloral hydrate and menthol, equal parts. Useful in acute fibrositis, rubbed in gently with the fingers.

Pilula Camphoræ.

To form camphor into pills use $\frac{1}{2}$ its weight of powdered curd soap and a few drops of alcohol, or a little lard in a warm mortar.

Spiritus Camphoræ (B.P.).

Dose.—5 to 30 minims (0.3 to 2 ml.).

Contains 10% *w/v* of camphor in alcohol 90%.

Spiritus Camphoræ (U.S.P. XI).

Average dose.—15 minims (1 ml.).

Camphor 9.2 to 10.4% *w/v* in alcohol.

Æther Spirituosus Camphoratus (P. Dan.). Syn. KAMFERDRAABER. 10% *w/w* in spirit of ether 25% *w/w*.

Spiritus Camphoræ Fortior. Syn. RUBIN'S SOLUTION.

Flowers of camphor 1, absolute alcohol (by weight) 1. *Dose* for diarrhoea.—2 to 5 drops on sugar every 5, 10 or 15 minutes, according to the severity of the symptoms.

[P1] *Syrupus Camphoræ Compositus (B.P.C.).*

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains $\frac{1}{10}$ gr. of camphor and 1 m. of tincture of opium with oil of anise, benzoic acid, glacial acetic acid, vinegar of ipecacuanha and vinegar of squill in a syrup basis to 1 dr.

Tablets of Camphor and Quinine. Camphor $\frac{1}{2}$ gr., with quinine acid sulphate 1 gr. To check catarrh and as a tonic.

Teinture de Camphre Concentrée (Fr. Cx.). Camphor 10% *w/w* in alcohol 90%.

Teinture de Camphre Faible (Fr. Cx.). Camphor 2.5% *w/w* in alcohol 60%.

Unguentum Camphoræ (B.P.C.). 10% in white soft paraffin. *Fr. Cx.* has 20% in a base of benzoinated lard and white beeswax.

Unguentum Camphoræ Durum (B.P.C.). Syn. CAMPHOR ICE. 6% in hard and soft paraffins.

Acidum Camphoricum (B.P.C., P. Ned. V, P. Helv. V, P. Jap. V, F.E. VIII). $C_8H_{14}(COOH)_2 = 200.2$.

Dose.—8 to 30 grains (0.5 to 2 g.) in cachets or suspended with tragacanth in a mixture.

Formed on oxidation of camphor with nitric acid. Odourless crystals, dextrorotatory, m.p. 185° to 187°.

Soluble about 1 in 160 of water, about 1 in $1\frac{1}{2}$ of alcohol 90% and 1 in 10 of fatty oils; also soluble in ether, but only slightly in chloroform.

Uses. Has been advocated for use in night sweats of phthisis, but its action is doubtful; also in cystitis by intravesical injections of 2% aqueous solution with 11% alcohol, and as an intestinal disinfectant. Further in solution as a local astringent for nose and throat. In skin affections saturated solution in dilute alcohol locally useful.

Camphoræ Monobromidum (*B.P.C.*, *P. Helv. V*, *P. Ital. V*, *P. Jap.*, *F.E. VIII*, *P. Belg. IV*, and *P. Ned. V*). *Syn.* CAMPHORA MONOBROMATA, 3-BROMOCAMPHOR. $C_{15}H_{15}OBr = 231.0$.

Dose.—2 to 8 grains (0.12 to 0.5 g.), in pills with $\frac{1}{2}$ of its weight of curd soap and proof spirit *q.s.*, or dissolved in oil and emulsified.

In colourless prisms with persistent camphoraceous taste. **Soluble** 1 in 12 of alcohol 90%, 1 in 2 of ether, 10 in 7 of chloroform, 1 in 8 of olive oil, sparingly soluble in glycerin, soluble in sulphuric acid with formation of nearly colourless solution. It is used as a hypnotic, and is of value in epileptic vertigo, cases of petit mal, chorea, hysteria, delirium tremens, whooping cough and asthma, and for erections in gonorrhœa.

Elixir Camphoræ Monobromatæ.

Camphor monobromide 1, spirit of cinnamon (1 in 10) 10; dissolve and add red elixir 60, syrup *q.s.* to 100. **Dose.**— $\frac{1}{4}$ ounce.

Enuresis is treated with this combined with belladonna, where potassium bromide is unsuitable.

Camphemyl (*Ciba, London*). 10% solution of camphor in a mixture of methyl urethane, monoethyl urea and distilled water. An improvement on oily solutions.

Camphro-Salyl (*Fraisse, Paris; Wilcox, Jozeau, London*). Ampoules contain benzyl salicylate 0.5 g., camphor 0.1 g., in olive oil 5 ml. **Dose.**—5 ml. injected into the sciatic nerve. For the relief of pain in sciatica, neuritis and lumbago.

Sodii Camphorsulphonas. *Syn.* SODIUM CAMPHOSULPHONATE. $C_{15}H_{15}OSO_3Na = 254.28$.

Dose.—2 to 5 grains (0.15 to 0.3 g.) by subcutaneous, intramuscular or intravenous injection in the form of a 15% aqueous solution.

A white crystalline substance, readily **soluble** in water.

Uses. This possesses the stimulating action of camphor on the respiration and circulation, but has the advantage over camphor in oil solution that it is more rapidly absorbed and has only very slight toxicity. It is employed in the treatment of heart failure, syncope and shock, in cases of poisoning by carbon monoxide, gas, narcotics, etc., and in collapse during narcosis.

Salts of camphosulphonic acid have given satisfactory clinical results in cardiopathy. Directions are given for preparing camphosulphonic acid, its quinine, calcium and magnesium salts and concentrated solutions of the latter for hypodermic injection.—*per Pharm. J.*, i/1938, 53.

The slight, but definite, action of camphor on respiration and the cardiovascular system is rendered surer through even distribution and absorption. Its use

has been recommended in cases in which stimulation of a patient who is to receive a transfusion is required.—E. C. Dodds, *Proc. R. Soc. Med.*, 1936, 29, 656.

Cardatone (*Evans, Sons, Lescher & Webb, Liverpool*). An aqueous solution containing 15% of sodium campho-sulphonate. A non-toxic analeptic for use as a cardiac and respiratory stimulant.

Dose.—1 or 2 ml. subcutaneously, intramuscularly or intravenously, or 1.5 to 6 ml. of a special solution *per os*. In cases of poisoning by carbon monoxide, gas, narcotics, etc., as much as 5 to 15 ml. may be given intravenously; in collapse during narcosis, 2 to 6 ml. may be injected intravenously followed by up to 5 ml. intramuscularly.

Calcium Camphorsulphonate. ($C_{10}H_{12}OSO_3$)₂Ca = 502.6. A white, amorphous or minutely crystalline powder, very soluble in water and alcohol, but sparingly soluble in ether. Its solutions are very stable and may be sterilised by heating at 112° for 30 minutes.

The use of this salt, by reason of its stimulant action in depressive states, and because it diminishes bronchial secretion and lessens sweating in pre-tubercular states and tuberculosis, will increase.—R. Bozzola, *per Pharm. J.*, 1/1938, 53.

Chinocal (*Richter, London*). Ampoules contain calcium camphorsulphonate 8 gr., quinine hydrochloride $\frac{1}{2}$ gr., in distilled water 5 ml. *Dose*.—5 ml. once or twice daily rectally or intravenously. In diseases of the upper respiratory tract and for the induction of labour.

Magnesium Camphorsulphonate. ($C_{10}H_{12}OSO_3$)₂Mg = 486.9. A white crystalline substance, soluble in water, sparingly soluble in alcohol, but insoluble in ether.

Magnesium camphorsulphonate may advantageously be employed in association with the calcium salt, because of its stabilising action. A solution containing 20% of calcium camphorsulphonate and 10% of magnesium camphorsulphonate sterilised at 112° for 30 minutes, was unaltered and neutral in reaction.—R. Bozzola, *per Pharm. J.*, 1/1938, 53.

Solucamphre (*Delalande, Paris; Roberts & Co., London*). Water-soluble camphor. 14% solution of *d*-camphor sulphonate of diethylenediamine. *Dose*.—1 to 3 injections of 5 ml. daily subcutaneously or intramuscularly, or an injection of 2 to 5 ml. intravenously in urgent cases. Also as drops, 50 to 100 daily. To replace camphor in oil as a cardiac and respiratory stimulant.

Leptazolium (*B.P. Add. III*). *Syn.* METRAZOL.
(CH_2)₅C·N₄ = 138.1.

Dose.— $\frac{1}{2}$ to 1½ grains (0.05 to 0.1 g.).

Leptazol is pentamethylenetetrazol, a white, crystalline powder with a bitter taste; m.p. 57° to 60°.

Freely *soluble* in water, alcohol, chloroform and ether, giving neutral solutions. Aqueous solutions may be sterilised by autoclaving.

Uses. Leptazol has a powerful action on the vasomotor and respiratory centres, and is thus a powerful cardiac and respiratory stimulant. It is usually employed by injection (*vide infra*) either subcutaneously, intramuscularly or intravenously, but in less urgent cases it gives good results by the mouth, the average dose being 1½ gr. three or four times daily. (Alternatively, a dose of 1 ml. of the 10% solution may be given orally.)

Injectio Leptazoli (*B.P. Add. III*).

Dose.—8 to 15 minims (0.5 to 1 ml.), by subcutaneous injection; 30 to 75 minims, increasing to 180 minims (2 to 5 ml., increasing to 12 ml.), by intravenous injection as a convulsant.

Leptazol 10 g., sodium phosphate 0.25 g., in distilled water to 100 ml., with sufficient dilute hydrochloric acid or sodium hydroxide to give a pH of 7.8. The addition of an antiseptic to the

solution when dispensed in multiple-dose containers is not allowed.

Uses. Its action is produced smoothly and is of great value in a dose of 1 ml. subcutaneously, in cardiovascular collapse, shock and respiratory depression.

It is also of value in the treatment of barbiturate poisoning and anæsthetic narcosis, for which purpose it is given by slow intravenous injection in a dose of from 3 to 5 ml.

In addition to the foregoing, it has been widely employed for the convulsant treatment of schizophrenia, starting with a dose of 5 ml. intravenously and increasing by 1 ml. until a fit occurs. It should be pointed out, however, that the treatment, though producing valuable results, is both unpleasant and dangerous (the violence of the convulsions may cause fractures of the limbs or vertebræ), and should be carried out only in a fully equipped mental hospital.

ANÆSTHETIC NARCOSIS. Observations on 96 patients who had been anæsthetised with Evipan, ether, or Avertin, and who had been awakened by an intravenous injection of 5 ml. of Cardiazol. In most cases the effect was very prompt; even during the injection, which was given very slowly, the respiration became deeper and in some cases more frequent, the pulse meanwhile becoming stronger and more regular. The improvement thus effected in the action of the heart was so marked in some cases that, although a saline infusion had previously seemed necessary, it now became superfluous. With the exception of four cases (abdominal operations) there was an appreciable shortening of the post-operative unconsciousness, and thus the risk of aspiration accidents was reduced.—Pieniezny, *Dtsch. med. Wschr.*, 1935, 1641.

SCHIZOPHRENIA. Convulsive treatment with Metrazol (Cardiazol) is of value in the treatment of patients with dementia præcox, particularly when the duration is not of more than two years. The rate of remission is almost inversely proportional to the duration of the psychosis. 85% of patients whose symptoms were less than six months in duration had a remission. The type showing the greatest tendency to remit is the catatonic, followed closely by the paranoid. The treatment is given in the morning on an empty stomach. The dose is the smallest amount of the drug that will produce a typical convulsive seizure. The first dose ranges from 2 to 5 ml. of a 10% solution, which usually produces a convulsion. When the convulsive dose is reached it is maintained until it fails to give a reaction. The injections are given two or three times a week until the patient shows a remission, the treatment being resumed if there is a relapse. Contraindications are acute infectious diseases, pulmonary disease and cardiovascular disorders.—I. Finkelman *et al.*, *J. Amer. med. Ass.*, i/1938, 706.

Vertical and lower limb fractures may be completely eliminated by giving a spinal anæsthetic (10 mg. of Pontocain hydrochloride or 100 mg. of Novocain, dissolved in 4 ml. of cerebrospinal fluid obtained by lumbar puncture). Large doses of Cardiazol may be avoided by a preliminary intravenous injection of 0.5 ml. of adrenaline solution; at the moment of facial blanching half the usual dose of Cardiazol is injected and the result equals that of the full dose.—A. E. Bennett, *Amer. J. med. Sci.*, 1939, 198, 695.

Cardiazol is a valuable means of treatment. Of 34 patients treated 12 recovered, 10 improved and 12 showed no improvement. Compared with other methods of shock treatment, Cardiazol therapy is relatively safe. It seems to exert its maximum beneficial effect on early cases of mental disorder characterised by emotional and intellectual blocking and reduced psychomotor activity, but without severe destruction of nerve cells.—M. V. Govindaswamy, *Lancet*, i/1939, 506.

Statistical data of 2011 cases. Recovery rate sufficiently high to justify Cardiazol treatment.—F. Reitmann, *Lancet*, i/1939, 439.

From a consideration of 218 cases of schizophrenia it was concluded that there is no significant difference in the numerical results obtained by ordinary hospital treatment, hypoglycæmic treatment and convulsant treatment. Hypoglycæmia

gives the best results in the paranoid sub-group. Convulsion therapy appears to be best suited for stupor reactions. The special treatments offer the best chance of recovery to a potentially recoverable patient whose illness is dragging on. They reduce the average duration of hospital treatment.—H. Stalker, *Lancet*, i/1939, 437.

In patients undergoing convulsion therapy with Cardiazol or Triazol, the development of resistiveness, fear and panic during treatment has been noted. Sedatives such as morphia, hyoscine and the barbiturates, proved unsatisfactory in allaying these symptoms. Insulin premedication not only proved effective in obtaining co-operation in 22 resistive patients, but also reduced the incidence of confusion and excitement of recovery from the induced fits. A scheme of stepping up the dosage is employed similar to that used in insulin shock. The patient is started with 10 units and the injection increased by tens until the desired co-operation is obtained.—D. E. Sands, *Lancet*, ii/1939, 250.

Aqueous or alcoholic extract of curare in physiologic dosage intravenously sufficient to produce flaccid generalised motor paresis adequately protects the patient from traumatic complications of convulsive shock therapy.—A. E. Bennett, *J. Amer. med. Ass.*, i/1940, 322.

STUPOR. It would appear advisable to treat every case of stupor, whether of long or short duration, with Cardiazol. Complete recovery or improvement may be expected in those cases in which the illness has lasted a relatively short time and in which the stupor has been almost the earliest symptom. A 10% solution of Cardiazol, buffered to pH 8 with 0.1% disodium hydrogen phosphate, is injected intravenously, beginning with 0.5 g. in the case of men, and 0.4 g. in the case of women. Three injections are given weekly and the dose increased by 0.1 g. whenever a larger amount is required to produce a convulsion.—J. S. Harris and C. R. Birnie, *Brit. med. J.*, ii/1938, 449.

Cardiazol (Knoll, London). Preparations of leptazol issued as liquid (1 ml. ampoules and 10 ml. bottles), tablets (1½ gr.) and powder; for the treatment of narcosis it is available in 3 ml. ampoules, and for convulsion therapy in 5 ml. ampoules or 50 ml. bottles.

[P1-51] **Cardiazol-Dicodid Drops (Knoll, London).** 20 drops correspond to about 1½ gr. of Cardiazol and ⅓ gr. of dicodid hydrochloride (*exempt* [D]). *Dose.*—Start with small doses to establish tolerance; infants and young children 2 to 5 drops 2 to 3 times daily, older children 5 to 10 drops 3 times daily, adults 10 to 20 drops. Cough, whooping cough, asthmatic and stenocardiac conditions.

[P1] **Cardiazol-Ephedrine,** a combination of Cardiazol with ephedrine hydrochloride, for bronchial asthma, circulatory collapse and collapse during narcosis. Each tablet or each ml. of solution contains ½ gr. of ephedrine hydrochloride and 1½ gr. of Cardiazol.

Cardiazol-Quinine. Tablets contain ½ gr. of Cardiazol and 1½ gr. quinine hydrochloride (*dose.*—2 to 3 daily); ampoules of 1 ml. contain 1½ gr. of Cardiazol and 4 gr. of quinine lactate in aqueous solution (*dose.*—2 to 3 daily intramuscularly); suppositories contain 1½ gr. of Cardiazol and 4 gr. of quinine valerianate. Catarrhal symptoms and infectious diseases, disorders associated with high temperatures and circulatory disturbances, disordered cardiac conductivity.

Phrenazol (Boots, Nottingham). Leptazol solution available for use as a cardiac and respiratory stimulant in 1 ml. ampoules and ½ oz. bottles (oral use); for the treatment of narcosis 1, 3 and 5 ml. ampoules are issued; for convulsion therapy 3 and 5 ml. ampoules, 25 ml. vials and Phrenazol powder are available.

Hexazole. *Syn.* TRIAZOL 156, CYCLOHEXYL-ETHYL-TRIAZOL. (Marketed on the Continent under the Trade Name "AZOMAN.")

It is readily soluble in water and is employed in the form of a 5% solution, intramuscularly or intravenously, in the convulsion treatment of schizophrenia.

Appears to have several advantages over Cardiazol in the convulsion treatment of schizophrenia, the chief being the lessened unpleasantness of the treatment to the patient, the smaller dosage, and the ease with which failure to induce a fit can be rectified by a supplementary dose, the elimination of venous sclerosis and the possibility of intramuscular use where intravenous injections are impracticable. Convulsions can be readily induced with quantities ranging from 0.7 to 2.5 ml. of 5% solution intravenously, most patients requiring between 1.2 and 1.8 ml. Intramuscularly, approximately twice the intravenous dose is required, but patients vary, and it is best to begin with a somewhat smaller dose.—W. Mayer-Gross and A. Walk, *Lancet*, i/1938, 1324.

A reliable convulsant for both intravenous and intramuscular use, a series of fits having been successfully induced in all the cases tried. It is without danger in cases tried. There is a danger of awakening latent pulmonary tuberculosis.—I. Atkin, *Lancet*, 1/1939, 435.

Nikethamidum (*B.P. Add. III*). *Syn. and Prop. Names.* N-DIETHYLNICOTINAMIDE, ANACARDONE (*British Drug Houses, London*), CORAMINE (*Ciba, Horsham*), CORVOTONE (*Boots, Nottingham*), NICAMIDE (*Burroughs, Wellcome, London*). $C_5H_4N \cdot CO \cdot N(C_2H_5)_2 = 178.1$.

Dose.—3 to 8 grains (0.2 to 0.5 g.); 8 to 20 grains (0.5 to 1.25 g.), by intravenous injection as a stimulant.

It is generally supplied ready for use in the form of a 25% solution.

Nikethamide is pyridine- β -carboxylic acid diethylamide, prepared by the action of diethylamine upon the acid chloride obtained by treating nicotinic acid with thionyl chloride. It occurs as a colourless or yellowish oily liquid, or crystalline solid; f.p. 22° to 24°.

Miscible in all proportions with water; readily soluble in ether and other organic solvents. Aqueous solutions may be sterilised by autoclaving.

A solution of nikethamide may be prepared as follows:—nikethamide 250, lactic acid 70, concentrated spirit (*P. Dan.*) 50, glycerin 50, distilled water 580. Solutions of nicotinic acid diethylamide in water or dilute acids were found not to have hydrolysed after autoclaving or after a year's standing. The yellow colour of such solutions is not due to decomposition, but to the presence of 3-nitro-5-(3-pyridyl)-pyrazol, a precursor in the synthesis of nicotinic acid diethylamide.—F. Reimers, *Dansk Tidsskr. Farm.*, 1939, 43, 9.

Uses. A powerful cardiac and respiratory stimulant for use by the mouth or by injection. Following its administration there is marked stimulation of the depth and frequency of respiration and an increase in the force of cardiac contraction, the action on the heart being mainly through the central nervous system. It has an extremely low toxicity and does not give rise to undesirable reactions.

Nikethamide is indicated in all cases of shock, collapse or circulatory failure, in asphyxia neonatorum, and in poisoning by carbon monoxide, narcotics and barbiturates.

In acute cases it is usually administered subcutaneously or intramuscularly in a dose of 2 to 3 ml. of a 25% solution, repeated if necessary. In cases of severe collapse it is advisable to give it by intravenous, or even intracardiac, injection in doses of from 5 to 15 ml. of the solution, the injection being made very slowly and with short pauses. In order to interrupt or control the depth and duration of basal anaesthesia with bromethol, from 3 to 5 ml. may be injected intravenously, followed immediately by an intramuscular injection of 5 ml., according to the dose of narcotic used.

In chronic and mild conditions it may be usefully employed by the mouth in a dose of 1 or 2 ml., as in respiratory and circulatory embarrassment during and following pneumonia and other acute infections, in neuro-circulatory asthenia (e.g., repeated fainting

attacks and "D.A.H."), and in the after-treatment of coronary thrombosis.

ALCOHOLIC INTOXICATION. Thirty cases of drunkenness, ranging from mild to medium intoxication, successfully treated by administration intramuscularly of 1 or 2 small ampoules of Coramine (1.7 ml.); in severe cases a dose as large as 5.5 ml. was used. In all cases soberness was obtained in 10 to 15 minutes and vomiting often ceased promptly.—per *Practitioner*, ii/1939, 663.

BARBITURATE POISONING. The most useful and reliable method of correcting respiratory depression due to the use of barbiturates during anaesthesia. In practice it can almost be guaranteed to make a patient depressed by a barbiturate wake up enough to require restraint to prevent him falling off the table. It does, however, need to be given in sufficient dosage, 5 ml. or more, and direct into the circulation. A number of other drugs, such as Metrazol and Cardiazol are also needed, but they do not appear to be as effective as Coramine.—F. B. Mallinson, *Brit. med. J.*, i/1940, 123.

HYPERPIESIS. Coramine has been given intravenously and intramuscularly in doses up to 2 ml. So far as can be measured with the ordinary sphygmomanometer or an oscillogram, no effect whatever is produced on the blood pressure.—H. Dodd, *Lancet*, i/1940, 358.

Calcio-Coramine (Ciba, London). Double salt of pyridine- β -carbonic acid diethylamide and calcium thiocyanate. Tablets contain 6 gr. *Dose*.—1 or 2 tablets 3 times a day after meals. Cardiac and respiratory stimulant and expectorant in bronchitis, catarrh, broncho-pneumonia, emphysema, etc.

Cyclitol (Roche Products, Welwyn Garden City). The diethylamide of 3:5-dimethylisoxazol-4-carboxylic acid supplied in 25% solution for oral use, and in tablets containing 0.1 g.; also in 2 ml. ampoules for injection. *Dose*.—1 to 2 ml. of the oral solution or 2 to 5 tablets; or 2 to 6 ml. of the parenteral solution subcutaneously, intramuscularly or intravenously. A respiratory and circulatory stimulant, and as a restorative in acute poisoning or collapse.

Icoral (Bayer Products, London). A 5% solution of a mixture of the hydrochlorides of *m*-oxyethyl-diethylaminoethylaminobenzol and *m*-oxy-*n*-phenylpropanolamine, mixed in the ratio of 4 parts of the former to 1 of the latter. A respiratory and cardiac stimulant used with success in barbituric acid poisoning, carbon monoxide poisoning, morphine poisoning and in a case of quinsy with suffocation. Of no value in severe infections with collapse of purely vasomotor type. Injected intravenously with care (except in cases of severely damaged myocardium) in dose of 0.3 ml. repeated in 20 minutes.—H. Frank, *Dtsch. med. Wschr.*, i/1933, 764.

The prompt elevation of the blood pressure is like that produced by a dose of adrenaline; the rise is excessive and the consequent bleeding from an ordinary wound is heavy. It is felt that this medium is too powerful for surgical purposes, especially in elderly people. Such vigorous stimulation is unnecessary. The useful dose is 0.3 to 0.5 ml. The 1 ml. recommended by the manufacturers gives an excessive response.—H. Dodd, *Lancet*, i/1940, 359.

Oleum Camphoræ Rectificatum (B.P.C.). *Syn.* WHITE OIL OF CAMPHOR, OLEUM CAMPHORÆ ESSENTIALE, LIGHT OIL OF CAMPHOR.

Consists of the lighter fractions of the oil obtained in the manufacture of natural camphor. It varies in composition according to the extent to which camphor and safrole are removed. The heavier fractions of the crude oil are used as a source of safrole and are known as "brown oil of camphor." The rectified oil contains not less than 35% of cineole. It is a colourless or pale yellow liquid, *soluble* 1 in 3 of alcohol, and is used as a mild counter-irritant in rheumatism, and as a parasiticide.

Moschus (B.P.C., Fr. Cx.). MUSK.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

The sac containing the dried secretion from the preputial follicles of the musk deer, *Moschus moschiferus* (Ungulata).

Grain musk (*Moschus in grano*) is the dried granular secretion. A useful nerve stimulant in cases of exhaustion in fevers and blood poisoning. Of value both for nervous excitement or nervous collapse. Is effective in obstinate hiccough and infantile convulsions. The odour of musk is due to muskone, $C_{15}H_{26}O$. The butyl derivatives of many aromatic hydrocarbons are sold as **artificial musk**, e.g., MUSK AMBRETE is dinitro-*tert.*-butyl-*m*-cresylmethylether, $C_6H_4(C_2H_5)(CH_3)(OCH_2)(NO_2)_2$.

Mistura Moschi. Musk 5 gr., acacia 5 gr., syrup of orange 1 dr., rose water to 1 oz.

Tinctura Moschi. *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml). 1 in 20 of alcohol 50%. A tincture of artificial musk has been used in whooping cough. In cardiac failure of acute pneumonia it has been given alone in cachets or with camphor in pills.

Sassafras (*B.P.C.*) is the dried inner bark of the root of *S. variifolium* (Lauraceæ). Is carminative by virtue of its oil content.

Sassafras Medulla is the pith from the stem of *S. officinale*. Forms with water a demulcent mucilage which has been used in eye lotions.

Sassafras Radix is the root of *S. officinale*. Contains about 2% of volatile oil.

Sassafras Cortex (*P. Helv. V*). The cleaned and dried bark of the root of *S. officinale*. It is used in making compound liquid extract of sarsaparilla.

Safrolum (*B.P.C.*). *Syn.* SAFROL, SAFROLE, ALLYL CATECHOL METHYLENE ETHER. $C_8H_8 \cdot C_3H_7 \cdot O \cdot OCH_2 = 162.1$.

Is the chief constituent of oil of sassafras but is obtained from essential oil of camphor. Occurs as a colourless or yellowish oil with odour of sassafras. Is used for lice and nits in pediculosis. In treating ringworm, the hair is cut close to identify the patches, and the oil applied twice a day by a brush, treatment being continuous for a few weeks if necessary. Non-irritating, pleasant to use, prevents spread of infection and destroys the fungus. Safrole is used also as a perfume for cheap soap, in the manufacture of heliotropin, and is occasionally added to anodyne liniments for rheumatism.

Oleum Sassafras (*B.P.C., U.S.P. XI, Fr. Cx.*).

Dose.—1 to 5 minims (0.06 to 0.3 ml.). *U.S.P. XI* average dose $1\frac{1}{2}$ minims.

A pale yellow or reddish oil containing about 80% of safrole. Is used to destroy pediculi, being applied to the hair with a stiff brush.

As an insecticide for dogs and cats safrol, or oil of sassafras, may be extremely toxic in some cases.

CANNABIS

B.P.C.

Syn. CANNABIS INDICA (*U.S.P. XI, F.E. VIII, P. Belg. IV, Fr. Cx., P. Helv. V*), MARIHUANA.

[D] "*Indian hemp and resins obtained from Indian hemp and all preparations (except extract and tincture of Indian hemp) of which such resins form the base.*" (See p. 1143.)

"*Any extract or tincture of Indian hemp.*"

[P1] "*Cannabis* (the dried flowering or fruiting tops of *Cannabis sativa* Linn.); the resin of cannabis; extracts of cannabis; tinctures of cannabis; cannabin tannate."

[B1] "*Cannabis*; the resin of cannabis; extracts of cannabis; tinctures of cannabis; cannabin tannate."

Rule 10 of the Poisons Rules, 1935, exempts from the application of the Pharmacy and Poisons Act, 1933, and of the Rules made under that Act all corn paints in which the only poison is a poison included in the Poisons List under the heading of "*Cannabis*."

Under the "Marihuana Tax Act, 1937," patterned after the Harrison Narcotic Act, the U.S. government extends federal jurisdiction over cannabis so as to cover its intra-state production, manufacture, distribution and use. The real object of the Act is not the raising of revenue but the prevention of the cannabis habit. Under the act, practitioners, dentists and veterinary surgeons who wish to dispense or prescribe cannabis or any of its derivatives or preparations, must register themselves and pay a yearly tax of one dollar. Persons convicted of a violation of any of the provisions of the Act are liable to a fine of not more than 2000 dollars or imprisonment for not more than five years, or both.—*J. Amer. med. Ass.* (Organisation Section), ii/1937, 31B.

The dried flowering or fruiting tops of the pistillate plant of *Cannabis sativa* (Urticaceæ). The B.P. '14 required the drug to be obtained from plants grown in India, but this requirement is not included in the B.P.C., since African, American and German varieties are also pharmacologically active.

The masses obtained in European commerce are called Guaza. Ganja differs slightly and is more active. Bhang or Hashish consists of the leaves, small stalks and fruits.

The therapeutic value of the drug is contained in the resin (cannabinone) which contains cannabinal, $C_{21}H_{36}O_2$. The latter becomes oxidised on exposure to the air and less active, but even long storage of whole cannabis does not destroy its activity.

Bhang consists of specially dried leaves and flowering shoots of both male and female plants, wild or cultivated. Ganja consists of dried flowering tops of the cultivated hemp-plant which become coated with a resinous exudation. Charas is the name given to the resinous matter collected from the leaves and flowering tops of the plant, and constitutes the active principle of hemp; the best quality and the maximum amount of resin is obtained from plants grown in Yarkand in Chinese Turkestan, and the major part of the charas produced in Chinese Turkestan finds its way into India and forms, indeed, one of the most important articles of trade between Central Asia and India.

The physiological activity of the hemp-plant varies with the locality in which it is grown. The minimum fatal dose by the mouth of charas, ganja and bhang works out at 2000 mg., 8000 mg. and 10,000 mg. per kilo bodyweight respectively.—R. N. Chopra and G. S. Chopra, "The present position of hemp-drug addiction in India," *Indian med. Res. Mem.*, No. 31, July 1939, 1-119.

Antidotes. Empty stomach by emetic or stomach tube. Stimulants such as strong black coffee frequently. Strychnine, $\frac{1}{2}$ gr., hypodermically. Keep patient warm. Artificial respiration may be necessary.

A case of cannabis indica intoxication from the smoking of cigarettes made from the dried leaves and tops of plants grown in England.—E. T. Baker-Bates, *Lancet*, i/1935, 811. See also W. A. J. Fleming, *ibid.*, 1301.

Addiction among marihuana users is unlike addiction among the users of morphine or heroin. With these latter the victim must have the drug to feel normal, but with marihuana the addict wants to recapture the pleasurable euphoric state into which the drug lifts him. It is more of a psychological condition—there is no marked physiological disturbance on withdrawal of the drug.

After long usage, however, a dull state supervenes in which the victim is for all practical purposes an addict, and in which ethical and intellectual deterioration and apathy are the outstanding factors.—W. Bromberg, *Med. Rec.*, ii/1935, 309.

The smoking of marihuana cigarettes has spread from the U.S.A. to Canada, and 34 out of 48 States have promulgated laws to suppress illicit traffic. In New York during 1935 no less than 185 tons of *Cannabis* were destroyed.—E. W. Adams, *Bull. Hyg.*, 1937, 241.

Marihuana: a psychiatric study.—N. Bromberg, *J. Amer. med. Ass.*, ii/1939, 4.

Uses. For chordee and asthma, also as an aphrodisiac, and is successful in migraine. Is a narcotic and anodyne, but may give peculiar dreams and even delirium.

It is useful in dysmenorrhœa, especially with gelsemium, and with nuxvomica in incipient delirium tremens, nausea, and paroxysmal colic, supraorbital neuralgia, cough of phthisis and for whooping cough. It is of great use combined with chloral in chorea, mental worry and restlessness. Should be given in small and frequent doses. It has been used in menorrhagia.

In gonorrhœa (acute anterior urethritis) cannabis internally with hyosciamus is useful before patient is in condition for injections.

Absorption is greatly facilitated if the drug is taken one hour before a meal, when its action is felt within two hours of administration. If taken after a meal no result may be apparent for as long as six hours.

HEADACHE DUE TO HIGH BLOOD PRESSURE well treated, especially where chronic interstitial nephritis is a contraindication to blue pill.—A. Feiling, *Brit. med. J.*, ii/1930, 907.

HERPES ZOSTER. Administration of the extract in pill form, $\frac{1}{2}$ to $\frac{1}{4}$ grain, according to age, three times a day, quickly relieves the pains.—C. E. Matthews, *Brit. med. J.*, ii/1939, 431.

[D-P1-81] **Extractum Cannabis (B.P.C.).** *Syn.* EXTRACT DE CHANVRE INDIAN (*Fr. Cx.*).

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.), in pill with lycopodium. A soft alcoholic extract.

[D-P1-81] **Extractum Cannabis (U.S.P. XI).** *Average dose.*— $\frac{1}{4}$ grain (0.015 g.). A soft or pilular extract.

[P1-81] **Mistura Cannabis Indicæ (C.H.W.).**

Tincture of cannabis 10 m., spirit of nitrous ether 30 m., solution of ammonium acetate 1 dr., mucilage *q.s.*, camphor water to 1 oz.

[P1-81] **Cannabine Tannas.**

Dose.—4 to 8 grains (0.25 to 0.5 g.) taken an hour before bedtime in a pill or in sal volatile and water.

A brownish powder, soluble in alkaline water and alcohol, said to be a useful hypnotic and is specially valuable in nervous sleeplessness and in acute mania; also for dysmenorrhœa and menorrhagia.

Cannabinone has been used as a hypnotic in doses of $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.).

[D-P1-81] **Tinctura Cannabis (B.P.C.).**

Dose.—5 to 15 minims (0.3 to 1 ml.). 1 of extract in alcohol 90% to 20. When dispensed in mixtures, mucilage must be added to suspend the resin.

[D-P1-81] **Tinctura Cannabis Indicæ (Fr. Cx.).**

Dose.—Maximum single dose 0.5 g., maximum in 24 hours 1 g. 1 in 10, made with alcohol 90%.

[P1-S1] *Cannabis Sativa* (P. *Helv. V*). Russian hemp-seed, oil-free, has been used in form of decoction, strength 100 g. in 1 litre, heated gently and evaporated (without boiling) to 250 ml. 35 to 50 ml. of the resulting liquor is given to children in food.

[D P1-S1] *Fluidextractum Cannabis* (U.S.P. XI).

Average dose.— $1\frac{1}{2}$ minims (0.1 ml.). 1 ml. represents 1 g. of the herb.

Apocynum (B.P.C.). *Syn.* AMERICAN INDIAN HEMP ROOT, CANADIAN HEMP.

Dose.—1 to 5 grains (0.06 to 0.3 g.). U.S.P. VIII average dose 15 grains. The rhizome and roots of *Apocynum cannabinum* and other species of *Apocynum* (Apocynaceæ).

Stated to be a rapid and efficient cardiac stimulant, also an active non-cumulative diuretic, occupying a place between digitalis and caffeine, and has been employed in cardiac dropsy and Bright's disease. It has an irritant action on the stomach, however, and should not be prescribed in acute conditions or in the presence of inflammation of the stomach or intestines.

It is also a powerful emetic, diaphoretic, cathartic and antelmintic.

Apocynum rhizome varies enormously. It had a great reputation among the aborigines and early settlers for dropsy. Good *apocynum* is many times more active than digitalis as a heart stimulant.—H. H. Rusby, *Pharm. J.*, ii/1929, 312.

Decoctum Apocyni. *Dose.*— $\frac{1}{2}$ to 1 ounce. 1 in 60.

Tinctura Apocyni (B.P.C.). *Dose.*—5 to 10 minims (0.3 to 0.6 ml.); up to 1 fl. drachm (4 ml.) is sometimes given. 1 in 10 of alcohol 80%. Resembles tincture of digitalis in action but is more irritant. Is used as a diuretic in cardiac dropsy. Large doses may cause gastric ulcerations.

Uremia is warded off by the profuse diuresis it produces and it is of use in removing pleuritic effusion.

Asclepias incarnata. *Syn.* WHITE INDIAN HEMP RHIZOME. Is a speedy, potent and reliable diuretic. Tincture, 1 in 10. *Dose.*—5 to 40 minims.

Asclepias tuberosa. *Syn.* PLEURISY ROOT. Is expectorant and diuretic. Tincture, 1 in 10. *Dose.*—5 to 40 minims.

CANTHARIS

B.P.C., U.S.P. XI, *Fr. Cx.*, P. *Helv. V*.

Syn. LYTIA, SPANISH OR BLISTERING FLY.

[P1] "Cantharidin; cantharidates."

[S1] "Cantharidin except substances containing less than 0.01 per cent. of cantharidin."

"Cantharidates except substances containing less than the equivalent of 0.01 per cent. of cantharidin."

By Rule 10 of the Poisons Rules, 1935, machine-spread plasters are exempt from the provisions applying solely to substances in the First Schedule to the Rules.

Dose.— $\frac{1}{16}$ to $\frac{1}{2}$ grain (0.004 to 0.03 g.) in pill. Better given as tincture.

The dried beetle *Cantharis vesicatoria*, found in Southern Europe. It contains about 0.4 to 0.8% of cantharidin. P. *Jap. V* has *Epicauta Gorhami* with 1% of cantharidin.

Cantharides in powder is adjusted to contain not less than 0.6% of cantharidin.

Antidotes. Empty stomach by emetics or stomach tube. Medicinal charcoal, stirred up with a dose of magnesium sulphate, has been recommended. Give demulcent drinks freely, but *not* oils or fats. Morphine, $\frac{1}{2}$ gr., hypodermically for pain. Hot baths or hot applications to the abdomen may relieve the pain.

Uses. Externally vesicant, irritant and powerful counter-irritant. Used in pleurisy, pericarditis, meningitis, neuritis, applied above the stomach to stop vomiting, and in rheumatoid arthritis (v. Emplastrum).

Internally is said to have aphrodisiac properties, but its use is inadvisable owing to its irritant action on the gastro-intestinal tract. In cardiac dropsy, cantharides has been used to promote diuresis.

[P1-81] **Ceratum Cantharidis** (U.S.P. XI).

Macerate cantharides 35 parts with a mixture of glacial acetic acid and turpentine, add to a melted mixture of beeswax, resin and benzoated lard and heat to produce 1000 parts.

[P1-81] **Emplastrum Cantharidis** (U.S.P. XI).

Cantharides cerate 0.1 g. per sq. cm. of adhesive plaster, muslin, paper, or other suitable backing material.

[P1-81] **Tinctura Cantharidis** (U.S.P. XI).

Average dose.— $1\frac{1}{2}$ minims (0.1 ml.).

Cantharides 10, glacial acetic acid 10, in alcohol to 100.

[P1-81] **Tinctura Cantharidis** (Fr. Cx.) is made by percolation with alcohol 70%, and contains 0.04% of cantharidin. *P. Ital. V* is similar.

Tincture of cantharides may be prepared by percolation, using as menstruum 3% lactic acid in ethyl alcohol; an improved method.—L. M. Omhart and E. T. Morgan, *J. Amer. pharm. Ass.*, 1939, 385.

[P1-81] **Mylabris** (B.P.C.). *Syn.* CHINESE CANTHARIDES.

The dried beetles *M. Sida* and other species, some of which (e.g., *M. pustulata*) may contain up to 2.3% of cantharidin. It is used as a source of cantharidin and as a substitute for cantharides in India and the East.

[P1-81] **Cantharidinum** (B.P., Fr. Cx., P. Ital. V, P. Helv. V, F.E. VIII, P. Belg. IV). $C_8H_{12}O(CO)_2O = 196.1$.

Dose.—No dose is given in B.P. '32. Fr. Cx. and P. Helv. V have max. single and max. daily dose 0.0002 g.

Cantharidin is the lactone of cantharidic acid, in flat glistening rectangular prisms, melting at 216° to 218° and volatilising in very irritating white fumes. **Soluble** 1 in 55 of chloroform, 1 in 34 of ether, 1 in 40 of acetone, 1 in about 1100 of alcohol 90%, and about 1 in 150 of ethyl acetate. Soluble also in ether, benzene, glacial acetic acid and fixed oils. Very sparingly soluble in water.

Poisoning Effects and Antidotes, see *Cantharis*.

Uses. Solutions of cantharidin, as well as other preparations of cantharides, are employed for stimulating the growth of the hair in alopecia, and preventing its falling off.

[P1-81] **Acetum Cantharidini** (B.P.C.) contains cantharidin 1 in an acetic acid solution q.s. to 2000.

[P1-81] **Acetum Cantharidis** (B.P.C.). Cantharis, 1 in 10, extracted by percolation with an acetic acid menstruum.

[P1-81] **Colloodium Vesicans** (B.P.C.) is a coloured solution of pyroxylin in blistering liquid.

[P1-81] **Emplastrum Cantharidini** (B.P.). *Syn.* BLISTERING PLASTER.

Contains cantharidin 0.2% in a basis of beeswax, castor oil and wool fat.

[P1-81] **Emplastrum Calefaciens** (B.P.C.) contains 1 in 5000 of cantharidin.

[P1-81] **Emplâtre Mouches de Milan**, used in France, is similar.

[P1-81] **Emplastrum Lyttæ** (B.P.C.). Powdered cantharides, 1 in 3, in a soft plaster basis. The machine spread plaster is usually prepared with not less than $3\frac{1}{2}$ ounces of the mass per yard of bleached unglazed calico.

[P1-81] **Linimentum Crinale** (Squire).

Cantharidin 1 gr., ethyl acetate 6 dr.; dissolve with gentle heat, and add alcohol (90%) 8 oz., castor oil 2 oz., lavender oil 15 m. It is better to dilute this with an equal quantity of spirit, and the head should be washed after applying it a few times, to prevent the cantharidin accumulating.

[P1-81] **Liquor Cantharidini** (B.P.C.). *Syn.* TINCTURA CANTHARIDINI. 1 in 10,000; is $\frac{1}{8}$ strength of *I.A.* *Dose.*—2 to 5 minims (0.12 to 0.3 ml.).

[P1-81] **Liquor Epispasticus** (B.P.) contains cantharidin, 0.4% w/v, with castor oil and colophony in acetone. Should not be applied over too large a surface or toxic effects may occur from absorption.

[P1-81] **Lotio Cantharidini** (B.P.C.). *Syn.* LOTIO CRINALIS STIMULANS. Cantharidin 1 in 5000 with acetone, castor oil and alcohol 90% (or methylated spirit).

[P1-81] **Unguentum Cantharidini** (B.P.C.).

Contains cantharidin 1, dissolved by means of chloroform in benzoinated lard 3000.

One part diluted further with two of soft paraffin forms a useful pomade for stimulating growth of the hair.

[P1-81] **Unguentum Cantharidini Compositum** (W.H.). Vinegar of cantharidin 1 dr., wool fat 30 gr., red mercuric oxide ointment 1 oz.

[P1-81] **Potassii Cantharidas**.

$C_{12}H_{14}O(COOK)_2 \cdot 2H_2O = 326.3$.

Dose.— $\frac{1}{100}$ to $\frac{1}{200}$ grain (0.00015 to 0.0003 g.) hypodermically in very dilute solution. In minute white needles, soluble 1 in 25 of water. Has properties representative of cantharidin, q.v.

CAOUTCHOUC

B.P.C., Fr. Cx., P. Helv. V.

India-Rubber. *Syn.* ELASTICA, CAUTSCHUC (*P. Jap. V.*).

The prepared milk-juice of *Hevea brasiliensis* (Euphorbiaceæ) and other species; known in commerce as pure Pará rubber.

Preservation. The best means of preserving rubber goods is to immerse completely in distilled water.

Bandages of rubber:—(i) Webbed with strands of rubber; (ii) Statham's porous; (iii) Martin's (solid) perforated and non-perforated; (iv) elastic circular stockings and india-rubber webbing.

Bougies of solid elastic gum:—

With bulbous end = a Boule, in sizes 1 to 16.

" " silk web " " 1 to 16.

Conical pointed in shape " " 1 to 12.

Cylindrical, not tapered, various textures and materials—sizes 1 to 16.

(Œsophageal bougies are bulbous, conical and cylindrical, of elastic gum.—Sizes 10 to 24.

Catheters. Elastic gum, black and webbed, or silk web:—

Bulbous (a Boule).—Sizes 1 to 16.

Coudé (bent at end) also Bi-Coudé with two bends.—Sizes 5 to 12.

Cylindrical.—Sizes 1 to 15, with or without wire stilettes, and sizes 5 to 12 with solid or hollow ends.

Conical (simply pointed, *i.e.*, tapered), with wire stilette.—Sizes 1 to 12.

Catheters, Soft Rubber.—13 and 16 inches long, with and without funnels, and the sizes vary between 4 and 12.

Self-staining catheters are also prepared.

Web catheters may be sterilised by boiling in nearly saturated solutions of ammonium sulphate or sodium chloride, washing afterwards in sterile water.

Catheters, Female, are of glass, straight or curved, metal, or soft rubber.

Dental Rubber, manufactured of pure Pará rubber and coloured. This is supplied in various shades of colour, *e.g.*, white, pink, red, orange, black. The varieties in commerce are designated "Samson," "Doherty," "Gold Dust," "Ash's "Whalebone," and Jamieson's "Horn." The rubber is hardened by vulcanisation and used to form a frame to carry artificial teeth. In vulcanising most rubber, especially Ash's, raise the temperature gradually until 315°F. or 100 lbs. pressure is obtained. Maintain this temperature or pressure 75 minutes to complete vulcanising process.

Mackintosh or Waterproof Sheeting, 36 and 54 inches wide is supplied having rubber on one or both sides.

Stomach Tubes. That known as Van Valsh's, with bevelled "Velvet Eyes," is considered one of the best, but the bevelling may have the disadvantage of weakening the tube on one side and causing it to turn round when an obstruction is met. For passing the tube a special lubricant jelly is supplied, or a glyco-gelatin pastille of menthol and cocaine is useful.

Emplastrum Adhesivum (B.P.C.) is spread with a rubber adhesive compound containing not more than 25% of fillers.

Elastic Adhesive Bandages. Elastic adhesive bandages are self-adhesive, resilient bandages consisting of elastic cotton fabric spread with a rubber adhesive compound, and available in various widths and lengths. They are usually medicated with zinc oxide.

Uses. These bandages have been much used as a tight binder for varicose veins and ulcers, both for support and for fixing zinc gelatin dressings. They also provide compression and support for the after-treatment of fractures and dislocations, etc. X-ray photographs can be taken through several layers of them. Elastic adhesive bandages have also been used in the treatment of bed-sores, boils and impetigo, the bandage being applied to the affected area, left on for a period of from four to six days and then changed.

VARICOSE ULCERS. The standard practice is the ambulatory treatment by the Dickson-Wright method (*see Brit. med. J.*, ii/1930, 996), using elastic adhesive bandages. A broad strip of bandage is placed longitudinally along the whole length of the inside and outside of the leg. Commencing at the toes, a bandage

is then wound firmly around the limb in an ascending spiral, each succeeding loop overlapping the preceding one by about two-thirds of its width. It is essential that the bandage is applied firmly. The limb is thus totally encased in a supportive material which will allow standing or walking.

BOILS. Twenty cases successfully treated by the occlusive method. The dressing used was Elastoplast bandage applied directly to the shaven skin and extending well beyond the outer limit of the inflamed area, the surrounding skin being sterilised with 1:1000 acriflavine solution. The average number of dressings was 2 or 3 and the average days under treatment 11 or 12.—P. K. Fraser, *Brit. med. J.*, ii/1935, 894.

IMPETIGO. Treatment by occlusive dressing consisting in the application of a piece of Elastoplast bandage to the lesion without cleaning adjacent skin, removing crusts or pricking pustules, and leaving the bandage in situ. Total time lost by school children 9.7 days per child, compared with 18.6 days by Ung. Hyd. Ammon. Dil. treatment and 22.5 days by intensive ointment treatment and removal of crusts by starch poultices. Results better and infectivity of the disease diminished.—J. L. Newman, *Brit. med. J.*, i/1933, 823. Confirmation.—J. M. Morris, *ibid.*, 986.

VARICOSE ULCERS. Reflux pressure in the veins may upset the hydraulics on removing bandage. Single long veins easiest to treat.—F. A. E. Silcock, *Brit. med. J.*, i/1931, 34.

Varicose ulceration. Compression or squeezing of excess fluids out of the limb. Very tight bandaging required.—J. H. Twiston Davies, *Brit. med. J.*, i/1931, 201.

Support is given which skin and tissues have lost and the blood is made to circulate properly. Patients should walk about.—Sir L. Hill, *Brit. med. J.*, i/1931, 240.

Painting the leg with 5% ichthylol in glycerin prevents irritation.—R. W. Cockshut, *Brit. med. J.*, i/1931, 652.

If there is the slightest concurrent varicose eczema present, as is often the case, along with varicose ulceration, then the application of elastic, adhesive, and occlusive bandages, is absolutely asking for trouble in the form of further skin disorder. The use of Unna's Zinc-Gelatin bandage is still one of the best methods of treating varicose ulcers.—F. A. E. Silcock, *Brit. med. J.*, ii/1939, 1205.

Although it is true that adhesive elastic bandage has an irritating effect on some skins, it is the sheet anchor of the treatment of varicose ulcer, just as the organic preparations of arsenic are the mainstay of the syphilologist, even though they occasionally cause arsenical poisoning.—H. Haldin-Davis, *Brit. med. J.*, i/1940, 231.

WARTS. A simple and effective treatment for warts on the hands is to bind the warty parts tightly with Elastoplast, which is removed once a week, the softened epithelial debris being scraped away with a blunt scalpel.—McAusland, *Brit. med. J.*, i/1935, 1123.

Ligamentum Elasticum Adhesivum (B.P.C.) is spread with rubber adhesive plaster containing not less than 20% of zinc oxide.

Elastoplast Bandages (T. J. Smith & Nephew, Hull). Elastic adhesive bandages medicated with zinc oxide.

Semiplast Bandages (T. J. Smith & Nephew, Hull) are elastic adhesive bandages spread only half-way across with adhesive rubber base.

Viscopaste Bandages (T. J. Smith & Nephew, Hull). Elastic adhesive bandages spread with gelatin.

Variban Bandages (Cuxson, Gerrard, Birmingham). Elastic adhesive bandages impregnated with zinc oxide.

Ceraban Bandages (Cuxson, Gerrard, Birmingham). Adhesive elastic, porous roll bandages spread with a lead-base plaster and free from rubber and gum.

Crepoplast (Herts Pharmaceuticals, Welwyn Garden City), **Dalzoflex** (A. De St. Dalmaz, Leicester), **Elastikon** (Johnson & Johnson, Slough), and **Vitaplast** (Carnegie Bros., London), are also elastic adhesive bandages.

Liquor Caoutchouc (B.P. '98). Caoutchouc 1, benzene 10, carbon disulphide 10. Treat the rubber with the carbon disulphide for an hour or two to form a jelly, and add the benzene. It may be medicated, but traumaticin is preferable.

Gutta Percha (B.P.C., Fr. Cx.).

The dried purified latex of *Palaequium oblongifolium* and other species (Sapotacæ). Occurs in lumps, brownish externally, reddish-yellow or reddish-grey internally, and consists chiefly of the hydrocarbon gutta, (C_8H_8)_n.

The principal districts of supply are Pahang, Kelantan, Siak, Bolungen and Sarawak. Small quantities are also exported from Siam and Manila, and a lower grade from Nigeria. From Borneo is obtained the well-known "leaf gutta"; this is extracted from the leaves and small twigs of the tree, and is boiled, cleaned, and pressed into slabs and cakes, considered by some to be the best. Unfortunately on keeping it oxidises and becomes brittle.—*Chem. & Drugg. Commercial Compendium*.

[P1] **Liquor Gutta Percha** (B.P.C.). *Syn.* TRAUMATICIN. Gutta percha 10% w/v in chloroform. P. Belg., P. Ital. V, F.E. VIII, P. Jap. V and P. Ned. V use gutta percha (purified) 1, chloroform (by weight) 9. More cleanly than liniments or ointments.

Tela Gutta Percha (B.P.C.). Gutta percha tissue is gutta percha in thin sheets.

Sericum (B.P.C.). Silk.

The prepared fibre from the cocoons of the silkworm, species of *Bombyx* and of *Antheraea*. The fibre is unwound from the cocoons and degummed. The threads are solid and rounded or rounded-triangular in cross-section. They are soluble in 5% aqueous potassium hydroxide.

Sericum Oleatum (B.P.C.). Oiled Silk.

A silk fabric made waterproof by treatment with a drying oil, often coloured with a green dye.

Sindon Oleata (B.P.C.). Oiled Cambric. *Syn.* YELLOW OILED CAMBRIC.

A bleached cotton cloth made waterproof by treatment with a drying oil.

CAPSICUM

(with ARNICA, PIPER, ETC.)

B.P., U.S.P. XI.

Syn. CAYENNE, AFRICAN PEPPER, CHILLIES, CAPSICI FRUCTUS.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.), in a pill.

The dried ripe fruit of *Capsicum minimum* (Solanacæ) (*C. frutescens*). Capsicum (P. Helv. V, P. Dan.) is from *C. annum* var. *longum*.

Contains as chief constituent capsaicin, $C_{18}H_{27}O_3N$, the average content being about 0.14%.

Uses. Internally, capsicum has a tonic and carminative action, especially of value in atonic dyspepsia, but contraindicated in gastric catarrh. Externally, it is employed as a counter-irritant in lumbago, neuralgia and rheumatic disorders.

Emplastrum Capsici (B.P.C.). Contains 1 in 50 of oleoresin of capsicum in plaster of colophony.

Emplastrum Capsici Elasticum (*B.P.C.*) is the same strength as the preceding but is made with rubber adhesive plaster. The machine spread plaster is usually prepared with about 4 ounces of mass per square yard, on bleached cotton cloth of plain weave.

Emplastrum Capsici Mitis (*R.D.H.*).

Caoutchouc 10, yellow soft paraffin 1; heat carefully so as just to liquefy and add colophony 10, orris 4, capsicum, finely powdered, 4. Spread thinly on holland or linen and cut into pieces half the size of a finger-nail.

Emplastrum Capsici Fortis (*R.D.H.*).

Prepare as above, omitting the capsicum. When spread, brush the surface with a thin coating of compound capsicum ointment (*B.P.C.*).

These plasters are for dental use.

Fluidextractum Capsici.

Dose.—1 minim (0.06 ml.). Alcoholic percolate, 1 = 1. Gerrard advised the following formula:—

Exhaust capsicum 100 with 90% alcohol, distil off alcohol until the residual extract weighs 50; 1 of extract = 2 of drug.

Gossypium Capsici (*B.P.C.*). *Syn.* CAPSICUM WOOL, CALORIFIC WOOL. Contains the equivalent of about 20% of capsicum.

Alternative formula (Gerrard):—

Dissolve liquid extract of capsicum (Gerrard) 2 oz. in alcohol 90% 7 oz. Pour the solution on to the cotton wool 9 oz. under pressure to saturate evenly. Dry and preserve in well closed cartons. Contains 10% extract. Colour with eosin, as otherwise the colour fades. Cover with oiled silk when applying, to increase activity.

Linimentum Capsici (*B.P.C.*).

Stronger tincture of capsicum about 1 in 3, with oleic acid, oil of lavender and alcohol.

Painted on the skin, or applied sprinkled on piline or flannel, it produces a red glow within one hour; its action may be arrested by smearing the part with soft paraffin. Useful in chest affections, rheumatism, sciatica, etc. Does not redden the skin for any length of time, hence may be used on exposed parts.

Mistura Capsici Sedativa (*L.H.*).

Potassium bromide 10 gr., sodium bicarbonate 10 gr., tincture of capsicum 5 m., strong tincture of ginger 5 m., infusion of quassia to $\frac{1}{2}$ oz. For alcoholic dyspepsia.

Oleoresina Capsici (*B.P.C.*). *Syn.* CAPSICIN.

Dose.— $\frac{1}{100}$ to $\frac{3}{100}$ grain (0.0006 to 0.002 g.).

Made by extracting with ether, and evaporating the solvent, extracting the residue with alcohol 90% and removing the alcohol by evaporation. It is approximately four times as strong as the oleoresin of the *B.P.C.* 1923, and occurs as a dull reddish-brown oily mass becoming crystalline.

Commercially, so-called oleoresins are also available, consisting of the extractive obtained by percolation with ether or with acetone.

Pigment. Capsici c. Methyl. Sal. (*N.I.F.*).

Oleoresin of capsicum 3 gr., rectified oil of turpentine 2 dr., methyl salicylate 1 dr., rectified oil of camphor to 1 oz.

Pŭla Capsici Composita.

Capsicum oleoresin $\frac{1}{2}$ m., clove oil $\frac{1}{2}$ m., calomel 1 gr., aloe $\frac{1}{2}$ gr. For the atonic stomach of drunkards.

The proportion of oleoresin should be reduced owing to the increased strength of the B.P.C. 1934 preparation.

Tela Carbasi et Gossypii Capsici (B.P.C.). *Prop. Names.* THERMOGENE (*Veno Drug Co., Manchester*), CAPSOGEN (*Southall Bros. & Barclay, Birmingham*). Capsicum tissue consists of capsicum wool enclosed in absorbent gauze.

Tinctura Capsici (B.P.).

Dose.—5 to 15 minims (0.3 to 1 ml.).

1 in 20 of 60% alcohol.

Given internally it increases the flow of saliva and gastric juice. Increases peristalsis, relieves atonic dyspepsia, and is useful in dipsomania—it allays the craving for alcohol (*cf.* *Mistura Capsici Sedativa*). The B.P. tincture is too weak for external use as a counter-irritant.

Tinctura Capsici (U.S.P. XI). *Average dose.*—8 minims (0.5 ml.). 1 in 10.

Tinctura Capsici Ætherea.

Prepared as B.P. tincture, with ether instead of alcohol.

Tinctura Capsici Fortior. (B.P.C.). *Syn.* TURNBULL'S TINCTURE OF CAPSICUM.

Dose.—1 to 3 minims (0.06 to 0.2 ml.). 1 in 3. Principally used externally. Is useful for chilblains, but only when the skin is not broken. This is too irritating generally.

Unguentum Capsici (B.P.).

Capsicum, bruised, 25% in a basis of soft and hard paraffins and lard, strained after digesting an hour on the water bath.

B.P. Add. II authorises the use of simple ointment, prepared with yellow soft paraffin, in place of lard and hard and soft paraffins, in making capsicum ointment.

[P1] **Unguentum Capsici Compositum (B.P.C.).** *Syn.* UNGUENTUM OLBORESINÆ CAPSICI COMPOSITUM, CHILLIE PASTE.

Oleoresin of capsicum 2%, with menthol, chloral hydrate and camphor in yellow soft paraffin.

Unguentum Capsici Forte (B.P.C.).

Oleoresin of capsicum 4.5% in yellow beeswax and benzoinated lard. May be too strong for tender skins—will bear dilution 2 or 3 times.

Capselin (*Parke, Davis, London*). Camphor, oleoresin of capsicum, oil of turpentine, oil of cajuput and croton oil in ointment form for use as external counter-irritant to counteract local congestion, muscular rheumatism, neuralgia, etc.

Arnica Flos (B.P.C., Fr. Cx.).

The dried flowerheads of *Arnica montana* (Compositæ). Gastric and intestinal irritant. The-tincture is employed externally as a local application to sprains and bruises when the skin is unbroken.

Antidotes. Give emetic if patient has not already vomited. Medicinal charcoal, stirred up in water, may be given freely, also demulcent drinks.

Tinctura Arnicae Floris (B.P.C.). 1 in 10. Local application may produce severe dermatitis. Under saline purges and sedative ointment rash and irritation subside. *Fr. Cx.* has 1 in 6 with alcohol 60%.

Arnicae Rhizoma (B.P.C.). *Syn.* ARNICA ROOT.

The dried rhizome and rootlets of *A. montana* (Compositæ).

Linimentum Arnicae (B.P.C.). *Syn.* ARNICA OPODELDOC.

A solid liniment containing 1 in 4 of tincture of arnica root in a soap basis.

Tinctura Arnicae Radicis (B.P.C.). *Syn.* TINCTURE OF ARNICA. 1 in 20.
Used externally as a local application for sprains and bruises.

Calendula (B.P.C.). *Syn.* MARIGOLD FLOWERS. Dried florets of *Calendula officinalis* (Compositæ).

Tinctura Calendulae (B.P.C.). 1 in 5 of alcohol 90%. *Dose.*—5 to 20 minims. Applied to sprains, diluted with 20 to 30 parts of water, and given in amenorrhœa. It has diuretic and stimulant properties.

[P1-81] **Cevadilla** (B.P.C., *Fr. Cx.*, *P. Helv. V*, *P. Dan.*).

Syn. SABADILLA, CAUSTIC BARLEY.

[P1] "Alkaloids, the following; their salts, simple or complex:—*Sabadilla, alkaloids of.*"

[81] "Alkaloids, the following; their salts, simple or complex:—*Sabadilla, alkaloids of, except substances containing less than 1% of the alkaloids of sabadilla.*"

[86] "Alkaloids—sabadilla, alkaloids of—specify proportion as the proportion of any one alkaloid of sabadilla that the preparation would be calculated to contain on the assumption that all the alkaloids of sabadilla in the preparation were that alkaloid."

The dried ripe seeds of *Schoenocaulon officinale* (Liliacæ), containing the alkaloid cevadine (*syn.* veratrine, which name has also been given to veratridine, an amorphous alkaloid, and to indefinite mixtures of cevadine and veratridine).

Used as a parasiticide, especially for pediculosis capitis, in the form of [P1-81] ointment 20% or as—

[P1-81] **Acetum Cevadillæ** containing 10 of cevadilla macerated in alcohol 10, acetic acid 17.5 and water to 100.

[P1-81] **Veratrina** (B.P.C., *Fr. Cx.*, *P. Helv. V*, *P. Ned. V*). *Syn.* AMORPHOUS VERATRINE.

Dose.—*Fr. Cx.* has max. single dose 0.002 g., max. in 24 hours 0.01 g.

A mixture of alkaloids from cevadilla containing cevadine (crystallised veratrine), $C_{27}H_{49}O_5N$, veratridine, $C_{27}H_{53}O_{11}N$, cevadilline, $C_{24}H_{53}O_5N$, sabadine, $C_{29}H_{51}O_5N$, and cevine, $C_{27}H_{45}O_3N$. It occurs as a whitish or greyish powder with bitter taste followed by numbness of the tongue. *Soluble* about 1 in 3 of alcohol 90%, 1 in 6 of ether, 1 in 3 of chloroform and in other organic solvents, also in acids, forming salts.

Antidotes. If patient has not vomited freely, empty stomach by emetic or stomach tube. Give medicinal charcoal, stirred up in water. Keep patient warm, lying down with head rather lower than the rest of the body. Stimulants, *e.g.*, aromatic spirit of ammonia $\frac{1}{2}$ dr. in water by mouth, or hot, strong coffee by rectum. Atropine, $\frac{1}{160}$ gr., hypodermically.

Uses. Is applied externally, where the skin is not broken, for its analgesic properties in neuralgia, and in the form of an ointment as a parasiticide, especially for pediculosis capitis. It is seldom

employed internally, owing to its violent irritant action on the mucous membranes, even in minute doses.

Caution.—Its sternutatory properties are most marked.

[P1-81] *Oleinum Veratrinæ* (B.P.C.). 2% w/w in oleic acid and olive oil.

[P1-81] *Unguentum Veratrinæ* (B.P.C.). 2% in oleic acid and benzoinated lard.

[P1] **Veratrum Album** (B.P.C., *P. Helv. V*). *Syn.* WHITE HELLEBORE RHIZOME.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Veratrum, alkaloids of.*"

[81] "*Alkaloids, the following; their salts, simple or complex:—Veratrum, alkaloids of, except substances containing less than 1% of the alkaloids of veratrum.*"

[86] "*Alkaloids—veratrum, alkaloids of—specify proportion as the proportion of any one alkaloid of veratrum that the preparation would be calculated to contain on the assumption that all the alkaloids of veratrum in the preparation were that alkaloid.*"

The dried rhizome and roots of *V. album* (Liliaceæ). Contains jervine, protoveratrine and other alkaloids. Formerly used internally as a cardiac depressant and diuretic, and to lower the temperature in the early stages of pneumonia and other acute infections, but is now seldom employed.

[P1] **Veratrum Viride** (B.P.C., *U.S.P. XI*). *Syn.* AMERICAN HELLEBORE, GREEN HELLEBORE RHIZOME.

Dose.—*U.S.P. XI* average dose $1\frac{1}{2}$ grains.

The dried rhizome and roots of *V. viride* (Liliaceæ). Contains various alkaloids as in white hellebore. Is a powerful cardiac, nerve and arterial sedative, useful in puerperal eclampsia, hyperpiesia and in aneurism.

Both the preceding must be distinguished from *Helleborus Niger* (Ranunculaceæ), or Christmas Rose, which is purgative and emmenagogue and has strong sternutatory properties. It is now little used.

H. niger and *H. viride*—a comparative study. It is not possible at present to find any character enabling one to distinguish with certainty between these rhizomes and roots.—T. E. Wallis and A. M. Saunders, *Pharm. J.*, ii/1924, 90.

[P1] *Tinctura Veratri* (B.P.C.). *Dose.*—5 to 30 minims (0.3 to 2 ml.). 1 in 10.

[P1] *Tinctura Veratri Viridis* (*U.S.P. XI*).

Average dose.—15 minims (1 ml.). 1 in 10.

[P1] *Veratrone* (*Parke, Davis, London*). An extract of veratrum 1 ml. of which is equivalent to 20 minims of tincture. In eclampsia.

Helleborsid. A solution of hellebrin, a crystallised pure glycoside of *Helleborus niger*, is about 20 times more active than helleborein; aqueous solutions are highly stable and retain their efficacy for years. The pharmacologic properties of hellebrin greatly resemble those of strophanthin. It is a highly effective cardiac stimulant. It is less toxic than strophanthin and its secondary effects are either absent or appear later and in a milder form. It is administered intravenously, an initial dose of 0.5 ml. of solution is given (containing 0.25 mg. of hellebrin) and is increased later to 1 ml., the injections being given daily until the desired effect is obtained, and then intermittently. 74 patients with various forms of cardiac decompensation were treated with good results.—M. Grossmann and B. Benzon, *Schweiz. med. Wschr.*, 1940, 70, 251.

Piper Nigrum (*B.P.C.*, *P. Jap. V*). *Syn.* PIPER. *Dose.*—5 to 10 grains (0.3 to 0.6 g.).

The dried unripe fruits of *Piper nigrum* (Piperaceæ). Contains 5 to 9% of the alkaloid piperine and 1 to 2.5% of volatile oil.

Black pepper has stimulating, carminative and diuretic properties.

Piper Album is black pepper fruits from which the outer coatings have been removed. It contains less volatile oil than black pepper.

Piper Longum. *Dose.*—5 to 10 grains (0.3 to 0.6 g.) is the dried unripe fructification of *P. Chaba* (Piperaceæ). Contains about 5% of piperine and 1% of volatile oil.

Confectio Piperis (*B.P.C.*). Black pepper 10% with caraway and purified honey.

Piperina. $C_{17}H_{19}O_3N = 285.2$. *Dose.*—1 to 10 grains. A crystalline principle from the fruits of *Piper nigrum* and *Piper longum* (Piperaceæ). Melts at 130°. Insoluble in water, soluble in alcohol. It has febrifuge, stomachic and antiperiodic action.

Oleoresina Piperis. *Average dose.*— $\frac{1}{2}$ grain. Is prepared by acetone extraction of pepper.

Piperidine. *Syn.* HEXAHYDROPYRIDINE. $C_4H_{11}N$. A colourless liquid with peppery odour and taste; b.p. 106°.

Piperidinæ Tartras. *Syn.* PIPERIDINE ACID TARTRATE.

Dose.—10 to 15 grains (0.6 to 1 g.).

Colourless pleasant-tasting crystals, readily soluble in water. Uric acid solvent.

Effervescent Piperidine Tartrate.

Dose.—1 drachm or more; 5 grains in 1 drachm.

Dolantal (*Bayer Products, London*). The carboxylic acid ethyl ester of 1-methyl-4-phenylpiperidine, a spasmolytic and analgesic in .25 mg. tablets for oral administration, and ampoules containing 100 mg. in 2 ml. for intramuscular injection. Advocated for spasm of the intestinal tract, urogenital system, etc., and for the relief of pain in carcinoma, arthritis, etc. *Dose.*—1 to 2 tablets or 1 ampoule 3 times daily. The ampoules may be given by slow intravenous injection for prompt relief.

Piperazina (*B.P.C.*, *F.E. VIII*). *Syn.* PIPERAZINE HYDRATE (*Fr. Cx.*).

Dose.—5 to 15 grains (0.3 to 1 g.).

In colourless, glassy deliquescent tablets, absorbing atmospheric carbon dioxide to give the carbonate, and containing 44% of anhydrous piperazine. M.p. about 43°. M.p. of anhydrous base about 109°.

Very *soluble* in water; soluble 1 in 2 of alcohol; insoluble in ether.

Incompatible with alkaloidal salts, iron salts, quinine, sodium salicylate, spirit of nitrous ether.

Uses. Given internally for the uric acid diathesis, in gout and rheumatism, and urinary calculi. Said to prevent change from glycogen into sugar in diabetes.

Piperazina Effervescens (*B.P.C.*).

Dose.—1 to 3 drachms (4 to 12 g.). Contains about 5 grains per drachm.

Urazine (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Piperazine citro-salicylate in effervescent granules for use in rheumatism, gout, etc.

CARBO

*B.P.C., Fr. Cx., P. Jap. V, P. Dan.**Syn. CARBO LIGNI, MEDICINAL CHARCOAL.**Dose.*—1 to 2 drachms (4 to 8 g.).

Made by burning wood, *e.g.*, willow, with access of as little air as possible.

In cachets or as charcoal biscuits as an adsorbent in distension of the stomach, *e.g.*, in dyspepsia. Is antiseptic, and is used externally as a poultice to foul ulcers.

A test of activity of medicinal and other charcoals by exposure to water and other vapours. Active charcoal will absorb 50 to 100%, or even more, of moisture. The water figure is slightly higher than that for alcohol or turpentine. *Pulv. Carbo. Lig.* as ordinarily dispensed for medicinal purposes is inactive. The author suggests improvements in the manufacture and the adoption in the *B.P.* of tests for activity.—H. Brindle, *Pharm. J.*, ii/1928, 84.

It has been calculated that 15 grains of medicinal charcoal can absorb *in vitro* 13 gr. of corrosive sublimate, 20 gr. of iodine, 9 gr. of strychnine, 4.5 gr. of phenol from 1% solution, 8 gr. of potassium permanganate.—G. H. W. Lucas and V. E. Henderson, *Canad. med. Ass. J.*, ii/1933, 22.

Cataplasma Carbonis (B.P.C.). 10% in linseed poultice.

Carbo Activatus (*B.P.C., U.S.P. XI, Fr. Cx.*). *Syn. and Prop. Names.* DECOLOURISING CARBON, NORIT (*Norit, Amsterdam; C. Zimmermann, London*), ULTRACARBON (*Merck, Darmstadt; Savory & Moore, London*). CARBOSERIN (*Bayer Products, London*) is activated charcoal in tablet form.

Dose.—As for Carbo.

Prepared by heating charcoal to a high temperature in a stream of steam or other activating gas (by which its adsorptive power is greatly increased), washing and drying. *U.S.P. XI* states that Carbo Activatus may be dispensed when Carbo Ligni is prescribed.

Activated charcoal is employed in the containers of "Service" and "Civilian Duty" gas respirators for adsorbing toxic gases.

Activated charcoal adsorbs or inactivates strychnine, brucine, adrenaline, histamine and tyramine. With ephedrine and acetylcholine adsorption or destruction is not quite complete.—F. Saunders and co-workers, *J. Pharmacol.*, June, 1931, 177.

Carbo Animalis (*B.P.C.*) is prepared by boiling crude animal charcoal with hydrochloric acid, washing and drying. *P. Helv. V* describes Carbo Adsorbens, Carbo Adsorbens Granulatus and Carbo Ligni; the first must be dispensed when Carbo Animalis is prescribed. *Fr. Cx.* describes ordinary animal charcoal made by burning bones (Carbo Ossium) and purified animal charcoal (Carbo Ossium Acido Depuratus), in addition to Carbo Ligni and Carbo Activatus.

A 2% aqueous suspension has been widely employed, especially on the Continent, by intravenous injection in a variety of infective conditions. There is a possibility of risk, however, in this procedure; death from pulmonary embolism has occurred in rabbits following intravenous injection of from 2 to 5 ml.

Over 100 patients treated, including 14 cases of acute puerperal infection, 5 of pneumonia, 3 of acute cholecystitis, and 5 of furunculosis. No reaction, and all

patients recovered. Initial dose 3 ml. of a 2% suspension of finely pulverised animal charcoal, the piston of the syringe, and the needle, being lubricated with liquid Vaseline to prevent jamming.—E. Saint-Jacques (Montreal), *Lancet*, i/1934, 418.

Doses consist of 2 to 5 ml. of a 1 to 3% suspension of charcoal in isotonic glucose serum, injections being given daily, or every other day, or at longer intervals, the maximum total dosage being 42 ml. of a 2% solution. Injections painless, free from violent or febrile reaction. Best results in diffuse inflammatory processes when reaction of the organism to the infection hangs fire, or when it runs an acute and serious course without free suppuration.—Gaudier and Demarez, *Bull. Acad. méd., Paris*, 1934, 112, 45.

ERYSIPELAS. Intravenous injections of 3 to 5 ml. of a 2% suspension of animal charcoal in a 10% hypertonic dextrose solution bring about a rapid process of recovery—the pain and tension stop, the fever abates and then disappears, the erysipelatous patches lose their lustre and regress, general symptoms improve, and desquamation rapidly takes place.—H. D. Gonzalez and M. Scheingart, per *J. Amer. med. Ass.*, i/1936, 1430.

FEBRILE DISEASES. Intravenous injections of 4 to 5 ml. of a 2% suspension of charcoal in saline or gum-saline produced no benefit in 123 cases of febrile disease. In afebrile cases an average leucocyte increase of 45% was produced in five hours, but gum-saline alone produced a leucocytosis of 50%. The response to charcoal in several ways resembles the response to injections of proteins and colloids.—E. Davis, *Lancet*, ii/1936, 1266.

SKIN DISEASES. 50 severe skin cases were treated with intravenous charcoal injections; promising results were obtained in acute eczema, boils, impetigo, and seborrhæic dermatitis. The dosage recommended for an adult is 4 ml. of a 2% suspension in distilled water or gum-saline (children tolerate charcoal well in doses of 2 to 3 ml.). Each successive dose should be increased by 0.5 ml. and given at intervals of 24 to 48 hours. Charcoal should be continued until recovery seems established, and repeated should there be signs of a relapse, or if recovery becomes sluggish; it is contraindicated in very debilitated patients. A collapse reaction contraindicates further charcoal, and doses of 8 ml. or more should be given with caution, if at all. If four injections have been given without benefit it is unlikely that charcoal will be of use. In afebrile individuals the injections often cause an elevation of pulse, temperature and respiration, which may be associated with chills and rigor.—E. Davis, *Brit. J. Derm.*, 1936, 495.

Carboacid (Richter, London). Charcoal containing 2% of HCl. *Dose.*—2 tablets 3 times daily with meals. In flatulent dyspepsia, etc.

Carbact (Wilcox, JozEAU, London). Activated charcoal tablets, each containing activated charcoal 3 gr., bismuth tribromphenate $1\frac{1}{2}$ gr., dried extract of rhubarb $\frac{1}{2}$ gr., excipient to $7\frac{1}{2}$ gr. *Dose.*—2 tablets three times a day. Gastro-intestinal disorders, flatulent dyspepsia, gastro-enteritis, etc.

Carbolax (Richter, London). Tablets containing activated charcoal 7 gr., with diphenolisatine $\frac{1}{4}$ gr. *Dose.*—Two tablets three times daily with meals. Habitual constipation.

Carbonei Dioxidum (B.P., U.S.P. XI). *Syn.* CARBONIC ANHYDRIDE. $\text{CO}_2 = 44$.

Carbon dioxide in the gaseous condition when used in dilutions of 4 to 6% with oxygen stimulates expiration, acts as a cardiac stimulant, exerts an indirect effect as a sedative and tones up a weak pulse. It is employed after an anæsthetic and operation, also in pneumonia and in asphyxia, e.g., from electric shock, carbon monoxide poisoning, and drowning.

ACUTE ALCOHOLISM. Acute alcoholic coma with dangerous respiratory depression, paralysis and cyanosis is a medical emergency. Death may be definitely prevented and recovery accelerated by inhalation of a mixture of 10% carbon dioxide in 90% oxygen for a length of time sufficient to maintain normal respiration and colour, even after the inhalation is suspended. A minimum time of half an hour should be observed.—L. J. Robinson and S. Selesnick, *J. Amer. med. Ass.*, ii/1935, 1735.

ANÆSTHESIA. Carbon dioxide and oxygen to prevent atelectasis. Important prophylactic in operations.—La Flèche, *Brit. med. J.*, ii/1930, 526.

Carbon dioxide 5% (some employ even 25%) with oxygen as a control of respiration in anaesthesia; also in asphyxia of the new-born, alcoholic intoxication and carbon monoxide asphyxia. The mixture is not used "straight" but is added to air or oxygen from another cylinder.—Yandell Henderson, *Brit. med. J.*, ii/1925, 1170. See also *ibid.*, 1181 *et seq.* and 1186.

ANGINA PECTORIS benefited by inhalation daily for 15 minutes from an open mask.—*Brit. med. J. Epit.*, ii/1931, 26.

PNEUMONIA. In the absence of respiratory failure, as evinced by shallow breathing, the clinical benefits of CO₂ administration are not sufficiently demonstrated to warrant its routine use in lobar pneumonia.—R. Hilton, *Brit. med. J.*, i/1934, 420.

WHOOING COUGH. Dyspnoea and cyanosis immediately relieved in a child of 8 weeks by spraying a little gas on the face.—J. Dunlop, *Brit. med. J.*, ii/1932, 822. Also in spasmodic asthma and chronic rhinitis.—G. Willett, *ibid.*, 1996.

"Carbonic Snow," i.e., carbon dioxide in the semi-solid condition, formed as the gas evaporates from a storage cylinder, is much employed therapeutically. The cylinders contain CO₂ at a pressure of about 950 lbs. to the square inch (65 atmospheres), yield the snow on opening with a temperature of -79°C. (-110°F.), which by collecting in a suitable receptacle can be formed into a stick or crayon like an ordinary candle, or may be compressed into a mould and cut any shape with a knife. The cylinders should be mounted on a stand with the stopcock on a lower level than the opposite end so that the liquid gas covers the inner orifice of the valve.

Crayons, Method of making. The snow evaporates slowly—a crayon 5 by 1 inch will last about 1 to 2 hours. As many as thirty applications with this size can be made. The temperature of the crayon is constant. A towel is folded into three and wrapped round an ordinary ruler—the ruler is then removed and the tube thus produced is bound on to the valve of the CO₂ cylinder, the gas is turned on and the towel tube fills with the snow. The frozen gas may then be pressed into a piece of vulcanite or celluloid tubing about 1 inch in diameter with a ruler. A cardboard postal tube or roll of blotting paper (several thicknesses) will also serve. Cover end of crayon with lint for handling. Can be pointed with a pen-knife or shaped by rubbing against the side of a vessel containing hot water.

An old glove finger has been suggested for collecting the CO₂ by tying on to the vent of the cylinder. When completely filled and rigid, remove and with a sharp knife cut the end of the finger off at about 1½ inches from the point, thus exposing a corresponding length of the crayon, which can be used to the part, the rest of the glove finger serving as a holder.

Uses. For removal of nævi, moles and blemishes, lupus erythematosus, lupus vulgaris, rodent ulcer, and warts (for last mentioned long application necessary). Also employed for trachoma and chronic localised eczema. A single application usually suffices. The thawing out is usually more painful than the freezing.

ALOPECIA AREATA of 3 to 7 years' duration has been well treated. Hair grows after three or four applications within 3 weeks.

CORNEAL ULCERS. The surface of the ulcer is carefully touched. Cocaine is not necessary. If patient complains of discomfort the eye can be bathed with cold boracic lotion. The surface of the ulcer becomes white and raised; within 24 or 36 hours this "slough" separates, leaving a clean healing ulcer. Infiltrations disappear from the surrounding healthy cornea and hypopyon vanishes. After treatment, pads and bandages are used instead of fomentations, and atropine sulphate 1% is instilled once daily. The method is not advised for marginal or ring ulcers.

KERATOSIS accompanying X-ray dermatitis. Brief applications answer well. The treated area becomes firmer and in 2 or 3 minutes swollen. A wheal forms with acute hyperæmia within half an hour and a vesicle usually within an hour; applying 30 seconds or longer, this will almost certainly be followed by scarring. An intense superficial destruction is obtained by a second application immediately after the tissues have thawed out.

Boric ointment is used for after-treatment. If blister forms, the fluid is removed within a few days; the crust forming should be allowed to fall off. The scar ultimately is pale, soft and pliable.

NÆVI. In the case of an ordinary capillary nævus the crayon is roughly shaped to that of the nævus—or slightly larger; it is applied and firmly pressed down for, on an average, 40 seconds. If there is bone immediately beneath, a shorter time will do. For a cavernous nævus the end of the crayon is made the same size or slightly smaller than the area of the growth. A long application with deep pressure should effectually freeze the whole mass.

The treatment of strawberry nævi with CO_2 snow.—H. C. Semon, *Lancet*, i/1934, 1167.

Carbon dioxide snow offers a satisfactory and inexpensive means for the treatment of hemangiomas in children. The results in small thin lesions are excellent, but as the size and depth increase they become progressively worse, so that in large deep lesions the results by this method of treatment are poor.—N. M. Wong, *Canad. med. Ass. J.*, ii/1939, 571.

PSORIASIS. Patches removed by 30 seconds' application.

RODENT ULCER. Early rodent ulcers up to the size of a shilling treated as follows:—

Ring the ulcer with Novocain 2% and firmly scrape with a sharp spoon; the tumour comes away and a clean raw area is left. Apply a pencil of CO_2 snow for 60 seconds and then a dry dressing. There is œdema for a day or two but practically no pain, and the ulcer heals rapidly under boric ointment. The resulting scars are very smooth and fine. Recurrences infrequent and successfully treated by a repetition.—J. F. Smith, *Brit. med. J.*, ii/1928, 443.

Although it has occasionally cured a case, its use on the whole is most unsatisfactory. It is painful and produces scarring, and the proportion of failures is too great to make it permissible to use it.—N. S. Finzi, *Brit. med. J.*, ii/1933, 137.

TRACHOMA. The method may be applied energetically in trachoma without risk. The lid is everted and separated from the globe by a non-conducting spatula—the pencil is lightly pressed down on to the part of the conjunctiva to be treated for 15 to 30 seconds.

Carbonei Disulphidum (B.P.C., P. Helv. V). Syn. CARBON BISULPHIDE, CARBO SULFURATUS (Fr. Cx.). $\text{CS}_2 = 76.12$.

A clear liquid with characteristic odour, sp. gr. 1.268 to 1.272, b.p. 46° , flash point 20° .

Almost *insoluble* in water, but readily in alcohol, ether and chloroform and the fixed and volatile oils. Dissolves phosphorus, sulphur and rubber with avidity.

The vapour mixed with air in the proportions of from 1 to 50% is explosive when brought in contact with a flame or a steam-pipe. Exposure for $\frac{1}{2}$ hour to a concentration of 0.35% may cause severe illness.

Antidotes. Keep patient in bed and warm. Oxygen inhalations if necessary. On recovery from the comatose condition, the patient may become maniacal and must be controlled.

CHRONIC POISONING IN INDUSTRY. Absorption takes place both through the lungs and the skin, and the poison is cumulative. A concentration of 1 in 3000 in air will produce a headache after a few hours' exposure.

Inhalation of small quantities of the vapour over some weeks or months produces chronic effects, the first of which are nausea, headache and giddiness, fetid breath, pallor, and a pale and flabby tongue. Later symptoms include mental disturbances with impaired memory and depression, muscular weakness,

tremor, loss of sensation, and optic neuritis. Acute poisoning produces severe mental disturbance, possibly acute mania. In chronic poisoning some of the symptoms may continue after removal of the patient from toxic exposure.—(Memorandum on precautions against dangers of poisoning, fire and explosion associated with the use of carbon bisulphide in artificial silk, india-rubber, and other works.) H.M.S.O., Form 836, 1936.

The most usual form of insanity due to carbon disulphide poisoning is the manic-depressive type, which lasts for some months or a year or two, then usually clears up, but in some cases passes into lasting dementia. Dimness of vision is a common symptom, the lesion produced being a retrobulbar neuritis with atrophy of the optic nerves; this is sometimes transient and sometimes results in permanent loss of visual acuity. A form of Parkinson's disease, with a tremor like that of paralysis agitans, is reported from Italy. A polyneuritis, affecting the nerves of the lower extremities, has also been described and sexual impotence is a very common symptom in men.—A. Hamilton, *New Engl. J. Med.*, 1936, 215, 426.

Report of six cases of poisoning in the rayon industry. The concentration of carbon disulphide in the atmosphere should be kept around 10 parts per million (0.03 mg. per litre).—S. T. Gordy and M. Trumper, *J. Amer. med. Ass.*, i/1938, 1543.

Uses. Has been used as an external application in enlarged lymphatic glands, employing a wide-mouthed bottle containing a fluid drachm of carbon disulphide imbibed by a piece of sponge, the skin over the gland having been previously moistened with water. It has also been used in a similar manner in facial neuralgia and other local pains.

DIARRHŒA. Has been used as a remedy for diarrhœa in doses of 30 ml. of a 3.5% solution 4 to 5 times a day.—J. W. Tomb, *Brit. med. J.*, i/1934, 1097.

CHLORINATED HYDROCARBON COMPOUNDS.

(for Methyl and Ethyl Chlorides, see under *ÆTHYLIS CHLORIDUM*)

Carbonei Tetrachloridum (*B.P.*, *U.S.P. XI*, *Fr. Cx.*, *P. Jap. V*, *P. Ned. V*, *F.E. VIII*). *Syn. and Prop. Name.* TETRACHLOR-METHANE, TETRAFORM (*British Drug Houses, London*). CCl_4 = 153.83.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 6 ml. doses have been taken by an adult. 10 to 20 minims is safe for children of 3 to 4 years. Children of 1 year can have 10 minims; a child of 10 should receive 30 minims; a youth of 16, 40 minims ($2\frac{1}{2}$ ml.), and so on even when seriously ill from various causes. *U.S.P. XI* average dose (caution) 40 minims. Milk is the best vehicle even if given in capsule. Must not be given in spirit or turpentine.

A heavy, volatile, and mobile chloroform-like liquid, has a pleasant, pungent, quince-like odour if pure; not inflammable.

Insoluble in water; soluble in organic solvents and fixed and volatile oils.

Antidotes. (Swallowed.) Empty stomach by emetic or stomach tube. Keep patient lying down and warm. Give purgative dose of magnesium sulphate. Dextrose and fluids freely, but not oils or fats. (Inhaled.) Keep patient warm. Artificial respiration. Respiratory stimulants.

Deaths after carbon tetrachloride have occurred in Jamaica, and thymol is now the drug of choice against hookworms.—B. M. Wilson, *Brit. med. J.*, ii/1928, 207. Carbon tetrachloride a proved potent liver poison and should not be given to a purged and fasting patient unless sufficient glucose is given at the same time.—H. M. Hanschell, *ibid.*

Poisoning due to production of hypoglycemia. Relieved by intravenous calcium therapy.—A. S. Minot, *ibid.*, 1931, 312.

Its use in hairdressing (for making the hair look clean and glossy) is reprehensible on account of the risks of serious poisoning. Two cases recorded.—*Brit. med. J. Epit.*, 1/1933, 5.

Uses. It has been extensively used in ankylostomiasis (hookworm infection). The dose should be taken in the morning on an empty stomach. A mild laxative should be given the day before, and a purgative dose of magnesium sulphate three hours after the anthelmintic. To ensure complete removal of the worms a test dose of 3 ml. of chenopodium oil may be given a week later. Alcohol should be avoided during treatment, and the drug is contraindicated in the presence of disease of the heart, liver or kidneys and in alcoholic subjects. The combined use of carbon tetrachloride 2 ml., and oil of chenopodium 1 ml., has found much favour and is stated to be more effective and less toxic.

More than 100,000 consecutive treatments of hookworm disease without a death, and with few untoward symptoms.—S. M. Lambert, *J. Amer. med. Ass.*, 1/1933, 248.

Many hundreds of cases of hookworm treated as a routine measure every six months without complaints even of discomfort. The method of administration recommended is to give 3 ml. of carbon tetrachloride (Tetraform) in 15 ml. of castor oil (or liquid paraffin). No purgative is needed after its use.—A. S. Tuxford, *Lancet*, 1/1935, 1302.

A resurvey of hookworm disease in Fiji in 1935, 10 years after mass treatment with carbon tetrachloride, indicated that infection was only half of what it had been before the treatment campaign, and that infection was less severe in form. After 10 years there were still few clinical manifestations of hookworm disease in areas where formerly there had been almost universal anaemia.—S. M. Lambert, *J. trop. Med. (Hyg.)*, 1936, 21.

TAPEWORM. Carbon tetrachloride is the most effective remedy for the treatment of tapeworm infestations in man, the usual dose being 4 ml. It is superior to male fern, not only in efficiency, but in being less inconvenient, less time-consuming, and less expensive. Alcohol and fat should be avoided for at least a day before and after treatment, and there should be prompt purgation within a few hours.—J. H. Sandground, *New Engl. J. Med.*, 1/1938, 298.

Diphenan. *Syn. and Prop. Names.* *p*-BENZYLPHENYL CARBAMATE, BUTOLAN (Bayer Products, London), OXYLAN (Burroughs Wellcome, London). $C_6H_5 \cdot CH_2 \cdot C_6H_4 \cdot O \cdot CO \cdot NH_2$, = 227.2.

Carbamic acid ester of *p*-hydroxydiphenylmethane, in white, odourless, tasteless crystals, slightly soluble in water. For oxyuriasis (thread-worm). *Dose.*—1 or 2 tablets ($7\frac{1}{2}$ grains each) three times daily for one week.

The drug is singularly free from toxic effects, but may cause diarrhoea. It is wise to wash out the colon with quassia infusion daily, to administer dilute hydrochloric acid by mouth, and to smear the perianal region with a weak mercury ointment.—Hale-White.

Dichlorethyleneum (B.P.C.). *Syn.* ACETYLENE DICHLORIDE. $C_2H_2Cl_2$ = 96.93.

A heavy mobile liquid, with slightly acid ethereal odour, consisting of a mixture of two stereoisomers boiling at 48° and 60°, and having sp. gr. of about 1.30. It is not readily inflammable and is suggested to replace ether for laboratory use. It is the best known solvent for rubber.

Is employed as a solvent of iodine for sterilising the skin. 2.5% *w/v* is used, i.e., practically a saturated solution. This solution is said to cause the operating surgeon or assistants no lachrymation or catarrh of the nasal mucous membrane which the methylated spirit tincture produces.

Ethyleni Dichloridum (B.P.C.). *Syn.* DICHLORETHANE. $C_2H_4Cl_2$ = 98.95. A mobile liquid with ethereal odour and sweet taste. B.p. 84°. Used as a solvent of iodine (1 in 40) for skin disinfection.

Trichlorethylene. *Prop. Name.* CHLORYLEN (*Schering, London*).
 $\text{CHCl} : \text{CCl}_2 = 131.4$. Colourless liquid b.p. 88° , sp. gr. 1.47.

Uses. For trigeminal neuralgia 10 to 20 minims may be inhaled from cotton wool. Not more than 60 minims in twenty-four hours. It has also been found of value in the prevention and treatment of attacks of angina pectoris, but it should always be taken with the patient lying down and should not be used as a substitute for amyl nitrite in the acute attack. Externally, it is a useful cleansing agent for dirty and greasy wounds. To remove the smell wash well with a strong solution of potassium permanganate and with water. An ointment, 1 in 4, in soft paraffin, destroys body lice, and soap solutions containing 2% may be used for cleaning the body.

Used in commerce for the solution of tarry, bituminous products, rubber, sulphur, phosphorus, and for dry cleaning.

At first several fatalities were ascribed to exposure to its vapour, but these were in fact due to impurities or disintegration products. Since 1930 the process of manufacture has been so perfected, and the discovery of stabilisers so advanced, that the trichlorethylene of commerce is now a pure and stable substance, and since that date no trace of any fatality ascribed to it can be traced.

A powerful "degreaser," and as a wound cleanser greatly superior to surgical spirit, methylated spirit, etc. It is also a good solvent for tar and is particularly useful in the treatment of tar burns. A boy of 9 playing with a tar-spraying machine received very extensive burns; following cleansing with trichlorethylene and coagulation with Tannafavine he made an uninterrupted recovery.—H. B. Trumper, *Brit. med. J.*, ii/1934, 1219.

Applied as a spray it is a useful cleansing agent for all dirty and greasy wounds, including tar burns. As it has no effective antiseptic power *per se*, the wound should be dressed with a recognised antiseptic after the preliminary cleansing.—H. B. Trumper, A. T. Jones and H. Taylor, *Lancet*, ii/1936, 1390.

ANGINA PECTORIS. Inhalation of 1 ml. morning and evening relieved the distress and apprehension in most cases.—J. C. Krantz, *J. Amer. med. Ass.*, i/1936, 485.

Results rather disappointing; of 40 cases treated only one obtained complete relief, and in 13 cases no improvement was noted. Should be given a trial when other methods have failed. The inhalations are safe and well tolerated.—F. A. Willius and F. J. Dry, *Amer. Heart J.*, 1937, 659.

TIC DOULOUREUX. From 10 to 50% of patients are benefited by inhalation of doses of 25 to 35 drops four times daily, continued for two or three weeks. If no relief results at the end of that time it is useless to continue the treatment. There is risk of damage to the liver if the drug is used over many months.—P. G. Flothow, *per Prescriber*, 1939, 137.

Tetrachlorethylene (B.P.C.). *Syn.* PERCHLOR-ETHYLENE.
 $\text{C}_2\text{Cl}_4 = 165.8$.

Dose.—15 minims (1 ml.) in capsules. For ankylostomiasis doses totalling 3, 4 and 5 ml. are given at hourly intervals on each of three consecutive days; on the third day, 3 hours after the last dose, give saline purge.

Colourless heavy mobile liquid with odour similar to that of carbon tetrachloride. B.p. 117° to 122° ; sp. gr. about 1.62.

Insoluble in water; miscible with alcohol 90%, ether and oils. Used for the expulsion of hookworm in man and animals and of roundworms in animals. It is stated to be as effective as carbon

tetrachloride against hookworm without its toxicity. Its use should be followed by a saline purgative, and patients should remain in bed and drink plenty of milk; alcohol should be avoided.

ANKYLOSTOMIASIS. An extremely valuable substance for the treatment of uncomplicated hookworm disease. Thought to be as effective against hookworm as carbon tetrachloride, but should not be classed with the latter as a toxic anthelmintic. Ineffective against ascaris.—P. D. Lamson and co-workers, *J. Amer. med. Ass.*, ii/1932, 293.

Much less toxic in cats than carbon tetrachloride and harmless in therapeutic doses. A mixture of 2 ounces of saturated magnesium sulphate with 4 ml. of tetrachlorethylene and 1 ml. of oil of chenopodium, shaken to form a fine emulsion and given immediately, gave 62% of cures with one treatment in 50 cases.—P. A. Mapleston, A. K. Mukerji and R. N. Chopra, *Indian med. Gaz.*, 1933, 554 and 617.

More than 46,000 treatments of hookworm disease without a death, and with few untoward symptoms. The most satisfactory anthelmintic so far developed for hookworm disease.—S. M. Lambert, *J. Amer. med. Ass.*, i/1933, 248.

Tetrachlorethylene is a safe and reliable anthelmintic for general use when properly administered. Potency increased by addition of oil of chenopodium.—D. Manson, *Indian med. Gaz.*, 1934, 500.

Doses of 4 to 5 ml. may be safely given to adult patients and two such treatments at intervals of 10 days may be expected to cure even severe cases of ankylostomiasis. Children may be given tetrachlorethylene in doses of 4 to 5 times the age in minims. No appreciable toxic action has been found even after 8 ml. doses on the cardiovascular, respiratory, hepatic, and renal organs.—P. B. Fernando, *Indian J. med. Res.*, 1939, 26, 759.

OKYURIASIS. Tetrachlorethylene is one of the best drugs for a single-dose treatment for pinworms. It is especially effective for light pinworm infestations, but will probably fail to effect cures in the majority of persons heavily infested. The tetrachlorethylene is administered at a dose rate of 0.1 ml. for each year of apparent (not chronological) age, the drug being given in a suitable dose of a solution of magnesium citrate (which gives rise to fewer reactions than magnesium sulphate).—W. H. Wright, *J. Amer. med. Ass.*, ii/1937, 570.

Tetrachlorethane. *Syn.* ACETYLENE TETRACHLORIDE.

$C_2H_2Cl_4 = 167.8$.

A liquid with penetrating odour, b.p. about 146° ; sp. gr. about 1.6. It dissolves oils, fats, waxes, and resins, and sulphur (1% at ordinary temperature), phosphorus and chlorine.

Used as a solvent for varnishes, especially cellulose acetate, and as a paint-remover and degreaser. Extensively employed as an insecticide, especially for white fly on tomato plants and for weevils, 10 fl. oz. being allowed to volatilise for 1000 cu. ft.

Pentachlorethane, $C_2HCl_5 = 202.3$, is similar. B.p. 159° .

Hexachlorethane. $C_2Cl_6 = 236.7$.

A solid subliming at 185° without melting; almost insoluble in water, more soluble in alcohol and ether, or a mixture of the two. It has a smell similar to camphor, for which it is used as a substitute in the celluloid industry. Also employed to render substances non-inflammable in explosives industry, and is incorporated in anti-fouling paints.

CARYOPHYLLUM

(with CARDAMOMUM, etc.)

B.P., U.S.P. XI, Fr. Cx., P. Dan.

Dose.—2 to 5 grains (0.12 to 0.3 g.).

The dried flower-buds of *Eugenia aromatica* (Myrtaceæ) (*E. caryophyllata*).

In senile flatulence good effects are produced by powdered cloves, better even than a fluid preparation. Spirit of cloves is absorbed in the stomach but the woody fibre passes on to the seat of the complaint.

Aqua Caryophylli Destillata (B.P.C.). Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.), 1 in 40.

Aqua Caryophylli Concentrata (B.P.C.). Dose.—5 to 15 minims (0.3 to 1 ml.). Contains 2% v/v of oil of clove and is approximately 40 times the strength of the distilled water.

Infusum Caryophylli Concentratum (B.P.). Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 5.

Infusum Caryophylli Recens (B.P.). Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.), 1 in 40.

Tinctura Caryophylli. 1 in 8 of alcohol 90%. Digest 10 days. Dose.—20 to 40 minims or more: aromatic, carminative and stimulant.

Oleum Caryophylli (B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V).

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Colourless to brownish oil. Contains 85 to 90% v/v of eugenol, $C_{10}H_{12}O_2$. Soluble 1 in 2 of alcohol 70%.

Internally, oil of cloves is antispasmodic and carminative, and may be employed in doses of 3 to 5 minims to relieve flatulence and to reduce expectoration, especially in phthisis. Externally, it is rubefacient and slightly anæsthetic, and may be applied, mixed with olive oil, to neuralgic areas. It is a useful domestic remedy for toothache, a plug of cotton wool soaked in the oil being inserted in the cavity of the carious tooth.

NEURALGIA. A useful household remedy to keep in reserve for the pain of a carious tooth is oil of cloves, either alone, or better still, added to equal parts of carbolic acid and menthol. The carious cavity is mopped out with a fine probe, e.g., a pointed match stick with a little wool twisted round it, and a tiny piece of cotton wool soaked in the solution gently pressed into the cavity. This will usually arrest the pain for several hours.—Wilfred Harris, *Practitioner*, i/1940, 320.

Eugenol (B.P.C., U.S.P. XI, P. Dan.). Syn. EUGENIC ACID, 2-METHOXY-4-ALLYLPHENOL. $C_9H_9(OH)(OCH_3) \cdot C_2H_5$, 4:3:1 = 164.1.

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

A colourless oily liquid, b.p. 251° to 253°, U.S.P. XI 250° to 255°; darkening on exposure. It is the chief constituent of oil of clove and has a strong clove odour. Is a powerful antiseptic and antiputrescent. Is employed by dentists as an abundant causing reduced sensibility of mucous membrane, but not complete anæsthesia. Useful with wool fat in eczema.

Isoeugenol, used in perfumery for its carnation-clove odour and for the manufacture of vanillin, is obtained by heating eugenol with potassium hydroxide.

Cardamomum (B.P., U.S.P. XI, P. Helv. V). Syn. CARDAMOMI SEMINA, FRUCTUS CARDAMOMI (P. Dan., P. Jap. V).

The dried ripe seeds of *Elettaria Cardamomum* var. *minuscula* (Zingiberaceæ). The seeds should not be removed from their fruits until required for use. Given in atonic dyspepsia. Contained in Pulvis Aromaticus.

Tinctura Cardamomi Aromatica (B.P.C.). Syn. TINCTURA CARMINATIVA. Dose.—2 to 10 minims (0.12 to 0.6 ml.).

Cardamom about 1 in 16 with strong tincture of ginger and oils of caraway, cinnamon and clove.

Tinctura Cardamomi Composita (B.P.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). Cardamom 1.4% with caraway, cinnamon, cochineal, glycerin and alcohol 80%. Is more or less decolorised by alkaloidal salts, bismuth oxide, oxycarbonate and subnitrate; also by metals of the alkaline earths and sodium bromide: employ Liquor Bismuthi in preference.

Tinctura Cardamomi Composita (U.S.P. XI).

Average dose.—60 minims (4 ml.).

Cardamom seed 2, cinnamon 2.5, caraway 1.2, cochineal 0.5, glycerin 5, in diluted alcohol to 100.

Oleum Cardamomi (B.P.C.). *Dose.*— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.).

Obtained from the whole fruits of cardamom. Aromatic carminative.

Carum (B.P., U.S.P. XI). Syn. CARUI FRUCTUS, CARAWAY FRUIT OR SEED.

Dose.—10 to 30 grains (0.6 to 2 g.). The dried ripe fruits of *Carum Carvi* (Umbelliferae). An aromatic carminative of value in flatulent colic, especially in children.

Aqua Cari Destillata (B.P.C.). *Syn. AQUA CARUI DESTILLATA.* *Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 10.

Aqua Cari Concentrata (B.P.C.). *Dose.*—5 to 15 minims (0.3 to 1 ml.). Contains 2% v/v of oil of caraway and is approximately 40 times the strength of the distilled water.

Oleum Cari (B.P., P. Helv. V). Syn. OLEUM CARUI.

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Contains 53 to 63% w/w of carvone, $C_{10}H_{14}O$. Soluble 1 in 1 of alcohol 90% and 1 in 7 of alcohol 80%.

Carvone, $C_{10}H_{14}O$, the principal constituent of oil of caraway, occurs also in oils of dill and spearmint. It is a colourless or slightly yellow liquid, miscible with alcohol.

Coriandrum (B.P., Fr. Cx., P. Dan.).

Dose.—5 to 15 grains (0.3 to 1 g.).

Dried ripe fruits of *Coriandrum sativum* (Umbelliferae). Aromatic and carminative.

Oleum Coriandri (B.P.). *Dose.*—1 to 3 minims (0.06 to 0.2 ml.). Is added to preparations of rhubarb and senna to prevent griping. The flavour becomes less pleasant on keeping.

Myrica (B.P.C.). Syn. BAYBERRY, WAX MYRTLE BARK.

Dose.—10 to 60 grains (0.6 to 4 g.).

The dried root-bark of *Myrica cerifera* (Myricaceae). Tonic and astringent, emetic in large doses. Is an ingredient, together with various proportions of ginger, capsicum and clove, of COMPOSITION POWDER or COMPOSITION ESSENCE used as a domestic remedy for colds.

Myricin. *Dose.*—2 to 5 grains. The powdered extract of *Myrica cerifera*. An astringent and stimulant, and in large doses, emetic. For diarrhoea and jaundice.

Myristica (B.P., U.S.P. XI, P. Helv. V, P. Jap. V). Syn. NUX MOSCHATA, NUTMEG, MUSCADE (Fr. Cx.).

Dose.—5 to 10 grains (0.3 to 0.6 g.). The dried kernels of the seeds of *Myristica fragrans* (Myristicaceae). An aromatic carminative. From one to one and a half nutmegs, or a teaspoonful of powdered mace, have caused severe poisoning symptoms.

Oleum Myristicæ (B.P., U.S.P. XI). *Dose.*—1 to 3 minims (0.06 to 0.2 ml.). Distilled from nutmeg. Soluble 1 in 3 of alcohol 90%.

Oleum Myristicæ Expressum. *Syn. ADEPS MYRISTICÆ, BUTYRUM MYRISTICÆ (Fr. Cx.), MACE BUTTER.*

Bright orange, solid fat obtained from nutmeg or mace by hot expression. Soluble in ether, alcohol and chloroform. Is a mild stimulant and has been incorporated in plasters.

The expressed or concrete oil of nutmeg of yellowish colour contains myristicin, $C_{15}H_{24}O_2 = 206.1$. It is occasionally employed as a gentle local stimulant. It is stated to have narcotic properties.

Spiritus Myristicæ (B.P.C.). Dose.—5 to 20 minims (0.3 to 1.2 ml.). 1 in 10.

Oleum Myristicæ Deterpenatum (B.P.C.). Terpeneless Oil of Nutmeg. Is prepared by concentration *in vacuo* and is about 5 times as strong as oil of nutmeg.

Macis (Fr. Cx.). Mace is the arillode of the seed of *Myristica fragrans*. It contains 7 to 14% of a volatile oil similar to oil of nutmeg.

Oleum Myrciæ (B.P.C.). OIL OF BAY.

Is obtained from *Pimenta acris* and other species. Occurs as a yellow liquid becoming brown on exposure to air. **Soluble** when fresh in an equal volume of alcohol 95%, less soluble on keeping.

Spiritus Myrciæ Compositus (B.P.C.). *Syn.* SPIRITUS PIMENTÆ COMPOSITUS.

Contains oils of bay, orange and pimento, and dry extract of quassia in diluted alcohol. Preparations of similar composition and coloured brown are sold as bay rum.

Pimenta (B.P.C.). *Syn.* PIMENTO, ALLSPICE, JAMAICA PEPPER.

The dried full-grown unripe fruits of *Pimenta officinalis* (Myrtaceæ).

Aqua Pimentæ Concentrata (B.P.C.). Dose.—5 to 15 minims (0.3 to 1 ml.). Oil of pimento 1 in 50. This preparation diluted 1 to 40 with water is to be dispensed for Aqua Pimentæ.

Oleum Pimentæ (B.P.C.).

Dose.— $\frac{1}{2}$ to 3 minims (0.06 to 0.2 ml.).

Soluble 1 in 3 of alcohol 70%; *miscible* with alcohol 90%. Eugenol content not less than 60% v/v. Stomachic and antispasmodic.

CASCARA SAGRADA

B.P., U.S.P. XI, Fr. Cx., P. Ital. V, F.E. VIII, P. Helv. V, P. Belg. IV.

Syn. SACRED BARK.

Dose.—20 to 60 grains (1.2 to 4 g.) in cachets.

The dried bark of *Rhamnus Purshiana* (Rhamnaceæ).

B.P. and *U.S.P. XI* require the bark to be kept at least one year, but *Fr. Cx.* does not. The tree grows extensively in British Columbia.

Uses. Increases peristalsis and is used chiefly in chronic constipation; it is useful for piles, since it forms a soft stool and is not irritating. For dosage see Liquid Extract.

Elixir Cascaræ Sagradæ (B.P.).

Dose.—30 to 60 minims (2 to 4 ml.).

1 in 1, prepared by percolating with boiling water a mixture of cascara, liquorice and light magnesium oxide, evaporating, and adding alcohol, glycerin and flavouring agents. It is practically free from bitterness but is sometimes alleged to be less active therapeutically than the liquid extract.

Fluidextractum Cascaræ Sagradæ Aromaticum (U.S.P. XI).*Average dose.*—30 minims (2 ml.).

Closely resembles the elixir of the B.P. 1932, but contains 0.01% of methyl salicylate and larger proportions of saccharin, oil of anise and alcohol.

P. Ital. V has also an aromatic liquid extract employing magnesia, with liquorice, glycerin, saccharin and anise.

Extractum Cascaræ Sagradæ Liquidum (B.P.).*Dose.*—30 to 60 minims (2 to 4 ml.).

An aqueous extract containing 25% of alcohol (90%). It may be made miscible with water by adding half its volume of sal volatile.

P. Ital. V is very similar. *P. Belg. IV* uses 60% alcohol. *P. Jap.* makes with alcohol 90% and water equal parts. *Fr. Cx.* makes with alcohol 50%, 1 = 1 by weight using 8% of light calcined magnesia in the extraction.

Use in Constipation. The initial dose depends on the individual, but it must be correctly found—15 to 20 drops *t.d.* suffices for the adult. The object is to procure one motion only each day. The dose that is sufficient must be taken in a wineglassful of water thrice daily after meals for a week or ten days, or until the action becomes somewhat too pronounced. Then reduce dose by one drop only and take with the same regularity as before. In time it will be found that 1 drop in water thrice daily after meals will be sufficient. Finally the medicine may be omitted altogether.

After laparotomy, suitable aperients are confection of senna or the following: Ext. Cascara Sagrada Liq. 1 oz., sodium sulphate 1 oz., solution of ammonia 40 m., chloroform water to 8 oz. *Dose.*—2 to 4 drachms night and morning.—C. W. Gordon Bryan, *Lancet*, ii/1930, 1141.

Fluidextractum Cascaræ Sagradæ (U.S.P. XI).*Average dose.*—15 minims (1 ml.).

One ml. represents 1 g. of the bark; it is of the same strength as the liquid extract of the B.P.

Extractum Cascaræ Sagradæ Siccum (B.P.).

Dose.—2 to 8 grains (0.12 to 0.5 g.) in pill.—An aqueous extract evaporated under reduced pressure, so as to produce a spongy mass which is readily granulated. *Fr. Cx.* and *P. Ital. V* extract with 60% alcohol.

Vacuum drying of extracts. Examination of commercial extracts of cascara, krameria and hamamelis showed that many preparations are overheated during drying, probably due to the use of steam-jacketed vacuum pans, when as the extractive thickens the portion in contact with the pan will take the temperature of the steam irrespective of any reduction of pressure employed. The degree of overheating can usually be detected by the solubility of the product in the original solvent. Vacuum ovens or pans used for drying should be heated by means of water jackets or very low pressure steam. It is suggested that the B.P. should direct dry extract of cascara to be evaporated to dryness at a temperature not exceeding 100°, and dry extract of krameria at a temperature not exceeding 70°. In both cases a limit of 10% w/w of matter insoluble in cold water should be fixed.—H. Berry and E. M. Temple, *Quart. J. Pharm.*, 1938, 364.

Extractum Cascaræ Sagradæ (U.S.P. XI). *Average dose.*— $\frac{1}{4}$ grain (0.015 g.). 1 g. represents 3 g. of the bark.

Mistura Cascaræ (Gt. Orn. H.). (For 1 year old child.)

Liquid extract of cascara, liquid extract of liquorice, syrup of orange, chloroform water, of each 15 minims for one dose.

[P1] Mistura Cascaræ Composita (B.P.C.).*Dose.*— $\frac{1}{4}$ to 1 ounce (15 to 30 ml.).

Contains 20 m. of liquid extract of cascara per ounce, with tincture of belladonna and tincture of nux vomica.

[P1] Mistura Cascaræ Composita (L.H.). *Syn.* MISTURA APERIENTIS (L.H.).

Liquid extract of cascara sagrada 1 dr., liquid extract of senna 30 m., liquid extract of liquorice 60 m., tincture of hyoscyamus 30 m., tincture of nux vomica 10 m., emulsion of chloroform 10 m., compound decoction of aloes to 1 oz.

Mist. Cascar. (*N.I.F.*). Liquid extract of cascara sagrada 20 m., ammonium carbonate 2 gr., liquid extract of liquorice 20 m., chloroform water to $\frac{1}{2}$ oz.

[P1] **Mist. Cascar. c. Nuc. Vom.** (*N.I.F.*).

Liquid extract of cascara sagrada 20 m., ammonium carbonate 2 gr., tincture of nuxvomica 5 m., tincture of belladonna 3 m., liquid extract of liquorice 20 m., chloroform water to $\frac{1}{2}$ oz.

Mistura Hepatica. *Dose.*—1 to 2 drachms in water. Liquid extract of cascara 20, tincture of jalap 20, tincture of podophyllum 10, compound tincture of gentian 10, chloroform water 50, sal volatile 10.

[P1-S1] **Pilulæ Cascaræ Compositæ** (*B.P.C.*). *Dose.*—1 to 3 pills; contain $\frac{1}{2}$ gr. of dry extract of cascara with dry extracts of belladonna and nuxvomica.

An agreeable and efficient aperient, with gentle action continuing beyond the first day; good for liver inaction.

Syrupus Cascaræ Aromaticus (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.) as laxative.

Contains 40% v/v of liquid extract of cascara flavoured with orange and cinnamon.

Tabellæ Cascaræ Sagradæ (*B.P.C.*) contain 2 gr. (0.12 g.) of the dry extract.

Tinctura Cascaræ Sagradæ (*Fr. Cx.*).

Laxative Dose.—10 to 60 minims (0.6 to 4 ml.).

Percolate 1 to 5 with alcohol 60%.

[P1] **Tinctura Laxativa.**

Dose.—20 to 60 minims (1.2 to 4 ml.).

Liquid extract of cascara sagrada 2, aromatic spirit of ammonia 2, spirit of chloroform 2, tincture of belladonna 1, tincture of nuxvomica 1. This is an agreeable and elegant form of administering cascara, being miscible with water.

Trochisci Cascaræ Sagradæ et Olei Menthe Piperitæ.

These are made with fruit basis, and contain $2\frac{1}{2}$ gr. of extract flavoured with peppermint; they are useful correctives. *Dose.*—1 or 2.

Vinum Cascaræ.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Liquid extract of cascara 1, sugar 1, aromatic elixir 1, sherry-type wine to 20. Mix and decant from any sediment which may form on standing.

Cascara Evacuant (*Parke, Davis, London*). Palatable cascara preparation. *Dose.*—10 to 30 minims.

Cascaromat (*Evans, Sons, Lescher & Webb, Liverpool*). An aromatic preparation of cascara sagrada free from bitterness.

[P1-81] **Hepatagen** (*Hewlett, London*). Contains extract of cascara, extract of rhubarb, jalapin, podophyllin, cocaine hydrochloride, aromatics, etc.

Dose.—10 to 60 minims. In biliousness, hepatitis and chronic gastritis.

Kasak (*Squire & Sons, London*). *Dose* for children, 1 or 2 drachms; adults, $\frac{1}{2}$ ounce. A laxative free from bitterness.

Kasena (*Squire & Sons, London*). Similar to Kasak but contains senna.

Kasena Capsules are also made.

Molevac (*Parke, Davis, London*). Liquid paraffin, malt extract and Cascara Evacuant (12 m. per oz.). *Dose.*—From one teaspoonful. Chronic constipation.

Peristaltin (*Ciba, Horsham*). Water-soluble glycosides of cascara sagrada. Supplied in tablets containing $1\frac{1}{2}$ gr. and ampoules of 1.5 ml. (= $2\frac{1}{2}$ gr.). *Dose.*—1 to 3 tablets daily or 1 or 2 ampoules daily hypodermically or intravenously. In chronic constipation and post-operative intestinal paresis.

Dihydroxyanthraquinone. *Syn. and Prop. Name.* DIOXYANTHRACHINONUM (*P.G. VI*); ISTIN (*Bayer Products, London*) is dihydroxyanthraquinone in 0.15 g. tablets. $\text{HO}-\text{C}_6\text{H}_3(\text{CO}-\text{CO}-\text{C}_6\text{H}_4)_2-\text{OH} = 242.1$.

Dose.—2 to 6 grains (0.12 to 0.4 g.).

Orange crystalline powder, slightly soluble in water. M.p. 190° to 192° . A synthetic purgative.

Immidiol (*Napp, London*). A mixture of anthraquinone glucosides in an alcoholic solution of salicylic acid. Advocated for use as a gargle diluted about 1 in 80 in the treatment of various anginas of the mouth and throat. The preparation may also be applied undiluted as a spray or paint.

Isacen (*Roche Products, Welwyn Garden City*) is DIACETYL-DIHYDROXY-PHENYL-ISATINE, a synthetic purgative, which in small doses stimulates peristalsis by action upon the mucous lining of the colon and large intestine. It passes through the stomach unchanged and has no action upon the kidneys.

Dose.—1 to 4 granules, each $\frac{1}{2}$ grain (0.005 g.)

Frangula (*B.P.C., P. Helv. V, P. Dan.*). *Syn.* ALDER BUCKTHORN BARK, *BOURDAINE* (*Fr. Cx.*).

The bark from the stem and branches of *Rhamnus Frangula* (*Rhamnaceae*). Indigenous to Europe and America. Should be one year old. Cathartic especially for hemorrhoids and chronic constipation; resembles cascara in constituents and action. Liquid Extract *B.P.* '85 (1 = 1). *Dose*.—1 to 4 drachms. *Fr. Cx.* liquid extract is 1 in 1 with alcohol 30%.

Rhamnus (*B.P.C.*). *Syn.* BUCKTHORN, *NERPRUN* (*Fr. Cx.*).

The fresh ripe fruit of *R. cathartica* (*Rhamnaceae*).

Syrupus Rhamni (*B.P.C.*). *Dose*.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). A solution of sucrose in the juice expressed from buckthorn, with oil of pimento. A laxative, used chiefly in veterinary practice.

Normacol (*Norgine Pharmaceutical Products, London*).

Dose.—1 to 2 drachms in a glass of water once or twice daily.

A preparation of dried plant mucilage of the bassorin type containing a little buckthorn extract. For treatment of habitual constipation.

Bassorin is the name given to the insoluble portion of many gums karaya, tragacanth, etc. It swells up with water, but is not soluble.

Juglandin. An extractive prepared from the inner bark of the root of *Juglans cinerea*, the North-American butter nut; is an hepatic stimulant and cathartic. *Dose*.—2 to 5 grains in pill. **Spiritus Nucis Juglandis**, distilled from *Juglans regia*, the common European walnut, is an antispasmodic and has been used for checking sickness of pregnancy. *Dose*.—1 to 4 drachms. **Folia Juglandis** are in *P. Austr.*; also in *P. Belg.* (and Fluid Extract) and *P. Helv. V.*

CASEINUM

Casein is the principle albuminoid constituent of milk, and is present in solution in the aqueous portion of the milk as an alkali-albuminate, probably as a calcium compound (the alkali in milk is about 0.5%). Some hold that casein exists as caseinogen, and that this is converted into casein by ferment. It is precipitated by dilute acids and by the enzyme, rennet. Casein is present in milk to the extent of 3 to 5% (average 3.2%). Once thrown out of solution it is not readily dissolved again, except with added alkali or hydrochloric acid.

Uses. Insoluble casein is largely used in industry; treated with formaldehyde and subjected to heavy pressure, it gives a very hard material similar to ebonite, which has many industrial uses.

Caseinum Solubile (*B.P.C.*).

Soluble casein is a compound of casein with a small proportion of alkali, prepared by mixing moist precipitated casein with powdered sodium carbonate and drying at a low temperature. It is a white to yellowish-white, odourless, non-hygroscopic powder with a characteristic taste.

Almost entirely *soluble* in water.

Incompatible with acids.

Uses. Soluble casein is the chief constituent of various nutritive preparations and proprietary foods; it has the advantage of being more readily miscible with water and more easily digested. It is also employed as a constituent in non-greasy skin creams.

A mixture of amino-acids has been given intravenously to human beings for parenteral protein alimentation. The mixture was obtained by the acid hydrolysis of casein, to which was added 2% tryptophane and cystine (or methionine). No evidence of toxicity either clinically or histologically was observed when the injection was given slowly, even though as much as 2 g. per Kg. was injected. Experimental and clinical observations have indicated that the injected amino-acids are rapidly utilised; this was shown by nitrogen balance studies, by regeneration of serum protein and by reduction of nutritional œdema.—R. Elman and D. O. Weiner, *J. Amer. med. Ass.*, i/1939, 796.

SYNTHETIC MILK. For use when milk is forbidden, as in a strictly salt-free diet, has been prepared from water, lactose, cream, "ashless" casein ("a special acid-washed first grade acid casein"), and a salt mixture containing calcium, magnesium, potassium, iron and phosphorus. A salt-free bread containing 19.7% of protein may also be prepared, using "ashless" casein.—E. M. Widdowson and R. A. McCance, *Lancet*, i/1935, 1437.

Pigmentum Casein. *Syn.* UNGUENTUM CASEINÆ. Casein 14, potassium carbonate $\frac{1}{2}$, glycerin 7, soft paraffin 21, zinc oxide $\frac{1}{2}$, phenol $\frac{1}{2}$, water to 100. If good casein be used this is almost too thick—add a little more water. A basis for skin medicaments. Thymol *q.s.* may be added to preserve it.

Fissan Brand Products (*Genatosan, Loughborough*). A series of preparations including dusting powders, ointments, etc., whose base is an "albumin colloid isolated from milk," which is rendered especially effective by means of a light powder, "fluoro-silica colloid."

Notes on Artificial Feeding with Cows' Milk and Casein Products.

Human milk has the average composition:—Fat 3.4%, lactose 6.4%, albuminoids 1.7% (casein and lactalbumen), mineral matter 0.2%. (The difference between human milk and cows' milk in the relationship between the albuminoids and the mineral matter is dealt with in *Vol. II*.)

If artificial feeding has to be resorted to, Tuberculin Tested cows' milk (*see Vol. II*) should first be tried, as a general rule diluted with an equal quantity of water. Milk sugar, a drachm to the pint, is also a useful addition. The product contains approximately the same proportion of protein as human milk but is low in fat and sugar.

Artificial human milk may be made from diluted milk by addition of cream, or other fat, and lactose. To 4 oz. of diluted milk add 1 teaspoonful of lactose and 1 teaspoonful of cream (Hutchison & Mottram, *Food and Principles of Dietetics*). Instead of adding cream, "upper milk" may be used instead of whole milk. This consists of the upper portion of milk that has stood in a cool place until a cream layer has formed. By diluting with water, or with water and whole milk, mixtures are obtained containing a high percentage of fat with a normal percentage of protein. Upper milks are much superior to cream mixtures for feeding—the fat percentages are more uniform and the dilutions do not so readily separate as those employing cream.

Sodium citrate, 1 gr. per oz., may be added to prevent clotting in the stomach.

Alternatively, the extra fat may be incorporated in the form of *Emulsio Olei Arachidis, B.P.C.*

Humanised milk in small quantities may be conveniently prepared by setting aside fresh cows' milk for four hours in a cool place, and separating the upper third. This is shaken, brought just to the boil and allowed to cool. After cooling, an equal volume of boiled water is added, and, for each pint, two tablespoonfuls of lactose and one ounce of lime water.—J. H. Burn, *Pharm. J.*, ii/1933, 737.

The following formula has also been employed:—Milk (of average quality) 10 oz., cream (33%) 1 oz. (or cream 48%, $\frac{1}{2}$ oz.), sugar (lactose at first, but later lactose, maltose and cane sugar mixed) 1 oz., broth 4 oz., water to 1 pint. The addition of broth has been found good.

(For particulars of the composition of cows' and other milks, also of condensed milk, graded milks, and of the effects of pasteurisation, see Vol. II.)

PROPRIETARY FOODS

Allenburys Diet (*Allen & Hanburys, London*). It is made from full-cream milk and whole wheat, with added vitamin D, and is prepared for use by the addition of boiling water or milk.

Allenburys Foods (*Allen & Hanburys, London*). No. 1 (for infants up to 3 months old) consists of dried milk from which excess of caseinogen has been removed and vegetable protein, lactose, and milk fat added, together with dextrin-maltose and vitamin D. No. 2 (for infants from 3 to 6 months old) is similar, but contains malted flour, free from starch. No. 3 (for infants more than 6 months old) consists of partially baked wheat flour with malt. A half-cream food and a food with additional iron are also available.

Almata (*Keen, Robinson, Norwich*). It is made from egg-yolk, butter-fat, dextrin-maltose, and decitrated fresh fruit juice and contains the needed mineral constituents. It is also of value as a galactagogue and an invalid food.

Ambrosia (*Ambrosia, London*). A dried milk powder. Also available humanised.

Benger's Food (*Benger's Food, Manchester*). A wheaten flour preparation containing trypsin and amylase. It is used with fresh milk or milk and water. It gives nourishment with complete or partial rest to the digestive system. The point of the preparation is that if the digestive system, however weak, can do any work at all, it should be given it to do to the extent of its power. The fat may be increased by adding cream or upper-milk.

Brestol (*Cow & Gate, Guildford*). "Humanised cream" with cod-liver oil and concentrated orange juice. As substitute for dairy cream and cod-liver oil emulsions in cases of fat intolerance and in backward and underweight babies, also in marasmus and tuberculosis.

Casac (*Mead, Johnson & Co., Evansville, U.S.A.; Brooks & Warburton, London*). Calcium caseinate, to correct diarrhoea and other nutritional disturbances of infants.

Casumen (*Prideaux, London*). A soluble form of casein (Flocculent Casein) containing a very high percentage of protein (90%). For use in all cases of poor nutrition. It contains practically no fat or sugar. It may be mixed with cocoa, chocolate, bread (10%) for diabetics, etc.

Colact (*Glaxo Laboratories, London*). Beverage of milk solids, cocoa and sugar with a concentrate of vitamins A and D. Each oz. contains 350 i.u. of vitamin A and 65 i.u. of vitamin D.

Cow & Gate Milk (*Cow & Gate, Guildford*). Dried milk without added sugar. Available as full-cream and half-cream.

Energen Bread (*Energen Foods, London*). Contains 40% of protein and only 46% of starch. Its caloric value is 108 cal. per oz. (ordinary bread 75 cal. = 1 oz.). Energen Bread and Breakfast Food (Bismel) are rich in protein and much reduced in starch, and are of value in cases requiring strict dietary.

Farex (*Glaxo Laboratories, London*). A preparation of wheat flour, wheat germ, oatmeal, cornmeal, edible bone meal, yeast and a concentrate of vitamins

and minerals (including calcium, phosphorus, iron, copper and vitamins A, B₁, B₂ and D). It does not require cooking. An invalid diet and in the treatment of gastro-intestinal disorders.

Ferrolac (*Glaxo Laboratories, London*). Full-cream and fat-modified forms of dried milk containing 5 gr. of iron, and ammonium citrate (1 gr. of Fe) per reconstituted pint, with 200 i.u. of vitamin D (fat modified) or 165 i.u. (full-cream).

Frailac (*Cow & Gate, Guildford*). A reconstituted milk specially devised for frail and premature babies.

Glaxo, Full-Cream (*Glaxo Laboratories, London*). Resembles Sunshine Glaxo, but retains full fat and protein content of cows' milk, and contains, when reconstituted, 165 i.u. of vitamin D per pint and 5 p.p.m. of iron. For infants after first 3 or 4 months.

Sunshine Glaxo is adjusted to a "humanised" formula and contains when reconstituted, 200 i.u. of added vitamin D (Calciferol) per pint and 5 p.p.m. of iron. Specially suited for infants in first 3 or 4 months of life.

Glax-Ovo (*Glaxo Laboratories, London*). A tonic malted food beverage containing dried milk, chocolate malt extract, and 140 i.u. of Ostelin vitamin D per reconstituted pint.

Hemolac (*Cow & Gate, Guildford*). Full-cream milk powder containing 31½ gr. (0.45%) of iron and ammonium citrate to the lb. For prevention of anaemia in infancy.

Lacidac (*Cow & Gate, Guildford*). A dried milk with addition of 1 dr. of lactic acid B.P. to 1 pint of milk. Made in two strengths: Separated (1% fat) and Half-Cream (16% fat), the optimum dilutions being respectively 1 to 9 and 1 to 8 parts of boiled water. In convalescence, marasmus, eczema, diarrhoea and vomiting.

Lacquin (*Cow & Gate, Guildford*). Dried milk containing in 1 teaspoonful 2½ gr. of quinine. For use in the tropics.

Lacto-Dextrin (*Battle Creek Food Co., Battle Creek; Coates & Cooper, London*). A carbohydrate food with a high caloric value. Contains 73% of lactose and 25% of dextrin. For changing the intestinal flora, to combat auto-intoxication.

Lactogen (*Nestlé, London*). Dried cows' milk to which cream and lactose have been added.

Mellin's Food (*Mellin's Food, London*). A malted food in which all the carbohydrate has been rendered soluble.

Neave's Food (*Neave's Food, Fordingbridge*). A baked flour containing starch, to be made with milk and water. Neave's Milk Food is a dried milk with added lactose and maltose.

Nestlé's Milk Food (*Nestlé, London*). A mixture of desiccated Swiss milk, baked wheat flour and cane sugar (27%). Contains about 18% of starch.

Ostermilk (*Glaxo Laboratories, London*). No. 1 is a modified milk food enriched with 200 i.u. of vitamin D per reconstituted pint, and 5 p.p.m. of iron. Specially suited for use during the first few months of life. No. 2 is a full-cream milk food with fat and protein content unmodified. Contains 165 i.u. of vitamin D in each reconstituted pint, and 5 p.p.m. of iron. For the complete feeding of infants from the fourth month, the same as Full-Cream Glaxo.

Ovaltine (*Wander, London*). Composed of malt extract, milk, eggs and converted cocoa, and contains active lecithin. Analysis: Fat 8.01%, soluble carbohydrates 67.9%, nitrogenous substances as protein 14.2%, ash 3.76%, water 1.5%.

Pantavene (*Anglo-French Drug Co., London*). Tablets each containing 0.6 g. of total extract of the oat, *Avena sativa*. Advocated in debility, hypotension, etc. Dose.—2 tablets t.i.d.

Peptalac (*Cow & Gate, Guildford*). Pancreatised milk, dextrinised and pancratised wheat, retaining full mineral and vitamin content with freedom from pathogenic organisms. For use where powers of digestive tract are deficient.

Plasmon (*Plasmon, London*). Soluble casein. Nutritive and easily digested. Plasmon biscuits, arrowroot, cocoa and chocolate are prepared.

Savory & Moore's Food (*Savory & Moore, London*). Wheat flour with addition of malt, the carbohydrate being rendered soluble.

Secway (*Trufood, London*). Whey protein (chiefly lactalbumen) 13%, milk sugar 76%, milk salts 9%, fat and moisture of each 1%. In premature and delicate infants.

Sister Laura's Food (*Sister Laura's Food Co., Glasgow*). A starchy food to be added to undiluted milk.

Soluble Protein G.L. (*Glaxo Laboratories, London*). Soluble sodium salt of casein (protein 91.5%) for use in high protein feeding. Added to skim milk in the proportion of 20 gr. to 1 oz. In fermentative diarrhoea and to increase alkalinity of stools.

Trufood (*Trufood, London*). A dried milk without added sugar. Humanised Trufood is also available.

Starchless Bread (both brown and white) also biscuits and flour are manufactured. These are generally gluten products (more or less free from starch) and bran foods. Previously they were the only foods available for diabetics. Casein (with eggs and butter) has latterly been employed. Casein bread and biscuits (*Callard & Co., London*) are free from carbohydrates.

It is best to give this casein bread with a weighed quantity of starchy bread when desired. "Gluten bread" may contain as much as 55% of starch. It can be made with 7% of starch, but it is not palatable.

Almonds and other nuts are also used for making bread and biscuits. Various sugarless condiments, foods and drinks are prepared. Saccharin is used as the sweetening agent.

Sugar-free Milk for Diabetics. Prepared by a process of separating and washing with warm water, using a dairy cream centrifugal separator. Pour a gallon of cream into a 10-gallon can, fill with water at proper temperature for skimming, and thoroughly stir. Adjust separator to deliver 1 part out of the original 10. The cream is separated and the reservoir and separator bowl rinsed, while still running, by adding more warm water. On repeating the process the cream becomes sugar-free. Flavour restored by addition of salt (0.5 to 0.7%) and a little saccharin (added just before serving).

The following lists may be useful in assisting the SELECTION OF FOODS FOR DIABETICS:—

(i) Foods free from carbohydrates or containing less than 1%:—Beef, mutton, lamb, pork, poultry, game, sweetbread, tongue, fish, turtle, lobster, eggs, butter, Cheshire, American, Dutch and gorgonzola cheeses, lard, gelatin and starch and sugar-free special foods.

(ii) Foods containing a low proportion of carbohydrates (percentage of carbohydrate is indicated):—Liver 1, sausage (pork) 1, crab 1, crayfish 1, scallops 3, asparagus 3, celery 3, cucumbers 3, lettuce 3, spinach 3, oysters 4, mussels 4, stilton cheese 3, cheddar 4, rhubarb 4, tomatoes 4, mixed pickles 4, cauliflower 5, leeks 6, radishes 6, mushrooms 7, water melons 7.

(iii) Foods rich in carbohydrates:—Milk 5 or more, whey 5, oatmeal (thin gruel) 6, strawberries 7, turnips 8, carrots 9, beet (fresh), cranberries and pine-apple 10, oatmeal (boiled), blackberries, dried peaches 11, oranges 12, parsnips, apricots, currants, walnuts and filberts 13, apples and pears 14, macaroni (cooked) 16, calves foot jelly, artichokes, peas (green), cherries and almonds 17, potatoes and pears (dried) 18, figs and grapes 19, plums 20, boiled potatoes 21, bananas 22, rice (boiled) 24, tapioca pudding and cocoa-nuts 28, chocolate 30, mince pie 38, chestnuts (fresh) 42, apple pie 43, bread (brown) 47, potatoes (fried chips) 47, bread (white) 53, rolls 56, lentils (dried) 60, bread (toasted) 61, peas (dried) 62, gingerbread 63, macaroons 65, sponge cake 66, oatmeal 67, chestnuts (dried) 74, sago 78, tapioca 88, arrowroot 97, dried fruits, i.e., apples, apricots, currants, dates, figs, prunes, raisins 62 to 78, meal flour, rice, macaroni, vermicelli 70 to 80.

In the case of list (ii) much of the carbohydrates in some of them is in the form of cellulose, which is not absorbed.

The carbohydrate content of common British fruits and vegetables.—*Spec. Rep. Ser. med. Res. Coun., Lond., No. 135, 1929.*

CEREVISIÆ FERMENTUM

B.P.C.

Syn. FÆX MEDICINALIS (P. Jap. V).

Dose.— $\frac{1}{2}$ to $\frac{1}{2}$ ounce (8 to 16 g.) of compressed yeast; $\frac{1}{2}$ to 1 drachm (2 to 4 g.) of dried yeast.

The cells and spores of *Saccharomyces Cerevisiæ*.

P.G. VI requires *Fæx Medicinalis* to be dried at a temperature not exceeding 40° and to retain its fermenting properties. Compressed and dried yeasts are included in *P. Helv. V. Fr. Cx.* specifies brewer's yeast, dried below 40° and powdered; it should have retained its vitamin B₁ content.

The chief species used in the fermentation industries are *Saccharomyces cerevisiæ*, *S. Carlsbergensis*, and *S. monacensis*. Brewer's yeast is a viscid frothy liquid with bitter taste. Baker's yeast or compressed distiller's yeast is obtained by filtering fermenting liquids and compressing the product. Dried yeast is prepared at temperatures not above 30°.

Uses. Fresh yeast may be useful in indigestion and flatulence. Both fresh yeast and the dried form are given to check boils and for acne. It is said that fresh yeast given *per os* grows actively in the stomach and slightly reduces sugar in diabetes. Yeast has been used for constipation, as also in tuberculous affections and in dysentery. In dyspepsia due to swallowing nasopharyngeal pus, it acts gastrically, and probably by *direct* contact. It not only checks vomiting, but after 14 to 21 days' use it will be noted that the patient loses the icteric complexion and gets a healthy colour.

Some hold the action of yeast is virtually that of nuclein, as it is still effective after the yeast has been heated to 130° for an hour.

YEAST EXTRACTS AS FOOD. These have almost no caloric value. Their chief dietary value lies in their vitamin B content, and they are employed for this purpose both in the prevention and treatment of pellagra, beri-beri, and other vitamin B deficiency diseases. They are sometimes used to adulterate and enrich genuine meat extracts, which they resemble closely in taste. The chief chemical difference between the yeast and meat extracts is the presence of adenine in the former and creatine and creatinine in the latter.

Extractum Fæcis (P.G. VI, P. Jap. V).

Prepared by first removing the bitterness of fresh "lower" beer yeast with 1% sodium carbonate, and then submitting to a process of auto-digestion in the presence of hydrochloric acid, finally extracting the mass with water, evaporating and incorporating 25% of "medicinal yeast" (entire yeast with bitterness removed) to produce the powder. The extract is used as pill excipient.

Tabellæ Cerevisiæ Fermenti (B.P.C.) contain 5 gr. (0.3 g.) of dried yeast.

Fæxalin (Coates & Cooper, London). Dry beer-yeast in the form of flakes.
Dose.—A teaspoonful to a tablespoonful thrice daily with water, milk or wine.

Fæxin (*Martindale, London*). A dry powdered yeast. *Dose*.—One teaspoonful in water, beer or milk, with meals.

Fæxin Extract is made by extracting fresh yeast. Used for the various affections for which fresh and dried yeast is employed, e.g., in acne, erysipelas, furunculosis, folliculitis, leucorrhœa, diabetes, conjunctivitis, phlyctenulosa, typhoid and acute articular rheumatism. Available in pills and tablets containing 3 gr.

Marmite (*Marmite Food Extract Co., London*). A palatable yeast extract, rich in vitamin B complex. It is stated to promote growth in weakly children, and assimilation of fat; produces leucocytosis in chronic septic conditions and increases general metabolism. It is also of value in pellagra and polyneuritis, and in macrocytic anemia and sprue.

Pernicious anemia of pregnancy treated with Marmite and with liver extract. Both preparations are active even when the anemia is complicated by malaria or hook-worm. Marmite thought equal to liver. Suggests that macrocytic anemia is a deficiency disease.—Lucy Wills, *Brit. med. J.*, i/1931, 1059.

Two cases of megalocytic hyperchromic anemia associated with tetany and steatorrhœa cured by Marmite, 12 g. daily. Marmite useless in the treatment of Addisonian pernicious anemia. There is probably a factor common to both liver extract and Marmite, but its determination is not yet possible.—J. M. Vaughan and D. Hunter, *Lancet*, i/1932, 833.

Good results reported from its use in tropical macrocytic anemia and sprue in India.—Lucy Wills, *Lancet*, i/1932, 838. See also Sir L. Rogers, *ibid.*, 906.

Marmite was found to be an effective alternative to liver extract in the treatment of pernicious anemia, the hæmoglobin increasing more rapidly than the red blood count in Marmite treatment, while the converse was seen in liver treatment. Dosage was 3 tablespoonfuls per day for primary and relapsed cases, 3 teaspoonfuls for maintenance.—A. Goodall, *Lancet*, ii/1932, 781.

The response to treatment of anemia with Marmite depends on the ability of the stomach to secrete an intrinsic factor. Thus Marmite was helpful in the cure of the macrocytic anemia of sprue but not in Addisonian pernicious anemia.—S. Davidson, *Brit. med. J.*, ii/1933, 481.

In their present form yeast or its products cannot be considered as substitutes for liver, liver extracts or gastric tissue products. The variation in response to treatment with yeast preparations can be explained by definite variations in the degree of failure in secretion of the intrinsic factor.—S. Davidson, *Med. Annu.*, 1935, 20.

Mycolactine (*Anglo-French Drug Co., London*). Combination of bile extract, yeast and lactic ferments. *Dose*.—2 tablets before each meal. Constipation, intestinal toxæmia, etc.

Mycoosin (*Richter, London*). Desiccated yeast tablets.

Proliferase (*Anglo-French Drug Co., London*). Suspension of living yeast cells—130 to 140 million cells per ampoule. In ampoules for oral administration in constipation, vitamin B deficiencies, furunculosis, etc.

Simfax (*Crookes Laboratories, London*). Pure standardised yeast.

Penicillin. During the growth of moulds a substance of unknown composition is formed, which has the power of inhibiting the growth of many bacteria. This substance is called penicillin, and it has been extracted as a solid mixed with coloured material. The purest extract so far obtained contains about 20% of penicillin. It has been tested against pathogenic organisms and found to be an extremely potent antiseptic even in high dilutions.

Hæmolytic streptococci were inhibited in a dilution of 1 in 800,000 of penicillin, as compared with 1 in 200,000 of sulphathiazole. Penicillin is apparently non-toxic.—A. Fleming, *Pharm. J.*, ii/1940, 172.

Penicillin is active *in vivo* against at least three of the organisms inhibited *in vitro*. It does not appear to be related to any chemotherapeutic substances at present in use and is particularly remarkable for its activity against the anaerobic organisms associated with gas gangrene.—E. Chain *et al.*, *Lancet*, ii/1940, 226.

Extracts of *B. Coli* were found to contain an enzyme (termed penicillinase), which destroyed the growth-inhibiting property of penicillin. It can be precipitated (with much loss of activity) by 2 volumes of alcohol, and its activity

increases considerably towards the alkaline range of pH. It is very active at pH 8 and 9; above the latter penicillin is unstable. Penicillinase was absent from extracts of *Staph. aureus*. The bacteriostatic action of the sulphonamide drugs is inhibited in the presence of tissue constituents and pus. Penicillin, not affected under these conditions, has thus a definite advantage. Since some bacteria contain an enzyme acting on penicillin, it is possible that the latter may have a function in their metabolism.—E. P. Abraham and E. Chain, *Nature, Lond.*, ii/1940, 837.

Penicillin snuff, containing penicillin 1, menthol 5, lycopodium 90, was tested on 4 subjects. It greatly decreased the number of staphylococci, although in 3 subjects the number increased again after treatment was stopped.—M. E. Delafield *et al.*, *Brit. med. J.*, i/1941, 148.

Vitamin E.

Vitamin E is an oil-soluble substance occurring in the oil from wheat-germ, rice-germ, cottonseed and maize, and in green leaves such as those of lettuce. Wheat-germ oil is the most commonly used source, and it should be stored at low temperature. The non-saponifiable fraction of this oil consists mainly of sitosterol, and when this is removed there remains a fraction having the characteristic physiological action of vitamin E. From this active fraction *alpha*-tocopherol, an alcohol of the empirical formula, $C_{55}H_{100}O_2$, has been isolated as a light yellow viscous oil insoluble in water, but soluble in alcohol and organic solvents, and found to have vitamin E activity to a marked degree. *Beta*-tocopherol and *gamma*-tocopherol have also been isolated from wheat-germ oil and from palm oil and cotton seed oil, but these two compounds have the biological activity of vitamin E in lesser degree than *alpha*-tocopherol.

Uses. Preparations of vitamin E are used in the treatment of patients with a history of habitual abortion. They are also used in cases of threatened abortion or premature separation of the placenta, and even in the later months success has been obtained. Vitamin E has been employed in the treatment of pregnancy toxæmia, and the routine administration of vitamin E to all pregnant women is recommended. Sterility treated by administration of vitamin E responds only if the condition is due to hypovitaminosis E, which is of rare occurrence. Muscular dystrophy has also been successfully treated by whole wheat-germ.

5 ml. wheat-germ oil each day for 2 weeks, then 5 ml. on alternate days for 2 weeks and subsequently 5 ml. every sixth day were given to each of 2 women who had had 4 and 5 consecutive miscarriages respectively; and each one then had a living child born.—P. Vogt-Møller, *Lancet*, ii/1931, 182.

Doses of 40 drops of wheat-germ oil three times daily for 4 months (third to seventh month of pregnancy) followed by a dessertspoonful of wheat-germ three times a day were effective in curing 17 out of 20 cases of habitual abortion.—P. Vogt-Møller, *Hospitalstidende*, 1933, 76, 621.

Use of vitamin E in 20 cases of habitual abortion and 5 of sterility. Successful in 17 cases of the habitual abortion group and in 2 of the sterility group. Treatment consisted in the administration of 40 drops of wheat-germ oil 3 times daily from the 3rd to the 7th month of pregnancy with a dessertspoonful of wheat-germ 3 times a day.—P. Vogt-Møller, *Hospitalstidende*, 1933, 76, 621.

Nineteen successful pregnancies and 5 expectant cases (*i.e.*, patients were past the time when abortion usually occurred) out of 27 cases of habitual abortion treated with vitamin E. In 3 cases of threatened abortion similarly treated there were 2 successes and 1 failure. In all of 10 cases of sterility treatment was unsuccessful.—W. Pelton Tew, *Canad. med. Ass. J.*, ii/1934, 521.

Of 29 cases treated, 23 have been delivered and the other 6 are all past the sixth month of pregnancy, the average length of treatment being 5 months. The 23 delivered mothers had had collectively 73 previous pregnancies, resulting in the birth of only 11 living children, 5 of which died immediately after birth. Vitamin E was given in the form of wheat-germ oil, 1 3-minim capsule daily *per os*, together with vitamins A and D.—D. W. Currie, *Brit. med. J.*, i/1936, 752.

Thirty-seven women who had collectively 130 pregnancies gave birth to only 16 viable children. Under treatment with vitamin E in a dose of not less than 3 minims of the oil extract daily these women produced 37 living children. Two of them aborted, there were two sets of twins and 4 children died in hospital from prematurity.—David Currie, *Brit. med. J.*, ii/1937, 1218.

The necessity for vitamin E for normal embryonic growth in animals other than the rat and the mouse has not been established. It is difficult to obtain proof that vitamin E is of value in the treatment of habitual abortion in human beings.—F. J. Browne, *Proc. R. Soc. Med.*, 1939, 32, 863.

While there can be no conclusion on general grounds as to the indispensability of vitamin E to the human species, an analysis of the results obtained to date by various chemical workers affords at least presumptive evidence that it is needed for normal pregnancy in women.—A. L. Bacharach, *Brit. med. J.*, i/1940, 890.

MUSCULAR DYSTROPHIES. Of 18 cases of muscular dystrophy, chiefly in children, the results of treatment with vitamin E were remarkable. Every patient, except one, improved who was treated for more than six weeks, even bed-ridden patients showing improvements. When it is remembered that these cases should have got worse, or at least remained the same, such definite improvement must mean that this treatment promises success in a disease which has always, until now, been hopeless. The slowness, however, of recovery and the necessity for prolonged treatment must be emphasised. The results obtained support the contention that muscular dystrophy and amyotrophic lateral sclerosis are deficiency diseases and curable. The treatment consisted of the administration of $\frac{1}{2}$ oz. of fresh dried whole wheat-germ twice daily over a prolonged period.—F. Bicknell, *Lancet*, i/1940, 10.

Davitamon E (*Organon Laboratories, London*). Capsules each containing 0.5 ml. of wheat-germ oil.

Ephynal (*Roche Products, Welwyn Garden City*). Tablets containing 3 mg. of synthetic α -tocopherol acetate.

Fertilol (*Vitamins Ltd., London*). Brand of wheat-germ oil. *Dose*.—3 5-minim capsules daily for a minimum period of 3 months recommended.

Germiol (*Paines & Byrne, London*). Wheat-germ oil concentrate issued in 1 ml. ampoules containing the equivalent of 100 g. of wheat-germ, and in capsules containing the equivalent of 5 g. of wheat-germ oil.

Phytoferol (*British Drug Houses, London*). Capsules each containing 3 m. of oily concentrate equivalent in activity to 3 mg. of *dl*- α -tocopherol.

Profecundin (*Richter, London*). Concentrated vitamin E preparation in solution and tablets. *Dose*.—30 to 40 drops of solution (1% vitamin E) or 2 tablets (each containing 0.01 g. vitamin E) three times daily.

Trigol (*Abbott Laboratories, London*). Brand of wheat-germ oil.

Wheat-Germ Oil (Collosol Brand) (*British Colloids Ltd., London*). Wheat-germ oil in capsules containing 3 minims (0.2 g.), the vitamin E potency being 40 units as expressed on the Pacini-Linn scale (*i.e.*, 25 mg. daily is required to ensure a litter of rats in a vitamin-E-depleted mother).

Viteolin Capsules (*Glaxo Laboratories, London*). 3-minim capsules containing the unsaponifiable matter from 5 g. of wheat-germ oil.

15 cases of habitual abortion, treated with 1 capsule daily for 3-6 months. Successful in every case.—G. C. M. McGonigle, *per Nutr. Abstr. Rev.*, 1934-5, 4, 613.

Zygon (*Squibb, New York; Savory & Moore, London*). Wheat-germ oil. Also available in 3 m. capsules. *Dose*.—One teaspoonful or 6 capsules daily.

Acidum Nucleicum (*B.P.C.*). *Syn.* NUCLEIC ACID (*Fr. Cx.*). *Dose*.—1 to 5 grains (0.06 to 0.3 g.). 15 minims of a solution made with alkalis *q.s.*, *v. infra*, hypodermically. Much larger amounts have, however, been given.

Greyish- or yellowish-white powder prepared from yeast. It is **insoluble** in water except in the presence of alkalis, with which soluble salts are formed. Its solution is acid to litmus paper, and liberates CO_2 from carbonates. Insoluble in alcohol and ether.

When nucleic acid is ordered for injection, give the equivalent in the form of sodium nucleate, the sodium nucleate being prepared from nucleic acid and a sufficiency of sodium carbonate to make it neutral to litmus. A 5% sodium nucleate solution is usually supplied when a saturated solution of nucleic acid is ordered for injection. Sodium nucleate solutions should be prepared with normal saline and a sufficiency of phenol for preservative purposes.

Uses. Usually in the form of the sodium salt in the treatment of influenza, pneumonia, scarlet fever and puerperal fever, also in tuberculosis. Injections cause an initial leucopenia, which is quickly followed by a marked leucocytosis.

Sodium nucleate solution 2 ml., containing 0.05 g. per ml., intramuscularly increases leucocyte count; found of value in influenza.

Apparently saved life in a case of imminent pneumonia. 2 ml. given every 4 hours. Should be tried in puerperal fever and other bacterial infections.—*Brit. med. J.*, i/1928, 52.

LOBAR PNEUMONIA. Sodium nucleate 0.1 g. intramuscularly, of value. It brings down the temperature within 48 hours—otherwise the dose is repeated. Sodium bicarbonate also given by mouth in $\frac{1}{2}$ drachm doses every 4 hours in severe cases when the urine contains acetone.—*Brit. med. J. Epit.*, i/1927, 64.

In lobar pneumonia of an asthenic type in which leucocytes do not rise in number as the disease advances.—J. D. Comrie, *Prescriber*, i/1927, 390.

SEPTICÆMIA, where operation is requisite, treated by *B. coli* 50 millions and *Streptococcus* 10 million 10 days and again 3 days before operation, and on the night preceding operation, 5 ml. of 5% sodium nucleate intramuscularly.—D. P. D. Wilkie, *Brit. med. J.*, ii/1931, 595.

Sodii Nucleas. *Syn.* SODIUM NUCLEINATE (*Fr. Cx.*).

Dose (of 5% *w/v* solution).—1 to 2 drachms (4 to 8 ml.) orally; $\frac{1}{2}$ to $\frac{1}{4}$ drachm (1 to 2 ml.) by injection.

Is used as a 5% solution obtained by treating nucleic acid with sufficient sodium carbonate to form a solution neutral to litmus.

Nargol (*Parke, Davis, London*) and **Cuprol** (*Parke, Davis, London*) are compounds of nucleic acid with respectively silver and copper. Cuprol is of use in granular ophthalmia in the form of 5% instillations. Nargol is soluble in water 1 in 4. Contains about 10% of Ag. It is supplied in the form of **Nargol Bougies**, 1% and 2%, for the treatment of specific urethritis.

Acidum Thymicum. *Syn. and Prop. Name.* NUCLEOTIN-PHOSPHORIC ACID, **SOLUROL** (*Allen & Hanburys, London*).

Dose.—4 to 6 grains (0.25 to 0.4 g.).

A yellowish-brown powder soluble in water. The solution dissolves uric acid, and has been used in the treatment of gout. It may also be administered by intramuscular injection in 2 gr. doses.

Pentose Nucleotide. Obtained by the alkaline hydrolysis of the nucleic acid of yeast by means of 1% sodium hydroxide. The resulting solution is acidified and the precipitated acids are purified by means of their lead salts, re-precipitated, and converted into the sodium salts. The latter are used therapeutically as an approximately 8% solution. The preparation probably contains the sodium salts of four nucleotides (compounds containing

phosphoric acid, pentose and pyrimidine radicals) of the general

formula $\begin{matrix} \text{HO} \\ \text{O} \diagup \text{P} - \text{O} - \text{C}_5\text{H}_8\text{O}_5 \cdot \text{B} \\ \text{HO} \diagdown \end{matrix}$, where B is one of the bases

guanine, adenine, cytosine or uracil, the pentose present being *d*-ribose.

Uses. The solution is given by intramuscular injection in doses of 10 ml. or more twice daily, in all cases exhibiting a leucopenia or neutropenia, especially in agranulocytic anæmia. This dosage is continued until an increase in the white cells is noted and is then reduced to 10 ml. daily, until a normal count has persisted for several days. In more severe cases 20 ml. twice a day for the first four days can be given. In successful cases the leucocyte count begins to return to normal about 5 days after treatment is commenced. In susceptible patients the injections may cause a temporary reaction accompanied by dyspnoea, bradycardia and sweating.

The standard dose is 10 ml., containing 0.7 g., administered intramuscularly twice daily till white cell count has risen definitely, and then once daily till count has been within normal limits for at least 3 days. Double the dose in desperately ill cases. If reactions occur (dyspnoea, precordial distress, sweating or vomiting) give divided doses into a site previously anaesthetised by Novocain and adrenaline. Description of a case successfully treated.—H. L. Marriott, *Lancet*, i/1934, 448.

In a series of 4 cases it was given in 1 acute case with benefit and in 3 chronic cases, with benefit in 1 and no effect in 2. In two other cases its use had to be abandoned owing to the severity of the reaction—one patient, who had previously been in a good condition, passed into a stuporous state and died. It will be agreed by those who have experience of Pentnucleotide that the reactions are not infrequently severe enough to prohibit further use of the drug. One reason that we have not been more fortunate in this country (as compared with America) may be insufficient dosage—in severe cases it seems desirable to inject 50 ml. a day. It is hoped that some means will be found to abolish the unpleasant side-actions of the drug so that doses of this order can be given with safety.—L. J. Witts, *Proc. R. Soc. Med.*, 1936, 29, 680.

An analysis of 393 cases recorded in the literature since 1933. The mortality in 75 untreated cases was 78%. The mortality in 43 cases receiving no specific therapy, but which received more than three days of general hospital care, was 70%. The mortality in 130 cases receiving inadequate amounts of any supposedly specific therapy was 77%. The mortality in 26 cases treated with adequate amounts of liver extract was 62%. The mortality in 85 cases treated with Pentnucleotide was 35%. At present it would appear that Pentnucleotide in doses of at least 40 ml. a day is the most promising form of specific therapy in this disease.—H. Jackson and T. J. J. Tighe, *New Engl. J. Med.*, i/1939, 732.

A patient with severe pulmonary tuberculosis and tuberculous laryngitis received sanatorium treatment and artificial pneumothorax. Following Sano-crysin therapy, agranulocytic anæmia developed, and was treated with Pentnucleotide. From one of the injections a staphylococcal abscess of the buttock developed, and this appeared to initiate recovery, which was eventually complete.—A. B. Taylor, *Lancet*, ii/1937, 74.

A case of pneumococcal peritonitis with leucopenia successfully treated with sodium pentose nucleotide.—J. B. G. Muir, *Brit. med. J.*, i/1938, 942.

Liquor Nucleotidi. The Committee on Pharmaceutical Chemistry of the Pharmacopœia Commission (*Report* 12) have recommended the inclusion in the *B.P.* of solution of pentose-nucleotides prepared by the hydrolysis of nucleic acid with a solution of sodium hydroxide, followed by purification of the nucleotides, and preserved with 0.3% of cresol.

Pentide (Allen & Hanburys, London), **Pentnucleotide** (Syn. NUCLEOTIDE K. 96) (Smith, Kline & French, Philadelphia; Menley & James, London) and **S.P.N.** (Evans, Sons, Lescher & Webb, Liverpool) are preparations of sodium pentose nucleotides.

Guanidine. Treatment with guanidine hydrochloride caused a marked and well-sustained improvement in muscular function in 5 cases of myasthenia gravis without the presence of undesirable symptoms. The drug may be administered either intravenously (2% solution in normal saline) or orally in gelatin capsules, and is equally effective by either route. 10 mg. per Kg. is a safe and adequate amount to give as a single dose to test the effectiveness in a given individual. For continued medication the total daily dose and the times of administration of divided doses must be worked out in terms of the needs and tolerance of each patient. Compared with normal persons, patients with myasthenia gravis can tolerate larger doses of guanidine over an indefinite period without the production of hyperguanidemia, the presence of which is indicated by gastro-intestinal or other symptoms. While these symptoms can be relieved by atropine they should serve as a warning that the administration of guanidine should be temporarily reduced or withheld. Treatment with guanidine may be combined with prostigmine.—A. S. Minot *et al.*, *J. Amer. med. Ass.*, ii/1939, 553.

Adenine Sulphate. Adenine sulphate, prepared by the hydrolysis of yeast nucleic acid, when given intravenously in 2 g. doses, is specific and non-toxic in stimulating myeloblastic activity in granulocytopenia developing as a result of severe sepsis. The material is prepared for injection by dissolving the salt in normal saline 1 g. to 100 ml. by boiling. It is not readily soluble, and it may be necessary to add 10% hydrochloric acid to the suspension for complete solution.—E. L. Richmond, *New Engl. J. Med.*, ii/1939, 267.

CHLORAL HYDRAS

B.P., U.S.P. XI, Fr. Cx., P. Ned. V, P. Helv. V, etc.

Syn. TRICHLORETHYLIDENE GLYCOL.

[P1] "*Chloral hydrate.*"

Dose.—5 to 20 grains (0.3 to 1.2 g.) in aqueous solution or in chloroform water, well diluted. *P. Helv. V* and *P. Dan.* have max. single dose 45 grains, max. during 24 hours 90 grains. *Fr. Cx.* has 60 and 180 grains.

Colourless, non-deliquescent crystals, volatilising slowly in air. It liquefies at 50° to 58°.

Soluble 4 in 1 of water, 5 in 1 of alcohol, 2 in 1 of glycerin, 2 in 1 of ether, and 1 in 3 of chloroform, likewise soluble in oils and fats.

Incompatible with alkalis and alkaline salts (*e.g.*, soluble barbitone), ammonium salts, borax, tannin, potassium iodide or permanganate, and with alcohol—chloral-alcoholate may separate. Liquefies with camphor, *q.v.*, and with quinine salts.

Antidotes. Empty stomach by emetic or by stomach tube, using at least 2 gallons of water at 105°F. Keep patient lying down and warm with hot blankets and hot-water bottles; he must be roused but *not* walked about. Give hot, strong coffee; aromatic spirit of ammonia, $\frac{1}{2}$ dr. in 4 oz. of water. Caffeine sodium benzoate, 2 gr., and strychnine, $\frac{1}{2}$ gr. hypodermically. Oxygen, or oxygen with 7% carbon dioxide, inhalations may be needed, also artificial respiration.

Uses. A hypnotic of special value in nervous insomnia, puerperal mania, insanity and delirium tremens. Small doses produce a sound natural sleep lasting for several hours. Its effect may be enhanced by the addition of morphine or bromide. It is also a valuable sedative against the convulsions of strychnine, tetanus and eclampsia, and has been employed in asthma and seasickness. Clinical trials show that chloral hydrate in therapeutic doses has no harmful effect on the heart. It is a remarkably effective hypnotic almost entirely free from habit formation. Its use is best avoided in the presence of gastro-intestinal irritation, though this drawback can be practically eliminated by diluting sufficiently with water. When the blood pressure is lowered during chloral hydrate administration, the effect is not much greater than occurs in natural sleep—actually many patients have an *increased* blood pressure after taking chloral hydrate.

It is used externally as an anodyne and counter-irritant in liniments for rheumatism, sciatica, etc.

Suppositories containing up to 33½% of chloral hydrate may be prepared by dissolving the medicament in the minimum quantity of water in a tared dish, adding sufficient melted oil of theobroma to produce the required weight and triturating with a glass pestle until homogeneous. A 15 gr. mould holds 17½ gr. of a suppository mass made in this way, equivalent to 5.8 gr. of chloral hydrate.—F. R. C. Bateson, *Pharm. J.*, 1936, 122.

INFANTILE CONVULSIONS controlled by 2 to 4 gr. *per os* or 5 grains *per rectum* repeated 2-hourly. When convulsions cease, gradually reduce dose to ½ gr. twice daily, then give calcium chloride 15 to 30 grains 4-hourly for 3 days.—*Per Lancet*, 1/1932, 897.

[P1] **Chloral Camphoratum (B.P.C.).** *Syn.* PIGMENTUM CHLORAL ET CAMPHORÆ (T.H.), CHLORAL CUM CAMPHORA.

Chloral hydrate 1, camphor 1. (Measures 1½ by volume.)

It remains liquid at ordinary temperatures, and forms a valuable application painted on painful parts in neuralgia and rheumatism. It mixes freely with alcohol, ether, oils and fats, but not with water or glycerin. [D-P1-81] Cocaine 10% or less may be incorporated.

The compound (chloral and camphor) dissolves the alkaloids atropine, morphine and veratrine to the extent of 1 in 30 or more, but their salts are less soluble in it.

[P1] **Enema Chloralis Hydratis (B.P.C.).** *Dose.*—4 ounces (120 ml.). 1 to 3% w/v in mucilage of starch.

[P1] **Haust. Chloral. (N.I.F.).**

Chloral hydrate 20 gr., potassium bromide 30 gr., liquid extract of hyoscyamus 5 m., syrup 2 dr., water to 1½ oz.

[P1-81] **Liquor Bromidi Compositus (B.P.C.).** *Syn.* LIQUOR BROMOCHLORAL COMPOSITUS.

Dose.—½ to 2 drachms (2 to 8 ml.).

1 drachm contains 15 gr. each of chloral hydrate and potassium bromide with extract of cannabis and liquid extract of hyoscyamus.

Resembles [P1-81] **Bromidia (Battle & Co., St. Louis, Mo.; prepared in England by Roberts & Co., London)** which is stated to contain in each ounce chloral hydrate 91 gr., potassium bromide 91 gr., extracts of cannabis and of hyoscyamus 1 gr. each. *Dose.*—½ to 1 drachm in syrup or water.

[P1] **Lotio Chloralis Hydratis (Mid. H.).**

Chloral hydrate 10 gr., castor oil 30 m., alcohol (90%) 1 dr., water to 1 oz. For pityriasis capitis.

[P1] **Mist. Sedativa (P.M.H.).** *Syn.* TWO FIFTEENS MIXTURE.

Potassium bromide 15 gr., chloral hydrate 15 gr., peppermint water to 1 oz., for a dose.

[P1] **Mist. Sedativa c. Opio (P.M.H.).** *Syn.* THREE FIFTEENS MIXTURE.

Potassium bromide 15 gr., chloral hydrate 15 gr., tincture of opium 15 m., peppermint water to 1 oz., for a dose.

[P1] **Pigmentum Chloralis et Camphoræ Compositus (B.P.C.)** contains equal weights of chloral, camphor and phenol.

[P1] **Pigmentum Chloral Compositum.** *W.H.* has chloral hydrate 1, menthol 1, thymol 1, camphor 3. *R.D.H.* is the same, with name Linimentum Chloral Compositum. *L.H.* consists of equal parts of chloral hydrate, menthol and camphor.

[P1] **Syrupus Chloralis (B.P.C.).** *Dose.*— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Chloral hydrate and water *a.a.* 20% in syrup; 1 dr. contains about 11 gr.

Somnos (Sharp & Dohme, London). Elixir containing 5.5% of chloral glycerolate. Less depressing to the heart, circulation and respiration than chloral hydrate. *Dose.*—(*Sedative*) 1 or 2 teaspoonfuls in a glass of water; (*Hypnotic*).—1 or 2 tablespoonfuls. Infantile convulsions, colic, chorea, whooping cough, etc., and *per rectum* as hypnotic in post-operative cases and in spasmodic phillia.

Chloralformamidum (B.P.C.). *Syn.* CHLORALAMIDE.
 $\text{CCl}_3 \cdot \text{CH}(\text{OH}) \cdot \text{NH} \cdot \text{COH} = 192.4$.

[P1] "*Chloral formamide.*"

Dose.—15 to 45 grains (1 to 3 g.) in weak spirituous or acidulated solution. Max. single dose 4 g., max. in 24 hours 8 g.

In colourless, odourless, shining crystals with a faintly bitter taste. **Soluble** 1 in 21 of water, 1 in 2 of alcohol, 1 in 12 of glycerin; readily soluble in ether and acetone. Hydrolyses when heated with water above 60°. M.p. 114° to 115° (*B.P.C.*), but commercial samples commonly melt at 118°. Incompatible with alkalis, giving chloroform, ammonia and a formate.

Antidotes. Treat as for poisoning by chloral hydrate.

Uses. Hypnotic in insomnia of alcoholism, neuralgia, hysteria, cardiac diseases and sea-sickness. It is slower and safer in action than chloral, into which it is probably decomposed. Chloralamide and potassium bromide of each 15 grains, with orange tincture and chloroform water has been recommended. It acts if given as an enema.

[P1] **Haus. Chloralamid. Co. (N.I.F.).**

Chloralformamide 20 gr., potassium bromide 15 gr., spirit of chloroform 20 m., water to 1½ oz.

[P1] **Chlorobrom (Burgoyne Burbidges, London).** *Dose.*— $\frac{1}{2}$ to 1 ounce. Contains 30 gr. each of chloralamide and potassium bromide in an ounce, flavoured with liquorice. For insomnia and sea-sickness.

Butylchloralis Hydras (B.P.C.). *Syn.* TRICHLOROBUTYLIDENE GLYCOL, CROTON-CHLORAL HYDRATE (formerly so-called).
 $\text{CH}_3 \cdot \text{CHCl} \cdot \text{CCl}_2 \cdot \text{CH}(\text{OH})_2 = 193.4$.

[P1] "*Butyl chloral hydrate.*"

Dose.—5 to 20 grains (0.3 to 1.2 g.), in mixtures, pills or cachets.

This body is produced by the addition of water to liquid butylchloral, which is the final product of the action of chlorine on aldehyde. In pearly-white crystalline scales with pungent odour resembling that of chloral hydrate, and an acrid, nauseous taste.

Soluble 1 in 43 of cold water, 5 in 3 of alcohol 90% (forming an alcoholate), 1 in 20 of chloroform, 1 in 1 *w/w* of glycerin, 1 in 20 of olive oil and 1 in 2 of ether.

Incompatible with alcohol. Butylchloral alcoholate will be formed, and in case of some mixtures will be precipitated.

Menthyl 2, with butylchloral hydrate 1 part, liquefy. Combines also with phenazone, *q.v.*

Uses. Hypnotic, but weaker than chloral and more depressing to the heart. Given for insomnia not due to pain. In combination with phenazone, cannabis or gelsemium, butylchloral is useful in migraine; neuralgia of nerves other than the cranial is rarely benefited.

[P1] **Mistura Butylchloralis.**

Butylchloral hydrate 4 grains, glycerin 15 minims, water to 1 ounce.

[P1-S1] **Pilula Butylchloralis cum Gelseminina.** NEURALGIC PILLS. Gelseminine hydrochloride $\frac{1}{100}$ gr. (0.0003 g.), butylchloral hydrate 3 gr. (0.2 g.).

[P1-S1] **Tablets** are also prepared. For facial neuralgia 2 at the outset followed by 1 hourly until 6 have been taken.

[P1-S1] **Pilula Butylchloralis cum Camphora et Gelsemio.**

Butylchloral hydrate 2 gr., camphor 1 gr., alcoholic extract of gelsemium $\frac{1}{2}$ gr., powdered acacia $\frac{1}{2}$ gr., powdered tragacanth $\frac{1}{2}$ gr., powdered liquorice 1 gr., syrup *q.s.* Varnish. Use similar to the last mentioned.

Chlorbutol (B.P.). *Syn. and Prop. Name.* ACETONE-CHLOROFORM (*P. Ital. V, Fr. Cx., F.E. VIII, P. Belg. IV*), ALCOHOL TRICHLOROISOBUTYLICUS (*P. Ned. V Supp. II*), CHLOROBUTANOL (*U.S.P. XI*), CHLOROTONE (*Parke, Davis, London*).

Dose.—5 to 20 grains (0.3 to 1.2 g.) in cachet, capsule or tablet, followed by a draught of water or milk, or suspended in a mixture. *U.S.P. XI* average dose 10 grains.

It consists of trichloro-*tert.*-butyl alcohol, $(CH_3)_3C(CCl_3) \cdot OH = 177.4$, with a variable proportion of water of crystallisation. Samples usually contain about $\frac{1}{2}H_2O$. White crystals, with camphoraceous taste. The anhydrous substance has a m.p. of 96°; the *B.P.* requires not lower than 78°. It volatilises with heat.

Soluble 1 in 125 of water, 1 in 10 of glycerin, 3 in 2 of alcohol 90%, 1 in 30 of liquid paraffin, 1 in 12 of olive oil; very soluble in ether and chloroform.

Uses. Chlorbutol is a local anæsthetic with an action weaker than cocaine, and an antiseptic with an action said to be fifteen times stronger than boric acid. Internally, it is hypnotic, and acts on the central nervous system similarly to chloral hydrate, but is less toxic and less irritant to the stomach.

Solutions in liquid paraffin 1 to 2% have been used for inflammation of the middle ear. Vaginal pruritus has been treated with a warm douche 0.4%. For piles, 5 grains in a 30 grain suppository; for a dusting powder for wounds and scalds use chlorbutol 23, with zinc oxide 120, and French chalk 90 parts. Capsules, 5 grains, check sea-sickness and other forms of vomiting, and are useful in whooping-cough, dysmenorrhœa, chorea and other spasmodic conditions.

Antidotes. Treat as for poisoning by chloral hydrate, *see p. 390*.

TETANUS successfully treated by chlorbutol in dose varying between 30 and 120 grains per rectum in olive oil and antitetanic serum. The chlorbutol injections reduce rigidity of the jaw.

Narist. Chlorbutol. (*N.I.F.*). Chlorbutol 5 gr., camphor 6 gr., oil of cinnamon 6 m., olive oil 2 dr., liquid paraffin to 1 oz.

Nebula Chlorbutolis Composita (*St. T. H.*). Chlorbutol 15 gr., camphor 40 gr., menthol 40 gr., oil of cinnamon 8 m., liquid paraffin to 3 oz.

Solutio Chloretone Composita Inhalans. *Syn.* SOLUCION DE CLORETONA COMPUESTA INHALANTE, *F.E. VIII.*

Chloretone 1 g., camphor 2.5 g., menthol 2.5 g., cinnamon oil 0.5 g., liquid paraffin 93.5 g.

Boro-Chloretone (*Parke, Davis, London*). Chloretone and boric acid. Antiseptic and analgesic dressing powder for use in eczema, urticaria, etc.

Chloretone Inhalant (*Parke, Davis, London*) contains Chloretone 1 g., menthol 1.8 g., camphor 2.5 g., oil of cinnamon *U.S.P. XI* (oil of cassia) 0.16 g., liquid paraffin to 100 g. A spray solution for use in catarrhal and congestive affections of nose, throat and bronchi.

Chloretone Compound Ointment (*Parke, Davis, London*). Chloretone, calomel, hydrastine, hamamelin, in lanolin and petrolatum base. For irritable and inflammatory conditions of the rectum.

Dentalone (*Parke, Davis, London*). Chloretone, oils of clove, cassia and wintergreen. Analgesic for treatment of painful and inflamed tooth sockets, etc.

Hæmamol (*Duncan, Flockhart, London*). An astringent and anæsthetic ointment containing a small percentage of chlorbutol for use in hæmorrhoids. [*P1-S1*] **Hæmocones** (*Duncan, Flockhart, London*). Suppositories for use in conjunction with Hæmamol. Each contains morphine hydrochloride 0.2%, and procaine hydrochloride 1%.

Mothersill's Remedy (*Mothersill Remedy Co., London*) and **Zotos** (*Sangers, London*) contain chlorbutol—*cf. Proprietary Medicines, Vol. II.*

Sedaform (*Allen & Hanburys, London*). Chlorbutol capsules 5 grains.

CHLORAMINA

B.P., U.S.P. XI.

Syn. and Prop. Names. CHLORAMINE-T, MIANIN (*P.G. VI, P. Belg. IV, F.E. VIII, P. Helv. V, P. Dan.*), CHLORAZENE (*Abbott Laboratories, London*), TOLAMINE (*Bürroughs Wellcome, London*), *p*-TOLUENE SODIUM SULPHO-CHLORAMIDE.

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.) has been given with charcoal.

Solubility. About 1 in 7 of water, 1 in 2 of boiling water, 1 in 7 of glycerin and 1 in 12 of alcohol. Organic solvents are undesirable. The aqueous solution is faintly alkaline and has a bitter taste. It is insoluble in liquid paraffin, ether, chloroform and benzene. It becomes less soluble on exposure to air, owing to decomposition.

Incompatible with alcohol, hydrogen peroxide and many other substances. Should not be mixed with other antiseptics.

Uses. For treatment of infected wounds and as a general surgical antiseptic, mouth-wash, vaginal douche and for urethral irrigation. It is non-irritant and practically non-toxic; does not coagulate blood serum. It has been used to replace Dakin's solution. Not suitable for intravenous use—has marked hæmolytic

action. 2% is used for infected wounds—increased to 4%. Mouth-wash, nasal or vaginal douche or for urethral irrigation (e.g., in gonorrhœa), 0.25 to 0.5%.

To sterilise water 1 in 250,000 is effective if a little citric acid (0.8 g. per litre) is added—the resulting water is not unpleasant to taste.

Carbasus Chloraminæ (B.P.C.) contains from 4 to 6% of chloramine. A 35% gauze is also made—the former for general use; the latter as preliminary dressing of a wound.

Use *dry* and subsequently moisten if necessary when in position.

Chloramine Ointment. *Syn.* ANTI-GAS OINTMENT No. 2. Anti-gas ointment for casualty services. Contains chloramine in a vanishing cream basis. Effective against mustard gas and lewisite. Speedy application is necessary, and it should be rubbed in for at least one minute. Also used as a prophylactic. Supplied in 1 and 4 oz. amber-coloured pots, fitted with air-tight closures.

Lotio Chloraminæ (I.H.). Chloramine 9 gr., normal saline solution to 1 oz. **Antipart** (Riddell Products, London). Foaming contraceptive tablet containing chloramine and saponin.

Zonitors Chloramine Pessaries (Fassett & Johnson, London). Contain sodium stearate 6%, potassium stearate 2.5%, hydrogen stearate 0.25%, chloramine 2%, water 89.25%. Contraceptive; also for leucorrhœa, vaginitis, etc.

Dygerma (Matthews Laboratories, Clifton, Bristol). A stabilised solution of chloramine in the proportion of 5% by weight. The chloramine is held in stable solution by the buffering action of the ions of sodium, potassium, and boron, and retains its activity for many years. It is a non-irritant and non-toxic germicide, miscible with water and readily diffusible. It does not exert a corrosive action even when used undiluted, and does not coagulate or precipitate proteins or retard the formation of granulation tissue. For use as a general antiseptic in surgery.

Dichloramina (B.P.C., F.E. VIII, U.S.P. XI). *Syn.* DI-CHLORAMINE-T, TOLUENE-SULPHODICHLORAMIDE.
 $\text{CH}_3\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\cdot\text{NCl}_2 = 240.04$.

Yellow crystals or crystalline powder with odour resembling chlorine. Decomposes on exposure to air with evolution of chlorine. M.p. about 78°.

Soluble 1 in 1 of chloroform, 1 in 1 of benzene, 1 in 3 of carbon tetrachloride, glacial acetic acid, chlorinated paraffin or eucalyptol.

This substance enables an oily solution to be prepared, the corresponding monochloride being insoluble in oils.

Uses. Is much more germicidal than chloramine and results are as good as with Dakin's solution. It has the disadvantage, however, of causing painful smarting when applied to open wounds, and of causing dressings to adhere to the wounds. In solution in chlorinated liquid paraffin, or in a mixture of chlorinated paraffin 1 and chlorinated eucalyptol 4, it is used as a disinfectant of the nasopharynx, e.g., in the treatment of meningococcus carriers (1 to 2% solution). 5% solutions may be applied as a spray to wounds, covering with gauze and re-dressing every 24 hours. Solutions are unstable, and should not be kept for more

than 2 to 3 days; they must not be used when a precipitate has appeared.

Chlorinated Eucalyptol.

Treat eucalyptol 100 ml. with potassium chlorate 3 g. and hydrochloric acid (conc.) 10 ml. for 12 hours or longer. Then wash with water and with sodium carbonate solution. Remove the water, add sodium carbonate 3 g., and allow to stand 24 hours. Filter and dry with a little calcium chloride.

Chlorinated Paraffin. *Syn.* CHLOROCOSANE (*U.S.P.* XI).

A colourless or yellowish oil, slightly soluble in alcohol, miscible with ether, chloroform and benzene. May be prepared by treating liquid paraffin 20 parts with potassium chlorate 0.1 part and hydrochloric acid 0.5 part, in a wide-mouthed glass bottle, and allowing the mixture to stand until chlorine ceases to be evolved; the mixture is placed in direct sunlight until the odour of chlorine and the yellow colour of the chlorinated oil have disappeared, and is then shaken in a separator with a slight excess of sodium carbonate solution; the chlorinated product is separated, washed with water until free from alkali, and dried by means of anhydrous calcium chloride.

Halazone. *Syn.* *p*-SULPHONDICHLOROAMINO BENZOIC ACID.

$C_6H_4(SO_2 \cdot NCl_2) \cdot COOH = 270.0$.

A white powder with a strong odour of chlorine. 1 in 300,000 is sufficient to sterilise ordinarily contaminated water in 30 minutes.

Soluble sparingly in water, insoluble in chloroform and petroleum. Soluble also in excess of cold sodium hydroxide solution, but with less quantity or with feebly alkaline salts, *e.g.*, phosphates or borates, hydrolysis occurs.

Tablets. To prepare, powder the acid 4, with dry sodium chloride 92 and add dried sodium carbonate 4 (or dried borax 8%). Pass through a No. 40 sieve (no lubricant required or indeed is to be used), and compress into tablets weighing 100 mg.

Each tablet so made contains 4 mg. of the disinfectant—sufficient for a litre or a quart of water.

Gynomin (formerly known as **Speton**) **Tablets** (*Coates & Cooper, London*). Contraceptive tablets containing sodium bicarbonate, tartaric acid, and sodium dichlorosulphamino-benzoate.

Azochloramid. A bright yellow, crystalline substance obtained by the chlorination of azodicarbonamidine, and containing about 98% of N,N -dichloroazodicarbonamidine, $H_2N(CIN) : C \cdot N : N \cdot C : (NCl)NH_2$. It has a chlorine-like odour and a burning taste; it explodes without melting at 155° . Slightly soluble in water, chloroform, ether and glycerin; soluble in alcohol; partly soluble in glacial acetic acid, acetone and ethyl acetate; solutions decompose on exposure to light.

Azochloramid is stated to be more effective for the dressing, packing or irrigation of wounds, cuts, etc., than chloramine or dichloramine. It is used as a 1 in 500 solution in glycerin triacetate or as 1 in 1600 and 1 in 3300 solutions in isotonic buffered saline solutions.

Azochloramid is active in such low concentrations that its toxic effects are negligible. Serum does not seriously interfere with its activity.—A. Winkler, *per Brit. chem. Abstr. B.*, 1939, 33, 1879.

Azochloramid Solution in Triacetin (*Wallace & Tiernan, London*). 1 in 500. Use undiluted as a wet dressing, packing or instillation. It should not be used on mucous membranes.

CHLORINUM

Cl = 35.46.

Liquor Chlori (B.P.C.). *Syn.* AQUA CHLORI. An aqueous solution of about 0.5% w/v of chlorine gas.

Acidum Hypochlorosum. $\text{HClO} = 52.46$. Hypochlorous acid, as such, has not been isolated. In solution and especially in the form of its salts—the hypochlorites, e.g., those of calcium and sodium—it has played an important part in many chemical processes.

The acid in dilute solution is practically colourless; in a concentrated form it is yellowish. It readily undergoes decomposition with formation of chlorine, chloric acid, oxygen and water. It is hence a strong oxidising agent and for this reason a bleaching agent.

The hypochlorites have been extensively employed for wound treatment, as described in the following pages.

Calx Chlorinata (B.P., P. Dan.). *Syn.* SEL DE JAVELLE, CALCIUM HYPOCHLOROSUM CRUDUM (*Fr. Cx.*), CALCARIA CHLORATA (*P. Helv. V, P. Jap. V*).

Bleaching powder is a dull white powder containing not less than 30% of available chlorine.

Uses. Bleaching powder is a powerful disinfectant and deodorant, and is used to disinfect faeces, urine, and sanitary utensils. It may be used to purify water for drinking purposes in the proportion of 1 ounce to 2000 gallons; the taste may be removed by a few crystals of sodium thiosulphate.

It is frequently used for the removal of dyes from the skin of the hands and may cause irritation; to avoid this the hands, after using the powder, should be dipped in a 10% solution of sodium bisulphite and then rinsed with water.

"Tropical" Bleaching Powder is remarkably stable even in hot climates. It consists of bleaching powder with an excess of unslaked lime.

Bleach Cream. Tropical bleaching powder 3 parts, water 5 parts, by weight.

Preparation. Place the water in an earthenware or enamelled iron pail and add the powder slowly in four equal portions at intervals of one hour, stirring well after each addition with a wooden pole. Allow the mixture to stand for 24 hours, again stir well and allow to stand for a further 24 hours. No further setting takes place, and after remixing, the cream is ready for use. In an emergency, add all the powder to the water at once and stir well, repeating the stirring frequently during use. For emergency application to mustard gas burns.

A cream, made to this formula, will be available for free distribution at all pharmacies, in districts contaminated by mustard gas, whose proprietors co-operate in a scheme prepared by the Ministry of Home Security. Tropical bleaching powder and 2-gallon pails with lids will be supplied by the local authority, and, on receipt of instructions, pharmacists will prepare the cream and place the pails outside the pharmacy. 6 lb. of powder and 10 lb. of water suffice for a 2-gallon pail, and the cream will keep for about six weeks.

Liquor Calcis Chlorinatæ (B.P.C.). 10%. Contains not less than 2% w/v available chlorine, 3% when freshly made.

Is of great value as a spray in acute tonsillitis.

Liquor Calcis Chlorinatæ cum Acido Borico (B.P.C.).

Syn. EUSOL, LIQUOR ACIDI HYPOCHLOROSI COMPOSITUS.

This solution contains when freshly prepared about 0.4% w/v of available chlorine, but rapidly loses strength.

Uses. Eusol is employed as a general antiseptic in the form of a lotion or on gauze wrung out and applied without waterproof; or as a bath, full strength or diluted. The object is to secure the maximum effect with minimum irritation. As a lotion it should be used *warm*. It has no harmful effect upon the tissues, the effect being purely local. Flow of lymph is induced by it from the tissues. It removes offensive odour in a wound. For field use the antiseptic may also be employed in the form of dry powder if water is not available—*vide* eupad.

Has been used undiluted in injuries to the head or hands, lacerated, contused or incised, including cases which are septic, in mastoid operations and in cases of cerebellar abscesses, also for treatment of ulcers of the leg, gangrene of the feet, pyorrhœa alveolaris and follicular tonsillitis. In a wound superficial bleaching may occur with some irritation. If pain is produced, the application should be diluted with saline. Also used in cystitis by irrigation with 1 in 8 dilution, and in tuberculous lesions, streptococcal infections and gonorrhœa (1 in 5 dilution). It must not be applied for long periods to wounds of the back of the hand, dorsum of foot and of the neck, forearm and wrist. In general it should be applied once or, exceptionally, twice daily and should not be covered by protective. It should not be more than 3 weeks old.

TONSILLITIS. Eusol solution, 1 in 3, or 1 in 4, the most effective of all gargles for tonsillitis; used hourly.—H. L. Marriott, *Brit. med. J.*, i/1934, 104.

Lot. Eusol (N.I.F.). Dissolve boric acid 52 gr., in water and make up to 6 oz. Dilute this solution with 2 oz. of water, add chlorinated lime 50 gr., shake occasionally for 10 minutes, filter and make up to the required volume with water. It should be freshly prepared.

Eupad. *Syn.* PULVIS CALCIS CHLORINATÆ ET ACIDI BORICI.

Mix intimately equal weights of finely ground bleaching powder (dry) and powdered boric acid. Should be kept in stoppered bottles and not exposed to the light; in preference mix freshly. Contains about 15% of available chlorine.

Caution. The evolution of chlorinated vapour in mixing the ingredients is sufficient to "gas" the unwary.

Uses. Employed as a dry dressing for wounds. It evolves hypochlorous acid rapidly when moistened between layers of gauze or lint (as in the pad of a first field dressing) and covered with wool and a bandage. When applied covered with waterproof it should be used for a short time only—10 to 15 minutes as a rule. If it causes pain a weaker application is indicated. 1 to 2 g. is suitable in the first field dressing.

Unguentum Calcis Chlorinatæ.

A useful application for chilblains. 10% in paraffin ointment.

Bleach Ointment. *Syn.* ANTI-GAS OINTMENT No. 1. Anti-gas ointment for casualty services. For application to cases which

have been in contact with liquid mustard gas. To be rubbed in within three minutes of exposure and wiped off after one minute.

A British Standards Specification (BS/ARP/40—1940) has been issued for Bleach Ointment (Anti-gas Ointment No. 1). The specification requires that the ointment shall consist of equal parts by weight of bleaching powder and white mineral jelly, and shall contain not less than 14% of available chlorine immediately after preparation. The label of the containers must bear the following particulars:—(a) Bleach Ointment (Anti-gas Ointment No. 1), (b) the name of the maker, and (c) the date of manufacture.

Bleach ointment of yellow paraffin and bleaching powder is liable to explode during manufacture.—*Pharm. J.*, ii/1938, 383.

The following precautions should be observed to prevent the spontaneous overheating of bleach ointment during, or soon after, manufacture. A soft paraffin of low reactivity should be used; no heat should be utilised; after preparation the ointment should be rapidly filled into small receptacles, which should be freely exposed to the cooling action of the air; if it is inconvenient to divide the bulk of the ointment it should be prepared in or transferred to a shallow uncovered container for one or two days to encourage the dissipation of any heat which is developed, and as cool a place as possible should be selected for the manufacture and storage of the ointment, particularly during the first two or three days after preparation.—H. Brindle and L. V. Rosser, *Quart. J. Pharm.*, 1940, 265.

A satisfactory bleach ointment is obtained from chlorinated lime 50 g., calcium hydroxide 1.5 g., white soft paraffin 50 g. Melt the white soft paraffin and add the calcium hydroxide. Continue to heat with constant stirring. Strain and stir until cold. Triturate the chlorinated lime, previously passed through a No. 60 sieve, with a portion of the base. Gradually add the remainder, mixing thoroughly by trituration.—H. W. Tomsiki, *Pharm. J.*, ii/1939, 447.

Samples of bleach ointment made with equal parts of tropical bleach (available chlorine 35 to 37%) and white soft paraffin, contained 16 to 17% of chlorine if the soft paraffin was of B.P. quality, but less (14 to 15%) if it was an inferior grade. On storage the loss of chlorine was rapid in the first few days, but gradually decreased, and samples tested after three months still contained 11% of chlorine.—A. G. Fishburn, *Pharm. J.*, i/1940, 35.

It is considered that a purchaser of bleach ointment for A.R.P. purposes is entitled to receive an article containing about 15% of available chlorine. It has been shown that in every instance when such an article has been sold, it has retained a high proportion of the active ingredient over a period of months, and that subsequent deterioration is likely to be very slow.—D. D. Moir, *Analyst*, 1940, 158.

Liquor Sodæ Chlorinatæ (B.P.C.). Dose.—10 to 20 minims (0.6 to 1.2 ml.). Contains 2.5 to 3% w/v of available chlorine. *Should be freshly made.*

Formerly used as an antiseptic for wounds and ulcers diluted with 15 to 60 times its volume of water. It is strongly alkaline and Liquor Sodæ Chlorinatæ Chirurgicæ (B.P.) is now preferred for medicinal purposes. For carbuncles Liquor Sodæ Chlorinatæ, diluted 1 in 20 or 1 in 30, is a non-irritant and effective dressing.

Eau de Labarraque or Liqueur de Labarraque (Fr. Cx.) is about $\frac{1}{2}$ the strength of Liquor Sodæ Chlorinatæ (B.P.C.). Initially Labarraque made his bleaching solution by passing chlorine into sodium carbonate solution. In this case free hypochlorous acid is present:

Eau de Javelle (first made in 1789) was originally a solution of chlorinated potash made with potassium carbonate on the same lines as chlorinated soda solution, but it is now replaced in great measure by the soda compound.

Cataplasma Sodæ Chlorinatæ (B.P.C.). Linseed poultice prepared with a mixture of solution of chlorinated soda and an equal volume of water.

Liquor Sodæ Chlorinatæ Chirurgicæ (B.P.). *Syn.* DAKIN'S SOLUTION.

Prepared from chlorinated lime, sodium carbonate and boric acid, the proportions varying with the amount of available chlorine in the chlorinated lime. Contains from 0.5% to 0.55% *w/v* of available chlorine. The pH is about 9.5 and the solution is stable for about 3 to 4 weeks. The formula is based on a paper by H. Davis (*Quart. J. Pharm.*, 1931, 360).

Uses. A non-irritating antiseptic for wounds. Fresh quantities should be brought in contact frequently. The solution assists in the dissolution of necrosed tissue, forming soluble chloramines.

Liquor Sodæ Chlorinatæ (B.P.C.), owing to hydrolysis, gives rise to alkalinity, which increases with dilution, hence the boric acid was added with a view to neutralising the caustic alkali as formed.

The solution was first used by *Carrel's Method* (*Brit. med. J.*, ii/1915, 318), employing rubber tubes with holes throughout their length about 1 cm. apart. Pieces of gauze are placed round and between the tubes, and the solution runs into the wound and irrigates it. Soft paraffin is smeared on the surrounding skin. Cicatrisation is not delayed even by continuous use.

Diluted with 15 to 60 times its volume of water or normal saline it is used as a vaginal douche, for irrigating the bladder and as a mouth-wash. Locally in skin affections 10% to 30% dilutions may be used. *It must not be injected intravenously.*

Concentrated, stable solutions may be prepared by saturating 1 litre of 10% sodium hydroxide solution with boric acid and adding 3 g. of aluminium chloride. Chlorine is then passed in until the precipitation of magnesium hydroxide begins and it is then filtered.—L. Mellersh-Jackson, per *J. Soc. chem. Ind., Lond.*, 1938, 1295.

In the last war, possibly the most popular antiseptic for use in septic wounds was Dakin's solution, especially when it was used by Carrel's method of instillation into the wound through a manifold of tubes once every two hours. I have made observations (1919) as to how long Dakin's fluid maintains its antiseptic power in a septic wound. A cup-shaped wound was chosen, into which a measured volume of fluid could be introduced and removed. When Dakin's fluid was introduced and removed after ten minutes, it was found on testing the available chlorine that this had been reduced to a point below that which was antiseptic in serum. If the fluid was kept agitated during its sojourn in the wound, the strength was reduced below the antiseptic level in five minutes. Therefore, in Carrel's method, which was generally regarded as the most successful "antiseptic" treatment in the war of 1914-1918, there was an antiseptic in the wound for at the most, ten minutes out of every two hours.

It seems likely that the benefits obtained by the intermittent instillation of Dakin's fluid into a wound depend more on its physiological effect (drainage of the infected walls of a wound) than on any direct antiseptic action.—A. Fleming, *Proc. R. Soc. Med.*, 1940, 33, 487.

OIL DERMATITIS is emphatically preventable by the use of an alkaline lotion, e.g., *Liq. Sodæ Chlorinat. c. Acid. Boric.*, as now used in many large engineering works.—W. J. O'Donovan, *Brit. med. J.*, ii/1932, 293.

One of the most common causes of dermatitis is the lubricating oil used in engineering, which gives rise to an acneiform condition. The use of Dakin's solution is a valuable preventive, and buckets of this placed in the wash-places or the shops for immersion of the hands prior to washing, or before commencing work, has reduced the incidence.—J. C. Bridge, *Brit. med. J.*, ii/1933, 326.

Liquor Sodii Hypochloritis (U.S.P. XI).

A solution of sodium hypochlorite, 4 to 6% NaOCl, which is not suitable for application to wounds.

Liquor Sodii Hypochloritis Dilutus (U.S.P. XI).

A modified Dakin's solution prepared by diluting Liquor Sodii Hypochloritis with water, adding sufficient sodium bicarbonate to produce a solution which is no longer alkaline to phenolphthalein, assaying and diluting to contain 0.48% w/v of NaOCl.

Liquor Sodæ Chlorinatæ cum Sodii Bicarbonate (B.P.C.).

Syn. DAUFRESNE'S SOLUTION. Contains about 0.45% w/v of available chlorine. **Chlorisol** (*Allen & Hanburys, London*). Concentrated hypochlorite solution for producing Dakin's solution.

Fecto (*Parke, Davis, London*). Alkaline solution of hypochlorites containing 4% of available chlorine. Disinfectant, deodorant and bleaching agent. Gargle in cases of diphtheria, etc.

"Milton" Disinfectant (*Milton Proprietary, London*). Contains sodium hypochlorite 1.01% with sodium chloride 16.8% and small quantities of chlorate, sulphate and carbonate, and calcium chloride. A deodoriser, preservative, insecticide and general antiseptic. It is stated to be harmless to the human system either internally or externally.

It is used for wounds and skin affections, either full strength or diluted down to 1 in 50 or more. For abscesses, fistulas, etc., it can be used undiluted. For the vagina and cervix 1 in 4. Dentures may be cleaned with it by the use of 10 to 20 drops—not more—in a tumbler of cold water overnight.

CHLOROFORMUM

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.

$\text{CHCl}_3 = 119.4.$

Syn. TRICHLOROMETHANE, FORMYL TERCHLORIDE, CHLOROFORMIUM AD NARCOSIN.

[P1] "*Chloroform.*"

[83] "*Chloroform—in substances containing less than 10% of chloroform.*"

Dose.—1 to 5 minims (0.06 to 0.3 ml.), in mucilage and water, or in a perle; 3 drops = 1 minim. Small doses may be given as chloroform water or spirit of chloroform. Very large amounts (up to 2 ounces) have been taken internally without causing death.

Chloroform has sp. gr. 1.485 to 1.490. About 15% v/v distils below 60°, the remainder at 60° to 62°. Should be kept in amber-coloured, stoppered bottles or in the dark.

Soluble about 1 in 200 of water; miscible with alcohol, ether, fixed and volatile oils, and most organic solvents.

Antidotes (for poisoning by drinking chloroform). Empty stomach by emetic or stomach tube. Give water freely, with 1 dr. of sodium bicarbonate dissolved in 1 pint. Keep patient lying down. Artificial respiration. Oxygen inhalations. Give 1 oz. of dextrose in 1 pint of hot strong coffee by rectum. No fats for some days; dextrose freely. For treatment of dangerous symptoms arising during anæsthesia, see below.

Uses. Inhaled, it is anæsthetic and analgesic. Brief inhalations may be used in angina pectoris and in croup. Internally it is antispasmodic and sedative for asthma, colic, cough and neuralgia.

In sea-sickness, 1 or 2 drops of chloroform on a lump of sugar or in a wine-glass of iced soda water, repeated every 15 minutes, often give relief.

Externally in liniments to promote absorption and allay pain, as in neuralgia and sciatica. It may be used as a local anæsthetic for toothache, the tooth being plugged with a piece of cotton wool soaked in chloroform. A 20 to 30% chloroform ointment is effective against all forms of external parasitic infection.

1 in 500 is a preservative of infusions and animal extracts. It is a useful deodorant, e.g., for the hands after post-mortem work.

Infection by intestinal parasites, e.g., *Ankylostoma*, *Ascarides* and *Oxiurides* are well treated by doses *per os* of 3 to 4 g. mixed with castor oil or olive oil.

ANÆSTHETIC USES OF CHLOROFORM

Advantages of Chloroform. (1) It is less irritating than ether vapour and its action is much more rapid. (2) The vapour is not explosive; chloroform can be used when a diathermy needle or cautery is to be employed. (3) It induces the most profound anaesthesia and relaxation. (4) It produces less suffocation, less excitement and less post-operative nausea and vomiting than ether.

Contraindications. The use of chloroform is not justifiable (1) in cases of grave debility with low blood pressure, especially in cases of patients suffering from shock; (2) in cases likely to develop acidosis, e.g., the diabetic, the sufferer from septic abdomen, and children (especially in the presence of acute sepsis); (3) in a great many cases during the induction period. Chloroform should not be used as an anæsthetic in women at the menopause, in advanced heart disease, Graves' disease or hæmorrhage.

Dangers. Chloroform is far more dangerous than ether or nitrous oxide. The dangerous effects fall into five groups: (1) depression of the respiratory centre, (2) fall in blood pressure, (3) late toxic effects, (4) chloroform syncope, (5) possible damage to the eyes.

ACTION ON THE LIVER. Half-an-hour's administration of chloroform caused injury requiring 8 days for recovery. Ether produced definite but transitory effect and nitrous oxide and ethylene none, except with concomitant anoxæmia.—Wesley Bourne, Sect. of Anæsthetics, B.M.A. Cent. Meeting 1932, *Brit. med. J.*, ii/1932, 319.

ACTION ON THE HEART. Chloroform is a cardiac poison and investigations show that the patient under light chloroform anaesthesia is often in a precarious condition. Undesirable effects on cardiac rhythm are less likely if it is not given to patients who are fatigued, if it is preceded by an injection of morphine and atropine, or if it is administered in the sitting posture or with the head and shoulders raised.—Per *Lancet*, i/1932, 1208. See also E. F. Hill, *ibid.*, 1280.

EYE TROUBLES following anaesthesia. Acute conjunctivitis may be caused by vapour of chloroform or ether, and keratitis with subsequent corneal scarring may occur. Instillation of castor oil prior to anaesthesia, or irrigation with boric acid lotion afterwards, recommended as preventive measures. Keep lids carefully closed and avoid frequent examination.—J. Blomfield, per *Prescriber*, 1926, 142.

Delayed Chloroform Poisoning occasionally occurs after

recovery from the anæsthetic. Vomiting may persist, or may commence a day or two after the operation; other symptoms are headache, ketosis, scanty albuminous urine, and jaundice due to fatty degeneration of the liver. Pre-operative starvation and purgation, sepsis and long exposure to the vapour predispose to the condition which usually ends in coma and death. The administration of dextrose before the operation is the chief preventive measure. If the condition arises, administration of dextrose either *per os* or intravenously, together with insulin, may be successful if used early.

Antidotes for treatment if dangerous symptoms arise during inhalation of chloroform. Pull out tongue with forceps, remove mucus, etc., from mouth; loosen clothing, begin artificial respiration at once and keep it up for at least an hour. The inhalation of carbon dioxide and the intravenous injection of lobeline stimulate the respiratory centre. Keep patient warm and lying down with head well below level of body. Place hot flannels over heart and flap face and chest with the end of a towel. Strychnine, $\frac{1}{2}$ gr., or caffeine sodium benzoate, 2 gr., hypodermically. Heart massage by subdiaphragmatic route.

Reported differences in the action of atropine on the heart in secondary chloroform syncope have been due to differences in mode of injection. It has been injected directly into the heart successfully, in contrast to results reported following injections into the jugular vein.—*C.R. Soc. Biol.*, Paris, 1935, 118, 854.

Administration. Chloroform is usually administered by a drop-bottle, using the open mask method (*vide* Ether). During administration the respiration and pulse should be carefully watched for signs of failure, and the operation should never be begun till the stage of muscular relaxation has commenced. For induction, the requisite concentration of chloroform vapour is about 2 to 3%, and the mask is held about an inch from the face. The anæsthetic is added slowly at first, the rate being gradually increased until about 30 to 60 drops per minute is being given, after which it is reduced as required. It is advantageous to ensure regular breathing of a proper depth by giving carbon dioxide and oxygen, the mask being placed on the face. Anæsthesia may be maintained by the drop method or, better, by some apparatus such as the Junker bottle, care being taken to see that the bottle connections are correctly made so that the patient receives chloroform vapour and not the liquid. Owing to the decreased amount of blood in the skin in chloroform anæsthesia it is sometimes difficult to observe the onset of cyanosis, and it is often considered advantageous to use oxygen in conjunction with the Junker bottle, the gas being passed through the chloroform.

Chloroform is also administered as an analgesic in obstetrics in friable glass capsules containing 20 to 60 minims (*v. infra*).

[P1] **Chloroform Mixtures.**

A.C.E. (dehydrated alcohol 1, chloroform 2, ether 3) and **C.E.** (chloroform 2, ether 3) were formerly much used in the belief that they were safer than either chloroform or ether used separately.

The ether stimulates the respiration and also the circulation, thus counteracting the effects of the chloroform. For abdominal operations, the addition of chloroform to ether ensures the requisite shallow breathing being obtained without the profound depth of anaesthesia necessary with ether alone, provided pre-anaesthetic sedatives have not been given. The disadvantage of the mixtures is that owing to the difference in the rates of evaporation of the constituents the composition of the vapour inhaled by the patient is quite different from that of the liquid mixture. With C.E. mixture the patient inhales alternately almost pure ether and almost pure chloroform. Approximate uniformity in composition may be obtained by using some form of Shipway's apparatus in which the air or oxygen is passed through separate bottles of the constituent anaesthetic agents arranged in parallel, but mixtures are now rarely used.

Chloroform Analgesia in Labour.

Capsules containing 20, 30, and 60 minims and encased in cotton wool and silk are made for use by midwives during labour.

Of all the drugs used for the assuaging of the pains of labour, chloroform is the most satisfactory under the prevalent conditions of ordinary domiciliary midwifery, but a limit must be set on the quantity used, and the degree of anaesthesia must be shallow.—F. Roques, *Lancet*, i/1933, 179.

An investigation on 100 cases at the Queen Mary's Maternity Home, Hampstead, showed that in 84% of cases there was no apparent effect on uterine contractions, while 16% showed a decrease. In 95% there was apparent lessening of pain; voluntary effort was affected in 60%, diminished in 37%, and increased in 3%. 92% of patients expressed themselves in favour of the capsules. In no case was there any ill effect on the child. Nine of the cases became excited under the chloroform, in 6 cases there was delay in the second stage, and in 8 cases loss above normal during the third stage. It would seem established that the use of chloroform capsules by midwives in the second stage of labour is both safe (but not when the midwife is conducting the case alone) and in the majority of cases beneficial to the patient. The average number of capsules used was 3.41 and the average interval between each capsule 10.16 minutes.—Arthur Rees, *Brit. med. J.*, ii/1933, 241.

The capsules have been an enormous boon in the obstetric departments of L.C.C. hospitals.—E. W. Masterman, *Brit. med. J.*, i/1933, 347. No bad effects in 861 cases, save that 5% of patients became noisy. Labour was not prolonged.—Letitia Fairfield, *ibid.*

Chloroform by any method should not be used by midwives acting alone. This conclusion has been reached with regret, but both the immediate and delayed dangers which are well recognised occurred in this investigation, and it is not possible fully to guard against such occurrences if the administration of chloroform is in inexperienced hands.—Report on Investigation by the College of Obstetricians and Gynaecologists at the request of the National Birthday Trust Fund, per *Lancet*, i/1936, 283.

GENERAL PREPARATIONS OF CHLOROFORM

Aqua Chloroformi (B.P.). 1 in 400 of water. *Fr. Cx.*, *F.E. VIII* and *P. Ital. V*, 1 by weight in 200. *U.S.P. XI* has a saturated solution.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Salts, e.g., sodium sulphate, are apt to cause deposition of chloroform from aqueous solution.

Aqua Chloroformi Concentrata (B.P.C.). *Dose.*—6 to 12 minims (0.4 to 0.8 ml.). 1 in 10.

Aqua Chloroformi Duplex (B.P.C.). *Syn.* AQUA CHLOROFORMI FORTIOR. *Dose.*—2 to 4 drachms (8 to 16 ml.) 1 in 200.

[P1] **Chloroformum Camphoratum (B.P.C.).** Camphor 2 (by weight) dissolved in chloroform 1 (by volume).

Useful for toothache, applied on cotton wool.

[P1] **Chloroformum Mastiche.**

Mastiche 1, chloroform *q.s.* to 2.

Emulsio Chloroformi (B.P.C.). *Dose.*—5 to 30 minims (0.3 to 2 ml.).

Chloroform, 1 in 20, with tincture of quillaia, mucilage of tragacanth and water. It is of the same strength as Spiritus Chloroformi.

[P1] **Guttæ Chloroformi cum Menthol Compositæ.**—SELF-INFLATOR DROPS. Menthol 15 gr., chloroform $\frac{1}{2}$ oz., acetic ether and alcohol 90% of each 2 dr.

Directions.—2 or 3 drops to be placed upon the wool in the inflator on each occasion of use.

CHRONIC TYMPANIC AND EUSTACHIAN CATARRH. Value depends to an extent on the ease with which air containing a little chloroform passes up the Eustachian tubes. Inflation with a Eustachian Self-Inflator is conducted as follows:—Drop the amount prescribed on the wool in the mouth-piece with a dropper. With the mouth-piece held firmly between or against the lips (according to the form of the instrument) and the nose-piece tightly in the freer of the two nostrils, compress the other nostril to close it completely. Draw a breath (not through the instrument) and then blow through the mouthpiece so as to puff out the cheeks and “crack the ears.” If vapour is too irritating blow through the instrument a few times before use. To concentrate the effect on the right ear, close firmly with the finger the left ear and bend head sideways over the left shoulder—*vice versa* for the left ear.

The duration of treatment should be controlled by the prescriber.

For the Medicated Politzer Apparatus in which these drops may be used, see Dundas Grant, *Practitioner*, June, 1925.

[P1] **Linimentum Chloroformi (B.P.C.).**

Chloroform 1, liniment of camphor 1.

[P1] **Linimentum Chloroformi (U.S.P. XI).**

Contains at 25° from 35 to 45% *w/v* of chloroform, and is made by agitating together 3 volumes of chloroform with 7 volumes of camphor and soap liniment.

[P1] **Mist. Tuss. Nig. (N.I.F.).**

Tincture of chloroform and morphine 10 m., liquid extract of liquorice 10 m., water to $\frac{1}{2}$ oz.

Oleum Chloroformii (P. Jap. V). Chloroform and olive oil, equal parts.

Spiritus Chloroformi (B.P.). *Syn.* CHLORIC ETHER. 1 in 20 of alcohol 90%.

Dose.—5 to 30 minims (0.3 to 2 ml.).

Spiritus Chloroformi (U.S.P. XI).

Average dose.—30 minims (2 ml.).

Chloroform 8.5 to 9.25% *w/v*, in alcohol. 6% by volume.

[P1] **Tinctura Chloroformi Composita (B.P.C.).** *Dose.*— $\frac{1}{2}$ to 1 drachm (1 to 4 ml.). Chloroform 10% *v/v* with alcohol 90% and compound tincture of cardamom.

[P1-81] **Tinctura Chloroformi et Morphinae (B.P.C.).**

Syn. CHLORODYNE, TINCT. CHLOROF. ET MORPH. (B.P. '85).

Dose.—5 to 10 minims (0.3 to 0.6 ml.).

10 minim dose contains chloroform $1\frac{1}{2}$ m., ether $\frac{1}{2}$ m., alcohol 90% $1\frac{1}{2}$ m., morphine hydrochloride $\frac{1}{8}$ gr. (equivalent to 0.18% of anhydrous morphine), and dilute hydrocyanic acid $\frac{1}{2}$ m., with oil of peppermint, liquid extract of liquorice, treacle and syrup *q.s.*

Poisoning by 4 ounces of chlorodyne, with recovery by use of atropine, strychnine, and stimulants is recorded.

[D-P1-81] **Tinctura Chloroformi et Morphinae Composita (B.P.C.).**

Dose.—5 to 15 minims (0.3 to 1 ml.).

Contains 7.5% *v/v* of chloroform, 1% *w/v* of morphine hydrochloride and 10% *w/v* of tincture of cannabis.

10 minim dose contains: chloroform $\frac{3}{4}$ m., morphine hydrochloride $\frac{1}{4}$ gr., dilute hydrocyanic acid $\frac{1}{2}$ m., tincture of capsicum $\frac{1}{4}$ m., tincture of Indian hemp 1 m.

Contains approximately four times the proportion of morphine present in *Tinctura Chloroformi et Morphinae*.

[D-P1-81] *Chlor-Anodyne* (Parke, Davis, London). Containing in each fluid ounce, morphine hydrochloride 2½ gr., chloroform 46 m., fluid extract of cannabis indica 46 m., dilute hydrocyanic acid 9 m., etc. For use in colic, acute gastro-enteritis, etc. *Dose*.—5 to 15 minims.

ANÆSTHETIC HYDROCARBONS

Ethyleneum (B.P., U.S.P. XI). *Syn.* OLEFIANT GAS.
 $\text{CH}_2 : \text{CH}_2 = 28.03$.

The first member of the olefine series of hydrocarbons—*i.e.*, the series in which a double linkage occurs. Ethylene is a colourless gas with slight ethereal odour. It has sp. gr. 0.9784 (air = 1). It burns in air with a bright flame and forms an explosive mixture with 3 vols. of oxygen. At 0° and under a pressure of 42.5 atmospheres it is converted into a colourless liquid which boils at -102°. It is a constituent of illuminating gas.

Soluble in 9.2 vols. of water, in 0.5 vol. of alcohol 95% and in about 0.05 vol. of ether, at 25°.

Uses. Ethylene is used as an anæsthetic, particularly in America. It is administered with 10 to 20% of oxygen in a manner similar to that of nitrous oxide. It is a more potent narcotic than nitrous oxide, hence more oxygen can be given and greater muscular relaxation obtained without dyspnœa. Recovery is rapid, consciousness returning in from one to five minutes, and vomiting occurs less frequently than after ether or chloroform. The smell is disagreeable but the senses are soon dulled. It is inflammable, and mixtures with air or oxygen are explosive. Muscular relaxation is less complete than that obtained with ether, but it has no irritant action on the respiratory tract.

A survey of 425,000 ethylene anæsthesias shows it is probably as safe as ether, if not safer. The quantity of ethylene capable of explosion is too small to produce considerable damage.—M. Salzer, *J. Amer. med. Ass.*, i/1929, 2097.

Much more satisfactory than nitrous oxide—could be used with as much as 20 to 30% of oxygen. Dangerous with cautery or diathermy.—I. W. Magill, *Lancet*, i/1931, 353.

For dental work its smell and risk of fire is a disadvantage.—R. R. Macintosh, *Brit. Dental J.*, Feb. 15, 1932.

Used with excellent results in a series of 525 operations on children, but use discontinued owing to the "appalling" headaches from which both anæsthetist and surgeon suffered afterwards.—R. Jarman, *Brit. med. J.*, ii/1932, 883.

In answer to a questionnaire, no fewer than 757,815 administrations alone, and 267,560 in combination with ether, are recorded.—*J. Amer. med. Ass.*, ii/1933, 1716. For earlier references see 21st Edition, Vol. I.

Acetylenum. $\text{CH} : \text{CH} = 26.02$. The initial member of the acetylene series of hydrocarbons (*i.e.*, with triple linkage); a gas with unpleasant odour. It has sp. gr. 0.92 (air = 1), and is compressible into a liquid which has explosive properties. It is more soluble than ethylene in alcohol.

Acetylene is a general anæsthetic with action similar to that of ethylene. Following clinical investigations by Gauss in 1923 it had a certain vogue in

America, especially among gynecologists, but it has been little used in this country. The disagreeable odour and the explosive risk have probably militated against its wider use. For anæsthetic use it is employed as a mixture consisting of acetylene 40% and oxygen 60% with the addition of oil of pine to mask the smell.

Cyclopropanum (U.S.P. XI Supp. II).

Syn. TRIMETHYLENE. $\text{CH}_2 \cdot \text{CH}_2 \cdot \text{CH}_2 = 42.05$.

Cyclopropane, an isomer of propylene ($\text{CH}_3 \cdot \text{CH} : \text{CH}_2$), is a colourless gas prepared by the action of zinc on 1 : 3-dibromopropane. It is heavier than air, with a density of 1.46, and is inflammable and explosive in concentrations of from 20 to 75% when mixed with oxygen. Cyclopropane has a characteristic sweetish odour not unlike chloroform or ethylene. B.p.—34.5°.

Soluble in 2.7 vols. of water at 15°; freely soluble in alcohol, ether, chloroform and oils.

Uses. Cyclopropane is an anæsthetic effective in low concentration, profound anæsthesia being produced by a concentration of 18%. Muscular relaxation is better than with nitrous oxide, but not as complete as with ether. It is not irritant to the respiratory tract and induction is pleasant, smooth and rapid. Recovery is rapid, nausea and vomiting are less frequent than with ether, and there are fewer post-operative complications.

The chief disadvantages connected with its use are the explosibility of anæsthetic mixtures of cyclopropane and oxygen, the increased hæmorrhage from the raised blood pressure, and the tendency to respiratory depression. On the other hand, the extremely high percentage of oxygen compatible with full anæsthesia, and the absence of irritation to the respiratory passages, render it particularly suitable for major thoracic surgery and bad risk cardiac cases.

As regards after-effects, Schmidt and Waters, in America, investigated 2200 cases anæsthetised with cyclopropane-oxygen, and compared them with 2200 similar operations performed under nitrous oxide and oxygen and ethylene-oxygen, the closed-circuit technique being used in each case. The figures for vomiting and respiratory complications were in favour of cyclopropane, but there were more circulatory complications and post-operative deaths than with the older methods.—C. L. Hewer, *Proc. R. Soc. Med.*, Jan., 1936, 262.

Induction is always pleasant for the patient, with no sensations of bursting, throbbing or choking, such as are sometimes complained of with other anæsthetics. Although the odour of cyclopropane as it issues from the cylinder is not pleasant, patients are not aware of it during induction, nor do they complain of unpleasant taste or smell during the recovery period such as occurs with ether. Complete abdominal relaxation always obtained although it has often been necessary to increase respiratory exchange by artificial methods. When this is resorted to it must be borne in mind that one is dealing with an extremely potent agent which is not without its effect on the heart muscle. The fact that cyclopropane is neither a respiratory stimulant nor an irritant makes it necessary that the anæsthetist should exercise the greatest care in its administration; but in the hands of the expert it is to be considered an anæsthetic of great utility and value.—S. Rowbotham, *Proc. R. Soc. Med.*, Jan., 1936, 260.

It can be satisfactorily administered by the endotracheal method. It is applicable to extremes of youth and age and has advantages over ether in operations on very small babies. Cyclopropane most nearly approaches the ideal anæsthetic.—H. R. Griffith, *Canad. med. Ass. J.*, i/1937, 496.

In a study of 1333 administrations of cyclopropane the outstanding observation was the relatively low figure both for the incidence of pulmonary morbidity and

for the morbidity-mortality ratio.—G. E. Burford, *J. Amer. med. Ass.*, i/1938, 1087.

Post-operative pulmonary complications are much less frequent than with other anaesthetics; nausea and vomiting are less frequent than with ether, but more frequent than with nitrous oxide alone. Recovery is rapid, being almost instantaneous after a short administration and from five to ten minutes after a long administration.—L. B. Mevill, *Edinb. med. J.*, 1939 (*Trans. Medico-Chir. Soc. Edinb.*, 70).

A combination of spinal anaesthesia (Percaine, 1 in 2000) with cyclopropane general anaesthesia was used in 70 major operations, mostly abdominal. The combination forms a pleasant and effective anaesthetic for the patient, and is a material aid to the surgeon, in operations on the upper abdomen.—H. Dodd and J. T. Hunter, *Lancet*, i/1939, 685.

Explosion hazard. As the result of a questionnaire sent to 100 anaesthetists it was found that among two and a third million administrations the explosion rates of ether, ethylene and cyclopropane were all very low, and all fell in the neighbourhood of from 2 to 4 per 100,000 anaesthetics. The mortality rates were too low to be figured since there were only two deaths among the 2½ million cases.—P. D. Woodbridge, *J. Amer. med. Ass.*, ii/1939, 2308.

Vinyl Ether. *Syn. and Prop. Name.* VINETHENE, VINESTHENE (Merck, New York; *Pharmaceutical Specialities* (May & Baker) Ltd., London). $(CH_2 : CH)_2O = 70.05$.

A volatile, clear, practically colourless liquid with a characteristic odour.

B.p. 28° to 31° ; sp. gr. 0.77. Readily decomposed in air and light into formaldehyde and formic acid, and polymerises to a jelly. Supplied containing 0.01% of phenyl- α -naphthylamine as an antioxidant and also 3.5% of dehydrated alcohol to prevent breath freezing owing to rapid evaporation when used as an anaesthetic.

Uses. Vinyl ether is used as an inhalation anaesthetic for short anaesthetics. It is more potent than ether, with more rapid induction and recovery. Post-operative complications are rare and nausea and vomiting less frequent than with chloroform. It is usually employed by the "open drop" method (60 to 80 drops per minute), but its use by this method should not exceed thirty minutes. It has found considerable use in dental practice and in obstetrics.

The anaesthetic potency is 4 times that of ether and greater than that of chloroform as 1:3 is to 1, and there is a wider "margin of safety" than with ether or chloroform. A few inhalations are sufficient to produce anaesthesia, there is very little excitement, any desired degree of muscular relaxation can be obtained, and recovery is very rapid. Respiration is not interfered with as much as with ether, and tests for liver function show practically no liver change. Results from its use in 50 and 102 obstetrical cases show it to be a very suitable anaesthetic for employment in obstetrics, with minimal danger to mother and child.—Wesley Bourne, *Lancet*, i/1934, 566.

Vinyl ether seems to be particularly suitable for obstetric anaesthesia in general practice on account of its safety for mother and child, its ease of administration, the rapidity of its action, the satisfactory maintenance of any desired degree of narcosis, and the early uneventful recovery. Although vinyl ether may be given with relative safety by the "open drop" method, it is preferable to administer it in a "closed" manner with oxygen.—Wesley Bourne, *J. Amer. med. Ass.*, ii/1935, 2047.

It is not recommended that the drug be used for periods exceeding 30 minutes, and those employing it for any period should familiarise themselves with the nature of the compound. Rapid induction is an advantage, provided over-concentration and excessive anaesthesia are avoided, and rapid recovery is also an advantage.—Rept. of Council on Pharmacy and Therapy A.M.A., *J. Amer. med. Ass.*, ii/1937, 656.

Employed as a general anæsthetic in a series of 100 infants and children ranging from one month to 11 years of age. It was found extremely satisfactory when given by the open mask method for minor operative procedures of 5 or 10 minutes' duration, and in no case was there any alarming or untoward reaction accompanying or following the anæsthesia.—R. E. Gross, *New Engl. J. Med.*, i/1939, 334.

In Vinesthene and Vinesthene mixture we have an anæsthetic of the greatest value to the general practitioner and well within his means. The use of the drug will facilitate the production and maintenance of anæsthesia and assist both practitioners and patient.—J. Elam, *Lancet*, ii/1939, 1115.

Vinesthene is becoming increasingly popular as an anæsthetic for the trivial operations of general practice. Although it has been found unreliable for producing the deep muscular relaxation often required for abdominal surgery, it has a sphere of usefulness in extra-abdominal surgery which may be of particular value in war casualties. Its advantages include portability, quick induction and recovery and comparative freedom from after-effects.—R. R. Macintosh and F. B. Pratt, *Brit. med. J.*, ii/1939, 1079.

A series of 200 children were given anæsthesia for extraction of teeth with (a) vinyl ether or (b) ethyl chloride. The results showed that these are both safe and useful anæsthetics. The action of vinyl ether is shorter and less certain than that of ethyl chloride, but it is useful for producing a short anæsthesia for the extraction of a few deciduous teeth in young children. Vinyl ether is more likely to cause struggling during the induction period and causes troublesome salivation in many cases. Recovery is much more rapid than from ethyl chloride and is less likely to be accompanied by vomiting.—J. O. French *et al.*, *Brit. med. J.*, i/1940, 432.

Convulsions. During a series of 2406 Vinesthene anæsthesias there have been nine cases of convulsions, none of them fatal. The cause of the convulsions is obscure, but it is recommended that anæsthesia with Vinesthene should not exceed an hour in duration.—C. J. M. Dawkins, *Brit. med. J.*, i/1940, 163.

CHROMII TRIOXIDUM

B.P., U.S.P. XI, P. Helv. V, P.G. VI, P. Dan.

$\text{CrO}_3 = 100.0$.

Syn. ACIDUM CHROMICUM, CHROMIC ANHYDRIDE (*Fr. Cx.*).

In deliquescent, crimson crystals. A powerful oxidising agent.

Caution: Incompatible with alcohol, glycerin and other oxidisable substances. **Soluble** about 5 in 3 of water.

Gargarisma Chromii Trioxidi (B.P.C.). 0.2% *w/v*.

Liquor Chromii Trioxidi (B.P.C.). *Syn.* LIQUOR ACIDI CHROMICI.

25% *w/v* in water. *Fr. Cx.* has 50% *w/v*.

Uses. Caustic, astringent and germicidal. Applied to warts, to condylomata and lupus; 1 in 40 to ulcerated gums and mouth sores. For sweating feet 5 to 10% lotion; in leucorrhœa and ozæna 1 in 2000. In secondary syphilis of the pharynx, the so-called snail-track ulcer treated with a solution (10 grains to the ounce). For mucous and warty patches 5% is useful. A 10% solution brushed on daily with alternately boric acid and zinc ointment has been employed in the treatment of rodent ulcer.

In ulcerative stomatitis chromium trioxide used warm 1 in 200 to 1 in 400 and applied with wool round a probe relieves pain and removes the necrotic tissue. Immediately after the use of the chromic lotion paint the affected area with a mixture of 20 gr. of chlorbutol to the ounce of equal parts glycerin and spirit.

CHROMIUM PLATING. The process consists in wiring the articles to a frame ready for the plating vat, the actual plating (anything up to 15 mins.), unwiring, swilling and polishing. Current 500 to 1000 amps. and 4 to 10 volts. Solution contains 50% of chromic acid. Fumes contain the acid forced up in spray by the evolution of hydrogen at the cathode. Lassar's paste modified with a preponderant base of soft paraffin smeared on hands and arms before work, and a little instilled into each nostril. Soap containing free lanolin used in some works. Dermatitis treatment—double strength calamine solution. When oedema subsides scrub spots with gauze soaked in spirit, dry, and wrap in lint and Lassar's paste. Chromium ulcers should be cleaned and dressed with zinc oxide and soft paraffin. Ulceration of the nose treated with gauze soaked in flavine 1 in 1000.—H. B. Trumper, *Brit. med. J.*, i/1931, 705.

The use of chromium and its salts is steadily increasing industrially. The industries concerned are (1) electrolytic chromium plating, (2) the manufacture of colours containing chromium, e.g., lead chromate, (3) chromium tanning of skins, which is replacing vegetable tanning, (4) dyeing fabrics and furs, (5) dyeing certain woods, (6) the manufacture of sporting powders, (7) photography, (8) the manufacture of Swedish matches. Contact with the salts of chromium causes first erythema and then eczema; if the skin is anywhere abraded, a chemical reaction with the underlying tissue occurs, setting up tissue necrosis with the formation of painful, indolent ulcers, and in the presence of dust or fumes the mucous membrane of the nasal cavity is attacked. Symptoms of general poisoning are not usual, but anæmia occurs amongst those preparing chromates.—Leroux-Robert, *Bull. Acad. Méd., Paris*, 1936, 116, 875.

Potassii Chromas. $K_2CrO_4 = 194.2$. In yellow crystals soluble in water. Used as a reagent.

Potassii Dichromas (B.P.C.). *Syn.* POTASSIUM BICHROMATE (*Fr. Cx.*). $K_2Cr_2O_7 = 294.2$.

Dose.— $\frac{1}{10}$ to $\frac{1}{4}$ grain (0.006 to 0.012 g.).

An odourless, orange-red, crystalline substance with an acid taste.

Soluble 1 in 10 of water; insoluble in alcohol.

Antidotes. Empty stomach by emetic or stomach tube. Give magnesia or chalk freely in water. Demulcent drinks. Keep patient lying down and warm; give stimulants if necessary.

Dermatitis may follow the contact of potassium dichromate with the skin of susceptible persons. This may be avoided by frequently rinsing the exposed skin with a saturated solution of sodium bisulphite and then water.

Uses. In dyspepsia and gastric ulcer, in capsules or as pills massed with kaolin ointment. It has also been used, in the form of a 5% solution for external application, in the treatment of hyperhidrosis of the feet, and a 10% solution has been employed as a caustic to warts and nasal polypi.

CHRYSAROBINUM

B.P., U.S.P. XI, P. Jap., P. Ned. V, P. Helv. V, P. Dan., P. Ital. V, F.E. VIII.

Syn. Commonly but erroneously called CHRYSOPHANIC ACID; ARAROA DEPURATA (*P. Austr.*).

Dose.— $\frac{1}{8}$ to $\frac{1}{4}$ grain (0.01 to 0.03 g.).

A yellow, tasteless microcrystalline powder obtained from araroba by extraction with hot benzene. Is a mixture of chrysophanol-anthranol, $C_{15}H_{12}O_3$, and related substances.

Soluble slightly in alcohol 90%, 1 in 16 of ether, 1 in 12 of chloroform, 1 in 18 of benzene, also in fats; almost insoluble in water.

Uses. Has been employed internally in psoriasis, but is extremely irritant and may give rise to diarrhoea, vomiting and hæmaturia. Externally as ointment or pigment. Chrysarobin is a powerful stimulant and parasiticide in acne rosacea, alopecia, psoriasis, lupus, ringworm of the scalp, pityriasis and tinea circinata.

[P1] **Pigmentum Chrysarobini (B.P.C.).**

Chrysarobin 10% *w/v* in solution of gutta-percha.

In psoriasis, painted on twice a day with a brush for ten days without washing—finally washing off.

Pigmentum Chrysarobini et Pyrogallolis.

Chrysarobin 1, pyrogallol 1, ether and alcohol, of each 10, collodion 120. Apply after bathing, every third day for psoriasis and ringworm.

[P1] **Suppositorium Chrysarobini.**

Chrysarobin 1½ gr., iodoform, ½ gr., belladonna extract ½ gr., glycerin *q.s.* to make a suitable paste and oil of theobroma *q.s.* to 30 gr. Gives good results in hæmorrhoids.

Unguentum Chrysarobini (B.P.).

4% in simple ointment.

It stains the skin and hair, and a strong ointment after three days' continued use sometimes produces feverishness and irritation. 5 to 10 gr. to 1 oz. may be better. The ointment should not be employed over a large area of skin. Its stains can be removed by benzene, weak solution of potash or chlorinated lime. Will effect a cure of tinea cruris in six days if applied thickly on lint twice daily.

Unguentum Chrysarobini (U.S.P. XI).

Chrysarobin 6, wool fat 5, yellow wax 5, chloroform 4, liquid paraffin 6, yellow soft paraffin to 100.

Unguentum Chrysarobini Compositum (B.P.C.).

Chrysarobin 4, ichthammol 4, salicylic acid 2, in yellow soft paraffin to 100.

Unguentum Chrysarobini Compositum (St. J. H.).

Chrysarobin 25 gr., ichthammol 25 m., salicylic acid 10 gr., soft paraffin to 1 oz. Psoriasis is treated by an ointment of chrysarobin 5, salicylic acid 2½, oil of birch tar 5, soft soap 6½, soft paraffin 6½.

Controlled clinical experiments show that an ointment of chrysarobin and soft paraffin is not superior to chrysarobin paste, but its irritant effect is three times greater. The addition of salicylic acid only slightly improves the curative effect of chrysarobin paste but it intensifies the irritant effect of the chrysarobin. The addition of liquid soap to chrysarobin paste renders the preparation non-irritant but entirely inefficient.—H. W. Siemens, per *Brit. med. J. Ept.*, i/1938, 60.

Chrysarobin Tri-Acetate. A brownish powder recommended as a substitute for chrysarobin. Solutions of 2 to 3% are said to be effective and free from toxic effects; non-irritant, and do not stain. It is soluble in ether, chloroform and in acetone.

Araroba (B.P.C.). Syn. GOA POWDER, CRUDE CHRY SAROBIN.

A brownish concretion from the cavities in the trunk of *Andira Araroba* (Leguminosæ), dried and powdered.

Crude araroba is imported from Brazil; it contains about 50% of chrysarobin. The Indian mode of using the drug is to cut a lime fruit, dip it in the powder

and dab it on the affected skin. The Brazilians mix it with vinegar. Has been used as an ointment (1 in 16 to 1 in 32 with lard) as a parasiticide.

Dithranol. *Syn. and Prop. Names.* DIHYDROXYANTHRANOL, ANTHRAROBIN (*P. Dan.*), ANTHRALIN (*Abbott Laboratories, London*), CIGNOLIN (*Bayer Products, London*), DEROBIN (*Glaxo Laboratories, London*). $C_{14}H_{10}O_3 = 226.08$.

1 : 8-Dihydroxyanthranol, occurring as a yellowish, crystalline powder, m.p. 176° .

Insoluble in water but soluble in organic solvents, oils, oleic acid and in dilute sodium hydroxide, the latter solution having a green fluorescence.

Stains caused by dihydroxyanthranol may be removed from clothing with petrol, and from the skin with olive oil.

Uses. Dihydroxyanthranol possesses properties similar to those of chrysarobin, but is three or four times as active therapeutically. It is less toxic than chrysarobin and less likely to cause dermatitis, but the reaction of the patient should be tested by applying a 0.25% ointment before application to the head or face. It is indicated in the treatment of psoriasis, chronic eczema, alopecia areata, and dermatophytosis, applied in the form of an ointment varying in strength from 0.25 to 3% twice a day.

CINCHONA

B.P.

Dose.—5 to 15 grains (0.3 to 1 g.).

Consists of the dried bark of cultivated trees of *C. Calisaya*, *C. Ledgeriana*, *C. officinalis* and *C. succirubra* (Rubiaceæ), and of hybrids of either of the last two with either of the first two. It contains not less than 6% of total alkaloids of which not less than one-half consists of quinine and cinchonidine. CORTEX CHINCHON (*P. Helv. V, P.G. VI*) is from *C. succirubra*. CINCHONA (*U.S.P. XI*) is from *C. succirubra*, *C. Ledgeriana*, *C. Calisaya* and hybrids. *P. Ital. V* prescribes *Calisaya* or *succirubra* bark. *F.E. VIII* has *Calisaya*, *Loja* and *succirubra*. *P. Belg. IV* has *C. succirubra* and "other species", and *Fr. Cx.* includes *C. Calisaya*, *Quinquina Jaune*, *C. officinalis*, *Quinquina Gris*, and *C. succirubra*, *Quinquina Rouge*.

The principal dried barks used for the production of the salts of the cinchona alkaloids are:—Red cinchona bark, from *Cinchona succirubra*, containing 6 to 9% of total alkaloids, 1.5 to 3.5% being quinine; yellow cinchona bark, obtained from *C. Calisaya*, containing 6 to 7% of alkaloids, 3 to 4% being quinine; pale cinchona bark (crown or *Loxa* bark), from *C. officinalis*, containing about 6% of alkaloids of which half may be quinine; ledger bark, from *C. Ledgeriana*, which may contain up to 10 to 14% of quinine.

The quinine barks, as they are called, now imported from South America, are chiefly the *Calisaya* in quills. A large quantity of

bark, the produce of *C. succirubra*, *C. officinalis*, and hybrids, is grown in Madras and other parts of India.

Nine-tenths of the world's supply of bark consists of the rich Java bark, produced by *C. Calisaya* var. *Ledgeriana*.

For further references to the cultivation of cinchona, see 21st Edn., Vol. II, p. 117.

Uses. The bark in the form of the liquid extract, tincture and its alkaloids has extended use as a bitter tonic. Taken, as such, in powder form it is astringent, giving a feeling of warmth in the epigastrium and occasionally causing vomiting. For further data see the alkaloids quinine, quinidine, etc.

Decoctum Cinchonæ Concentratum (B.P.C.). Dose.—1 to 2 drachms (4 to 8 ml.). When Decoctum Cinchonæ is prescribed this concentrated decoction diluted with seven times its volume of distilled water may be dispensed.

Elixir Cinchonæ (B.P.C.). Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Tincture of cinchona, 1 in 6 $\frac{1}{2}$, in syrup, glycerin and aromatic elixir.

Elixir Calisayæ is the same prepared with tincture of *Cinchona Calisaya*.

Extractum Cinchonæ (B.P.).

Dose.—2 to 8 grains (0.12 to 0.5 g.). Contains 10% w/w of cinchona alkaloids. A concentrated standardised extract from which the liquid extract, tincture and other preparations may be obtained by dilution.

Extractum Cinchonæ Flavæ (Fr. Cx.) is a dry extract prepared with 60% alcohol from *C. Calisaya* and containing 12% of total alkaloids.

Extractum Cinchonæ Rubræ (Fr. Cx.) is a soft aqueous extract made from *C. succirubra* and containing 8% of total alkaloids.

Extractum Cinchonæ Liquidum (B.P.).

Dose.—5 to 15 minims (0.3 to 1 ml.).

Contains 50% w/v of extract of cinchona, equivalent to 5% w/v of total alkaloids, with hydrochloric acid, glycerin, alcohol and water.

If prescribed with acid, as in the following:—Spirit of chloroform 1 $\frac{1}{2}$ dr., nitrohydrochloric acid 1 $\frac{1}{2}$ dr., liquid extract of cinchona 1 $\frac{1}{2}$ dr., water to 6 oz., mix the first three in order as written, and pour into the water to produce best result.

Extrait de Quinquina Rouge (Fluide) (Fr. Cx.) is made by percolation with dilute hydrochloric acid and contains 3.5% of total alkaloids. *P. Ital. V* contains 5% of total alkaloids.

Infusum Cinchonæ Acidum Concentratum (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 2 $\frac{1}{2}$.

Infusum Cinchonæ Recens (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 20, with 1 in 80 of aromatic sulphuric acid.

Mist. Cinchon. Acid. (N.I.F.).

Liquid extract of cinchona 10 m., dilute phosphoric acid 10 m., glycerin 10 m., water to $\frac{1}{2}$ oz.

Mist. Cinchon. Ammon. (N.I.F.).

Liquid extract of cinchona 10 m., ammonium carbonate 3 gr., chloroform water to $\frac{1}{2}$ oz.

Tinctura Cinchonæ (B.P.). Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Extract of cinchona 10% w/v, in alcohol 70%.

Tinctura Cinchonæ Composita (B.P.). *Syn. HUXHAM'S TINCTURE OF BARK.* Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Extract of cinchona, 5% *w/v*, with orange peel, serpentry and cochineal.

Tinctura Cinchonæ Composita (U.S.P. XI).

Average dose.—60 minims (4 ml.).

Cinchona 10, bitter orange peel 8, serpentaria 2, in alcohol, with glycerin and hydrochloric acid but without cochineal.

Tinctura Cinchonæ Rubræ (Fr. Cx.). Red cinchona bark 1 in 5 with alcohol 60%.

Vin de Quinquina Officinal (Fr. Cx.).

Dose.— $\frac{1}{2}$ to 5 ounces (15 to 150 ml.).

Macerate cinchona 25 with dilute hydrochloric acid 2, alcohol (60%) 75, for 24 hours, shaking occasionally. Add red wine 920, macerate 24 hours and filter. *Fr. Cx.* also includes Cinchona wine made from liquid extract of red cinchona 3, alcohol 60% 5, red wine 92 parts, all by weight.

Vinum Chinæ (P. Jap. V). Liquid extract of cinchona 5, sherry 80, sugar 14, tincture of orange 1.

Vibrona (Fletcher, Fletcher & Co., London). A wine containing the alkaloids of cinchona. A wineglassful contains the combined alkaloids of 5 gr. of cinchona bark in the form of hydrobromides. Total alkaloidal content 0.025%.

Acidum Quinicum. Syn. KINIC ACID.

$C_6H_7(OH)_2COOH \cdot H_2O = 210.1$.

Dose.—4 to 8 grains (0.25 to 0.5 g.).

An acid contained in cinchona, principally combined with the alkaloids and with calcium, forms white crystalline masses, soluble in water about 5 in 6, and in alcohol 90% 1 in 35. It is decomposed into hippuric acid in the system. This and lithium quinate in similar dose have been used in gout and rheumatism.

Alstonia (B.P.C.).

The dried bark of *A. scholaris* (dita bark) from India and of *A. constricta* (Australian fever bark), from Australia (Apocynaceæ). Contains various alkaloids and is used in the East and in Australia in diarrhoea and in the treatment of malaria. **Infusum Alstoniæ.**

Dose.— $\frac{1}{2}$ to 1 oz. 1 in 20. **Tinctura Alstoniæ.** *Dose.*— $\frac{1}{2}$ to 1 drachm. 1 in 8.

Cusparia (B.P.C.). *Dose.*—10 to 30 grains (0.6 to 2 g.). *Syn.* ANGOSTURA BARK.

The bark of *Galipea officinalis* (Rutaceæ). Stimulant and tonic. In diarrhoea, dysentery and dyspepsia much employed in South America and West Indies. The bark is stated to contain cusparine, $C_{20}H_{19}NO_2$, cuspareine, $C_{18}H_{19}NO_2$, and galipoidine, $C_{18}H_{19}NO_2$.

Infusum Cuspariæ Concentratum (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 2 $\frac{1}{2}$.

When Infusum Cuspariæ is prescribed this concentrated infusion diluted with seven times its volume of water may be dispensed.

CINCHOPHENUM

B.P., P. Dan.

$C_6H_5 \cdot C_9H_5N \cdot COOH = 249.1$.

Syn. and Prop. Names. ACIDUM PHENYL CINCHONINICUM (P.G. VI, P. Helv. V, P. Ned. V, P. Svec. X, P. Ital. V, P. Belg. IV, F.E. VIII), ACIDUM PHENYLCHINOLIN CARBONICUM, QUINOPHENUM (P. Jap. V), QUINOPHAN, 2-PHENYLQUINOLINE-4-CARBOXYLIC

ACID, AGOTAN (*Howard & Sons, Ilford*), ATOPHAN (*Schering, London*), PHENOQUIN (*Southall Bros. & Barclay, Birmingham*), TOPHOSAN (*Richter, London*).

[P1] "*Phenylcinchoninic acid; salicylcinchoninic acid; their salts; their esters.*"

[S1] "*Phenylcinchoninic acid; salicylcinchoninic acid; their salts; their esters.*"

[S4] "*Phenylcinchoninic acid; salicylcinchoninic acid; their salts; their esters.*"

Dose.—B.P. *Add. I* 5 to 10 grains (0.3 to 0.6 g.). B.P. '32 gave max. dose 15 grains. Is often given with sodium bicarbonate, as in the following scheme. 8 gr. thrice daily after meals. Simultaneously on the first day, $\frac{1}{2}$ oz. (15 g.) and on the following days 75 gr. to 150 gr. (5 to 10 g.) of sodium bicarbonate in plenty of water.

A yellowish cream-coloured amorphous powder, melting at 214° to 217° .

Soluble 1 in about 120 of alcohol 95%, 1 in about 100 of ether and 1 in about 400 of chloroform. Insoluble in water. It dissolves in solutions of alkali hydroxides, bicarbonates and carbonates.

Incompatible with sodium bicarbonate and other alkalis *in vitro*.

Toxic Effects. Prolonged administration, especially to susceptible individuals, may give rise to skin rashes, palpitation, fall of blood pressure, cyanosis, vomiting, epigastric pain, hepatic dysfunction and jaundice. A careful watch should be kept for early signs of liver poisoning, e.g., malaise and loss of appetite, and administration stopped at the first symptoms of intolerance.

Two cases terminating fatally following continued use (three $7\frac{1}{2}$ -grain tablets daily).—L. J. A. Lowenthal, W. A. MacKay and E. Cronin Lowe, *Brit. med. J.*, i/1928, 592.

Forty-seven cases of cinchophen toxicosis published, with 10 deaths. Evidence of serious injury to liver in all cases.—H. S. Reichle, *J. Amer. med. Ass.*, ii/1929, 951.

Fatal case of poisoning. 45 grains a day for 4 days, with intermission for $2\frac{1}{2}$ months. Death due to acute hepatitis.—W. Morris, *Brit. med. J.*, i/1931, 221.

Should not be used as a routine measure in the treatment of gout. Details of 35 cases of jaundice following use.—T. G. Reah, *Lancet*, ii/1932, 504.

92 cases of poisoning have been recorded, 40 fatal—probably many cases of non-fatal toxicity are unrecognised and unreported.—H. A. Harris, *Brit. med. J.*, ii/1932, 707.

A fatal case of subacute yellow atrophy of the liver following taking of $37\frac{1}{2}$ grains of cinchophen (Atophan) at the rate of one $7\frac{1}{2}$ -grain tablet on 5 successive days.—T. N. Fraser, *Brit. med. J.*, ii/1934, 1195.

In the eight-year period from 1924 to 1932 inclusive, there were about 660,000 pounds of cinchophen produced and consumed, representing approximately 660 million doses of $7\frac{1}{2}$ gr. each. Despite this, during this period there were only 38 reported deaths in the United States attributed to the use of this drug, making the chance toxic dose 1 : 17,000,000, which is as low as one could reasonably expect for any active therapeutic agent. Cinchophen is not a harmless drug, but it is a very effective one, and when used with proper care and reasonable precautions, its benefits far outweigh its limitations.—R. G. Snyder and co-workers, *J. Lab. Clin. Med.*, 1936, 21, 545.

Antidotes. (Chronic poisoning—from prolonged dosage.) Stop the drug. Keep patient in bed. Dextrose and fluids freely dextrose and insulin for severe cases.

Uses. Cinchophen possesses an analgesic and antipyretic action similar to that of the salicylates, and in addition causes an increase of uric acid excretion in the urine; this increase continues for 24 hours after administration of the drug, is followed by a compensatory decrease, and returns to normal in two to three days. Cinchophen is employed in the prevention and treatment of acute gout, in which it is stated to act more promptly than colchicum; it is also used with benefit in subacute and chronic gout, and is of value for the relief of pain in lumbago, sciatica and neuralgia. In order to minimise the possibility of liver damage, it is recommended that dextrose and calcium lactate should be given concurrently with cinchophen.

[P1-81-84] **Tabellæ Cinchopheni** (*B.P.C.*) contain 5 gr. (0.3 g.).

[P1-81-84] **Acitophosan** (*Richter, London*). A combination of calcium cinchophen and calcium aspirin. *Dose*.—3 to 6 8-grain tablets daily with plenty of fluids. Influenza, gout and rheumatic affections.

[P1-81-84] **Atophan Balsam** (*Schering, London*). Amyl ester of Atophan 10% w/w, phenyl salicylate, camphor and synthetic menthol in a neutral base. For external application in rheumatism, sciatica, gout, etc.

[P1-81-84] **Atophanyl** (*Schering, London*). Contains equal parts of sodium Atophan and sodium salicylate in solution.

For intravenous injection.—10 ml., containing 0.5 g. of each.

After injection, the arm should be held above the head for 1 to 2 minutes. Warm the ampoules first. The patient should not undertake undue exertion too soon after the pain has been relieved.

For intramuscular injection.—5 ml., containing 0.5 g. of sodium Atophan, 0.5 g. of sodium salicylate, and 0.3 g. of urethane in distilled water. To be given deeply in the upper external quadrant of the gluteal muscle.

In chronic cases, 10 to 15 injections are given; usually one injection per day for 4 days, followed by an interval of 2 to 3 days. Used for the same purposes as cinchophen.

[P1-81-84] **Goron Cachets** (*T. Christy & Co., London*). A combination of cinchophen, hexamine, and glycooll. Also in ampoules of solution for intramuscular injection. In sciatica, lumbago, etc.

[P1-81-84] **Hexophan** (*Bayer Products, London*). Oxyphenylquinoline-dicarboxylic acid. *Dose*.—1 or 2 7½-grain tablets thrice daily. In gout, rheumatism and lumbago.

[P1-81-84] **Neo-Phenoquin** (*Southall Bros. and Barclay, Birmingham*) is lithium phenylcinchoninate. $C_6H_5C_6H_4N \cdot COOLi = 255.0$.

Dose.—From 5 to 10 tablets daily, each tablet containing 0.25 g., after meals, followed by a glass of water. For elimination of uric acid in acute and chronic gout. Simultaneous use of sodium bicarbonate is sometimes desirable.

[P1-81-84] **Oxyl-Iodide** (*Lilly, London*). Phenylcinchoninic acid hydriodide, containing 33% iodine. In arthritis, neuritis and myositis.

[P1-81-84] **Sciatego** (*Coates & Cooper, London*). Dragées containing cinchophen, hexamine and glycooll. *Dose*.—2 dragées twice daily for 2 or 3 weeks. Rheumatism, lumbago, sciatica.

[P1-81-84] **Tophamid** (*Richter, London*). Tablets contain 4 gr. each of phenylcinchoninic acid and amidopyrin. *Dose*.—1 or 2 tablets three times daily. Influenza and pyrexial conditions.

[P1-81-84] **Tophosanyl** (*Richter, London*). Sodium phenylcinchoninate 8 gr., sodium salicylate 8 gr., in ampoules of 10 ml. for intravenous injection.

[P1-81-84] **"Ung. Agotan Co."** (*Howard & Sons, Ilford*).

Agotan with a rubefacient in ointment form, for use in general, articular and muscular rheumatism, gout, lumbago, sciatica, erythema nodosum, torticollis, pleurodynia, neuritis, urticaria and chilblains. The simultaneous use of Agotan tablets *per os* increases results.

[P1-81-84] **Atoquinol** (*Ciba, Horsham*) is allyl phenylcinchoninate in tablets containing 4 gr. *Dose*.—4 to 8 tablets in 24 hours. They should be administered

with a large quantity of liquid, and if the urine shows a sediment of uric acid or urates, it is advisable to prescribe sodium bicarbonate as well.

It forms odourless yellowish crystals, m.p. 30°, insoluble in water, readily soluble in ether and oils. Has analgesic and antipyretic properties and is used similarly in arthritis, gout, neuralgia, sciatica, etc. It may be applied externally in an ointment (20%).

[P1-S1-S4] **Methyl Phenylcinchoninate** (*P. Ned. V Supp. II*). *Syn. and Prop. Name.* METHYL PHENYLCHINOLINCARBONATE (*P. Helv. V, P.G. VI*), METHYLCHINOPHENUM, NOVATOPHAN (*Schering, London*). $C_8H_7-C_6H_4N-COOCH_3$, = 263.1.

Dose.—8 grains (0.5 g.) 4 times daily to 15 grains (1 g.) thrice daily. Simultaneously on first day $\frac{1}{2}$ ounce (15 g.), and on the following day 75 to 150 grains (5 to 10 g.) of sodium bicarbonate.

This compound is the methyl ester of cinchophen and is used similarly. It occurs as yellowish tasteless crystals insoluble in water.

[P1-S1-S4] **Arcanol** (*Schering, London*). Tablets containing methylphenylcinchoninate $7\frac{1}{2}$ gr. and acetylsalicylic acid $7\frac{1}{2}$ gr. In influenza, etc.

Neocinchophenum (*B.P.C., U.S.P. XI*). *Syn. and Prop. Name.* ETHYL METHYLPHENYLCHINCHONINATE, TOLYSIN (*Calco Chemical Co., Bound Brook, N.J.; Martindale, London*).

Dose.—10 to 15 grains (0.6 to 1 g.) 3 or 4 times daily for 4 or 5 days. It may be necessary to give 100 grains daily in rheumatic fever. *U.S.P. XI* average dose 8 grains.

A yellowish-white crystalline powder, m.p. 74°. It is the ethyl ester of 6-methyl-2-phenylquinoline-4-carboxylic acid.

Uses. An analgesic, antipyretic and uric acid eliminant. Indicated in gout, rheumatism, arthritis, neuralgia, neuritis and sciatica. In acute rheumatic fever it is stated to be as efficient as the salicylates. It does not depress the heart, or injuriously affect the kidneys.

In rheumatic heart disease Tolysin has definite action, is less toxic than salicylates, and enables the worst cases of carditis to be treated without fear of drug complications.—F. J. Poynton, *Lancet*, ii/1928, 638.

Contrasted with control litter mates, no difference could be observed in the growth rate of young rats receiving daily for 100 days 1 g. per kilo of Tolysin. Histological evidence of liver damage in these animals is entirely lacking. Complete absorption of daily doses of this size in rats has been demonstrated. Tolysin in this enormous dosage has therefore no toxicity for rats. Similar dosage with cinchophen usually causes death within a few days or weeks, and even those which survive for many weeks exhibit very poor growth curves. Tolysin is far less toxic to rats than cinchophen, which fact accords with the extreme paucity of clinical evidence of Tolysin toxicity.—H. G. Barbour and A. Gilman, *J. Pharmacol.*, 1935, 55, 400.

CINNAMOMUM

B.P.

Syn. CANNELLE DE CEYLAN (*Fr. Cx.*).

Dose.—5 to 20 grains (0.3 to 1.2 g.).

The dried inner bark from *C. zeylanicum* (*Lauracæ*).

Aromatic, carminative and antiseptic, employed as flavouring agent. Contains volatile oil and tannin.

P. Jap. V has *Cortex Cinnamomi Loureirii*, *syn.* NIKKEI BARK, Japanese Cinnamon Bark. *Cinnamomum U.S.P. XI* is from *C. Loureirii*. *P. Helv. V* includes both *Cortex Cinnamomi ceylanici*

and chinensis, Ceylon cinnamon being used for the syrup, while other preparations are made from *C. Cassia* bark.

Aqua Cinnamomi Destillata (B.P.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 10.

Aqua Cinnamomi Concentrata (B.P.).

Dose.—5 to 15 minims (0.3 to 1 ml.).

Contains 2% *v/v* of oil of cinnamon, and is approximately 40 times the strength of the distilled water.

Pulvis Cinnamomi Compositus (B.P.C.). *Syn.* PULVIS AROMATICUS.

Dose.—10 to 60 grains (0.6 to 4 g.).

Cinnamon, ginger and cardamom, equal parts.

Tinctura Cinnamomi (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm. 1 in 5.

Tinctura Cinnamomi Composita (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Cinnamon 1 in 40, with cardamom, long pepper and ginger.

Oleum Cinnamomi (B.P., Fr. Cx.).

Dose.— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.).

The light yellow oil distilled from the bark.

Contains 50 to 65% *w/w* of cinnamic aldehyde, C_9H_8O . *Fr. Cx.* requires 65 to 75%.

Oleum Cinnamomi (U.S.P. XI, P. Jap. V) is identical with **Oleum Cassiæ (B.P.C.)**, from *C. Cassia*. It contains not less than 80% *v/v* of cinnamic aldehyde. *P. Helv. V* includes the oils from each of the two barks.

Soluble in alcohol 90% about 10 in 3.

Uses. Cinnamon oil is used in influenza and catarrhs, being given in milk or on sugar; is occasionally prescribed as an inhalation (30 to 40 minims) with boiling water 1 pint.

Solutio Cinnamomi Composita (Brompton H.).

Menthol 4, oil of cinnamon 3, oil of lemon 4, creosote 10, oil of pumilio pine 10, spirit of chloroform 10. For use on an oro-nasal respirator.

Spiritus Cinnamomi (B.P.C.). *Dose.*—5 to 20 minims (0.3 to 1.2 ml.). 1 in 10.

Spiritus Cinnamomi (U.S.P. XI). *Average dose.*—15 minims (1 ml.).

Oil of cinnamon (*U.S.P. XI, see above*) 10%, in alcohol.

Cassia (B.P.). *Syn.* CASSIÆ PULPA. *Dose.*—1 to 2 drachms (4 to 8 g.). The evaporated aqueous percolate of the pulp of commercial cassia pods. Mild aperient.

Cassia Cortex. *Syn.* CHINESE CINNAMON, CORTEX CINNAMOMI (*P. Jap. V*). Is the bark of *Cinnamomum Cassia* (Lauraceæ). It contains 1 to 2% of volatile oil. **Cassia Flos,** *syn.* CASSIA BUD, are the immature fruits, and are used as a spice.

Cassia Fructus (B.P.C.). *Syn.* CASSIA POD. The ripe fruits of *C. Fistula* (Leguminosæ). The fruit is a dark chocolate-brown pod about 35 to 50 cm. long and 18 to 25 mm. in diameter.

Oleum Cassiæ (B.P.C.).

Dose.— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.).

Obtained from the leaves and twigs of *Cinnamomum Cassia*. Resembles oil of cinnamon but has a less fragrant odour and a harsher taste.

Canella (B.P.C.). *Syn.* WILD CINNAMON. The bark of *Canella alba* (Canellaceæ) containing volatile oil. Stomachic.

Oliveri Cortex (B.P.C.). *Syn.* BLACK SASSAFRAS. From *Cinnamomum Oliveri* (Lauraceæ). Has been used as a substitute for cinnamon.

Tinctura Oliveri Corticis. *Dose.*— $\frac{1}{2}$ to 1 drachm. 1 in 10.

COCA

(with COCAINE and COCAINE SUBSTITUTES)

B.P.C., Fr. Cx.

Syn. COCÆ FOLIA (P. Helv. V, P. Ital. V), CUCA.

[D] "Coca leaves," see p. 1143.

"Cocaine (including synthetic cocaine) and ecgonine and their respective salts, and the esters of ecgonine and their respective salts";

"Any solution or dilution of cocaine or its salts in an inert substance whether liquid or solid, containing any proportion of cocaine, and any preparation, admixture, extract or other substance (not being such a solution or dilution as aforesaid) containing not less than one-tenth per cent. of cocaine or of ecgonine."

"All preparations of esters of ecgonine or of their respective salts and all preparations of ecgonine containing less than one-tenth per cent. of ecgonine."

Note.—"Ecgonine" is used above to mean lævo-ecgonine, and includes any derivatives of ecgonine from which it may be recovered industrially.

[P1] "Alkaloids, the following; their salts, simple or complex:—Coca, alkaloids of."

"Amino-alcohols, esterified with benzoic acid, phenylacetic acid, phenyl propionic acid, cinnamic acid or the derivatives of these acids."

"Guanidines, the following:—Polymethylene diguanidines, di-para-amisylphenetyl guanidine."

"Orthocaine; its salts."

"Oxycinchonic acid, derivatives of; their salts; their esters."

"Para-amino-benzoic acid; esters of; their salts."

"Phenetidylphenacetin."

[S1] "Alkaloids, the following; their salts, simple or complex:—Coca, alkaloids of, except substances containing less than 0.1% of the alkaloids of coca."

"Amino-alcohols, esterified with benzoic acid, phenylacetic acid, phenyl propionic acid, cinnamic acid or the derivatives of these acids, except in substances containing less than 10% of esterified amino-alcohols."

"Guanidines, the following:—Polymethylene diguanidines, di-para-amisylphenetyl guanidine."

"Oxycinchonic acid, derivatives of; their salts; their esters."

"Phenetidylphenacetin."

Dose.— $\frac{1}{2}$ to 1 drachm (1. to 4 g.). Fr. Cx. gives maximum dose in 24 hours 8 g.

The dried leaves of *Erythroxylum Coca* (Bolivian or Huanuco Leaf) or of *E. truxillense* (Peruvian or Truxillo leaf) (Erythroxylaceæ).

The Bolivian leaves are browner, larger, broader and thicker; the veins are prominent; and there are clearly defined lines on each side of the midrib, which shows a distinct ridge in its centre.

Peruvian leaves are pale green, less oval and more elliptical in outline, and are much more fragile, being frequently broken.

The Bolivian leaves, imported from that country, are preferred for medicinal use, since a larger proportion of the alkaloids is cocaine. Java supplies most of the Truxillo variety. Ceylon was at one time a regular producer, but cultivation was abandoned at the request of the British Government. Coca is now frequently valued on its ecgonine content since commercial cocaine is obtained synthetically from ecgonine.

The total alkaloid content varies from 0.5 to 1.5%. Truxillo and Java leaf contains more, but only about 50% is cocaine. The total alkaloid of Bolivian leaf contains 70 to 80% of cocaine.

Uses. As a nerve and muscle stimulant, and of value in gastralgia, nausea and vomiting, and for the discomfort following excessive eating or drinking. Coca leaf chewing is extensively practised in Bolivia and Peru, 2 to 4 ounces being used per day. It staves off hunger and fatigue and gives stamina.

[P1] **Elixir Cocæ** (B.P.C.). *Dose.*—1 to 4 drachms (4 to 15 ml.) in water.

A palatable preparation containing 16½% v/v of liquid extract of coca equivalent to about 0.08% w/v of alkaloids; 4 dr. contains about ½ gr.

[D-P1-S1] **Extractum Cocæ.**

Dose.—2 to 15 grains (0.12 to 1 g.), in pills or pastilles. A dry extract, made with alcohol 60% and standardised to 2% of alkaloids (1 = about 4 of leaves).

[D-P1-S1] **Extractum Cocæ Liquidum** (B.P.C., Fr. Cx.). *Syn.* MISCELLIBLE LIQUID EXTRACT OF COCA.

Dose.—½ to 1 drachm (2 to 4 ml.). Standardised to contain 0.5% of ether-soluble alkaloids; 1 dr. contains about ½ gr. of coca alkaloids.

A single emergency dose of Extractum Cocæ Liquidum is said to be of value in cases of hæmorrhage due to piles when patient has to stand for any length of time.

[P1] **Vinum Cocæ** (Fr. Cx.). Macerate coca leaves 60 g. in "liqueur wine" 1000 g., for 10 days.

[D-P1-S1] **Cocaina** (B.P., F.E. VIII, P. Helv. V, U.S.P. XI, Fr. Cx.). *Syn.* METHYL-BENZOYLECAGONINE.

$C_9H_{13}(CH_3)(C_6H_5CO)NO_3 = 303.2$.

Dose.—½ to ¼ grain (0.008 to 0.016 g.), in a pill or tablet. *Fr. Cx.* has max. single dose 0.05 g.; max. in 24 hours 0.15 g.

In shining monoclinic prisms, m.p. 97° to 98°. It is obtained from coca, and was first isolated by Niemann in 1860.

Soluble 1 in 10 of alcohol 90%, 2 in 1 of chloroform, about 1 in 4 of ether, 1 in 80 of light petroleum, 1 in 100 to 150 of liquid or soft paraffin, 1 in 10 of castor oil, 1 in 24 of olive oil, 1 in 2 of warm anhydrous wool fat; soluble in oil of clove and other volatile oils. Soluble 1 in 1300 of water and about 1 in 1000 of 1% sodium bicarbonate. Insoluble in glycerin.

Antidotes. (Acute poisoning.) Emetics will probably be useless, so empty stomach by stomach tube, using dilute solution of potassium permanganate or tannic acid. Give medicinal charcoal stirred up in water. (If the cocaine has been injected, obviously the use of the stomach tube and charcoal is useless.) Keep patient lying down and warm. Ammonia inhalations. Strychnine, ½ gr. hypodermically. Sodium Amytal, 3 to 10 ml. of 10% solution,

intravenously at rate of 1 ml. per minute, or chloroform, for convulsions. Nikethamide, 5 to 15 ml. of 25% solution, intravenously for circulatory collapse.

Cocaine Addiction. Cocaine fascinates by the rapidity with which it relieves exhaustion and dispels gloom by producing a delightful sense of mental and physical vigour. The stimulant effect is succeeded by a feeling of profound depression. Considerable tolerance is acquired by cocaine addicts, so that as much as 2 or 3 g. daily may be self-administered hypodermically. The discomforts caused by cocaine are readily controlled by morphine and when the patient learns this, the addiction becomes confirmed. Atropine, or better, hyoscine is the best for treatment of addiction.

Cocaine sniffed up the nose is readily absorbed. It first powerfully stimulates the brain and lassitude and fatigue pass, but a marked depression of the central nervous system succeeds. Frequent application to the nose causes perforation of the nasal septum.

Uses. For general uses of cocaine and its salts *vide* *Cocainæ Hydrochloridum*. The base is used for the preparation of oily solutions and ointments. A solution in olive oil has been used to anæsthetise the mucous membrane and allay cough in cauterising laryngeal growths.

A 2% solution in almond oil is mostly used for earache. For the eye a 2% solution in castor oil is used, sometimes combined with homatropine; for catheters, a solution in equal parts of castor and almond oils is useful.

1 or 2% in soft paraffin is suitable for eye work, and 4% or stronger is useful for catheterisation, burns, and for intense sensitiveness of parts, pruritus, etc.

[D-P1-S1] **Buginaria Cocainæ (B.P.C.)** contain $\frac{1}{2}$ grain of the alkaloid. Useful in urethral affections.

[P1-S1] **Guttæ Cocainæ (B.P.C.)**. *Syn.* COCAINE EYE DROPS (FACTORY ACT, SOLUTION No. 1), FACTORY EYE DROPS.

For a foreign body in the eye.

Dissolve powdered cocaine (base) 0.5 g. in castor oil 95 g. on a water bath. While still warm add a solution of 0.033 g. of mercuric chloride in 1 ml. of dehydrated alcohol. Mix by rotating. Apply with a camel hair brush. (Exempt [D].)

The crystals which form on standing consist of benzoylecgonine and are produced by hydrolysis of the cocaine. The conditions necessary for maximum stability are the use of a good quality castor oil having a low acid value, a dry container and absence of water in the alcohol, and use of little or no heat.—W. Forster, *Pharm. J.*, ii/1936, 83.

[D-P1-S1] **Gutt. Cocain. c. Oleo (N.I.F.)**.

Cocaine 2 gr., castor oil to 2 dr. To be dissolved in the cold.

[D-P1-S1] **Nebula Cocainæ Composita (B.P.C.)** contains 0.5% w/v of cocaine in compound menthol and thymol spray.

[D-P1-S1] **Nebula Cocainæ Oleosa.**

Cocaine 1, oleic acid 4, liquid paraffin to 20.

[D-P1-S1] **Unguentum Cocainæ (B.P.C.)**. Cocaine 4%, as oleate, in lard. Useful where absorption is required, as in facial neuralgia, shingles, eczema, erysipelas, urticaria, and pruritus.

[D-P1-S1] **Cocainæ Hydrochloridum (B.P., U.S.P. XI, Fr. Cx., P. Helv. V, P. Dan., etc.)**. $C_{17}H_{21}O_4N.HCl = 339.6$.

Dose.— $\frac{1}{8}$ to $\frac{1}{4}$ grain (0.008 to 0.016 g.), but more may be given,

in solution, pill or pastille. *Hypodermically* $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.016 to 0.03 g.).

Fr. Cx. and *P.G. VI* give maximum single dose, $\frac{3}{4}$ grain; maximum during 24 hours, 2 $\frac{1}{2}$ grains approx. *P. Ital. V* and *P. Helv. V* $\frac{1}{2}$ and 1 grain respectively.

Shining, lamellar crystals, with bitterish taste. One part of cocaine base = 1.12 of the hydrochloride.

Soluble 2 in 1 of water, 1 in 3 of alcohol, also in glycerin; insoluble in ether, fats, and oils. It will crystallise with 9.5% of water of crystallisation, but the anhydrous salt is preferred. M.p. when placed in heating bath at 193°, not below 197°.

For a review of investigations into the loss of activity of solutions on keeping, see *Pharm. J.*, ii/1934, 501.

Conflicting results have been reported, but it appears to be desirable that the reaction of the solution should be about pH 5 before sterilisation.

Incompatible with ammonium carbonate (soluble in excess), phenol, mercuric and mercurous chlorides. It is also precipitated by borax.

When borax and cocaine hydrochloride are prescribed together, a weight of boric acid equal to that of the borax should be ordered at the same time to prevent precipitation.

In dispensing ammoniated mercury with cocaine hydrochloride in the form of an ointment, dissolve the cocaine salt in a drop or two of water. Rub the ammoniated mercury down with a little almond oil, mix, and add the remainder of the ointment base—e.g., soft paraffin.

With phenol, cocaine hydrochloride is compatible in presence of glycerin or alcohol, but not in aqueous solutions.

Uses of Cocaine and its Salts.

Cocaine is a powerful local anæsthetic, paralysing the sensory nerve fibres and causing local vasoconstriction. It renders the superficial structure of the eye anæsthetic, is a mydriatic, and paralyses the accommodation. Applied to mucous membrane it blanches the part, simultaneously producing anæsthesia. The anæsthetic action of cocaine may be prolonged by the addition of adrenaline solution. Application of an ointment (alkaloid) will remove the pain of eczema, erysipelas, facial neuralgia or shingles, and the irritation of urticaria or pruritus.

For burns and scalds, brush with a 4% aqueous solution (hydrochloride) and apply cocaine ointment on cotton wool or lint; for fissured nipples and insect bites, apply an aqueous solution; for hay fever, influenza, coryza, bronchitis, spasmodic asthma, laryngitis and pharyngitis, a spray of an aqueous solution to relieve irritability of mucous surface. Spasmodic and painful affections of the vagina may be minimised by vaginal injections of $\frac{1}{4}$ grain in 1% oily solution; rectal and prostatic pains are relieved by $\frac{1}{2}$ -grain suppositories. In the urethra a solution exceeding 1% should not be used. A rectal injection checks diarrhoea and dysentery.

IN DENTISTRY. For extraction, 1 ml. of 1 to 2% solution is used with the addition of $\frac{1}{2}$ to 1 minim of solution of adrenaline hydrochloride. For plugging, preparations such as 10% cocaine in lanolin or Cocaine-Menthol-Eugenol are used.

Much of the ill-effect formerly thought to be due to cocaine is now realised to be due to adrenaline. For dental extraction and conservative work strengths of from 1 in 50,000 to 1 in 75,000 are sufficient. Too much adrenaline in the solution may cause delayed hæmorrhage.—H. T. Roper-Hall, *Dental Gazette*, Sept. 1939, 26.

FOR SMALL OPERATIONS. Solutions of cocaine hydrochloride have been used in excision of the tonsils, cauterising the turbinated tissue of the nose, painting chancres previous to the application of caustics, removing polypi, iridectomy and operation for cataract, squint, and the removal of foreign bodies from the eye. For the eye aqueous solutions of cocaine hydrochloride 2 to 4% strength and for other purposes 4 to 50%; it is necessary to repeat the application of the weaker solutions. No operation should be commenced within at least 10 minutes of the first application. Injurious effects, either local or constitutional, rarely follow its use.

FINGER AMPUTATION. Cocaine solution 5%, to which 5 m. of liquefied phenol and 5 m. of solution of adrenaline hydrochloride have been added to each ounce of the solution: never exceeding 90 m., often less.

NOSE, THROAT AND EAR OPERATIONS. The *nose* may be plugged with strips of gauze soaked in 10 to 20% cocaine solution, to which a few drops of 1 in 1000 adrenaline have been added. None of the synthetic local anæsthetics equal cocaine when applied to mucous membrane. Operations should be preceded by morphine and atropine hypodermically. In nose operations *adrenaline* should be applied followed by cocaine, injection being made slowly.

In *throat* operations a 5 to 10% solution should be applied first.

For *ear* operations as local anæsthetic. Cocaine hydrochloride, menthol, phenol, clove oil, and rectified spirit, equal parts.

A useful and safe solution of cocaine for local anæsthesia of the nose is one containing 34% cocaine, 1 in 1000 adrenaline solution, 2% potassium sulphate. The potassium sulphate solution acts as a catalytic agent, and the anæsthesia to be expected from a 15% solution of cocaine is attained.

Local anæsthesia of the pharynx or larynx may readily be induced by the application of cocaine and adrenaline on cotton-wool applicators. For the pharynx 10% solution of cocaine with one-fifth part of adrenaline solution can be used. For the larynx 20% with one-fourth part of adrenaline solution is used.—F. C. Ormerod, *Practitioner*, i/1937, 528.

ENUCLEATION OF THE TONSIL under local anæsthetic. For surface anæsthesia a mixture of equal quantities of 10% cocaine hydrochloride solution and adrenaline solution used, applied with cotton swabs, and repeated three or four times, followed by infiltration of the tissues in which the tonsil lies embedded with a 5% Novocain solution.

INTRASPINAL ANÆSTHESIA. Cocaine hydrochloride has been used for *intraspinal anæsthesia* using $\frac{1}{2}$ to 2% solution, but it is generally considered too toxic for this purpose.

LOCAL INFILTRATION ANÆSTHESIA is produced by 0.1 to 0.2% solutions of cocaine with a small quantity of adrenaline solution. Its action commences in three minutes, increases for ten to twenty

minutes, and mostly disappears within half an hour. The anæsthesia may be prolonged by applying a triangular bandage when possible above the site of injection; this has also the advantage of lessening the risk of toxic symptoms, as the delay of cocaine in the tissues renders it innocuous.

[D-P1-81] *Auricular Cocainæ Hydrochloridi*. Ear cones, contain $\frac{1}{10}$ gr. in each with oil of theobroma basis.

[D-P1-81] *Guttæ Cocainæ (R.L.O.H.)*. Cocaine hydrochloride 8 or 16 gr. to 1 oz.

[D-P1-81] *Guttæ Cocainæ cum Adrenalina*.

Cocaine hydrochloride 5% in solution of adrenaline hydrochloride.

[D-P1-81] *Injectio Cocainæ et Sodii Bicarbonatis*. Cocaine hydrochloride $\frac{1}{2}$, sodium bicarbonate $\frac{1}{2}$, chlorbutol $\frac{1}{2}$, distilled water to 100.

Dose.— $\frac{1}{2}$ to 4 drachms (8 to 15 ml.) for *urethral injection*.

This solution is remarkably efficacious for use prior to passing a catheter.

[D-P1-81] *Lamellæ Cocainæ (B.P.)*. DISCS OF COCAINE.

Discs of gelatin, each containing $\frac{1}{10}$ gr. of cocaine hydrochloride, are for ophthalmic use. Also prepared containing $\frac{1}{10}$ gr. in each in combination with atropine sulphate (*q.v.*), and homatropine (*q.v.*).

[D-P1-81] *Isotonic Cocaine Eye Lotion*.

Cocaine hydrochloride 1, sodium chloride 1.25, distilled water to 100. This is isotonic with the tears.

[D-P1-81] *Mixtura Cocaini (Fr. Cx.)*. *Syn.* BONAIN'S ANÆSTHETIC MIXTURE, *SOLUTIO BONAIN (T.H.)*.

Cocaine hydrochloride, phenol and menthol, equal parts.

[D-P1-81] *Nebula Cocainæ Composita*. Cocaine 2 gr., cinnamon oil 5 m., menthol 15 gr., liquid paraffin to 1 oz.

[D-P1-81] *Nebula Cocainæ Hydrochloridi*. May be prepared 1, 5 or 10%, or more if ordered, with sterile normal saline for general use.

[D-P1-81] *Oculentum Cocainæ (B.P.)* contains 0.25% of cocaine hydrochloride.

[P1] *Pastilli Cocainæ Hydrochloridi (B.P.C.)* contain $\frac{1}{10}$ gr. (0.0016 g.).

To allay throat irritation and hoarseness.

[D-P1-81] *Pigment. Cocain. Co. (P.M.H.)*. Dilute ointment of mercuric nitrate 30 gr., menthol 2 gr., oil of lavender 10 m., cocaine hydrochloride 6 gr., olive oil to 1 oz.

[D-P1-81] *Pigmentum Cocainæ et Hydrargyri Perchloridi*. Cocaine hydrochloride 28 gr., solution of mercuric chloride 20 drops, glycerin 4 dr., water 4 dr., after syringing ears twice or thrice daily with boric acid lotion.

Of value for painting the external auditory meatus and membrana tympani.

[D-P1-81] "Cocaine-Menthol-Eugenol." Cocaine, menthol, eugenol and alcohol 90% equal parts. Applied on a pledget of cotton wool, followed by jets of cold air, *e.g.*, from a chip syringe, relieves toothache rapidly.

[D-P1-81] Camphor 5, chloral hydrate 5, cocaine hydrochloride 1, warmed, form an oily liquid which cures toothache.

[D-P1-81] *Suppositories and Pessaries* $\frac{1}{2}$ grain (0.03 g.), or more.

[D-P1-81] *Compound Cocaine Suppository* of cocaine hydrochloride $\frac{1}{8}$ gr. with morphine hydrochloride $\frac{1}{2}$ gr. is useful for painful hæmorrhoids.

[D-P1-81] *Tabellæ Cocainæ*. $\frac{1}{10}$, $\frac{1}{20}$, and $\frac{1}{30}$ grain with chocolate. The usual dose is $\frac{1}{30}$ grain.

Dose.—1 every quarter, half-hour or hour, quickly eaten and swallowed. Useful for sea-sickness, chloroform or alcoholic sickness, and that of pregnancy.

Sea-sickness may be overcome by internal use of the following:—Cocaine hydrochloride 0.2 g., iodine tincture 2 ml., water to 150 ml. *Dose*.—1 tablespoonful 2 to 4 times daily. More palatable without the iodine.

[D-P1-81] *Trochisci Cocainæ Hydrochloridi (T.H.)*. $\frac{1}{10}$ grain (0.006 g.) in each. *Brompton H.* has $\frac{1}{8}$ grain in 20 grains.

[D-P1-S1] **Codrenine** (*Parke, Davis, London*). Cocaine hydrochloride 2% and adrenaline chloride 1 in 15,000. *Dose*.—For dental extractions 8 minims. Local anæsthetic.

[D-P1-S1] **Locosthetic** (*Parke, Davis, London*). Cocaine hydrochloride 0.75% with adrenaline chloride 1 in 50,000. Analgesic for use in dentistry. Locosthetic Modified is similar with 1 in 100,000 of adrenaline chloride.

[D-P1-S1] **Sterilocaine** (*Pharmaceutical Manufacturing Co., London*). Self-sterilising local anæsthetic solution containing cocaine hydrochloride 0.95%, adrenaline 0.00125%, with quinine derivatives and thymol in Ringer's solution.

[D-P1-S1] **Cocainæ Nitras** (*P.G. VI, P. Helv. V*).
 $C_{17}H_{21}O_4N.HNO_3 = 366.2$. (*Fr. Cx.* has $2H_2O$.)

Dose.— $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.008 to 0.016 g.).

In large colourless crystals, readily soluble in water. Is compatible with silver nitrate, and if used previously in solution lessens the pain caused by the latter salt.

[D-P1-S1] **Cocainæ Salicylas**. $C_{17}H_{21}O_4N.C_6H_4(OH).COOH = 441.2$.
Dose.— $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.008 to 0.016 g.).

In white deliquescent masses; it forms a solution which keeps well. Soluble 5 in 1 of water, $2\frac{1}{2}$ in 1 of alcohol 90%. In spasmodic asthma, the hypodermic injection of a full dose at the beginning relieves the attack.

[P1-S1] **Tropacocainæ Hydrochloridum** (*P.G. VI, P. Jap. V*).
Syn. BENZOYL PSEUDOTROPINE HYDROCHLORIDE.

$C_9H_{14}ON.C_6H_5CO.HCl = 281.6$.

The salt of the base tropacocaine obtained from Java coca, or synthetically. In white crystals, m.p. 271° . Freely soluble in water. Aqueous solutions keep well and can be boiled with impunity.

Uses. Is a powerful anæsthetic; in the eye causes neither ischæmia nor irritation of hyperæmia. 3% solution recommended; anæsthesia is produced more quickly than with cocaine but is more transitory; the action may be kept up by adding a drop from time to time. Mydriasis occurs occasionally but is slight. Severe sciatica has been treated successfully by injecting 1 ml. of 5% solution into the dural sac in the lumbar region.

The 5% solution has been used for intraspinal anæsthesia, the dose for a healthy person weighing 11 stones being 20 m.; a further 8 to 12 m. being given 40 to 50 minutes later if required.

Erythrophlœum. *Syn.* CASCA BARK, SASSY BARK, ORDEAL BARK. The bark of *Erythrophlœum guineense* (Leguminosæ). Contains the alkaloid erythrophlœine which has a digitalis action and is also anæsthetic.

Tinctura Erythrophlœi. 1 in 10 of alcohol 90%. *Dose*.—5 to 10 minims.

Erythrophlœinæ Sulphas. *Dose*.— $\frac{1}{16}$ to $\frac{1}{8}$ grain in pill. Yellowish granular crystals, very soluble in water. Has the combined action of digitalin and picrotoxin, and is a local anæsthetic for eye work in 0.05 to 0.25% solution, also as a dental obtundent in 50% solution in eugenol.

[P1-S1] **Amydricainæ Hydrochloridum** (*B.P.C.*). *Syn.* BENZOYL TETRAMETHYLDIAMINODIMETHYLETHYL CARBINOL HYDROCHLORIDE (*P.G. VI*). (Formerly issued under the proprietary name ALYPIN.) $C_9H_5.COOC(C_2H_5)[CH_2N(CH_3)_2]_2 = 314.7$.

Dose.— $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.003 to 0.03 g.) *per os*.

White, crystalline powder melting at about 169° . *Soluble* 1 in 1 of water and 1 in 4 of alcohol 90%.

Uses. Solutions containing 0.025 to 0.5% or up to 10% are efficient in eye work. (Strong solutions keep well, but weak ones may become cloudy; they may be sterilised by boiling, but not

longer than five minutes.) 2% strength produces insensibility of cornea in sixty seconds. It produces no mydriasis nor any disturbance of accommodation. Its toxicity equals that of cocaine and it is more irritant.

For lumbar anæsthesia injection of $\frac{1}{2}$ to 1 ml. of 2% solution has been used. For infiltration 0.01 to 0.1% solution has been used with same quantities of cocaine hydrochloride in 0.2% sodium chloride solution.

Internally in sickness and post-operative vomiting it acts like cocaine.

[P1-81] **Amylocainæ Hydrochloridum** (B.P., P. Ital. V, P. Belg. IV, P. Argent. II, F.E. VIII). *Syn. and Prop. Name.* CHLORHYDRATE D'AMYLÉINE (Fr. Cx.), STOVAINE (Pharmaceutical Specialities (May & Baker) Ltd., London).

$C_6H_5 \cdot CO_2 \cdot C(CH_3)(C_2H_5) \cdot CH_2N(CH_3)_2 \cdot HCl = 271.6$.

Dose.—Per os and hypodermically, $\frac{1}{2}$ to $\frac{3}{4}$ gr. (0.02 to 0.05 g.). By intrathecal injection, $\frac{1}{2}$ to 1½ grain (0.02 to 0.1 g.). Fr. Cx. has maximum single dose 1½ gr. approx., maximum in 24 hours 2½ gr. approx. P. Belg. IV gives 5 and 10 gr. approx. respectively.

In small white crystals, melting at 177° to 179°. Consists of the hydrochloride of the benzoyl ester of methylethyldimethylaminomethylcarbinol. Soluble 1 in 2 of water, 1 in 3 of dehydrated alcohol; readily soluble in methyl alcohol; almost insoluble in ether.

Uses. Amylocaine hydrochloride is a local anæsthetic. Its toxicity is only about half that of cocaine, but it is much more irritant and is inferior to cocaine for application to mucous membranes. It has been used similarly to cocaine for minor surgical operations, but its chief value is as a regional and spinal anæsthetic (*vide infra*).

ANGINA PECTORIS. Injection of 10 ml. of 1% Stovaine solution under the skin at the site of the most severe pain gave definite relief, when nitrites, etc., had failed. Valuable in patients with angina pectoris due to coronary spasm. —Brit. med. J. Epit., ii/1931, 7.

[P1] **Unguentum Adrenalinae et Amylocainæ Compositum** (B.P.C.). Adrenaline 1 in 14,000, amylocaine hydrochloride and benzocaine 1% with liquid extract of hamamelis in wool fat and yellow soft paraffin. A valuable soothing ointment for hemorrhoids.

Intraspinal Anæsthesia with Amylocaine Hydrochloride.

The advantages of intraspinal anæsthesia are absence of post-operative shock, complete muscular relaxation, no venous engorgements or respiratory movements, no starvation, and no post-operative sickness. It is contraindicated in cases of advanced sepsis, in the presence of organic disease of the spinal cord or brain, and in very low blood pressure.

The canal is punctured between the second and third lumbar interspaces, the patient being in a sitting posture with the head and shoulders bent forward. 5 ml. of fluid is allowed to escape and then the injection made. Anæsthesia is produced within ten minutes, and lasts for about an hour.

By carefully adjusting the curves of the spine, either a high or low anaesthesia can be produced by gravitation. The lowering of the head in any operation is not favoured. The best results are obtained by not altering the level of the body after injection, except in cases of the labouring class advanced in life, where the spinal column may be almost rigid—here the pelvis may have to be raised. Usually 5 to 10 ml. of cerebrospinal fluid is withdrawn before injection. Any alteration of posture may be made providing the relative levels of head and pelvis remain as before.

To prevent shock following intraspinal anaesthesia, after removal of 5 to 10 ml. of spinal fluid and the injection of the anaesthetic, the spinal fluid is injected intravenously at the bend of the elbow and the operation commenced 5 or 6 minutes later.

For the production of spinal anaesthesia various solutions are employed, those most commonly used being (1) "Heavy" solution (Barker's solution), (2) Chaput's solution, and (3) "Light" solution—Stovaine 5% in normal saline. The terms "light" and "heavy" are misleading, however, and unless the solution has the same specific gravity as the cerebrospinal fluid, *i.e.*, approximately 1.007, gravitational diffusion will occur.

[P1] **Barker's Solution.** Stovaine 0.1 g., dextrose 0.1 g., sterilised water to 2 ml. Sp. gr. 1.025. *Dose.*—1 ml. Often the dose may be reduced to 0.8 ml., sometimes increased to 1.2 ml.

Using this solution, a small dose of the drug can be employed and the severest operations performed. The equivalent of 0.06 g. of Stovaine is usually found to be sufficient. As a rule anaesthesia is established in 5 to 7 minutes for the groins and 8 to 10 for the epigastrium. There is almost always pyrexia but no post-operative shock. Highest analgesia—clavicles.

Caffeine, 2 gr. hypodermically, should be given as soon as Stovaine has been administered, to counteract the fall in blood pressure; a second dose should be kept ready in case of emergency (the two "danger periods" are immediately after injection and 20 minutes later): pituitary extract a satisfactory substitute. Let the maximal dose of Stovaine solution be 0.8 ml.—Hamilton Bailey, *Practitioner*, i/1927, 372.

Other solutions used are the following:—

[P1] **Solutio Stovainæ et Glucosi** (*St. T. H.*) contains 2½ or 5% with dextrose (anhydrous) 2½ or 5%.

[P1-S1] **Chaput's Solution.** *Syn.* TUFFIER'S SOLUTION (*M.R.I.*). Stovaine 0.1 g., sodium chloride 0.1 g., sterilised water to 1 ml. Sp. gr. 1.080.

[P1] **Kroenig's Solution** (*M.R.I.*). Stovaine 0.08 g., sodium chloride 0.0022 g., water to 2 ml.

[P1] **Chaput's Alcohol Solution** (*M.R.I.*). Stovaine 0.08 g., alcohol 95% 0.2 ml., sterilised water to 2 ml.

These solutions are sometimes preferred because they diffuse more readily than the solution containing dextrose.

[P1] **Jonnesco's Stovaine Caffeine Solution** contains from 0.02 to 0.05 or 0.1 g. of Stovaine with caffeine 0.5 g. and sodium benzoate.

[P1] **Duplas' Solution** (*M.R.I.*). Stovaine 0.06 g., caffeine 0.1 g., sodium benzoate 0.1 g., sterilised water to 2 ml.

Caffeine is included in these formulæ to counteract the fall in blood pressure, and is preferred to strychnine, which was at one time advocated for the purpose by Jonnesco.

Combined Spinal and Splanchnic Anaesthesia.

For abdominal operation in the neighbourhood of the diaphragm, spinal anaesthesia with 0.1 g. of Stovaine (between the second and

third lumbar vertebræ), combined with splanchnic anæsthesia with 60 to 70 ml. 0.5% solution of procaine hydrochloride, given according to Braun's method, is the anæsthetic of choice. In operations lasting over an hour spinal anæsthesia alone is not sufficient. Anæsthesia may be prolonged by a further dose of splanchnic anæsthetic and infiltrating the peritoneal and abdominal muscles with 0.5% procaine hydrochloride in 1 in 200,000 adrenaline solution. In nervous patients, a dose of bromethol per rectum produces quiet sleep. The combination gives complete and uniform muscular relaxation and reduces diaphragmatic movements to a minimum.

[P1-S1] **Benzaminæ Hydrochloridum (B.P.C.).** *Syn. and Prop. Name.* BETACAINE HYDROCHLORIDE, BETA-EUCAINE HYDROCHLORIDE (*Schering, London*), EUCAINE HYDROCHLORIDE (*U.S.P. XI*), 4-BENZOYLOXY-2:2:6-TRIMETHYLPYPERIDINE HYDROCHLORIDE. $C_8H_7N(CH_3)_3(C_6H_5COO) \cdot HCl = 283.6$.

Dose.— $\frac{1}{2}$ to $\frac{1}{2}$ grain (0.008 to 0.03 g.) or more.

A white crystalline synthetic compound allied to cocaine, soluble about 1 in 30 of water (crystals may deposit on cooling but can be redissolved without harming the salt), 1 in 35 of alcohol 90% and 1 in 6 of chloroform at 25°. 2% solutions are used in ophthalmic work. Solutions may be boiled without decomposing the salt.

A local anæsthetic possessing only about half the toxicity of cocaine, but with slighter anæsthetic effect and greater irritation. It does not dilate the pupil and it renders the tissues hyperæmic.

Local Infiltration Anæsthesia (Barker) with benzamine hydrochloride is suitable for very short operations using a solution of benzamine hydrochloride 3 gr. (0.2 g.), sodium chloride 12 gr. (0.8 g.), and water to 3½ oz. (100 ml.). This is isotonic.

The solution is boiled and on cooling 10 m. of adrenaline solution may be added. In the operation 50 ml. or more (up to 100 ml.) is injected all round the region to be dealt with.

[P1] **Nebula Benzaminæ.**

Benzamine hydrochloride 10 gr., sodium sulphate 4 gr., distilled water to 1 oz.

[P1] **Pastilli Benzaminæ (B.P.C.)** contain $\frac{1}{2}$ gr. (0.03 g.).

[P1] **Unguentum Benzaminæ.**

Benzamine hydrochloride 1, olive oil 2, hydnous wool fat 7. For pruritus, menthol 2% may be added.

[P1-S1] **Beta-Borocaine (British Drug Houses, London).** Benzamine borate, $C_{14}H_{21}O_2N_3 \cdot 5HBO_3$. *Dose.*— $\frac{1}{2}$ grain (0.025 g.). A surface anæsthetic recommended especially for ear, nose and throat work. Borocaine (*q.v.*) is preferred for injection.

For operative work on the eye, a 0.25% solution is recommended, and for operations on and examinations of the urethra and bladder in general a 0.5% solution is suitable.

It has three times the anæsthetic action on the rabbit's cornea, and $\frac{1}{10}$ the experimental toxicity of cocaine hydrochloride. It is mildly irritant, causes some congestion, especially in the nose, and in very large doses excites the central nervous system.

[P1-S1] **Beta-Borocaine Tablets** contain 0.025 g., with adrenaline 0.00005 g., sodium chloride and cane sugar *q.s.* One dissolved in 10 ml. makes a 0.25% solution: 1 in 5 ml. makes a 0.5% solution.

[P1-81] **Benzaminæ Lactas (B.P.C.).** *Syn.* EUCAINE LACTATE, BETACAINE LACTATE. $C_{15}H_{21}O_2N, C_2H_4O_3 = 337.2$.

Dose.— $\frac{1}{8}$ to $\frac{1}{2}$ grain (0.008 to 0.03 g.).

A white crystalline salt with m.p. 152° to 156° .

Soluble about 1 in 5 of water and about 1 in 8 alcohol (90%).

Incompatible with salicylic acid.

For ophthalmic work and in dentistry employ 2 to 3%; for infiltration 0.1% with sodium chloride 0.8%; for regional anæsthesia 2.5%; nose, throat and ear 10 to 15%; for urethral injection, 1 to 2% solutions may be used to relieve pain. Solutions can be boiled.

It is slower in action than cocaine, is less toxic, and anæsthesia is more prolonged, while the heart is not affected, nor the pupil dilated.

Sciatica has been treated by injections.

[P1] **Benzocaina (B.P.).** *Syn. and Prop. Name.* ETHYL *p*-AMINO-BENZOATE (U.S.P. XI, P.G. VI, P. Helv. V, P. Dan., P. Ned. V, F.E. VIII, P. Belg. IV), ANÆSTHESIN (Bayer Products, London). $NH_2 \cdot C_6H_4 \cdot CO_2 \cdot C_2H_5 = 165.1$.

Dose.—5 to 10 grains (0.3 to 0.6 g.) in powder or cachets. U.S.P. XI average dose 5 grains. (The Council on Pharmacy and Chemistry of the A.M.A. does not approve of its internal use.)

White crystalline powder, m.p. 90° to 91° , with slightly bitter, numbing taste.

Soluble 1 in about 2500 of water, 1 in 8 of alcohol 90%, 1 in 4 of ether, 1 in 2 of chloroform, 1 in 50 of almond oil, 1 in 35 of olive oil.

Uses. A surface anæsthetic in powder form for dusting on wounds and injured surfaces; it rapidly paralyses sensory nerve endings. Internally it may be given in a dose of 3 to 5 gr. several times daily before meals to relieve the pain of gastric ulcer and carcinoma. Local insufflations sometimes with equal amount of orthocaine for pharyngeal and laryngeal affections; bougies 3 grains for urethritis, and suppositories 10 grains for hæmorrhoids. Ointments 10% for burns, eczema and intertrigo.

Pneumococcic (and tuberculous) infection of the throat, in a case of difficulty in swallowing, has been greatly relieved by applications of benzocaine dissolved in palm oil—in form of a spray.

Great relief of pain in inoperable carcinoma of the rectum from suppositories of benzocaine 5 gr. and acetylsalicylic acid 10 gr.—D. G. Greenfield, *Brit. med. J.*, ii/1932, 1041.

[P1] **Injectio Benzocainæ.** *Syn.* A.B.A.

Benzocaine 3, benzyl alcohol 5, and ether 10, in sterile olive oil q.s. to 100.

Has been widely used in the treatment of pruritus ani, pruritus vulvæ, and anal fissure.

In pruritus ani 10 ml. may be safely used at the first treatment—injected in relation to the posterior half of the perianal region through 4 punctures, $2\frac{1}{2}$ ml. at each point. A week later 5 ml. is given by 2 punctures, and again another dose after a further week. In the average case, 3 doses—10, 5, and 5 ml.—suffice.

Permanent relief of pruritus ani from subcutaneous injections (round the anal margin) of either Benacol—a solution of equal parts of benzocaine and benzyl alcohol in 90 parts of almond oil, or A.B.A. as above. 4 ml. of either may be injected at a time and repeated at 3 to 7-day intervals, till the entire perianal region has been injected, 8 ml. being the average total injected. No general reaction or complications. Also gives rapid and brilliant cure in recent anal fissure.—W. B. Gabriel, *Brit. med. J.*, i/1929, 1071.

A.B.A. valuable for ano-rectal complaints—better than Novocain.—P. Kennedy Murphy, *Brit. med. J.*, ii/1930, 162.

Large doses of both oily and aqueous solutions as anaesthetics in pain and fissure should be avoided.—P. Kennedy Murphy, *Brit. med. J.*, ii/1930, 498.

Anal fissure treated by 2 to 5 ml. of A.B.A. injections into the sphincter.—W. J. Lytle, *Brit. med. J.*, i/1931, 498.

Pruritus ani and anal fissure, and spasm of the sphincters, treated by A.B.A. Pain relieved instantly.—Arthur S. Morley, *Brit. med. J.*, ii/1930, 80.

Percaine (see p. 439) 0.5%, benzyl alcohol 10%, phenol 1%, in 5 ml. of sterile oil, also used instead of the above. For anal fissure A.B.A. 5 ml., or the Percaine in oil (5 ml.) will reduce sphincteric relaxation. Local anaesthetic effect lasts as long as 10 days.—W. B. Gabriel, *Brit. med. J.*, ii/1930, 311.

Percaine in oil (made up according to Gabriel's formula) is the most satisfactory local anaesthetic in hæmorrhoidectomies; anaesthesia lasts from 7 to 10 days. Contraindications are local infection, eczema and a possible idiosyncrasy.—N. J. Simmons, *New Engl. J. Med.*, 1936, 214, 20.

45 cases of anal fissure treated with A.B.A. 18 healed after one injection, and 4 after two. In another 14 it can be assumed that in most, if not all, the fissure healed. The important point, however, is that many cases do not heal in spite of repeated injection.—J. W. Riddock, *Lancet*, ii/1936, 1150.

RECTAL ANÆSTHESIA. A.B.A. and the Percaine solution both found to give rise to pain on injection and very often to severe pain several hours afterwards. The following formula is an improvement: Procaine base 1.5%, butyl-paraminobenzoate 6%, benzyl alcohol 5%, in sterilised almond oil. Its advantages are its certainty of effect, painlessness on injection (if given slowly), freedom from severe after-pain, anaesthesia or hypoaesthesia produced for periods up to 28 days or longer. It is comparatively non-toxic; 20 to 30 ml. may be injected without ill-effect and with no local reaction. The solution, first warmed, is injected into the deeper tissues at the inner boundary of the ischio-rectal fossæ as well as into the more subcutaneous plane. On no account should an injection be given in the presence of acute sepsis, and when there are excoriations the needle must be inserted through clean normal skin. Good results in the treatment of fissure-in-ano (5 to 10 ml. average amount injected) and pruritus ani (from 15 to 30 ml. injected at one time).—C. N. Morgan, *Brit. med. J.*, ii/1935, 938.

PRURITUS VULVÆ. Though A.B.A. does not cure the condition, it affords a long relief, enabling septic scratches to heal and the patient to gain much-needed rest.—A. Bourne, *Practitioner*, ii/1933, 441.

Of 15 patients treated 5 were cured, 5 much improved, 4 slightly improved and 1 not improved. Weekly injections of 2 ml. just beneath the skin in such manner that a fan-shaped area is treated, a different zone being dealt with at each visit, until eventually the whole vulvar region has been infiltrated. The number of injections varied from 3 to 33.—C. W. Kennedy, *Edinb. med. J.*, Sept., 1933, 125.

[P1] **Sterules B.A.B.A.N.** (*Martindale, London*) contain 5 ml. of an alcohol-oil solution of Butesin and benzocaine with 1% of procaine base.

The addition of 1% of basic Novocain as in B.A.B.A.N., is a distinct improvement; a more immediate effect is noted after its injection, and also an excellent late anaesthetic effect is developed; pain after injection is usually absent. In anal spasm and fissure the deep injection of 5, or sometimes 10 ml., of A.B.A. or B.A.B.A.N. into the external fissure has proved of great value. In acute anal fissures a preliminary injection, from a posterior puncture, of 10 ml. of Novocain into the sphincter, on each side of the middle line, is often helpful. In pruritus ani, if palliative treatment fails to relieve the irritation, and in the absence of any local cause, subcutaneous injections of A.B.A. or B.A.B.A.N. are of value, giving 3 injections of 10 ml. at 5 to 7 day intervals. These injections should not be given in the presence of an acute moist dermatitis, and good results are unlikely if the pruritus extends forward to the vulva.—W. B. Gabriel, *Practitioner*, ii/1934, 497.

[P1] **Pigmentum Benzocainæ cum Menthol** (*Brompton H.*).

Menthol 24 gr., acacia 2½ dr., almond oil 2½ dr., water 2½ dr.; emulsify, and add benzocaine 90 gr., alcohol 90%, 10 dr., water 2 oz.

Painted on the larynx affords relief in tuberculosis of the larynx.—Sir James Dundas Grant, *Practitioner*, ii/1931, 260.

[P1] **Unguentum Benzocainæ (Nasal)** (*J.H.*).

Benzocaine 20 gr., ephedrine hydrochloride 5 gr., solution of adrenaline 15 m., eucalyptol 5 m., soft white paraffin to 1 oz.

[P1] **Anesthose Cream** (*Parke, Davis, London*). Benzocaine, adrenaline chloride and ephedrine hydrochloride in lanolin and soft paraffin base. Anæsthetic and astringent; gives relief in hay fever and is a palliative in allaying irritation, congestion and inflammation of the nasal mucous membrane.

[P1] **Cycloform Ointment** (*Bayer Products, London*). Alkyl ester of para-aminobenzoic acid 10%, with extract of hamamelis and zinc oxide. Analgesic, antiseptic and astringent; for hæmorrhoids, pruritus, burns, eczema, etc.

[P1] **Larysept** (*Richter, London*). Tablets containing benzocaine ½ gr., butyl-aminobenzoylethylmethylaminoethanol hydrochloride (*see* Butethanol) 100 gr., formalin ½ m., menthol ⅛ gr. *Dose*.—1 tablet dissolved in the mouth every three hours. An antiseptic and analgesic in laryngitis, pharyngitis, etc.

[P1] **O-R-92** (*Medico-Chemical Corporation, New York; Coates & Cooper, London*). Lozenges for use in throat affections containing the ethylbutyl ester of dicarboxydiphenylmethaneacridoni-oxyquinoline, with borax, potassium sulphate and benzocaine.

[P1] **Proctocaine** (*Allen & Hanburys, London*). Procaine base 1.5%, butyl-*p*-aminobenzoate 6%, benzyl alcohol 5%, in sterilised almond oil. *Dose*.—1 to 5 ml. repeated if necessary at intervals of a week or more. For rectal anæsthesia in anal fissure, pruritus ani, etc.

When using oil-soluble anæsthetics such as Proctocaine in rectal surgery it is of paramount importance to use them *before* the operation for fissure or hæmorrhoids is actually commenced, and to be meticulous in the aseptic technique of injection in order to avoid abscess formation and the spreading of infection. Not infrequently rectal pain due to a small submucous abscess is treated by injection of an oil-soluble anæsthetic in the belief that the patient has an uncomplicated fissure. The results are disastrous. Injection must not be given in the presence of infection or in cases of unproved diagnosis.—C. N. Morgan, *Practitioner*, ii/1939, 515.

[P1] **Risin** (*Coates & Cooper, London*). Ointment containing benzocaine, adrenaline, menthol, eucalyptol, boric acid and soft paraffin and wool fat. Catarrh, hay fever, etc.

[P1] **Butyl-*p*-aminobenzoate** (*Fr. Cx.*). *Prop. Names.* BUTESIN (*Abbott Laboratories, London*), SCUROFORME (*Pharmaceutical Specialities (May & Baker) Ltd., London*).

$C_6H_4NH_2 \cdot COOC_4H_9 = 193.2$.

Butyl-*p*-aminobenzoate is a white, crystalline, odourless and tasteless powder. M.p. 56°.

Almost *insoluble* in water; soluble in dilute acids, alcohol, chloroform, ether and fixed oils.

It is used as a local anæsthetic where prolonged and rapid anæsthesia is required, and is applied either as a powder or in the form of suppositories, ointment, or in alcoholic or oily solution.

[P1] **Butesin Picrate** (*Abbott Laboratories, London*). A compound of butyl-*p*-aminobenzoate and trinitrophenol, supplied in the form of a dusting powder 5%, as an ointment 1%, and as an eye ointment 1%. An analgesic-antiseptic for burns, scalds, ulcers, abrasions, etc.

Four cases of eruption following the use of Butesin Picrate ointment.—M. B. Sulzberger and F. Wise, *Arch. Derm. Syph.*, 1933, 461.

[P1] **Orthocaina** (B.P., *P. Helv. V*). *Syn. and Prop. Name.* AMINO-BENZ, ORTHOFORM (*Bayer Products, London*), METHYL *m*-AMINO-*p*-HYDROXYBENZOATE.

$\text{HO} \cdot \text{C}_6\text{H}_3(\text{NH}_2)\text{CO}_2 \cdot \text{CH}_3$ [$\text{HO} : \text{NH}_2 : \text{CO}_2 \cdot \text{CH}_3 = 4 : 3 : 1$] = 167.1.

Dose.— $1\frac{1}{2}$ to 3 grains (0.1 to 0.2 g.) for stomach ulceration. *P. Helv. V* has max. single dose 15 grains; max. in 24 hours 45 grains. (The Council on Pharmacy and Chemistry of the A.M.A. does not approve of its internal use.)

A white crystalline powder, possessing local analgesic and anti-septic properties.

Soluble 1 in 7 of alcohol 90%, 1 in 50 of ether; readily soluble in sodium hydroxide solution; sparingly soluble in water.

The [P1] **Hydrochloride**, $\text{HO} \cdot \text{C}_6\text{H}_3(\text{NH}_2)\text{CO}_2 \cdot \text{CH}_3 \cdot \text{HCl} = 203.5$, is soluble about 1 in 9 of water, giving a strongly acid solution. The action of the base is more prolonged.

A 10% aqueous solution of the hydrochloride, or 10 to 20% with lanolin or paraffin ointment, or collodion solution of pure orthocaine, or this as a dusting powder, may be employed to alleviate pain in sores or burns, but has little action unless the surface is broken.

Has relieved whooping-cough and laryngeal tuberculosis by insufflation.

Eruption following application of 10% orthocaine ointment to septic ulcers of the foot.—P. C. P. Ingram, *Brit. J. Dermat.*, 1933, 526.

[P1-S1] **Phenacainæ Hydrochloridum** (U.S.P. XI). *Syn. and Prop. Name.* PHENETIDYLPHENACETIN HYDROCHLORIDE, HOLOCAIN HYDROCHLORIDE (*Bayer Products, London*).

$\text{CH}_3\text{C} \leq \begin{matrix} \text{N} \cdot \text{C}_6\text{H}_4 \cdot \text{OC}_2\text{H}_5 \\ \text{NH} \cdot \text{C}_6\text{H}_4 \cdot \text{OC}_2\text{H}_5 \end{matrix}$, $\text{HCl} \cdot 2\text{H}_2\text{O} = 352.7$.

The hydrochloride of ethenyl-*p*-diethoxydiphenylamidine in small colourless shining crystals.

Soluble 1 in 55 of water. **Incompatible** with alkalis.

As an anæsthetic in ophthalmology, 2 to 5 eye drops of 1% solution. It is not adapted for hypodermic use.

[P1-S1] **Guttæ Holocainæ** (R.L.O.H.). Holocain hydrochloride 4 gr. to 1 oz. of sterilised water.

[P1-S1] **Procainæ Hydrochloridum** (B.P., U.S.P. XI, *P. Helv. V*, *P. Dan.*, *P. Jap. V*). $\text{NH}_2 \cdot \text{C}_6\text{H}_4 \cdot \text{CO}_2 \cdot \text{C}_2\text{H}_4\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{HCl} = 272.6$. *Syn. and Prop. Names.* ETHOCAINE HYDROCHLORIDE (*F.E. VIII*), *p*-AMINO-BENZOYLDIETHYLAMINOETHANOL HYDROCHLORIDE (*Fr. Cx.*, *P. Ital. V*, *P. Argent. II*, *P.G. VI*, *P. Ned. V*, *P. Svec. X*, *P. Belg. IV*), ALLOCAINE, SYNCAINE, ÆTHOCAINE (*Nederlandsche Cocainefabriek, Amsterdam; Greef, London*), KEROCAIN (*Kerfoot, Bardsley*), NEOCAINE (*Corbière, Paris; Anglo-French Drug Co., London*), NOVOCAIN (*Bayer Products, London; Saccharin Corporation, London*), PLANOCAINE (*Pharmaceutical Specialities (May & Baker) Ltd., London*), SEVICAINE (*Glaxo Laboratories, London*).

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.) subcutaneously, up to 15 grains (1 g.); by intrathecal injection, up to $2\frac{1}{2}$ grains (0.15 g.).

Fr. Cx. has max. single dose *per os* 0.1 g., max. during 24 hours 0.25 g.

A colourless crystalline salt melting at 154° to 156°. The aqueous solution is neutral to litmus.

Soluble 1 in 1 of water, 1 in 8 of alcohol 90%, 1 in 30 of dehydrated alcohol.

Incompatible with alkalis, tannin, calomel, potassium dichromate, potassium permanganate and silver salts. With the latter use procaine nitrate (3% solution).

Sterilisation. Acid solutions of procaine hydrochloride (pH 6 or less) are stable at normal temperatures, but on heating they become hydrolysed and the hydrochloric acid liberated catalyses the decomposition of the free procaine base into *p*-aminobenzoic acid and diethylaminoethanol. Hence, the minimum amount of heating in the process of sterilisation compatible with the production of a sterile solution is desirable. For this reason many workers deem Tyndallisation, as recommended by the B.P. to be unsuitable. A. E. Marston and J. P. Allchin (*Pharm. J.*, ii/1938, 603) found that solutions of 1% or over were germicidal to the commonly occurring air-borne organisms, and accordingly they state that sterile solutions of procaine hydrochloride of these strengths may be prepared by using an aseptic technique and heating to 60° for one hour only.

The decomposition of solutions on storage or heating, and its estimation.—F. Hartley, *Pharm. J.*, i/1938, 461.

Alkaline solutions are advocated on the grounds that they cause less pain both on injection and after, result in less tissue damage, thus leading to a more rapid recovery, and are more active. Tablets containing sodium bicarbonate or solutions buffered at about pH 8.0 with sodium phosphate have been recommended.

No alkaline solution of procaine hydrochloride may safely be sterilised by heating, since it either becomes acid or marked decomposition occurs. Neither may it be stored for more than six hours at room temperature. A method is described for the dispensing of dry ampoules suitable for the preparation of alkaline, sterile, isotonic and buffered solutions, and a report is given on the purity and the differences of commercial brands of procaine hydrochloride at present on the market.—K. Bullock, *Quart. J. Pharm.*, 1938, 407.

The use of distilled water in the preparation of Novocain solution must be condemned, because such a solution is markedly hypotonic. A 1% solution of Novocain in distilled water will hæmolyse red cells and rupture connective tissue and fat cells, resulting, in some cases, in enough tissue necrosis to cause breakdown of a perfectly aseptic wound. To obtain a practically isotonic solution, normal salt solution should be used to prepare Novocain solutions for infiltration purposes. Such solutions in saline are acid in reaction, but are promptly buffered in the subcutaneous tissues by the ample amounts of carbonates and phosphates in the tissues, which allow the Novocain base to exert its action. For the injection of nerve trunks or roots, however, a buffer solution such as Hartmann's solution is recommended as a solvent, and for spinal anaesthesia the best solvent is the patient's own spinal fluid. If Novocain solutions require to be autoclaved this should be done not more than 15 or 20 minutes before use, since oxidation of the Novocain occurs after this.—S. Gilman, *New Engl. J. Med.*, 1938, 841.

From a study of the evidence both for and against the use of alkalinised or buffered solutions, there would appear to be no particular advantage of the most complex formula over the simplest freshly prepared procaine hydrochloride solution.—H. T. Roper-Hall, *Dental Gazette*, Oct. 1939, 90.

Uses. A powerful local anaesthetic, but its effect is very transient

unless adrenaline is added. It is much less toxic than cocaine and most other cocaine substitutes, and is well tolerated by the tissues. It is not satisfactory for surface anæsthesia, since it has little power of penetration. 0.25 to 2% solutions are employed for hypodermic use; care must be taken to avoid injection into a vein.

Infiltration anæsthesia (injection of the drug directly into the tissues to be operated on) has been practised, using 200 ml. of 0.5% solution in normal saline—a maximum dose. This is sufficient to anæsthetise the area for most operations. 50 to 75 ml. is enough for a moderate size elbow; 150 ml. for a knee. Solution tablets of procaine hydrochloride and adrenaline are available in various strengths.

ACUTE STRAINS. Immediate relief from pain, cessation of swelling and restoration of almost complete mobility of the joint follow the use of procaine infiltration (Leriche's method). This consists in infiltrating the periarticular tissues of the injured joint with a 2% solution of procaine (*without* adrenaline); in ankle sprains 10 to 15 ml. will suffice. Some hours later the pain returns, taking from 4 to 7 hours to pass off. In some cases it may be necessary to repeat the injection on the following day. As the "after-pain" is often very great, the treatment should be confined to severe or moderately severe sprains. Injection of physiological saline solution is stated to relieve the pain, which is thought to be due to the procaine itself. The average period of incapacity is reduced from 10 to 12 days to 2 to 3 days. The treatment also gives dramatic and lasting cure of minor complaints such as stiff neck, fibrositis, lumbago and vague muscular pains.—E. J. Moynahan, *Brit. med. J.*, i/1939, 671.

Successful results in 100 cases of minor fracture.—H. Cullumbine, *Lancet*, ii/1939, 552.

MUSCULAR RHEUMATISM. A method of treatment which secures not only immediate relief from pain, but prompt restoration of function in muscular rheumatism (e.g., stiff neck, lumbago, "pseudo-sciatica") consists in giving local injections of Novutox (or a 2% mixture of procaine and adrenaline). The injection is best given one-eighth of an inch beneath the surface of the fascia covering the affected muscle, the needle being inserted obliquely through the skin and the fascia then being felt for with the point. Through a single skin puncture, inject amounts of 0.5 ml. in each of 3 or 4 directions through separate punctures in the fascia. The patient should be warned that the injection is painful, and should also be warned of the tremor following the administration of adrenaline. After an hour's rest the patient should get up and move about. Stiffness is usually felt in the affected part for several days.—M. Button, *Brit. med. J.*, ii/1940, 183.

Intrasacral extradural anæsthesia for operations on hæmorrhoids, fistulæ, and other conditions in and about the anus. 20 ml. of 2% solution to which 5 drops of a 1 in 1000 adrenaline solution is added—the amount of procaine hydrochloride thus exceeds 6 gr. 15 gr. have been used in a local or regional anæsthesia, and even 35 gr. have been used.

Local anæsthesia in operations on the anal region has been effected by injection of solution consisting of procaine hydrochloride 2%, adrenaline (1:1000) 1% and phenazone 1%. An average injection of 2 oz. is preceded by hypodermic injection of morphine $\frac{1}{4}$ gr. and hyoscine hydrobromide $\frac{1}{160}$ gr.

Regional anæsthesia is a form of local anæsthesia by which the sensory nerve paths are blocked by injection of the anæsthetic into, or round, a nerve trunk, using a stronger solution than that for local infiltration. A small quantity is introduced round the nerve trunks which supply the parts to be operated on, at some part of their course which is anatomically accessible. This form

of anaesthesia has been effected with a solution of procaine hydrochloride 2, sodium chloride 0.5, distilled water 100. Five drops of a 1 in 10,000 solution of adrenaline are added to each 20 ml. of solution immediately before use.

Methods described. The multiplicity of punctures necessary, Novocain intolerance, and the psychic factor are disadvantages, but the technique is regarded as a life-saving measure in the surgery of the old and feeble, and those with cardiac, renal, or pulmonary disease, or diabetes.—Stanford Cade, *Lancet*, i/1925, 856.

HERPES ZOSTER. Twenty-two patients suffering from herpes zoster were treated by injections of a 0.5% procaine solution (without adrenaline) into the intervertebral and prevertebral ganglia, 8 ml. being as a rule used for each segment. Except in two patients the pain ceased and the vesicles dried within 24 to 48 hours. Two patients suffering from trigeminal zoster had their Gasserian ganglia injected with 1 and 2 ml. of this solution and in 48 hours the symptoms disappeared. Perfect asepsis is of the utmost importance, and the treatment should be abandoned if the only way of reaching the ganglion is through an area of infected vesicles—one should probably inject directly into the ganglion. Full segmentary anaesthesia results within 15 minutes of injection.—S. Rosenak, *Lancet*, ii/1938, 1056.

TRIGEMINAL NEURALGIA. The following technique gives good results. A small bleb of skin is first anaesthetised with Novocain and then a needle is gradually introduced towards the foramen ovale and Proctocaine 1 ml. injected drop by drop. The patient has an immediate anaesthesia of the affected side and the pain has been relieved. The relief in some cases is lasting, but in others re-injections are required at long intervals. There are no untoward results.—G. Slot, *Lancet*, ii/1938, 1329.

Spinal anaesthesia with procaine hydrochloride should be reserved for adults, and should not be used in the tuberculous, the syphilitic, or in nervous cases. Specially suitable for operations below the umbilicus. (*See also Amylocaine Hydrochloride*, p. 426.)

Barker's method of Stovaine-Glucose is not used so much now. Procaine hydrochloride is the least toxic of known local anaesthetics. Raising blood pressure by ephedrine injection simultaneously leads to rapid absorption and diminishes the anaesthetic effect. High spinal anaesthesia has many advantages (using 1 to 1.2 ml. of 10% procaine hydrochloride), and is safe if careful technique followed.—C. A. Pannett, *Lancet*, i/1929, 271, 291; *see also* W. Howard Jones, *Lancet*, i/1929, 362, and reply, *ibid.*, 416.

Deaths under spinal anaesthesia.—*J. Amer. med. Ass.*, ii/1930, 234; *Lancet*, ii/1930, 650.

In a series of 812 cases (inhalation anaesthesia 474, spinal anaesthesia 338) post-operative complications were 4.29 times more frequent after spinal than after inhalation anaesthesia, in spite of the fact that more "bad risk" patients were operated on under the latter.—A. L. Brown and M. W. Debenham, *J. Amer. med. Ass.*, ii/1932, 210.

As remedial measures for the circulatory depression of spinal anaesthesia are recommended: the raising of the lower part of the body, but not the lowering of the head; the inhalation of oxygen, and the inhalation of dilute ammonia. The injection of ephedrine or adrenaline is not recommended.—C. A. Pannett, *Lancet*, ii/1933, 169.

Headache following spinal anaesthesia, usually caused by seepage of spinal fluid from the dural wound, is minimised by using a fine needle (24-gauge), making a single puncture, and avoiding elevating the head for 24 hours. Merely using a fine needle so nearly abolishes headache that patients can comfortably become ambulatory within 24 hours.—A. W. Squires, *New Engl. J. Med.*, ii/1939, 893.

Splanchnic analgesia with procaine hydrochloride. Advantages are perfect relaxation of the abdominal wall with less shock and fatigue to patient. Disadvantages are the extra 15 minutes' time to anaesthetise patient, and in some cases post-operative

headache and backache. Operations may be performed which would not be attempted under general anæsthesia alone.

UPPER ABDOMINAL SURGERY. Braun's technique modified. The vertebral column between aorta and inferior vena cava is felt just above the pancreas with the left index finger through the lesser omentum. The finger is kept close to the right side of the aorta and the narrow tubular guide of the long fine needle passed along its dorsum down to the vertebra and kept there by the middle finger. The needle is then passed down the guide as far as the bone, aspiration performed to prove the point of the needle not to be in a blood vessel, and 30 ml. of 1% procaine hydrochloride solution containing 20 drops of 1 in 1000 adrenaline per 100 ml. injected. The viscera fall back into the abdomen and render it easy to inject a further 10 ml. of the solution to the left of the aorta behind the œsophagus.

The most commonly used local anæsthetic in abdominal surgery is procaine hydrochloride in $\frac{1}{2}$ to 1% solution, with adrenaline. 1 g. procaine hydrochloride in $\frac{1}{2}$ % solution can be used without injury. In cachectic and anæmic patients $\frac{1}{2}$ % efficient (up to 500 ml.). In aged patients with arteriosclerosis add pituitary (posterior lobe) extract instead of adrenaline.

Choice of Methods of Anæsthesia:—

ANTERIOR SPLANCHNIC for radical operation after exploratory laparotomy.

PARAVERTEBRAL, in resections of large intestine to mobilise the fixed colon; for the resection.

Mesenteric anæsthesia added.

PARASACRAL sufficient for operations on rectum and perineum.

EPIDURAL (SACRAL) sufficient for pelvic operations.

SPINAL anæsthesia now little used in Germany owing to danger of fall of blood pressure and danger to respiratory centre.

Combined parasacral safer and efficient for longer time.

Prof. H. Finsterer, *Brit. med. J.*, ii/1932, 400.

[P1] **Injectio Procainæ et Adrenalinæ.** The Committee on Pharmacy and Pharmacognosy of the Pharmacopœia Commission (*Report 13*) have recommended the inclusion in the B.P. of procaine and adrenaline injection containing procaine hydrochloride 2%, sodium chloride 0.5%, *p*-chlor-*m*-cresol 0.1%, solution of adrenaline hydrochloride 2%, sodium metabisulphite 0.1%, in sterilised water.

[P1] **Injectio Procainæ et Adrenalinæ (R.L.O.H.).** *Syn.* INJECTIO NOVOCAINÆ ET ADRENALINI.

Procaine hydrochloride 8 or 16 gr., solution of adrenaline hydrochloride 24 m., sterilised water to 1 oz. (approx. 2 or 4%). *Dose.*—Up to 1 drachm of the 2%. In eye work may be employed, e.g., for excision of the lachrymal sac, and for other minor operations.

[P1] **Solutio Novocainæ Composita (St. T. H.).** *Syn.* DUNHILL'S SOLUTION. Novocain 3 gr., solution of adrenaline hydrochloride 7½ m., sodium chloride 14 gr., water to 3½ oz.

[P1] **Solutum Adrenalinæ Compositum (Fr. Cx.).** Procaine hydrochloride 2 g., solution of adrenaline 5 g., sodium sulphite 0.1 g., normal saline to 100 g. It is sterilised by Tyndallisation.

[P1] **Arecan (Evans, Sons, Lescher & Webb, Liverpool).** Solutions of procaine hydrochloride with adrenaline in various strengths.

[P1] **Asensitine (Duncan, Flockhart, Edinburgh).** A solution of 0.5% procaine, 2% eucaine and adrenaline 1 in 30,000 for local anæsthesia in dental operations. *Dose.*—1 to 2 ml. in divided doses.

[P1-S1] **Duracaine (Pharmaceutical Specialities (May & Baker) Ltd., London).** Solution of Planocaine in 15% alcohol with gum acacia for intraspinal anæsthesia. Issued as (1) light solution—s.g. 1.002, ampoules of 3 ml.; (2) heavy solution—s.g. 1.028, ampoules of 3.5 ml.

[D-P1-S1] **Epicaine (Burroughs, Wellcome, London).** Solution of Epinephrine 0.0003 g., and cocaine hydrochloride 0.02 g., per ml.

[P1] Neotonocain (*Richter, London*). Procaine hydrochloride and adrenaline in various strengths.

Novocain-Cobefrin (*Bayer Products, London*). A combination of procaine hydrochloride and Cobefrin, issued in [P1-S1] tablets and [P1] solutions of various strengths for local anaesthesia. Cobefrin is *o*-dioxymethylpropanolamine, a synthetic vasoconstrictor which dissolves readily in water, and exerts the vasoconstrictor action of adrenaline without its disturbing deleterious action on the circulation.

[P1] Novutox (*Pharmaceutical Mfg. Co., Cheltenham*). Procaine with isooctyl-hydrocupreine hydrochloride. A self-sterilising solution of procaine.

[P1] Parsetic (*Parke, Davis, London*). Procaine hydrochloride 2.25%, adrenaline chloride 1:30,000.

[P1-S1] Spinocain (*Bayer Products, London*). Each 2 ml. ampoule contains 0.2 g. of Novocain, 2.2 mg. of strychnine sulphate, and 14½% of alcohol in normal saline. It also contains gliadin or amyloprolamin.

The amount stated is mixed with more or less cerebrospinal fluid as required, and after injection the table is tilted to direct it to any region desired. In the circumstances of a modern operation a large fall of blood pressure is not greatly to be feared. Jonnesco gave up strychnine after 15 years' trial. A similar solution to Spinocain, but without the strychnine, gave equally good results. No evidence to show that addition of dextrin is not as good as gliadin.—E. Falkner Hill, *Lancet*, i/1930, 124.

Thought to be an improvement on Stovaine, the use of which was often followed by collapse.—C. L. Granville Chapman, *Brit. med. J.*, i/1930, 799; see also R. A. Grant, *Brit. med. J.*, i/1930, 1090.

Spinal anaesthesia with Spinocain, using Ephedrine-Novocain first. 250 cases.—A. Wilfred Adams, *Brit. med. J.*, i/1931, 785. Death under.—A. Wilfred Adams, *ibid.*, i/1931, 869.

[P1-S1] **Procaine Borate**. *Prop. Name*. BOROCAINE (*British Drug Houses, London*).

$2(C_{13}H_{20}O_2N_2) \cdot 5B_2O_3 \cdot 4H_2O$. Available as the substance and in tablets with or without adrenaline. Although a salt of procaine, it is stated to be more active but less toxic than procaine hydrochloride. The difference in properties is due to the fact that procaine borate, being the salt of a weak acid, in solution yields free alkaloidal-base by hydrolysis. It is employed by injection and as a surface anaesthetic in minor surgical operations, especially in dental practice.

For ophthalmic and dental use, for operations on and examination of the urethra and bladder, and for surface anaesthesia in general, 2% solutions are used, and for operations on the nose and throat 5% solutions. (Beta-Borocaine, *v. antea*, is stated to be a better surface anaesthetic.) For infiltration anaesthesia solutions of 0.5 to 1% are employed, and for regional anaesthesia from 1 to 2%.

An account of the borates of some anaesthetic bases ("borocaines").—A. J. Copeland and H. E. F. Notton, *Brit. med. J.*, ii/1925, 547.

A 2% solution of Borocaine is an improvement on a 0.5% solution of cocaine, in urethral anaesthesia, and a 1% solution of the former gives better anaesthesia than a 0.5% solution of cocaine, but a 0.5% solution of Borocaine has no advantage over a 0.3% solution of cocaine. Beta-eucaine borate in 0.5% solution is a perfect urethral anaesthetic and the relaxation is perfect. In ½% its action is equal to ¼% cocaine hydrochloride, but ¼% is not so good as ½% cocaine.—R. Coyte, *Brit. med. J.*, i/1926, 85.

OPHTHALMOLOGY. Borocaine greatly inferior to cocaine as regards surface anaesthetic effect. Cocaine is perfectly reliable, whereas the effect of Borocaine is variable.—T. H. Butler and R. U. Gillan, *Brit. med. J.*, i/1926, 84.

[P1-81] **Butyn** (*Abbott Laboratories, London*). *p*-Aminobenzoyl- γ -di-*n*-butyl-aminopropanol sulphate.

$[\text{NH}_2 \cdot \text{C}_6\text{H}_4 \cdot \text{COO}(\text{CH}_2)_3\text{N}(\text{C}_4\text{H}_9)_2]_2 \cdot \text{H}_2\text{SO}_4 = 710.6$.

A white amorphous powder, freely *soluble* in water, less soluble in alcohol, acetone and chloroform; insoluble in ether.

Incompatible with chlorides and salicylates.

Uses. A local anæsthetic especially recommended for surface anæsthesia of the eye, nose and throat. For surface anæsthesia of the eye a 2% solution is employed; a few drops of this suffice for the removal of a foreign body. It does not dilate the pupil or affect accommodation. The 2% solution is also suitable for general application to the tonsils and to the mucosa of the throat, mouth and nose. For subcutaneous injection and for infiltration anæsthesia in tonsillectomy from 0.1 to 0.25% solutions are used.

Contraindicated where there is a solution of continuity in the mucous membrane, either through trauma or ulceration, as this allows too rapid absorption of the drug.—W. R. Jamieson, *J. Amer. med. Ass.*, i/1929, 1519.

[P1-81] **Butyn Oral Obtundent** (*Abbott Laboratories, London*). Butyn sulphate 10%, alcohol (95%) 10%, aqueous solvent 80%. For topical application as a local anæsthetic in dental work.

[P1-81] **Butethanol**. *Syn. and Prop. Names.* PANTOCAINE, TETRA-CAINE, ANETHAINE (*Glaxo Laboratories, London*), DECICAIN (*Bayer Products, London*), PONTOCAINE HYDROCHLORIDE (*Winthrop, New York*).

$\text{C}_6\text{H}_5 \cdot \text{NH} \cdot \text{C}_6\text{H}_4 \cdot \text{COO} \cdot \text{C}_2\text{H}_4 \cdot \text{N}(\text{CH}_3)_2 \cdot \text{HCl} = 300.68$.

Butethanol is *p*-butylaminobenzoyldimethylaminoethanol hydrochloride, and occurs as a white crystalline powder melting at 148° to 150°.

Soluble 1 in 7 of water; also soluble in alcohol; insoluble in ether.

Uses. A local anæsthetic of the procaine series, used in 2% solution for surface anæsthesia and in 0.5 to 1% solution for spinal anæsthesia. For infiltration anæsthesia a 1 in 1000 solution in normal saline with adrenaline is employed; for ophthalmology a 0.5% solution has been employed, but it is reported to cause irritation and turbidity of the cornea. Butethanol is claimed to be fifteen times as active as procaine and ten times as active as cocaine, but is more toxic. It should be combined with adrenaline to minimise toxic reactions.

[P1-81] **Decicain L, Dry Substance** is issued in ampoules containing 10 mg. of dry Decicain, together with ampoules containing 2 ml. of Racedrin (racemic ephedrine), for spinal anæsthesia.

Decomposition on Sterilisation. The decomposition of Decicain solutions increases with temperature and hydrogen ion concentration. A solution in N/1000 hydrochloric acid is very stable.—A. Rae, *Pharm. J.*, ii/1938, 24.

Impletol (*Bayer Products, London*). A molecular compound of procaine hydrochloride and caffeine.

Dose.—2 ml. subcutaneously or intramuscularly. In migraine, dysmenorrhœa and pain due to vasomotor disturbances.

[P1-81] **Metycaine** (*Lilly, London*). Hydrochloride of γ -(2-methyl piperidino)-propyl benzoate. A local anæsthetic producing prompt anæsthesia either by infiltration or by application to mucous membranes.

Dosage for mucous membranes: eye 2%; nose and throat 2 to 10%; urethra 1 to 4%. It is supplied either in powder, tablets, solution or ampoules.

[P1-S1] **Panthesine** (*Sandoz, London*). N-Diethyl-leucinol ester of *p*-amino-benzoic acid. A local anæsthetic stated to have a surface anæsthetic action equal to that of cocaine with only one-third the toxicity. It may also be employed for infiltration and spinal anæsthesia. Issued in solution and ampoules and as powder. [P1] **Panthesine Balm** containing 5% of Panthesine is indicated in rheumatism, gout, neuralgia, etc.

[P1-S1] **Percaïne** (*Ciba, Horsham*). (*Syn.* NUPERCAINE in U.S.A.). The hydrochloride of α -butyloxycinchoninic acid diethylethylene-diamide or 2-butyloxyquinolinecarboxylic acid-4-diethylethylene-diamide hydrochloride,

It is supplied as base or hydrochloride and in 2% solution (for surface anæsthesia), also in solutions of various strengths for spinal anæsthesia, and in solution and tablets with adrenaline.

Dose.—For infiltration anæsthesia solutions of from 1 in 2000 to 1 in 1000 with addition of 0.1 ml. of adrenaline hydrochloride solution (1 in 1000) to 100 ml. Not more than 100 ml. of 1 in 1000 solution should be injected. For spinal anæsthesia from 7.5 to 10 mg. in 1 in 200 solution. For sacral anæsthesia 25 to 35 ml. of 1 in 1000 solution. Solutions should be prepared with distilled water, and alkali-free glass used.

Colourless crystals, m.p. 97°. Readily *soluble* in water, alcohol, chloroform and acetone, but insoluble in ether and oils. Solutions are made in normal saline, giving neutral solutions.

Toxic Effects. The symptoms of poisoning are clonic convulsions, motor excitement, acceleration of respiration, and ultimate paralysis. Deaths have followed its use for spinal anæsthesia.

Fatal syncope following Percaïne in operation for a large ovarian cyst. The prone position is an error. It should be remembered that the gravid uterus is a similar contraindication.—W. Howard Jones, *Lancet*, ii/1930, 550.

Used as a local anæsthetic in abdominal surgery, caused necrosis of the tissues. Prof. Finsterer (Vienna) reported two deaths within 24 hours following its use.—*Brit. med. J.*, ii/1932, 400.

Two deaths following lumbar anæsthesia with 2 ml. and 10 ml. of 0.4% solution.—*Per Brit. med. J.*, ii/1933, 95.

Death of a woman of 69 following the subcutaneous injection of 2% Percaïne solution. At the inquest the medical practitioner said that while he had ordered procaine from the chemist he had employed the 2% Percaïne solution mistakenly sent, since he thought that the reference to this strength solution in the makers' literature for use in "surface anæsthesia" meant that it was suitable for use by subcutaneous injection.—*Pharm. J.*, ii/1939, 370.

Uses. A local anæsthetic for infiltration and spinal anæsthesia, acting like cocaine when applied to mucous surfaces and like cocaine or procaine when injected, the action being relatively prolonged. Its toxicity is three times that of cocaine and about twenty-five times that of procaine when injected subcutaneously, hence it should not be employed by this route.

It is potent in such high dilution that the content adds next to nothing to the sp. gr. of the vehicle. For thoracic nerve root blocks, solutions 1 in 2000 to 1 in 1000 according to duration of analgesia needed. 7½ to 10 mg. said to be more effective than 150 mg. of procaine hydrochloride.—W. Howard Jones *Lancet*, i/1930, 573.

Mucous membranes, especially of the nose, anæsthetised with 1 and 2% solutions, with addition to each 50 ml. of $\frac{1}{2}$ ml. of adrenaline solution, for partial resections of turbinates, removal of polypi, ethmoidal curettages, and intranasal drainage of maxillary antrum.—O. Popper, *Brit. med. J.*, i/1930, 669.

Has far greater toxicity and no great advantage over Novocain-adrenaline for infiltration anesthesia but promising for mucous membranes.—M. C. G. Israels and A. D. Macdonald, *Brit. med. J.*, ii/1931, 986.

The least toxic of the spinal analgesics. Effect on blood pressure considerably less; the effect lasts from 1 to 3 hours and the patient is free from pain for from 6 to 12 hours after the operation, while a smaller number of headaches occur than with Stovaine, etc. High abdominal anesthesia can be produced with maximum of safety, and the same solution used to infiltrate the skin before introducing the intrathecal needle. The dilute solution (20 ml. of a 1 in 1500 solution) is more often used, but the stronger (2.3 ml. of a 1 in 200) is useful for operations on the perineum, etc., using doses of 0.6 ml. up to 2.3 ml., and operations such as removal of piles, cystoscopy and prostatectomy may be done with this strong solution. Premedication with Omnopon and scopolamine is given one hour before operation. Howard Jones' technique described, as used in 1200 cases. Injection in the upright sitting position the technique of choice for pregnancy, patients with large abdominal tumours, and similar cases.—R. Jarman, *Brit. med. J.*, i/1934, 797.

Prof. Sebrechts, of Bruges, from an experience of 35,000 cases, considers spinal anesthesia with Percaine the method of choice for abdominal surgery, using 15 to 20 ml. of the 1 in 1500 solution in fractional doses of 5 ml. at 5-minute intervals. Individuals vary in their reaction, ignorance of which probably accounts for most of the former failures and disasters. An injection of $\frac{1}{4}$ gr. of morphine and $\frac{1}{16}$ gr. of scopolamine an hour before operation helps in estimation of patient's response, the sensitive being deeply narcotised; the normal, somnolent; and the resistant unaffected.—*Brit. J. Anæsth.*, Oct., 1934, 4.

For details of use of Percaine in oil in the treatment of pruritus ani and anal fissure, see p. 430.

[P1-81] **Unguentum Sedativus (St. T.H.)**. Percaine (base) 2, liquefied phenol 1.25, solution of hamamelis 10, simple ointment 86.75.

[P1-81] **Percainol (Ciba, Horsham)**. Ointment containing 1% of Percaine with solution of hamamelis and aluminium formate. Anti-pruritic and analgesic application for skin diseases.

[P1-81] **P.B.A. (Allen & Hanburys, London)**. An oily solution containing Percaine 0.5%, benzyl alcohol 10%, phenol 1%. Ampoules contain 5 ml. for subcutaneous injection in pruritus ani, anal fissure, etc.

[P1-81] **Phenolaine (Phenolaine Co., London)**. The preparation is stated to contain methyl, ethyl, benzoic and carboxyl groups and an amine group. It has been used in a large number of operations without trouble as regards bleeding or subsequent after-effects. It does not produce vasodilatation on subcutaneous or intramuscular injection.

Dose.—For general surgery, e.g., for hernia or appendicitis, use 2 drops of Phenolaine to each ounce of sterile water. Not more than 6 ounces of the dilution should be used at one time. For teeth extraction use 8 drops to 1 ounce of water. Amputations of the breast have been conducted with 12 drops in 6 ounces of water.

[P1-81] **Tutocain (Bayer Products, London)**. *Syn.* BUTAMIN.
 $C_{14}H_{25}O_2N_2 \cdot HCl = 286.65$.

Tutocain is *p*-aminobenzoyldimethylamino-1:2-dimethyl propanol hydrochloride. It is a light, ivory-coloured, odourless crystalline powder, with a faintly bitter taste. M.p. 212° to 215° .

Soluble about 1 in 4 of water and 1 in 40 of alcohol.

Uses. A local anæsthetic applicable for surface and infiltration anesthesia. It is about one-third as toxic as cocaine and from two to four times as toxic as procaine hydrochloride. For surface

anæsthesia, a 3 to 5% solution is used and for infiltration a 0.2% solution.

The most suitable strength for urethral work is $\frac{1}{4}$ to $\frac{1}{2}$ % with adrenaline.—*Per Prescriber*, Jan., 1927, 7.

Tutocaine more toxic than procaine hydrochloride, but quicker in action. 1 in 500 solution proved a reliable anæsthetic.—H. V. Molesworth, *Brit. med. J.*, i/1930, 13.

CODEINA

B.P., *U.S.P. XI*, *P. Ned. V.*, *P. Ital. V.*, *Fr. Cx.*, *P. Helv. V.*,
P. Dan., *F.E. VIII*, *P. Belg. IV.*

[P1] "Alkaloids, the following; their salts, simple or complex:—Codeine."

[S1] "Alkaloids, the following; their salts, simple or complex:—Codeine except substances containing less than 1% of codeine."

Note.—Although codeine and its salts are controlled by the *Methylmorphine and Ethylmorphine Regulations*, 1933, these regulations do not affect any sale or distribution by an authorised seller of poisons in the course of any retail business (see page 1145).

Codeine and Dangerous Drugs Act, 1932.—It was argued at the 1925 Geneva Convention that codeine could be converted into drugs of addiction. Codeine being usually manufactured from morphine, it is open to a manufacturer, if codeine remains exempt from control, to buy codeine in the open market without the knowledge of the Government; he can then divert a corresponding amount of morphine into the illicit traffic and explain its disappearance by saying that he has converted it into the codeine. It was finally agreed that the restrictions should only relate to manufacture, export and wholesale trade.—*Brit. med. J. Supplement*, Mar. 5, 1932.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.). *Fr. Cx.* has maximum single dose 0.08 g., maximum during 24 hours 0.3 g. *P. Helv. V* has $1\frac{1}{2}$ and 5 grains respectively. *U.S.P. XI* average dose $\frac{1}{2}$ grain.

An alkaloid from opium or manufactured from morphine, in colourless crystals, melting, after drying at 100°, at 155° to 156°. It is a methyl ether of morphine—monomethyl-morphine.

Soluble 1 in 120 of water, 1 in 2 of alcohol 90%, 1 in 13 of benzene, 1 in 20 of ether; also in chloroform and in excess of aqueous ammonia, but insoluble in excess of potash solution; very soluble in dilute acids.

Antidotes. Treat as for poisoning by morphine, see p. 697.

Addiction. Codeine has a relatively feeble euphoric action and the addict can get little satisfaction from the drug taken by the mouth, but large doses of codeine taken hypodermically (e.g., up to 50 gr. daily), or intravenously, can act as a morphine substitute for the addict. On the other hand, it is said that a normal individual, not familiar with the effects of morphine, who takes small daily doses of codeine, say, $\frac{1}{4}$ or $\frac{1}{2}$ gr. three times daily inevitably becomes a "codeinist" within two months.

While the question as to whether the administration of codeine results in genuine addiction cannot be answered in the negative, there are no sufficiently conclusive findings to justify an affirmative reply—only seven cases of primar

codeine addiction have been recorded in the literature. On the other hand the parenteral administration of codeine has brought about a new state of affairs, since it seems possible for a genuine primary codeine addiction to occur even in persons not previously addicted to drugs, though in order to create this addiction very large doses are necessary parenterally. The new vogue of codeine injections undoubtedly represents a social danger. At the same time there cannot be said to be any *general* social danger, and the evil can be put down by national legislation without any need to set in motion the elaborate machinery of international regulation. The medical practitioner should not allow himself to be deterred from prescribing codeine freely in the usual small therapeutic doses, and he is still as justified as ever in regarding codeine as a good remedy without any dangerous accessory effects, though in the case of persons who have formerly been addicted to morphine or other drugs, or persons who are constitutionally predisposed to addiction, the doctor should no doubt avoid codeine as far as possible.—P. Wolff, *Bull. Hlth Org., L.O.N.*, 1938, 546.

Codeine addiction seems to have constituted a real problem in Canada in recent years. It is stated that Canada leads the world in the *per caput* consumption of codeine. The habit may arise without any relationship to previous addiction to morphine or heroin.—E. W. Adams, *Bull. Hyg.*, 1937, 241.

Withdrawal symptoms appear, as a rule, much later than in cases of morphinism. When the total dose of codeine sulphate varies from $1\frac{1}{2}$ to 3 gr. daily, the symptoms of withdrawal are definitely felt on the fifth and sometimes even on the sixth day of abstinence. When Rossium is given, codeinists, as a rule, are freed from the craving very quickly.—I. Ostrofnislensky, *Med. Pr.*, ii/1936, 30.

Uses. Codeine is less narcotic, less constipating and less apt to induce a habit or tolerance than morphine. In moderate doses is hypnotic and in frequent small doses it allays cough in phthisis. For cough following catarrh $\frac{1}{2}$ to 1 grain gives relief. In diabetes, beginning with $\frac{1}{4}$ grain thrice daily, it lessens the amount of sugar in the urine. A useful sedative in chronic cystitis with enlarged prostate.

Codeine can be used instead of morphine in nearly every case except when the aim of treatment is to relieve pain; it is especially useful in chronic diarrhoea and should be used a good deal more than it is. Unless there is pain to be relieved, codeine, in an appropriate dose, is preferable to morphine for the purpose of producing rest in internal hæmorrhage.—R. H. Micks, *Practitioner*, i/1937, 532.

More than 75% of true common colds can be aborted in the early stages by taking $\frac{1}{2}$ gr. each of codeine and papaverine five times daily for two days immediately the cold threatens.—F. Hutter, *Wien. klin. Wschr.*, i/1937, 376.

In the great majority of tuberculous patients requiring medication for cough relief, codeine, 10 mg. orally, is a sufficient dose.—L. F. Davenport, *J. Pharmacol.*, 1938, 64, 242.

[P1-81] **Capsulæ Codeinæ et Valerianæ Compositæ.**

Dose.—1 or more *p.d.* according to strength.

Codeine $\frac{1}{2}$ to 1 gr., extract of valerian 2 gr., phenol 2 gr., extract of cascara $1\frac{1}{2}$ gr. In glycosuria, codeine is valuable for treatment, the valerian is a nerve sedative and the phenol is an intestinal disinfectant.

[P1-81] **Capsulæ Codeinæ cum Extracto Cannabis.**

Codeine $\frac{1}{2}$ gr., extract of cannabis $\frac{1}{2}$ gr.

In neuralgia, 1 every 4 or 5 hours.

[P1] **Gelatinum Codeinæ (B.P.C.).** *Syn.* CODEINE AND GLYCERIN JELLY.

Dose.—1 drachm (4 g.). A lemon-flavoured preparation containing about 0.2% of codeine, equivalent to about $\frac{1}{2}$ gr. in 1 drachm.

Useful in chronic laryngitis, phthisical cough, etc. Also in ulcer of the stomach.

[P1] **Pastilli Codeinæ (B.P.C.)** contain $\frac{1}{2}$ gr. (0.008 g.).

[P1-81] **Pilula Codeinæ Composita.**

Codeine $\frac{1}{2}$ gr. (increased to 2 gr. if necessary), extract of nux vomica $\frac{1}{2}$ gr., extract of lettuce $\frac{1}{2}$ gr. or more, mucilage q.s. to make one pill. To be taken 2 or 3 times a day, for diabetes.

[P1] **Sirope de Codéine (Fr. Cx.)** contains 0.2% w/w of codeine in 5% of alcohol 60% and "cold-prepared" simple syrup.

[P1-81] **Codeinæ Hydrobromidum.** $C_{18}H_{21}O_2N, HBr, 2H_2O = 416.1$.

An anti-spasmodic similar in dose and use to the phosphate. For eye work has been advised to take the place of ethylmorphine—being said to cause less pain.

[P1-81] **Codeinæ Hydrochloridum** (*P. Ned. V, P. Ital. V, P. Helv. V, P. Dan.*). $C_{18}H_{21}O_2N, HCl, 2H_2O = 371.7$.

Dose.— $\frac{1}{4}$ to 2 grains (0.016 to 0.12 g.). White crystalline powder, soluble 1 in 30 of water.

[P1-81] **Codeinæ Phosphas** (*B.P., U.S.P. XI, P. Jap., Fr. Cx., P.G. VI, P. Helv. V, P. Dan., P. Ital. V, P. Belg. IV*).

$C_{18}H_{21}O_2N, H_3PO_4, H_2O = 415.2$. *U.S.P. XI* has $1\frac{1}{2} H_2O$; *P. Jap. V* has $2 H_2O$.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.). *Fr. Cx.* has max. during 24 hours 6 grains approximately.

In granular snow-white crystals, containing 69% of anhydrous alkaloid. Is suitable for hypodermic injection, 1 grain in 15 minims (1 ml.).

Soluble 1 in 3.5 of water, 1 in 350 of alcohol 90%; sparingly soluble in ether and chloroform.

[P1] **Linctus Codeinæ** (*B.P.C.*).

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.).

Contains codeine phosphate $\frac{1}{4}$ gr. with citric acid, emulsion of chloroform, glycerin and mucilage of tragacanth to 1 drachm.

[P1-81] *St. T. H.* has syrup of codeine phosphate 50% *v/v* in similar vehicle.

[P1] **Linct. Codein. Co.** (*N.I.F.*).

Syrup of codeine phosphate and syrup of tolu, equal parts.

[P1-81] **Pilulæ Codeinæ et Belladonnæ** (*C.X.H.*).

Codeine phosphate $\frac{1}{4}$ gr., dry extract of belladonna $\frac{1}{4}$ gr., kaolin $2\frac{1}{4}$ gr., hard soap to 4 gr.

A combination of two drugs with marked antispasmodic action and power to relieve pain originating in plain muscle. Designed for administration in painful colic spasm. To be taken regularly over a period of weeks for full effect. —E. C. Warner, *Practitioner*, 1935, 831.

[P1] **Syrupus Codeinæ Phosphatis** (*B.P.C.*).

Dose.— $\frac{1}{4}$ to 2 drachms (2 to 8 ml.).

Codeine phosphate 0.5% in a solvent of distilled water and syrup. Contains about $\frac{1}{4}$ gr. of codeine phosphate per drachm.

[P1] **Tab. Codein. Co.** (*N.I.F.*). Acetylsalicylic acid 4 gr., phenacetin 4 gr., codeine phosphate $\frac{1}{4}$ gr.

[P1] **Codoforme Botal Tablets** (*Bottu, Paris; Continental Laboratories, London*). A laryngeal sedative for all forms of cough. *Dose.*—1 to 5 tablets daily according to age and the nature of the cough. Each tablet is stated to be equivalent to codeine $\frac{1}{16}$ gr., bromoform 4 m., tincture of aconite 1 m., tincture of belladonna 1 m., with terpene $\frac{1}{16}$ gr. and sodium benzoate $\frac{1}{4}$ gr.

[P1] **Vagocodeine** (*Richter, London*). Tablets contain aspirin 4 gr., phenacetin 4 gr., codeine $\frac{1}{4}$ gr. *Dose.*—One tablet once or twice daily after meals. Antipyretic and analgesic.

[P1] **Veganin** (*Warner, London*). Acid acetylsalicyl. 32.68%, codeine 0.99%, phenacet. 32.68%, excipient ad 100. One tablet weighs 11.8 gr.

[P1-81] **Codeinæ Sulphas** (*U.S.P. XI*).

$(C_{18}H_{21}O_2N)_2, H_2SO_4, 5H_2O = 786.5$.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.).

White crystals efflorescent in air; soluble 1 in 40 of water, slightly soluble in alcohol.

Given with advantage in sciatica, also in morphine habit, *q.v.*

Apocodeinæ Hydrochloridum. $C_{15}H_{19}O_2N.HCl = 317.6$.

Dose.— $\frac{1}{2}$ gr. gradually increased to 1 grain (0.006 to 0.06 g.). 3 or 4 grains daily may safely be given. A greyish, hygroscopic powder consisting of the salt of the base or mixture of bases obtained by the action of zinc chloride on codeine. Soluble in water, less soluble in alcohol.

Uses. Is a sialogogue and sedative, and increases peristalsis. Is more expectorant than apomorphine and less emetic. Has been used in chronic bronchitis and other bronchial affections. Hypodermically 30 minims of 1% solution (= $\frac{1}{4}$ gr.) may purge in half an hour or less, but may also prove emetic.

[D-P1-S1] **Dicodid** (*Knoll, London*). Dihydrocodeinone acid tartrate (for oral use) or hydrochloride (for subcutaneous injection). In white crystals soluble in water. Its activity is midway between that of morphine and codeine with specific influence on the cough centre. Tablets contain $\frac{1}{3}$ gr. or $\frac{1}{2}$ gr. Ampoules contain $\frac{1}{2}$ gr.

Dose.—For cough and less severe pain $\frac{1}{3}$ gr. orally, 2 or 3 times daily, increased if necessary. Subcutaneously, half to one ampoule. Should not be administered on an empty stomach.

[D-P1-S1] **Dilaudid** (*Knoll, London*). *Syn.* DIHYDROMORPHINONE HYDROCHLORIDE. $C_{17}H_{19}O_3N.HCl = 321.6$.

Dose.— $\frac{1}{3}$ gr. *per os* or $\frac{1}{32}$ gr. subcutaneously. This dose is effective for 4 to 6 weeks without increasing. Tablets are available containing 0.0025 g. of the hydrochloride. Also issued in ampoules containing 0.002 g. in 1 ml., and in combination with scopolamine hydrochloride 0.0003 g., and with atropine sulphate 0.0003 g.

Soluble in water and alcohol, insoluble in ether. The analgesic effect of $\frac{1}{32}$ gr. of Dilaudid is equivalent to that of $\frac{1}{8}$ gr. of morphine. It is not suitable for infants.

Uses. Dilaudid is a powerful analgesic allied to morphine, with a marked depressant action on the respiratory mechanism, and alarming symptoms of respiratory paralysis may occur even with therapeutic doses. It is more toxic than morphine, and is effective in smaller doses, and it is equally liable to give rise to addiction. Nausea, vomiting and constipation are less frequent than with morphine. It is especially indicated for the relief of all types of severe pain and to allay incessant cough without expectoration.

Used with beneficial effects in pleurisy, sciatica, facial neuralgia, angina pectoris, and acute arthritis, to replace morphine, but of no value when morphine addiction has developed. Unlike morphine, it is not necessary to increase the dose. It may cause transient nausea, giddiness, and confusion, but does not cause constipation or affect the appetite.—O. Leyton, *Lancet*, i/1932, 835.

[D-P1-S1] **Eukodal** (*Merck, Darmstadt; Savory & Moore, London*). *Syn.* DIHYDRO-HYDROXYCODEINONE HYDROCHLORIDE, EUCODAL. $C_{18}H_{21}NO_4.HCl = 351.6$.

Dose.— $\frac{1}{3}$ gr. (0.005 g.) *per os*, or $\frac{1}{8}$ to $\frac{1}{2}$ gr. (0.01 to 0.02 g.) subcutaneously.

White crystalline powder soluble in water. M.p. 270°.

Analgesic and hypnotic, used as a substitute for morphine; it is less toxic and shows less by-effects.

For preparations of Eukodal *exempt* [D] see p. 1142.

Eukodal, Dicodid and Dilaudid. Eukodal differs from Dilaudid and Dico-
did in that it does not cause convulsions, and very large doses are needed to
cause death. The toxicity of Dilaudid is much greater than Dico-
did. The pharmacological actions of all of them are very similar to morphine, but they
are much more toxic; smaller amounts of Dilaudid than morphine are needed
to depress the respiratory centre. Eukodal has a much weaker action on the
movements of the alimentary tract than the other two, and does not increase
special reflexes, but it has a profound effect on respiration, as marked as that
produced by either Dilaudid or morphine. There is no reason to think that
any of these drugs are superior to morphine from a therapeutic point of view.

—G. N. Myers, *Brit. med. J.*, i/1933, 981.

Pharmacological action of Dilaudid, Dico-
did and Eukodal.—G. N. Myers,
Brit. med. J., ii/1933, 282.

Paracodin (Knoll, London). Dihydrocodeine. Tablets contain $\frac{1}{4}$ grain.
Dose.—1 to 3 tablets thrice daily. Also available in 1 ml. ampoules. Indications
as for codeine. **Paracodin Syrup** contains 0.2% of Paracodin.

COLCHICUM

[P1] "*Alkaloids, the following; their salts, simple or complex:—
Colchicine.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—
Colchicine except substances containing less than 0.5% of
colchicine.*"

[P1] **Colchici Cormus** (B.P.).

Dose.—2 to 5 grains (0.12 to 0.3 g.) of the dried corm.

The corm of the meadow saffron, *Colchicum autumnale* (Lili-
aceae). Both fresh and dried corm are official, although the
former is not used in making any preparations. The dried corm
contains not less than 0.25% of colchicine.

Toxic Action. Colchicum affects the gastro-intestinal mem-
brane. It may cause pains in the bowels, vomiting, diarrhoea,
intense thirst, and violent burning in the throat, oesophagus and
stomach.

Antidotes. Empty stomach by emetic, or by stomach tube
using dilute tannic acid solution. Give repeated large doses of
medicinal charcoal. Keep patient warm; give demulcent drinks
freely. Dextrose may be administered intravenously, or saline
infusion may be necessary. Atropine, $\frac{1}{160}$ gr., and morphine, $\frac{1}{4}$
gr., hypodermically to check diarrhoea. Strychnine, $\frac{1}{8}$ gr., or
caffeine sodium benzoate, 2 gr., hypodermically for collapse.

Uses. Has specific effect in gout, relieving pain and reducing
inflammation in the acute attack, but has no prophylactic action.
It may be given in pill with ipecacuanha and mercury, or as the
tincture in mixtures. To abolish the vomiting and diarrhoea often
produced, a small dose of atropine may be given with it. If any
symptoms of gastric or intestinal irritation appear its use must be
discontinued for a time.

Colchicum is probably the best and safest drug for all-round use to relieve
pain during the acute attack of gout, and is best given in combination with purga-
tives, as in the following mixture: tincture of colchicum 20 m., magnesium
sulphate 30 gr., heavy magnesium carbonate 10 gr., peppermint water to 1 oz.;
two ounces to be taken immediately and then one ounce every four hours.

Elderly persons need not be given more than 15 to 20 m. of the tincture as the initial dose. After 24 to 36 hours the dose of mixture should be reduced to half ounce and then omitted as soon as the acute stage has subsided.—Whitla.

[P1-81] Extractum Colchici Aceticum (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 grains (0.016 to 0.12 g.).

An unstandardised soft extract prepared by evaporating the juice of the corm to which acetic acid has been added.

[P1-81] Extractum Colchici Siccum (B.P.).

Dose.— $\frac{1}{2}$ to 1 grain (0.016 to 0.06 g.).

The 60% alcohol extractive adjusted with lactose to contain 1% of colchicine. *Fr. Cx.* extracts seeds with 70% alcohol, not standardised. Max. single dose $\frac{3}{4}$ grain, max. in 24 hours 3 grains approx. *P. Ital. V* extracts with alcohol 60% standardising to 2% of colchicine, *P. Belg. IV* and *F.E. VIII* use 70% with same standard.

[P1] Liquor Antirheumaticus Compositus.

Dose.—30 minims (2 ml.).

Colchicum wine 15, spirit of ether 5, camphor 2, compound tincture of lavender to 30.

[P1] Pilulæ Colchici et Aloes (B.P.C.).

Dose.—1 to 4 pills.

Contain $\frac{1}{2}$ gr. each of dry extract of colchicum, dry extract of hyoscyamus and aloes.

[P1] Pilulæ Colchici et Hydrargyri (B.P.C.).

Dose.—1 to 3 pills.

Contain $\frac{1}{2}$ gr. of dry extract of colchicum, $\frac{1}{2}$ gr. of pill of mercury and $\frac{1}{2}$ gr. of compound extract of colocynth.

[P1] Pilulæ Colchici et Hydrargyri Compositæ (B.P.C.). *Syn.* BRODIE'S GOUT PILLS.

Dose.—1 or 2 pills.

Contain $\frac{1}{2}$ gr. of dry extract of colchicum and $1\frac{1}{2}$ gr. each of pill of mercury, compound extract of colocynth and extract of rhubarb.

[P1] Vinum Colchici (B.P.C.).

Dose.—10 to 30 minims (0.6 to 2 ml.).

1 of corm in 5 of sherry-type wine.

Is given in mixtures with alkali and magnesium sulphate.

In gout, controls the inflammation. 30 minims as first dose, then 15 minims every 3 hours. It is not objectionable to the taste.

Pistia Gout Powder. *Syn.* POLVERE ANTIGOTTOSE (*Farmacia Benedettine, Pistia; Roberts, London*). Stated to contain *Gentiana lutea* 30, *Smilax China* (China root) 30, *Jateorhiza palmata* 20, *Aristolochia rotunda* (birthwort root) 10, *Artemisia Abrotanum* (Southernwood) 10.

[P1] Colchici Semen (B.P.).

Dose.—2 to 5 grains (0.12 to 0.3 g.).

Contains not less than 0.3% of colchicine. *U.S.P. XI* requires not less than 0.45%; *P. Ital. V* and *P. Belg. IV* 0.4%; *F.E. VIII* 0.45%; *P. Helv. V* 0.5%. *I.A.* requires all preparations to be made from the seed.

[P1] Extractum Colchici Liquidum (B.P.). *Syn.* Fluid-extractum colchici.

Dose.—2 to 5 minims (0.12 to 0.3 ml.).

Contains 0.3% w/v of colchicine.

[P1] Mist. Colchici (N.I.F.). Potassium bicarbonate 15 gr., sodium sulphate 10 gr., liquid extract of colchicum 3 m., peppermint water to $\frac{1}{2}$ oz.

[P1] **Mist. Colchici c. Sod. Sal. (N.I.F.).**

Sodium salicylate 10 gr., solution of burnt sugar 5 m., potassium bicarbonate 15 gr., liquid extract of colchicum 3 m., peppermint water to $\frac{1}{4}$ oz.

[P1] **Tinctura Colchici (B.P.).**

Dose.—5 to 15 minims (0.3 to 1 ml.). *Fr. Cx.* (1 in 10) has max. single dose 25 minims, max. daily dose 90 minims.

Contains 10% *v/v* of liquid extract, equivalent to 0.03% *w/v* of colchicine.

[P1] **Tinctura Colchici Seminis (U.S.P. XI).** *Syn.* TINCTURA COLCHICI, U.S.P. X.

Average dose.—30 minims (2 ml.).

Colchicum seed, 1 in 10. Is one third stronger than Tinctura Colchici B.P.

[P1] **Vinum Colchici Seminis (B.P.C.).**

Dose.—10 to 30 minims (0.6 to 2 ml.).

Colchicum seed, 1 in 10, in detannated sherry-type wine.

[P1] **Colchici Flos.** The fresh perianth of the meadow saffron. It has similar properties to the corn.

[P1-81] **Colchicina (B.P.C., Fr. Cx., F.E. VIII, P. Dan., U.S.P. XI).** $C_{22}H_{25}O_6N = 399.2$. *P. Helv. V* has $\frac{1}{2}H_2O$. *P. G. VI* has $C_{22}H_{25}O_6N, \frac{1}{2}CHCl_2$ which contains 87% of colchicine.

Dose.— $\frac{1}{100}$ to $\frac{3}{80}$ grain (0.0005 to 0.002 g.) in a pill. *P. Dan.* and *Fr. Cx.* have maximum single dose $\frac{1}{10}$ grain; max. during 24 hours $\frac{1}{10}$ grain approximately. *U.S.P. XI* average dose $\frac{1}{100}$ grain.

Intravenously has been tried in dose of $\frac{1}{100}$ grain with sodium iodide and sodium salicylate 1 g. each in 20 ml.

Yellowish flakes, crystals or powder, with a hay-like odour when damped and warmed. It is a weak base, most of its salts being decomposed by water.

Soluble 1 in 22 of water with neutral solution, readily in alcohol 90% but less in dehydrated alcohol; very soluble in chloroform, slightly soluble in ether (1 in 155).

Has been used in acute gout, rheumatic gout, asthma, cerebral congestion and uræmia.

GOUT. While there is no known cure for gout, colchicine is a most valuable drug for affording symptomatic relief. In the crystalline form this preparation is more reliable than the wine or the tincture of colchicum. For acute symptoms colchicine may be prescribed in amounts of $\frac{1}{30}$ gr., to be taken every one or two hours until 8, 12, or even 16 doses have been ingested. The symptoms of adequacy are associated with the development of nausea, vomiting, or diarrhœa. It may also be used with advantage during the periods between attacks in a dose of $\frac{1}{30}$ gr. each day for two or three days each week. The use of colchicine in this amount in several cases for more than two years has not produced any toxic symptoms and is a safe practice.—J. H. Talbott and F. S. Coombs, *J. Amer. med. Ass.*, i/1938, 1977.

[P1-81] **Colchicine Salicylate.** $C_{21}H_{23}NO_6, C_6H_4OH-COOH = 537.2$.

Dose.— $\frac{1}{100}$ to $\frac{3}{80}$ grain (0.0005 to 0.002 g.).

A yellowish powder soluble in water, alcohol and ether.

COLLOIDS

By the term "colloid" is meant a certain condition of matter depending chiefly upon the size of the particles. Thus a **Colloidal Solution** or more correctly a colloidal sol, is a system wherein a solid or liquid (disperse phase) is dispersed in a liquid medium

(continuous phase), the size of the dispersed particles lying between 100 and 1μ . When the disperse phase is a solid, it is called a suspensoid sol, and when a liquid, an emulsoid sol. Thus the conditions are different from those in an ordinary solution where the solute is present either as molecules or ions or a mixture of the two. Unlike solutions, colloidal sols possess the following properties:—

Electrical Properties.

The disperse particles are charged positively or negatively. On passing an electric current through the sol, the positively charged particles move towards the cathode and the negatively charged towards the anode. This movement of particles in an electric field is known as Kataphoresis. On the addition of electrolytes, a suspensoid sol becomes unstable owing to the neutralisation of the charge, and the dispersed particles aggregate together and precipitate as larger particles. Precipitation or coagulation of a negatively charged sol is brought about mainly by the positive ion of the electrolyte and *vice versa*. Emulsoid sols are not readily precipitated by electrolytes. When an emulsoid sol is mixed with a suspensoid sol, the emulsoid particles appear to be adsorbed on to the surface of the suspensoid particles, with the result that the mixture is much more stable towards electrolytes. This fact is made use of in the preparation of colloidal metal sols which, alone, are typical suspensoid sols. A trace of added emulsoid sol, such as gelatin, agar, egg albumin, isinglass or acacia, confers stability on the preparation.

Colloids such as gelatin are known as protective colloids. Amongst the sols having positively charged particles are the hydroxides of iron, aluminium and chromium, also the basic dyes such as methylene blue, methyl violet, etc. Negatively charged colloidal sols include those of metals, sulphur, iodine, soap and such acid dyes as congo red, eosin, indigo, fuchsin and resinous sols such as mastic, ginger, podophyllin, guaiacum, etc.

Osmotic Pressure.

The osmotic pressure of most colloidal sols is very small.

Brownian Movement.

The dispersed particles in a colloidal sol are in rapid motion, the phenomenon being known as the Brownian Movement. It may be observed in certain fine suspensions (not colloidal) using an ordinary microscope, but in colloidal sols it can only be detected by an ultramicroscope. The presence of Brownian Movement serves to distinguish a colloidal sol from a true solution which does not exhibit it. The movement is caused by the bombardment of the disperse particles by the molecules of the continuous phase.

Tyndall Cone.

When a parallel beam of light is passed through a colloidal sol, the path of the beam is visible. This again serves to distinguish a sol from a true solution, which does not show this phenomenon. A very similar phenomenon, due to fluorescence, is exhibited by some solutions, but whereas the beam of light made visible by the colloidal particles is polarised, this is not so in the case of fluorescence.

Isoelectric Point.

Many emulsoid sols, particularly those of amphoteric nature such as proteins, have varying charges on their particles according to the pH of the medium. At an intermediate point, the particles are uncharged. This point is known as the isoelectric point of the colloid, and is usually stated in terms of the pH of the medium. Colloids usually exhibit special physical properties at their isoelectric point, one being that of minimum solubility. This fact is often utilised in their separation from other colloids. Thus insulin is precipitated more easily at the isoelectric point, which lies between pH 5 and pH 6, than at other hydrogen ion concentrations.

Dialysis.

Graham's original conception of *colloids* as substances which will not dialyse through an animal membrane in contradistinction to *crystalloids* which will so dialyse, no longer holds good to-day. The type of membrane used in the dialysis and the dispersion medium or continuous phase are factors which determine the retention or passage of the disperse phase. Thus a copper ferrocyanide

membrane will hold back particles of molecular size. The process of dialysis is, however, an important process in removing electrolytes from mixtures after their employment as precipitants of colloids. The most useful membrane for general use is transparent cellulose tissue (*e.g.*, Cellophane) in the form of "sausage skins." It may be so obtained in long lengths capable of holding large volumes of liquids. The dialysing surface may be considerably increased by arranging a "skin" of smaller diameter inside a large one, placing the whole system in running water, allowing water also to flow through the central "skin" and placing the mixture for dialysis in the space between the two skins after the manner of a double surface condenser.

Nomenclature of Colloids.

Lyophile Colloids. This term refers to colloids such as gelatin, acacia, etc., which can form a sol by the mere addition of solvent or continuous phase in contradistinction to *lyophobic colloids*, such as the metallic sols, which will not do so, but require special dispersion methods. When water is the continuous phase the terms *hydrophile* or *hydrophobe* are used respectively.

Colloidal Electrolytes. Certain substances such as soaps undergo electrolysis in water similar to electrolytes, but one of the ions is a complex, consisting of aggregated molecules and ions. These latter aggregates are called *ionic "micelles,"* and form the colloidal particles of the system. Some colloids, like collodion, have a disperse phase which is neutral or uncharged.

Gels. Emulsoid sols may be of two types, those which are simple dispersions of liquids such as oils, and others like gelatin sols and agar, in which the particles are very heavily hydrated. In dilute sols these particles are separate, but as the concentration rises they appear to go in together to form a reticulated or sponge-like mass throughout the continuous phase. In this condition the whole system sets to a semi-solid condition which is known as a *gel*.

Manufacture.

Colloids are used in therapeutics mainly as metallic or metalloid sols. The processes of manufacture vary very considerably, and many are the subject of patents. In the 19th Edition Vol. I, p. 365, details are given relative to the preparation of sols of aluminium hydroxide, arsenic, bismuth, gold, manganese, selenium, etc., to which reference may be made, and particulars regarding the composition of colloidal solutions of certain elements and compounds are given under individual drugs (*see Index*). The following are the usual methods employed.

1. *Dispersion by precipitation in the presence of a protective colloid.* The precipitation may be the result of reduction, double decomposition, hydrolysis, etc. The preparation of colloidal silver is typical of this method.

This type of method may be used for the preparation of colloidal calomel, iodine, ferric hydroxide, bismuth, sulphur, selenium, manganese and lead.

2. *Electrical Dispersion.* Electrodes made of the metal to be dispersed are immersed below distilled water, and so arranged as to produce a uniform arc when using a current of 8 amperes at about 110 volts. A small quantity of some protective colloid, such as gelatin, is added, the current switched on, and the arc maintained until the necessary concentration of dispersed metal is reached. This type of method is employed for the preparation of gold, silver and lead sols.

3. *Grinding.* Very fine dispersion may be obtained by a process of wet grinding in so-called colloid mills, although the particles are rarely within the colloid range of sizes. The method is used in the preparation of so-called colloidal calamine, sulphur and silver.

4. *Kataphoresis.* In the preparation of certain colloids such as kaolin, the material is first ground to approximate colloidal dimensions in a mill and some electrolyte such as sodium silicate is added. The silicate ions become adsorbed on the kaolin particles and, on providing an electric field, they move to, and are deposited at the anode.

Therapeutic Properties.

The value of colloids in therapeutics has been the subject of much controversy. Special properties have been claimed for them because of the very small size of the particles in comparison with an ordinary suspension or emulsion. This greatly reduced size, is said to confer a greatly increased specific surface and surface energy, and therefore greater activity. Where it is intended that a medication shall pass through the skin or have a local skin reaction, then the use of

colloidal medicaments as ointments and lotions, etc., may have a justification. Similarly in the use of adsorbents such as kaolin and charcoal in the treatment of alimentary toxæmia, it is logical to presume that a greater adsorption of toxins, etc., would occur if the size of the particles were of colloidal dimensions. It is, however, difficult to understand how a colloidal sol administered by the mouth can avoid being quickly coagulated thus ceasing to possess a special value. Moreover, because of the use of a protective colloid in a suspensoid sol, it is difficult to assess the value of the preparation. Its action may depend upon the protective colloid present, and may change when a different one is used. This is particularly so when such sols are administered parenterally, the reaction which follows being often due to the non-specific protein of the protective colloid. Moreover, many of the so-called suspensoid sols are not permanent, for the dispersed medicament reacts with the protective colloid to form another entirely different substance. This applies especially in the case of the so-called iodine sols.

Colloidal solutions are supplied commercially under the names **Collobell** (*John Bell, Hills & Lucas, London*), **Collosol** (*British Colloids, London*), **Oscol** (*Oppenheimer, Son & Co., London*). Colloidal solutions are also prepared by most manufacturing chemists.

COLOCYNTHIS

B.P.

Syn. COLOCYNTHIDIS PULPA, COLOCYNTH PULP, BITTER APPLE, COLOQUINTIDE, COCOMERO AMARO (*P. Ital. V*).

Dose.—2 to 5 grains (0.12 to 0.3 g.). *P. Helv. V* max. single dose 5 grains; max. per day 15 grains. The toxic dose of colocynth is 0.6 to 1 g., and the fatal dose 4 g.

The dried pulp of the fruit of *Citrullus Colocynthis* (Cucurbitaceæ) containing not more than 5% of seeds, and not more than 2% of the outer sclerenchymatous part of the pericarp. Has a markedly bitter taste, is free from starch, and contains only about 3% of fixed oil or less, whereas the seeds contain 15% or more. Is imported from Smyrna (the best) and Spain.

Antidotes. Empty stomach by emetics or by stomach tube, using dilute tannic acid solution and leaving some in the stomach. Keep patient warm and give demulcent drinks freely. Stimulants, e.g., brandy, $\frac{1}{2}$ oz., or aromatic spirit of ammonia, $\frac{1}{2}$ dr., in water. Opium (tincture) by mouth or by rectum. Saline infusion if necessary.

Uses. A drastic cathartic. A frequent ingredient of aperient pills. Since it causes griping it is usually given with hyoscyamus. It is excreted by the kidneys and milk, and should therefore not be given to nursing women.

Extractum Colocynthidis Compositum (*B.P.*).

Dose.—2 to 8 grains (0.12 to 0.5 g.).

This is in powder form, made by extraction of colocynth and adding finely powdered aloes, scammony resin, curd soap and cardamom.

Pilulæ Colocynthidis Compositæ (*B.P.C.*). *Syn.* PIL. COCHIA.

Dose.—1 or 2 pills.

Each pill contains colocynth $\frac{2}{3}$ gr., aloes and scammony resin, of each $1\frac{1}{2}$ gr., with curd soap and oil of clove.

Pilulæ Colocynthis et Hydrargyri (B.P.C.).*Dose.*—1 or 2 pills.

Each pill contains compound extract of colocynth 2 gr. and pill of mercury 3 gr.

[P1] Pilulæ Colocynthis et Hydrargyri Compositæ (B.P.C.).*Dose.*—1 to 4 pills.

Each pill contains pill of colocynth and hyoscyamus $\frac{3}{4}$ gr. and pill of mercury $\frac{1}{4}$ gr.

[P1] **Pil. Aperiens (N.I.F.).** *Syn.* PIL. HYDRARG. C. COLOCYNTH. ET HYOSCY. Colocynth and hyoscyamus pill 4 gr., mercury pill 1 gr.

[P1] Pilula Colocynthis et Hyoscyami (B.P.).*Dose.*—4 to 8 grains (0.25 to 0.5 g.).

Contains colocynth, aloes, scammony resin, curd soap, dry extract of hyoscyamus, and oil of clove with syrup of liquid glucose.

[P1] **Pulvis pro Pilula Colocynthis et Hyoscyami** consists of the ingredients of the pill less the syrup of liquid glucose. Is more convenient for dispensing.

[P1] Hamilton's Pill.

Compound extract of colocynth 2, extract of hyoscyamus 1, made into 4-grain pills. Stated to be less griping than the preceding.

[P1] Pilulæ Hydrargyri Subchloridi, Colocynthis et Hyoscyami (B.P.C.). *Syn.* ZITTMANN'S PILLS.*Dose.*—1 or 2 pills.

Each pill contains mercurous chloride 1 gr., compound extract of colocynth 2 $\frac{1}{2}$ gr., dry extract of hyoscyamus 1 gr.

Pilulæ Hydrargyri Subchloridi et Colocynthis (B.P.C.).*Dose.*—1 pill.

Each pill contains compound extract of colocynth 4 gr. and mercurous chloride 1 gr.

Tinctura Colocynthis (P.G. VI).

Dose.—3 to 15 minims (0.2 to 1 ml.). Maximum single dose 1 g.; maximum daily dose 3 g.

1 in 10 of alcohol (90%). *P. Ital. V* is also 1 in 10 using 80% alcohol.

[P1] **Elaterium (B.P.C.).** *Dose.*— $\frac{1}{8}$ to $\frac{1}{4}$ grain (0.006 to 0.03 g.), usually in pills.

The dried sediment from the juice of the nearly ripe fruit of *Ecballium Elaterium* (Cucurbitaceæ). A powerful hydragogue cathartic, useful in renal or cardiac disease complicated with dropsy. Its action is variable owing to the fluctuating content of elaterin.

[P1] **Tinctura Elaterii Composita.** *Dose.*—10 to 30 minims.

Elaterium in powder 1, chloroform 50, macerate 2 days, then add alcohol (90%) 200 and compound tincture of cardamom 250, macerate 5 days more and filter. Is more active than a corresponding dose of the powder.

[P1] **Elaterinum (B.P.C.).** *Syn.* MOMORDICIN. $C_{28}H_{48}O_7$. *Dose.*— $\frac{1}{80}$ to $\frac{1}{10}$ grain (0.0015 to 0.006 g.). The crystalline neutral active principle (to extent of at least 20%) of elaterium, insoluble in water, soluble in chloroform (about 1 in 12) and sparingly in alcohol. It is used for the same purposes as elaterium but should be employed with caution, since large doses may cause dangerous prostration.

[P1] **Pulvis Elaterini Compositus (B.P. 1898).** *Dose.*—1 to 4 grains. Elaterin 1, lactose 39.

COLOPHONIUM

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.

Syn. RESIN, ROSIN.

The residue after distilling the volatile oil (oil of turpentine) from the oleoresin of species of *Pinus*. *Soluble* in alcohol 90%, ether, benzene, carbon disulphide, and light petroleum.

Ceratum Resinæ (*U.S.P. XI*).

Resin 3·5, beeswax 1·5, lard 50.

Heusner's Glue. Resin (commercial) 50, Venice turpentine 5, methylated spirit 50, benzene 25. For applying extension in fractures.

The following have also been suggested:—

(1) Dammar 250, castor oil or linseed oil 30, benzene 700, sodium bicarbonate 50, amyl acetate a few drops.

(2) Colophony 300, Venice turpentine 20, castor or linseed oil 10, benzene 700, sodium bicarbonate 60, amyl acetate a few drops. *See also Brit. med. J.*, i/1925, 441, and Mencièr's solutions.

Spiritus Adhesivus Resinosus (*P. Svec. X*). Terebinthina (*i.e.*, common frankincense from *Pinus* var. *esp. P. pinaster*) 7·5, colophony 18·5, alcohol (90%) 4.

Unguentum Colophonii (*B.P.C.*). *Syn. UNGUENTUM RESINÆ, YELLOW BASILICON OINTMENT.*

Colophony 26%, with yellow beeswax, lard and olive oil.

Copal (*B.P.C.*). *Syn. GUM ANIMI.*

A fossil resin from *Trachylobium Hornemannianum* (*Leguminosæ*), occurring in pale yellow to reddish masses, entirely *soluble* in alcohol, partially soluble in benzene, glacial acetic acid, ether, chloroform and oil of turpentine. It is used in the manufacture of varnishes.

This is Zanzibar copal. Indian copal is from *Vateria indica* (*Dipterocarpaceæ*), and Brazilian is from *Hymenaea* species and other plants. Australian copal is Gum Kauri, *q.v.*

Æther Copalis (*R.D.H.*) (*Copal Solution*). Copal 1, ether 1, dissolve. For covering cement fillings to protect from the saliva.

Dammar as used in this country for varnish making and for microscopic work is the East Indian Dammar from various species of *Shorea*, *Hopea* and *Balanocarpus* (*Dipterocarpaceæ*). It occurs in small yellow nodules, about 3 to 6 mm. in diameter. It is partially soluble in alcohol and soluble in chloroform.

Elemi (*Fr. Cx.*). An oleo-resin obtained from *Canarium commune* in soft yellowish, granular masses. *Fr. Cx.* also includes a purified variety.

Guaiaci Resina (*B.P.C., P. Helv. V*).

Dose.—5 to 15 grains (0·3 to 1 g.).

The resin obtained from the heartwood of *Guaiacum officinale* and of *G. sanctum* (*Zygophyllaceæ*), in rounded tears often covered with a green powder.

Soluble almost completely in ether, chloroform, dehydrated alcohol, and in sal volatile and alkalis.

Uses. Diaphoretic, diuretic and slightly laxative. It is of value in subacute and chronic rheumatism and in inflammatory conditions of the pharynx and tonsils associated with these affections; also as a gargle in quinsy and follicular tonsillitis. Combined with purgatives it is useful in gout and sluggish liver.

For dysmenorrhœa, 10 gr. of the resin 3 times a day. If this causes flatulence or colic add to each dose 1 gr. of Dover's powder. The patient should begin taking it a week before the period.

Confectio Guaiaci Composita (B.P.C.). *Syn.* CHELSEA PEN-SIONER. *Dose.*—1 to 2 drachms (4 to 8 g.).

Guaiacum resin 1%, rhubarb 2%, sulphur 14.5%, with potassium acid tartrate, nutmeg and honey.

Jephson's Powder. Precipitated sulphur 2, guaiacum resin 1. For tonsillitis, acne and constipation.

Mistura Guaiaci (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). Contains about 11 gr. of guaiacum resin per oz.

Tabellæ Guaiaci et Sulphuris (B.P.C.) contains 3 gr. each of sulphur and guaiacum resin.

Tinctura Guaiaci (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 5.

Tinctura Guaiaci Ammoniata (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

1 in 5, in an ammonia-alcohol solvent with oils of lemon and nutmeg.

This is very useful where the uvula and fauces are enlarged. When dispensed in mixtures the resin must be suspended with 1 in 8 of mucilage of tragacanth.

Trochisci Guaiaci Resinæ (B.P.C.). Contain 3 grains of guaiacum resin with fruit basis.

Kauri Gum. A resin obtained from *Dammara Australis* in Australia and New Zealand. Dental Compo contains kauri gum. This is used for taking impressions when making dentures.

Lacca (B.P.C.). SHELLAC. A resinous substance formed by a scale insect, *Tachardia lacca* (fam. Coccidæ, ord. Hemiptera), which lives on a variety of trees, e.g., *Butea frondosa*, *Ficus religiosa*, *Schleichera trijuga*, *Shorea robusta* (Wild Lac). The plants specially cultivated for lac are *Acacia arabica* and *Cajanus indicus*. An ammoniacal solution has been used for the enteric coating of pills, capsules, etc.

Mastiche (B.P.C., P. Helv. V, P. Dan., P. Belg.). *Syn.* MASTIC. *Dose.*— $\frac{1}{2}$ to $\frac{3}{4}$ drachm (1 to 3 g.).

A resinous exudation obtained by puncturing the bark of *Pistacia Lentiscus* (Anacardiaceæ). In small, hard yellowish tears becoming plastic when chewed.

Insoluble in water, partly soluble in alcohol 90%, also soluble 2 in 1 of ether and 2 in 1 of chloroform, readily in acetone.

Alcohol Mastichi (R.D.H.). Mastic 2, alcohol 90% 1; dissolve. Harvard Liquid is similar; this is employed for covering a cotton-wool dressing so as to form a temporary dental covering, e.g., during the treatment of carials.

Benzo Mastiche (Martindale, London). A solution of mastic in benzene (with other ingredients) for wounds and general surgical use.

The temporary first-aid bandage, if any, is removed and the wound, even if blood-smear, is painted straight away with a sufficient covering of the preparation, and then a dressing applied. Slight injuries may have a layer of sterile gauze first to draw off the wound secretion. Useful in burns and corrosions of the 2nd and 3rd degree, the whole area being painted over and covered with cotton wool.

Microscopic Varnish. Mastic $\frac{1}{2}$ oz., caoutchouc 15 gr., chloroform 2 oz.; macerate and filter.

[P2] **Tinctura Ammoniacæ Composita (B.P.C.).** *Syn.* EAU DE LUCE.

Contains 1½% of mastic with oil of lavender, alcohol 90% and strong solution of ammonia.

Sandaraca (B.P.C., Fr. Cx., P. Jap. V). *Syn.* SANDARAC, GUM JUNIPER. A resin obtained by incision from the stem of *Tetraclinis articulata* (Cupressaceæ). Brittle, pale yellow tears which do not agglomerate when chewed. Used in pill varnishes.

Sanguis Draconis (B.P.C.). *Syn.* DRAGON'S BLOOD. A resinous secretion on the fruits of *Demonorops propinquus* and other species (Palmæ). In dull red pieces or lumps weighing up to several pounds. Used for colouring varnishes and in zinc line engraving to protect those parts not to be etched.

Oleum Succini (B.P.C.). *Syn.* OIL OF AMBER, OLEUM SUCCINI RECTIFICATUM.

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

A yellowish liquid with penetrating odour obtained by the destructive distillation of resins, or by distilling resin oil. Has been given on sugar for asthma and whooping-cough. Used in liniments for its rubefacient properties.

Linimentum Succini Compositum (B.P.C.). Oil of amber and oil of clove 25% *v/v* of each in olive oil.

CONIUM

[P1] "*Alkaloids, the following; their salts, simple or complex:—Coniine.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Coniine except substances containing less than 0.1% of coniine.*"

[P1-S1] **Conium Folium (B.P.C.).** *Syn.* HEMLOCK LEAF.

Dose.—2 to 8 grains (0.12 to 0.5 g.).

The fresh leafy tops of *Conium maculatum* (Umbelliferae). The leaves contain about 0.2% of total alkaloids chiefly coniine.

Incompatibility. Conium preparations are incompatible with alkalis and preparations containing tannin.

Antidotes. Empty stomach by emetic or by stomach tube, using dilute tannic acid solution. Leave some tannic acid in the stomach as an antidote, or give medicinal charcoal, stirred up in water. Keep patient lying down and warm. Artificial respiration and oxygen with 7% carbon dioxide inhalations may be necessary. Stimulants, *e.g.*, brandy $\frac{1}{2}$ oz., or aromatic spirit of ammonia, $\frac{1}{2}$ dr., in water. Strychnine, $\frac{1}{4}$ gr., or caffeine sodium benzoate, 2 gr., hypodermically.

Uses. Conium and coniine act as direct sedatives to the respiratory centre; in poisonous doses death is caused by asphyxia. Employed in spasmodic affections, especially for whooping-cough and asthma; in neuralgia, epilepsy, and as a sedative in acute mania. Externally it is employed as a soothing application in hæmorrhoids, pruritus ani and anal fissure.

[P1-S1] **Extractum Conii (B.P.C.).** *Dose.*—2 to 6 grains (0.12 to 0.4 g.).

A soft extract prepared from the expressed juice.

[P1-S1] **Succus Conii (B.P.C.).** *Dose.*— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.).

The expressed juice preserved with alcohol.

[P1] **Unguentum Conii (B.P.C.).** *Syn.* HEMLOCK OINTMENT.

Extract of coniium 7% in glycerin and simple ointment. Gives relief in pruritus ani and painful fissures.

[P1-S1] **Conii Fructus (B.P.C.).** *Syn.* CIGUË OFFICINALE (*Fr. Cx.*).

Dose.—*Fr. Cx.* gives maximum single dose 0.25 g.; maximum in 24 hours 0.75 g.

Consists of the dried, unripe fruits of *C. maculatum* and contains up to about 2.5% of total alkaloids, mainly coniine. Used chiefly as a source of the alkaloid, but tinctures and extracts have been prepared from it and used in the same way as preparations of the leaf.

[P1-81] *Tinctura Conii*. *Dose*.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.).

Conium fruit, No. 40 powder, 1 in 5 of alcohol 60%, prepared by percolation, and standardised to 0.1% of coniine.

[P1-81] *Extractum Conii Liquidum*. *Dose*.—5 to 15 minims (0.3 to 1 ml.).

Conium fruit 100, in No. 40 powder, is exhausted with alcohol 60% containing 1.25% of acetic acid (33%), the last portion of percolate concentrated and mixed with the first 85 previously set aside, so as to produce a liquid extract containing alkaloids equivalent to 1% of alkaloidal hydrochlorides.

[P1-81] *Extractum Conii Fructus*. *Syn.* EXTRAIT DE CIGUË (*Fr. Cx.*).

Dose.—Maximum single $\frac{1}{2}$ grain (0.05 g.).

A firm extract produced by extracting the powdered fruits with 70% alcohol at 35°, evaporating the liquor and treating the residual extract with water, evaporating the aqueous extractive, rejecting the portion not dissolved.

[P1-81] *Coniina*. *Syn.* CONINE, CICUTINE, *d*- α -PROPYLPYPERIDINE.

$C_8H_{10}N(C_2H_5) = 127.1$.

Dose.— $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.001 to 0.01 g.).

An almost colourless liquid with mouse-like odour and acrid taste. B.p. about 166°. *Soluble* 1 in 100 of water, and in organic solvents.

Both this and the hydrobromide are very poisonous, and their internal use has been practically discarded.

[P1-81] *Coniinae Hydrobromidum* (*B.P.C.*, *Fr. Cx.*).

Syn. CICUTINÆ BROMHYDRAS (*F.E. VIII*). $C_8H_{11}N, HBr = 208.1$.

Dose.— $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.004 to 0.016 g.).

F.E. specifies single dose $\frac{1}{16}$ grain (0.001 g.); during 24 hours, $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.005 to 0.02 g.). *Fr. Cx.* has max. single dose $\frac{1}{8}$ gr., max. in 24 hours $1\frac{1}{2}$ gr. approx.

Colourless crystalline prisms *soluble* 1 in 2 of water and 1 in 3 of alcohol 90%.

Scoparium (*B.P.C.*). *Syn.* BROOM TOPS, GENÊT A BALAIS (*Fr. Cx.*), SCOPARIÏ CACUMINA.

The fresh or dried tops of *Cytisus scoparius* (*Leguminosæ*). Contains the alkaloids sparteine, genisteine and sarothamnine. Is mildly diuretic in cardiac dropsy.

Decoctum Scoparii (*B.P.C.*). *Dose*.—2 to 4 ounces (60 to 120 ml.). 1 in 20. *Decoctum Scoparii Concentratum* (*B.P.C.*). *Dose*.—2 to 4 drachms (8 to 16 ml.). 1 in 2½. Is eight times the strength of the fresh decoction.

Infusum Scoparii Concentratum (*B.P.C.*). *Dose*.—1 to 2 drachms (4 to 8 ml.). 1 in 1½. Is eight times the strength of the fresh infusion.

Infusum Scoparii Recens (*B.P.C.*). *Dose*.—1 to 2 ounces (30 to 60 ml.). 1 in 10.

Succus Scoparii (*B.P.C.*). *Dose*.—1 to 2 drachms (4 to 8 ml.). The juice expressed from the fresh plant, preserved with alcohol.

Scoparin, $C_{15}H_{23}O_{11}$, a phenolic body in broom tops. Has definite diuretic action in doses of 5 to 8 grains.

Sparteina. $C_{15}H_{25}N_2$. A volatile liquid alkaloid obtained from broom. Is colourless when fresh, darkening on keeping.

Sparingly soluble in water, soluble in alcohol 90%, chloroform and ether.

The pharmacological action of sparteine and related alkaloids.—R. St. A. Heathcote, *J. Pharmacol.*, June, 1926, 431.

Sparteinae Sulphas (*B.P.C.*, *Fr. Cx.*, *P. Helv. V*).

$C_{15}H_{25}N_2 \cdot H_2SO_4 \cdot 5H_2O = 422.4$. *Dose*.—1 to 2 grains (0.06 to 0.12 g.). *Fr. Cx.* has max. single dose $1\frac{1}{2}$ grain, max. during 24 hours 5 grains.

In colourless crystals. *Soluble* 2 in 1 of water, and about 1 in 5 of alcohol 90%.

Uses. Much less poisonous than coniine but similar in action. Resembles digitalis in its action on the heart and is of value in myocardial degeneration. The effect is cumulative owing to slow excretion. With potassium iodide is given in hypertension. It has a marked diuretic action, probably acting through the heart, and is effective in dropsy and post-operative retention of urine. Has been used as a sedative in the withdrawal treatment of opium and morphine addiction.

Viscum (*B.P.C.*). *Syn.* MISTLETOE, GUI (*Fr. Cx.*).

Dose.—10 to 60 grains (0.6 to 4 g.).

The whole plant, *V. album*, growing as a semi-parasite on various trees, especially the apple, poplar and plum. Has vasodilator action and is used in high blood pressure; has also been used in hysteria and chorea. Administered as a soft extract in pills or as infusion, tincture or liquid extract.

Hyperpiesia has been treated by extract of viscum injections intramuscularly (0.05 g. night and morning) and *per os* in pills (0.15 g. night and morning).

In albuminuria said to be of value. Solid extract used, 0.1 to 0.3 g. *per diem*; acting best when blood pressure and tension are high.

Detensyl (*Medico-Biological Laboratories, London*). Mistletoe, liver, pancreas and lung. Tablets for use in hypertension and disorders of the menopause.

Guipsine (*Leprince, Paris; Bengué, London*). Pills stated to contain 0.05 g. of active principles of fresh mistletoe. It lowers arterial tension due to a central vasomotor action, and is without any depressing action on the heart itself. For use in arteriosclerosis. *Dose*.—6 to 12 daily.

Hypotensyl (*Anglo-French Drug Co., London*). Viscum album extract 0.075 g., hepatic extract 0.10 g., pancreatic extract 0.05 g.

Dose.—3 to 6 tablets daily for continuous periods of 15 to 20 days with a week's interval between courses. Hyperpiesia.

COPAIBA

B.P., *U.S.P. XI*, *P. Helv. V*, *P. Dan.*, etc.

Syn. BALSAMUM COPAIVÆ, BALSAM OF COPAIBA, COPAHU (*Fr. Cx.*).

Dose.—10 to 30 minims (0.6 to 2 ml.).

The oleoresin obtained from the trunk of *Copaifera Lansdorfii* and other species (*Leguminosæ*), imported from the coast of South America.

Soluble almost completely 1 in 1 of alcohol 90%; miscible with dehydrated alcohol, ether, carbon disulphide, fixed and volatile oils. Soluble in an equal volume of light petroleum (b. p. 50° to 60°) but precipitated on adding more solvent. That known as Para copaiba is transparent, yellowish and contains 60 to 90% of oil. It is thinner than the Maracaibo variety, which is brownish and somewhat fluorescent and contains about 45% of oil. Sp. gr. about 0.960 to 0.995.

Uses. Diuretic and stimulant to mucous membranes, chiefly used for urethral diseases, and occasionally for chronic bronchitis. May produce a red rash. Given emulsified with mucilage or saponified, but best in capsule owing to its disagreeable taste.

Oleum Copaibæ (B.P.C.).

Dose.—5 to 20 minims (0.3 to 1.2 ml.).

Distilled from the oleoresin. Sp. gr. 0.896 to 0.910.

Soluble in its own volume of dehydrated alcohol and about 1 in 20 of alcohol 90%.

Is used for the same purposes as copaiba.

Liquor Copaibæ (B.P.C.). *Syn.* SOLUBLE COPAIBA.

Dose.—1 to 2 drachms (4 to 8 ml.), well diluted.

Copaiba 50% dissolved in a potassium hydroxide solution.

Liquor Copaibæ, Buchu et Cubebæ (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.), well diluted.

Solution of copaiba 80% v/v with liquid extracts of buchu and cubeb.

Liquor Copaibæ, Buchu et Cubebæ cum Oleo Santali (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Resembles the preceding solution but contains also 10% v/v of oil of sandal wood and 5% v/v of oil of cassia.

Liquor Copaibæ et Olei Santali (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains 80% v/v of solution of copaiba with oils of sandal wood and cassia.

Cubeba (B.P.C., Fr. Cx., P. Jap. V). *Syn.* TAILED PEPPER.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 g.) in cachets.

The dried unripe full-grown fruit of *Piper Cubeba* (Piperaceæ) imported from Java. Contains 10 to 18% of volatile oil. It is sometimes added to Ferrier's snuff, *q.v.*

A stimulant expectorant used in subacute and chronic bronchitis and the late stages of coryza. It also stimulates the mucous membranes of the genito-urinary tract, and has been used in gonorrhœa, prostatitis, leucorrhœa, etc.

Extractum Cubebæ Liquidum (B.P.C.). **Dose.**— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 1.

Oleoresina Cubebæ (B.P.C.). **Dose.**—5 to 30 minims (0.3 to 2 ml.).

The ether-soluble extractive.

Tinctura Cubebæ (B.P.C.). **Dose.**— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

1 in 5 of alcohol (90%). In chronic bronchitis as an expectorant.

Trochisci Cubebæ (T.H.) contain $\frac{1}{2}$ gr. each with fruit paste. **Dose.**—1 every 3 or 4 hours.

Oleum Cubebæ (B.P.C., P. Helv. V). **Dose.**—5 to 20 minims (0.3 to 1.2 ml.).

Colourless, pale green or greenish yellow oil, with camphoraceous odour and characteristic taste. Soluble about 1 in 18 of alcohol 90%. Capsules contain 10 minims. For combinations *v.* Oleum Santali. Used in bladder and urethral affections, also as an inhalation in bronchitis.

Vapor Cubebæ cum Limone (T.H.).

Oil of cubeb 40 m., oil of lemon 10 m., light magnesium carbonate 20 gr., water to 1 oz. A stimulant inhalation.

Oleum Santali (B.P., U.S.P. XI, P. Helv. V, Fr. Cx., P. Jap. V).

Dose.—5 to 15 minims (0.3 to 1 ml.).

Santal or sandal wood oil is distilled by steam under pressure from the wood of *Santalum album* (Santalacæ), the yield being from 1 to 6%. A yellowish oil, with an aromatic odour and pungent taste.

Soluble 1 in less than 1 of alcohol 90%, also in ether and chloroform.

Uses. Internally in chronic bronchitis, e.g., a few drops taken on a lump of sugar is found to relieve cough without expectoration. Is much employed in the treatment of gonorrhœa and gleet, and is said to be of value in urinary infections due to staphylococcus. It quickly checks the discharge in dose of 15 minims 3 times a day, and with the use of permanganate, zinc and silver nitrate injections gives good results; also in 10 minim capsules, with benzoic and boric acids as adjuvants, for chronic cystitis.

Mistura Olei Santali. Dose.—1 ounce (30 ml.).

Oil of sandal wood 4, tragacanth, in powder, 1. Mix and add quickly water to 128. Shake well. Aromatic water with syrup may be used.

Mistura Santali Composita. Syn. NISBET'S SPECIFIC.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.) in water or milk thrice daily.

Oil of sandal wood 12 $\frac{1}{2}$ dr., cassia oil 1 $\frac{1}{2}$ dr., pimento oil 40 m., alcohol (90%) 3 $\frac{1}{2}$ oz.

Capsules of Nisbet's Specific are prepared containing the oils of $\frac{1}{2}$ drachm dose of the above in 20-minim capsules.

Liquor Santali cum Buchu et Cubeba.

Dose.—1 to 2 drachms (4 to 8 ml.) well diluted.

Yellow sandal wood in powder 4, buchu in powder 1, cubeb in powder 1, alcohol 60% g.s. to moisten. Macerate 2 days, percolate with more alcohol and press to obtain 20.

Liquor Santali Compositus (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.) diluted.

Oil of sandal wood 5% with tincture of cubeb, tincture of buchu, and oil of cinnamon in alcohol 90%.

Oleum Santali Australiensis (B.P., Fr. Cx.).

Dose.—5 to 15 minims (0.3 to 1 ml.). Australian sandal wood oil is derived from *Eucarya spicata* and is largely used in Australia and other countries. It contains alcohols equivalent to not less than 90% w/w calculated as $C_{15}H_{24}O$. This oil might replace the more expensive oil from *S. album*.

Arheol (Astier, Paris; Wilcox, JozEAU, London). The purified active principle of sandalwood oil (containing not less than 98% of santalol). Supplied in capsules containing 0.18 g. and 0.5 g. (10 m.). **Dose.**—1 to 2 g. daily. In urinary infections and wherever sandalwood oil is indicated.

Eumictine (Bengué, London). Santalol, salol and hexamine. **Dose.**—8 to 12 capsules daily with meals. Gonorrhœa, cystitis, etc.

Gonosan (Riedel-de Haen, Berlin; Endocrines-Spicer, Watford).

Sandalwood oil 80%, kava-kava resin 20%. Capsules contain 0.3 g.

Dose.—2 capsules 3 to 5 times a day. Gonorrhœa.

Santal Midy (Laboratoire de Pharmacologie Générale, Paris; Wilcox, JozEAU, ndon). Capsules (0.25 g.) of Mysore citrin sandalwood oil containing 92 to

95% santalol. *Dose*.—2 to 4 capsules 3 times a day before meals. Urinary tract affections.

Savaresse's Membraneous Capsules (*Evans, Sons, Lescher & Webb, Liverpool*), are prepared with an animal membrane which generally remains entire until they have passed the stomach. They are available containing either copaiba 15 m., or ol. santal. flav. 10 m.

Sabal (B.P.C.). *Syn.* SAW PALMETTO.

Dose.—15 grains (1 g.).

The partly dried fruits of *Serenoa serrulata* (Palmæ). Reputed to have stimulant action on genito-urinary mucous membrane and used in gonorrhœa and cystitis.

Extractum Sabal Liquidum (B.P.C.). *Syn.* LIQUID EXTRACT OF SAW PALMETTO. *Dose*.—10 to 25 minims (0·6 to 1·5 ml.). 1 in 1.

Kava (B.P.C.). *Syn.* KAVA-KAVA, AWA ROOT.

The rhizome of *Piper methysticum* (Piperacæ) from the Polynesian Islands. Used as diuretic and genito-urinary antiseptic. In gonorrhœa it is not equal to copaiba or santal oil.

Extractum Kava Liquidum (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 1.

CREOSOTUM

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P.G. VI, P. Ital. V, P. Belg. IV, P. Helv. V, P. Dan.

Syn. KREOSOTUM, CREASOTE.

[P1] "*Creosote obtained from wood.*"

[83] "*Creosote obtained from wood—in substances containing less than 50% of creosote obtained from wood.*"

Dose.—2 to 10 minims (0·12 to 0·6 ml.), increased to 30 or even 60 minims, in capsules, or in cod-liver, almond, or olive oil, or emulsified in oil with acacia. If ordered in aqueous mixtures in excess of solubility it may be suspended with mucilage of tragacanth or with tincture of quillaia.

Is a mixture of phenols—chiefly guaiacol and creosol. The variety most used is from beechwood. It contains a large percentage of guaiacol, $C_6H_4 \cdot OCH_3 \cdot OH = 124 \cdot 1$. It mixes clear with glycerin. It is more soluble in water than the variety from pine-wood, which is anhydrous and mixes perfectly with oil of turpentine, consisting chiefly of creosol, $C_6H_5 \cdot CH_3 \cdot OCH_3 \cdot OH : 1, 3, 4 = 138 \cdot 1$, homopyrocatechin-methyl-ether. **Commercial creosote** used for timber preservation consists of naphthalene oils—a mixture of the heavy oil from coal tar distilling at 230° to 270° , with the residues from the middle oil (170° to 230°), after freeing from phenols.

Soluble about 1 in 150 of water; miscible with alcohol 90%, ether, and with fixed and volatile oils.

Incompatible with silver oxide (q.v.). Also with calcined magnesia and slaked lime.

Antidotes. Treat as for poisoning by phenol, *see* p. 807.

Uses. It is a powerful deodoriser, antiputrescent and antiseptic. Taken by the mouth it promotes expectoration and acts as a gastro-intestinal antiseptic. It is used internally to correct fetor, to check sickness, and to allay the cough and improve the general condition in phthisis; capsules of 5 or 10 m. taken after meals are stated to lessen the gastric irritation in bronchiectasis. Externally, it may be employed to fill the cavities of carious teeth and to allay toothache; it is also used in the form of an ointment in various parasitic skin diseases. Inhalations are of value in bronchiectasis, phthisis, bronchitis and whooping-cough.

ACNE. Good results when given in doses of not less than 6 minims 3 times a day, but urine should be watched for toxic effects.—A. Whitfield, *Brit. J. Dermat.*, 1934, 257.

PNEUMONIA. After a wash-out enema, inject slowly well up the rectum 40 drops of creosote shaken in 2 oz. of warm milk; retain for 2 hours. Repeat if not retained for more than $\frac{1}{2}$ hour; in adults add 10 drops of tincture of opium. Repeat enema twice in 24 hours. For children under 1 year give 2 to 10 drops, and older children 5 to 10 drops, with extra drop for each year. Almost specific in pneumococcal conditions; prophylactic in post-operative pulmonary complications and clears up catarrhal states prior to operation.—Ian Macdonald, *Brit. med. J.*, ii/1931, 1111. Value queried.—H. Sutherland, *ibid.*, 1198.

Mist. Creosot. (N.I.F.).

Creosote 1 m., spirit of juniper 1 m., syrup 30 m., water to $\frac{1}{2}$ oz.

Mist. Creosot. c. Pot. Iod. (N.I.F.).

Creosote 2 m., potassium iodide 5 gr., tincture of quillaia 2½ m., liquid extract of liquorice 30 m., water to $\frac{1}{2}$ oz.

Mist. Creosot. Sed. (N.I.F.).

Creosote 1 m., tincture of chloroform and morphine 5 m., liquid extract of liquorice 20 m., water to $\frac{1}{2}$ oz.

Nebula Creosoti Composita. Creosote 5 minims, cassia oil 5 minims, almond oil to 1 ounce.

Pilula Creosoti. Dose.—2 to 6 grains (0.12 to 0.4 g.).

Creosote 1, curd soap, in powder, 1, digested on a water-bath in a wide-mouthed stoppered bottle. As prophylactic against dysentery.

To make a pill containing creosote 2 m. and phenol 1 gr. use white wax 2½ gr. and powdered liquorice 1 gr. Incorporate the phenol, creosote and wax with the powder gently and quickly.

Perles of creosote, 1 or 3 minims in each, with oil, also capsules, 3 and 5 minims, or more, with oil are made.

Spiritus Creosoti.

Dose.—1 drachm. Creosote 1, alcohol 90% 40. Lessens cough and expectoration in chronic bronchitis and phthisis.

Syrupus Creosoti Compositus (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains 1 minim of creosote per drachm with spirit of chloroform, glycerin, syrup, and syrup of pine.

Unguentum Creosoti (B.P.C.) contains 10% of creosote in a beeswax, lard and paraffin basis.

Used in psoriasis and parasitic skin diseases. **Caution.**—Should not be applied to the abdomen, face, or flexor surfaces of the limbs.

Vapor. Creosot. (N.I.F.).

Creosote 1 dr., eucalyptus oil 1 dr., liquid paraffin to 1 oz. For use add 1 dr. to a pint of boiling water and inhale the vapour.

Vapor. Creosot. Ether. (N.I.F.).

Creosote 2 dr., liquefied phenol 2 dr., spirit of chloroform 2 dr., weak solution of iodine 1 dr., spirit of ether 1 dr.

Vapor Creosoti (T.H.).

Creosote 30 m., French chalk 30 gr., water to 1 oz. *C.L.T.H.* has creosote 40 m., light magnesium carbonate 40 gr., water to 1 oz.

A teaspoonful (*C.L.T.H.* a tablespoonful) in a pint of water at 140°F. Useful in chronic congestion of the larynx and trachea, and in ozæna, fetor of breath and syphilitic throats. For phthisis, it is more sedative in its action if mixed with an equal volume of spirit of chloroform, 5 to 20 m. being employed at one time.

Vinum Creosoti (Fr. Cx.).

Dissolve creosote 1, in alcohol 90% 9, and add simple syrup 10, and liqueur wine 80 parts, all by weight.

Calcii Creosotas (U.S.P. XI).

Dose.—4 to 16 gr. (0.25 to 1 g.). *U.S.P. XI* average dose 8 gr., given every 2 to 4 hours, beginning with small doses and increasing gradually.

A mixture of the calcium compounds of the constituents of creosote, containing when dried 40 to 50% of CaO. A dark brown powder with sharp phenolic taste. Partially *soluble* in water, insoluble portion consisting of calcium hydroxide and carbonate.

Used for administration of large quantities of creosote, but the increased tolerance is probably due to slower absorption and excretion. Does not cause nausea and vomiting.

Calcreose (*Maltbie Chemical Co., Newark, N.J.*). Preparations of calcium creosotate available as tablets (4 gr.), compound syrup, and solution.

Creosoti Carbonas (B.P.C., U.S.P. XI, P. Ned. V, F.E. VIII, P. Belg. IV, P. Helv. V, Fr. Cx.).

Dose.—5 to 20 minims (0.3 to 1.2 ml.) or considerably increased. *U.S.P. XI* average dose 15 grains. May be given in capsules or in milk.

A colourless or amber-coloured nearly odourless syrupy liquid, sp. gr. 1.15 to 1.18. *Soluble* in alcohol, chloroform, ether, benzene and fixed and volatile oils; insoluble in water or glycerin.

It contains the carbonates of guaiacol and creosol and decomposes in the alkaline intestinal juices. Has been used in tuberculosis, bronchitis and pneumonia.

Proposote Capsules (*Parke, Davis, London*). Contain 5 m. of creosote phenylpropionate. *Dose.*—1 capsule after each meal. Tuberculosis, bronchitis; also in intestinal disorders of bacterial origin.

Guaiacol (B.P., U.S.P. XI).

Dose.—5 to 10 minims (0.3 to 0.6 ml.). *U.S.P. XI* average dose 8 minims.

Occurs in two forms, liquid and solid, both of which are recognised by *B.P.* and *U.S.P. XI*. The crystals are official in *Fr. Cx.*, *P. Belg. IV*, *P. Ned. V*, *P. Ital. V* and *F.E. VIII*. The liquid is obtained by distillation of wood-tar creosote and consists mainly of *o*-dihydroxybenzene monomethyl ether, $C_6H_4(OCH_3)OH = 124.1$. The crystals of the pure ether are obtained synthetically by heating catechol, potassium hydroxide and potassium methylsulphate. M.p. about 28°. No dose is given in *B.P.* for the solid. Both forms resemble creosote in taste and odour.

Soluble 1 in 80 of water; miscible with alcohol 90%, ether, glycerin, and fixed and volatile oils.

Uses. Guaiacol is an antiseptic, deodorant and antipyretic.

Internally it is better tolerated than creosote, but has less antiseptic potency. In phthisis, particularly in incipient stages, it may be prescribed in capsules (guaiaicol carbonate), or as cordial, *e.g.*, guaiaicol 13.5, compound tincture of gentian 30, alcohol (90%) 250, and sherry to 1000; two teaspoonfuls two or three times a day in water—or as *Mistura Guaiacolis*, *vide postea*. It is also of value in bronchiectasis in capsules containing 5 to 10 m. three times daily after meals. It is sometimes rubbed into or painted on the skin, covered by oiled silk, over rheumatic joints, in orchitis, mumps, pleurisy and neuralgia; begin with 10 minims and increase to 30 or more; do not cover more than the space of the palm of the hand at a time. As a paint for infected tonsils guaiaicol 3 dr. in olive oil to 1 oz. is of value.

Injections of guaiaicol 5%, and iodoform 1%, in sterilised olive oil, in doses of 1 ml., increasing to 3 ml., have been used in tuberculosis; they are not free from danger and the drug is better given *per os*.

LUNG ABSCESS. Guaiaicol intravenously causes early subsidence of the symptoms and a regression of the pathologic condition in the lung without producing any unfavourable reactions. In a series of 20 cases so treated it was found that the patients felt considerably better in a very short time owing to the subsidence of the fever and cough, and to the decrease of the daily sputum output and loss of its foul odour. Eradication of all foci of infection about the mouth, nose and throat, and moderate restriction of all activities until the roentgenogram shows complete healing is very essential if the results of the treatment are to be permanent. The solution employed is prepared as follows: from 5 to 10 gr. of guaiaicol is dissolved in 2 ml. of ethyl alcohol and 18 ml. of water containing $2\frac{1}{2}$ gr. of sodium iodide. Kept in a dark container this solution is stable for some months. An intravenous injection of 20 ml. of this solution is given every third or fourth day. The solution is somewhat irritating to the subcutaneous tissues and should be injected only after the blood has welled into the syringe. No tobacco or alcoholic drinks are allowed, and a high caloric diet is instituted.—C. H. Nammack and A. M. Tiber, *J. Amer. med. Ass.*, ii/1937, 330.

Durant's Injection. Guaiaicol 5, iodine 1, potassium iodide 10, sterile olive oil 100. In pulmonary phthisis.

Mistura Guaiacolis *Dose.*— $\frac{1}{2}$ ounce (15 ml.) thrice daily.

Guaiaicol 1 dr., alcohol (90%) 1 oz., syrup of lemon 1 dr., spirit of chloroform 2 dr., water to 6 oz. Increase guaiaicol by 2 m. each week until a dose of 12 to 15 m. is given thrice daily, and continue for four months or more.

Mistura Guaiacolis cum Quinina.

Dose.— $\frac{1}{2}$ drachm gradually increased to 2 drachms, well diluted with water, thrice daily after meals.

Guaiaicol 30 to 40 m., quinine hydrochloride 20 to 25 gr., alcohol (90%) 2 oz., compound tincture of gentian 3 oz., water to 8 oz. The small dose of guaiaicol thus given is increased by giving guaiaicol carbonate in capsules.

Nebula Guaiacolis et Mentholis Composita (B.P.C.). Guaiaicol and menthol, 2% w/v in light liquid paraffin.

Unguentum Guaiacolis. Guaiaicol 1, lanolin ointment (or other suitable base) 5; useful in orchitis and mumps.

Vapor Guaiacol Compositus.

Guaiaicol and terebene of each 2, menthol and thymol of each 1, spirit of chloroform 3. Inhale 5 to 10 minims from an inhaler night and morning. Employed in phthisis.

[D-P1-S1] Fuller's Inhalant.

Guaiaicol 4, menthol 2.5, Sydenham's laudanum 125, compound tincture of benzoin to 250. Sometimes terebene 4 is added.

Bronchodermine (Bengué, London). Guaiaicol, terpinol, eucalyptol, helenine, pine oil. Applied to the back as a liniment in respiratory affections.

Quinacol (Allen & Hanburys, London). Quinine with guaiaicol in capsules. *Dose.*—One capsule (4 m.) increasing to 4 or 5, daily; children one capsule (2 m.) increasing to 3 or 4, daily. Phthisis, whooping-cough, bronchitis, etc.

Guaiacolis Benzoas. $C_6H_4 \cdot OCH_3 \cdot O \cdot CO \cdot C_6H_5 = 228.1$.

Dose.—4 to 12 grains (0.25 to 0.8 g.) in cachet.

In small crystals, almost tasteless, nearly insoluble in water.

Incompatible with alkalis.

Useful as an intestinal antiseptic and in incipient phthisis (especially for the diarrhoea).

Guaiacolis Camphoræ. *Syn.* GUAIACAMPHOL.

$[C_6H_4 \cdot OCH_3 \cdot O]_2(CO)_2C_8H_{14}$ or $C_{24}H_{28}O_6 = 412.2$.

Dose.—5 to 10 grains (0.3 to 0.6 g.) in cachets or 5-grain tablets.

Soluble only very slightly in alcohol, insoluble in water; for night sweats and diarrhoea of phthisis.

Guaiacol Carbonas (*B.P.C., Fr. Cx., P. Jap. V, etc.*).

$(C_6H_4 \cdot OCH_3 \cdot O)_2CO = 274.1$.

Dose.—5 to 15 grains (0.3 to 1 g.), gradually increased. As much as 6 g. has been given to phthisical patients without causing toxic symptoms.

A white crystalline substance, almost tasteless, and with slight odour.

Soluble about 1 in 70 of alcohol 90%, and 1 in 20 of ether, readily in chloroform and slightly in benzene; insoluble in water.

Uses. In phthisis, improves appetite and lessens cough, expectoration and night sweats, also in typhoid and for bronchitis.

In rheumatoid arthritis, both the subacute and chronic forms, it sometimes arrests the disease, diminishes size and increases movement of joint and relieves pain. To be given in cachets thrice daily in gradually increasing doses until each dose is 15 to 20 grains—to be continued at least twelve months. At the same time a mixture containing 10 grains of potassium iodide in each dose is given.

Mistura Arthritica (*C.X.H.*).

Potassium iodide 5 gr., sodium salicylate 5 gr., guaiacol carbonate 5 gr., mucilage of tragacanth 1 dr., chloroform water to 1 oz.

Tabelæ Guaiacolis Carbonatis (*B.P.C.*) contain 5 gr. (0.3 g.).

Guaiacolis Cinnamas. *Dose.*—5 to 15 grains (0.3 to 1 g.). White insoluble crystals, given in incipient phthisis.

"Iodised Tincture of Guaiacol" (*British Drug Houses, London*). *Dose.*—1 drachm twice daily. Used in pleurisy and synovitis of various types, neurosyphilis of the cerebrospinal system, meningitis, etc.

Tinct. Guaiacol Chlor-Iodide (*British Drug Houses, London*). *Syn.* G.C.I. An internal antiseptic for treatment of boils, whitlows, tonsillitis, erysipelas, etc.

Calcium Guaiacolsulphonate. *Syn.* GUAIACYL. *Dose.*—10 minims (0.6 ml.) of 5% solution or 1 ml. of 10% solution subcutaneously. Local anæsthetic. Has been employed intravenously, 0.33 g. in 20 ml., in tuberculosis and pulmonary affections. This dose is equivalent to $\frac{1}{2}$ grain of calcium and 3 grains of guaiacol.

Potassii Guaiacolsulphonas (*B.P.C., Fr. Cx., P. Ital. V, P. Helv. V, P. Jap. V, P.G. VI, P. Ned. V*). *Prop. Name.* THIOCOL (*Roche Products, Welwyn Garden City*), available in powder, tablets and syrup.

$C_6H_3(OCH_3)(OH)SO_3K = 242.2$. The composition given in the *B.P.C.* as $C_6H_3(OCH_3)(OH)SO_3K(1:2:3)$ is probably

incorrect; *P.G. VI* and *P. Helv. V* describe it as a mixture of (1 : 2 : 4) and (1 : 2 : 5).

Dose.—8 to 15 grains (0.5 to 1 g.) thrice daily. Tablets contain 5 grains.

In colourless crystals with slight guaiacol odour, soluble in water, 1 in 6, slightly in alcohol. Contains 52% of guaiacol.

Has been recommended as a sedative expectorant and intestinal antiseptic in phthisis, bronchitis and pneumonia, also for intestinal catarrh.

The commercial product is a mixture of two isomeric substances and consists of 3 parts of the compound with the $(\text{OCH}_3)_2(\text{OH})$ and (SO_3K) group in the positions 1 : 2 : 5 and 1 part of the 1 : 2 : 4 compound (using the notation adopted in the above formula). The 1 : 2 : 3 compound has never been prepared. —A. H. Clark and E. Kirch, *J. Amer. pharm. Ass.*, 1935, 564.

[P1] **Citro-Thiocol** (*Roche Products, Welwyn Garden City*). Each fluid ounce contains Thiocol 24 gr., codeine phosphate $\frac{1}{2}$ gr., sodium acid citrate 20 gr., chloroform $\frac{1}{2}$ m., alcohol 7 m., Ext. Glycyrrh. Glyc. 124 m. *Dose*.—One or two teaspoonfuls every two or three hours. Sedative expectorant for all kinds of cough.

Morson's Soluble Kreosote.

Dose.—Up to 15 grains (1 g.) thrice daily.

A light brown powder, consisting of the potassium salts of sulphonated fractions from beechwood creosote. It contains approx. 50% of total creosol and guaiacol oils and is soluble in water with slight flavour and agreeable after-taste. For bronchial affections.

Cresival (*Bayer Products, London*). An aromatic syrupy solution of calcium cresol sulphate. *Dose*.—1 dessertspoonful 3 to 4 times daily; children, 1 teaspoonful 3 to 4 times daily. Expectorant in bronchitis and other lung conditions.

Guyucose (*Bayer Products, London*). Liquid "Somatose" (water-soluble meat albumoses) with 7% of calcium guaiacolsulphonate. *Dose*.—3 to 4 teaspoonfuls daily. In broncho-pulmonary affections, pneumonia, tuberculosis, etc.

[P1-S1-84] **Kres-Lumin** (*Bayer Products, London*). Fluid preparation of calcium cresolsulphonate, containing Lumifal $\frac{1}{8}$ gr. to the teaspoonful. Expectorant and cough sedative.

Neo-Plasmoid (*Farnsworth Laboratories, Chicago; A. Tate, London*). An aqueous colloidal suspension of the potassium salt of *o*-guaiacolsulphonic acid, $\text{C}_6\text{H}_3(\text{OH})(\text{OCH}_3)(\text{SO}_3\text{H})(1 : 2 : 6)$, with a trace of a colloidal tannate, for the injection treatment of hernia.

Novocol-Calcium (*Richter, London*). Calcium guaiacolphosphate in 4 gr. tablets. *Dose*.—1 or 2 tablets thrice daily. In catarrh of the upper respiratory tract, pharyngitis, bronchitis and tuberculosis.

Resyl (*Ciba, Horsham*). Preparations containing glycono-guaiacol-ether. Issued in tablets ($1\frac{1}{2}$ gr.), syrup and ampoules for intramuscular injection.

Dose.—Tablets, 3 to 5 daily in water; syrup, 3 to 5 drachms daily; ampoules, 1 every second day for twenty days. Expectorant and antiseptic in acute and chronic affections of the respiratory organs.

CRESOL

B.P., U.S.P. XI., Fr. Cx.

$\text{CH}_3 \cdot \text{C}_6\text{H}_4 \cdot \text{OH} = 108.1.$

Syn. ACIDUM CRESYLICUM, CRESOLUM CRUDUM (*P. Helv. V, P. Dan., P. Jap. V*), CRESOLO GREZZO (*P. Ital. V*), CRESYL, CRESYLIC ACID.

[P1] "Phenols (any member of the series of phenols of which the first member is phenol, and of which the molecular composition

varies from member to member by one atom of carbon and two atoms of hydrogen) except in substances containing less than 60%, weight in weight, of phenols; compounds of phenol with a metal, except in substances containing less than the equivalent of 60%, weight in weight, of phenols."

[P2] "*Phenols as defined in Part I of this List (see [P1] above) in substances containing less than 60%, weight in weight, of phenols; compounds of phenol with a metal in substances containing less than the equivalent of 60%, weight in weight, of phenols."*

[83] "*Phenols—in Carvacrol; creosote obtained from coal tar; essential oils in which phenols occur naturally; medicines containing less than 1% of phenols; nasal sprays, mouth-washes, pastilles, lozenges, capsules, pessaries, ointments, or suppositories containing less than 2.5% of phenols; smelling bottles; soaps for washing; solid substances, other than pastilles, lozenges, capsules, pessaries, ointments and suppositories, containing less than 60% of phenols; tar (coal or wood), crude or refined; tertiary butyl cresol; thymol."*

[86] "*Phenols—specify proportion as the proportion of phenols (added together) contained in the preparation."*

"*Compounds of phenol with a metal—specify proportion as the proportion of phenols (added together) that the preparation would be calculated to contain on the assumption that the compounds of phenols with a metal had been wholly converted into the corresponding phenols."*

Dose.—1 to 3 minims (0.06 to 0.2 ml.). U.S.P. XI average dose 1 minim.

A yellowish brown liquid with tar-like odour. It is a mixture of ortho-, meta-, and paracresols, and forms the principal constituent in crude carbolic acids. **Ortho-cresol** (1 : 2) is a deliquescent solid, melting at about 30° and boiling at 191°. **Meta-** (1 : 3) is a colourless liquid, boiling at about 202°. **Para-** (1 : 4) melts at 36° and boils at about 201°. Sp. gr. 1.04 to 1.05.

Soluble 1 in 50 of water almost completely. Miscible with alcohol 90%, chloroform, ether, castor oil and glycerin in all proportions. Also miscible with almond and olive oil in all proportions, but to make a clear solution about 1 in 2½ is necessary.

Antidotes. Treat as for poisoning by phenol, see p. 807.

Uses. The mixed cresols are less potent in action than phenol (considered one-eighth as poisonous) and are used in many respects on analogous lines to the latter. Their odour is a disadvantage. Cresol is valuable for vaporising into the air in the treatment of whooping cough. It is largely employed in the manufacture of lysol (Liquor Cresolis Saponatus B.P.) and other disinfectants as described later. A small proportion (0.5%), preferably freshly distilled, is much used as an antiseptic to add to vaccines and various solutions for injection.

[P2] **Liquor Cresolis Saponatus (B.P.).** *Syn. and Prop. Names.* **LYSOL** (this synonym may be used only in Gt. Britain and Northern

Ireland, the name being a trade-mark in other parts of the world), ACROSYL (*Monsanto Chemicals, London*), JEYSOL (*Jeyes, London*), MARSHALL'S LYSOL (*Lysol, London*), etc.

Consists of 50% *v/v* of solution of cresol in a saponaceous solvent, any formula yielding a product complying with the *B.P.* characters and tests being officially recognised.

Many formulæ have been published—some employing linseed oil, as in the original lysol. Others proceed without heating, making the potash soap first by shaking, adding a proportion of alcohol and finally the cresol little by little. When vegetable oils are used the addition of 4% of alcohol hastens saponification. Others suggest an equivalent smaller proportion of soda instead of potash. The *B.P.* gives a method of preparation from saponified linseed oil, which is satisfactory if the acid value of the oil is not less than 3. The *P.G. VI* method, which can be completed at room temperature, is also satisfactory, *vide infra*. In order to obtain a lysol miscible with water in all proportions, the cresol used should be free from xylenols, although the product then has a lower Rideal-Walker coefficient. The germicidal value of lysol also varies according to the particular soap used in its preparation. Soaps made from linseed oil or castor oil give the highest values, whilst those made with oleic acid give the lowest.

[P2] **Liquor Cresolis Saponatus** (*U.S.P. XI*).

A more uniform preparation than *B.P.* lysol; it contains 50% *v/v* of cresol and is made with prescribed quantities of linseed oil and potassium and sodium hydroxides.

[P2] **Liquor Cresolis Saponatus** (*P.G. VI, P. Jap. V*), is made as follows:—

Add a solution of caustic potash 27 in water 41, with shaking, to linseed oil 120, and then alcohol 12. Shake frequently at room temperature until saponified. Finally, add cresol 200 and shake. (All parts by weight). It may be necessary to allow to stand a day or so.

These solutions are incompatible with acids.

The Lysol Patent specification, 1017/1890 (expired) gives the following methods of preparation:—

(i) Tar oil 100 g., linseed oil 100 g., caustic potash solution (1 in 2) 75 g., alcohol 65 g. Boil with reflux condenser until saponified.

(ii) Tar oil 40 g., common resin 10 g., caustic potash solution 70 g., alcohol 70 g.

Points of value in cresols for making lysol.—N. Glass and A. J. Jones, *Pharm. J.*, ii/1931, 76.

There are several oils (corn, soya bean, coconut) just as desirable as linseed oil for compound solution of cresol. Coconut oil makes a satisfactory product which shows a phenol coefficient from 50 to 100% higher than the coefficients shown by products made from other oils.—P. L. Burrin, A. G. Worton and F. E. Bibbins, *J. Amer. pharm. Ass.*, 1935, 24, 1079.

The preparation of lysol is greatly facilitated by the addition of 4% S.V.M. to the *B.P.* formula.—J. Jackson, *Pharm. J.*, ii/1938, 369.

Saponated solution of cresol can be rapidly prepared in the following way: Dissolve 24 g. of sodium oleate or sodium stearate in 50 ml. of cresol containing 20 ml. of water. Heat with constant stirring to about 65° until solution is effected. Cool and adjust to 100 ml. with water. Mix well. The resultant preparation is light amber in colour, but should be protected from light to prevent darkening.—L. F. Martin and W. A. Prout, *J. Amer. pharm. Ass., Sci. Edn.*, 1940, 327.

[P1] **Vapor Cresolis Compositus** (*B.P.C.*). Creosote 1, oil of eucalyptus 2, oil of Siberian fir 2, cresol to 100.

Cresineol (*British Drug Houses, London*). A combination of cineole and cresol in 3 gr. tablets for use as an internal disinfectant.

Kerol Capsules (*Napp, London*). Stated to contain an oxygenated diphenyl compound 60 times less toxic than phenol. Used as a gastric and intestinal antiseptic, the intestinal capsules being enteric coated.

[P1] **Trikresol** (*Schering, London*). A preparation of the three cresols, occurring as a colourless liquid slightly soluble in water. For surgical use $\frac{1}{2}$ to 1% solution, as an eye wash 1 in 1000 to 1 in 2000.

[P1] **Trikresol-Formalin** in the proportion of 4 of Trikresol to 1 of solution of formaldehyde is a useful application as a dental dressing.

Chloro-phenolic Antiseptics.

Chlorocresol (*B.P. Add. III*). *Syn.* PARACHLOROMETACRESOL. $\text{CH}_3\cdot\text{C}_6\text{H}_3(\text{Cl})\cdot\text{OH} = 142.6$.

Chlorocresol is 6-chloro-3-hydroxytoluene. It is a white, crystalline solid with a slight characteristic odour, and volatile in steam; m.p. 64° to 66° . R.W. coefficient about 13.3.

Soluble 1 in 250 of water, 1 in 50 of boiling water; more soluble in solutions of soap and in caustic alkalis; also soluble in organic solvents, terpenes and fixed oils.

Parachlorometaxylenol. $(\text{CH}_3)_2\text{C}_6\text{H}_3(\text{Cl})\cdot\text{OH} = 156.6$.

Parachlorometaxylenol is 2-chloro-5-hydroxy-*m*-xylene, a white crystalline solid; m.p. 115° . R.W. coefficient about 36.

Slightly **soluble** in water, a concentrated solution at 15° containing about 3 parts per 10,000. It is more soluble in solutions of soap and in caustic alkalis; also soluble in organic solvents.

Uses. Both chlorocresol and *p*-chloro-*m*-xyleneol are being increasingly used as antiseptics and germicides. They possess powerful bactericidal properties and relatively low toxicities, and the disadvantage of low solubility in water is overcome for purposes of use as general antiseptics by dissolving them in solutions of soaps. They are recommended for preserving pharmaceutical preparations, including solutions for hypodermic injections, chlorocresol proving more suitable for this purpose, as its solubility is sufficient to allow the use of the 0.25% solution, which is recommended.

Except in the case of solutions made with alkali, *p*-chloro-*m*-xyleneol shows coefficients nearly twice as great as those shown by *p*-chloro-*m*-cresol. Its great insolubility in water and the consequent necessity for higher concentration of substances to aid dissolution, so reduce the activity of its solutions as to make their efficiencies comparable with those of solutions of *p*-chloro-*m*-cresol. For practical purposes, therefore, the latter compound must be considered the more generally applicable.—N. F. Rapps, *J. Soc. chem. Ind., Lond.*, ii/1933, 175 T.

p-Chloro-*m*-cresol in a concentration of 0.05% was found to be approximately equivalent in germicidal power to 0.5% of phenol and 0.3% of Trikresol. *p*-Chloro-*m*-xyleneol and benzyl-*o*-chlorophenol were also tested, but their slight solubility in water precludes their use as preservatives of aqueous solutions of medicaments.—H. Davis, *Quart. J. Pharm.*, 1935, 683.

The preparation of solutions of morphine salts for hypodermic injection containing *p*-chloro-*m*-cresol as preservative.—H. Davis, *Quart. J. Pharm.*, 1935, 683.

It is suggested that for such medicaments as will withstand steaming (98°) for 30 minutes, the inclusion of either 0.25% of *p*-chloro-*m*-cresol or 0.001% of phenylmercuric nitrate will provide a big margin of safety against viable bacterial contamination.—H. Berry, E. Jensen and F. K. Siller, *Quart. J. Pharm.*, 1938, 729.

0.25% of *p*-chloro-*m*-cresol is more lethal than 0.5% of phenol or 0.3% of Trikresol, and is much more bactericidal if the substance is acid. Like other

similar substances the action is much diminished by mild alkalinity. Experiments are described in this paper on the use of *p*-chlor-*m*-cresol in low temperature sterilisation, and it is suggested that this use points to new sterilisation procedures of great efficiency involving relatively low temperatures that can be carried out without special apparatus such as autoclaves. A suggested process consists of dissolving or suspending the medicament in distilled water, glucose solution or physiological saline, to which has been added 1 in 400 of *p*-chlor-*m*-cresol, transferring to the final containers and tyndallising or heating to 80° for four hours or to 100° for one hour. Like phenol and cresol, *p*-chlor-*m*-cresol is absorbed by rubber, and this must be borne in mind when products are sent out in rubber-capped bottles.—C. E. Coulthard, *Pharm. J.*, i/1939, 79.

p-Chlor-*m*-cresol 0.1% is recommended as a preservative for hypodermic injections. It is more efficient than phenol 0.5%; the ultimate concentration in the injection is only one-fifth of that of phenol 0.5%, and it is less caustic and toxic than phenol.—H. Davis, *Quart. J. Pharm.*, 1940, 47.

Toxicity. Experiments on rats and mice showed that phenol and *p*-chlor-*m*-cresol in concentrations of the same order as those suggested for use in sterilisation appeared to be relatively innocuous. It seems unlikely, therefore, that toxic reactions would follow the injection of such concentrations of *p*-chlor-*m*-cresol into patients.—W. A. Broom, reported by C. E. Coulthard, *Pharm. J.*, i/1939, 79.

p-Chlor-*m*-cresol has been shown to have about the same order of toxicity as phenol. The 0.25% solution which is recommended for use is unlikely, therefore, to be more toxic than the 0.5% solution of phenol, which is widely used in pharmaceutical injections.—R. Wien, *Quart. J. Pharm.*, 1939, 212.

The introduction of the chlorine atom into the phenol molecule results in compounds having a markedly different mode of toxic action from that of phenol. According to the minimal product of the concentration and survival time, which measures toxicity in its range of most powerful action, the relative toxicity of the chlorophenols as compared with phenol is as follows:—*Ortho* 1.15; *meta* 1.51; *para* 1.89.—W. A. Gersdorff and L. E. Smith, *Amer. J. Pharm.*, 1940, 197. The bromophenols investigated similarly gave the following figures:—*Ortho* 1.25; *meta* 1.56; *para* 1.86.—*ibid.*, 1940, 316.

Liquor Antisepticus (N.I.F.). *p*-Chlor-*m*-xylenol 44 gr., ricinoleic acid 75 m., triethanolamine 75 m., ti-tree oil 29 m., industrial methylated spirit 144 m., water to 2 oz.

N.B. Distinguish this preparation from Liquor Antisepticus (B.P.C.).

Parachlorphenol. $C_6H_4Cl \cdot OH = 128.5$. Crystalline needles soluble in alcohol and ether, but not in water to any extent. M.p. 37°, b.p. 217°. Liquid *p*-chlorphenol is practically identical and is used similarly. The *ortho* body boils at 176° and the *meta* melts at 28.5° and boils at 212°.

A powerful antiseptic used in the treatment of lupus, phthisis, keratitis, iritis and in dental work as an analgesic. A filling is made with cobalt and tropacocaine hydrochloride equal parts, with enough *p*-chlorphenol and zinc oxide to produce a paste. The unpleasant taste may be moderated by menthol. 5 to 10% in glycerin has also been used for laryngeal catarrh. Inhalations $\frac{1}{2}$ to $\frac{1}{4}$ %.

C.M.X. Antiseptic (Wyleys, Coventry). Non-toxic and non-irritant germicide containing *p*-chlor-*m*-xylenol in a saponaceous solution of essential oils.

C.M.X. Obstetric Cream. A water-soluble ointment for use as an antiseptic in midwifery. **C.M.X. Pessaries.** Antiseptic pessaries containing C.M.X.

Dettol (Reckitt & Sons, Hull). A non-toxic, non-irritant antiseptic stated to consist of a halogen derivative of xylenol dissolved in a mixture of aromatic essential oils with a neutral solution of a suitable soap. For use in surgery, gynaecology, obstetrics, and for instrument sterilisation, etc. R.W. Coefficient, 3.

Dettol Obstetric Cream. A non-greasy ointment for use as an antiseptic in midwifery. Dettolin. A concentrated mouthwash stated to contain dimethyl-chlorophenylhydrate 1.02%, menthol 0.12%, *sapo vegetalis* 0.5%, tinct. *rozeum aromaticum* 64.9%, elixir *glusidi* (B.P.C.) 6.0%, water to 100.

A 1% solution of Dettol kills hæmolytic streptococci and *B. coli* even in the presence of pus, and its bactericidal activity is little diminished by admixture with soap. It may be used in concentrated form without toxic effects and is well tolerated by the hands, vulva and even the intact vaginal mucous membrane.—*Brit. med. J.*, ii/1939, 275.

N.P.A. (Richter, London). A non-poisonous antiseptic containing *p*-chlor- α -naphthol emulsified with antiseptic essential oils. R.W. coefficient 3.4 to 3.5.

Zant (Evans, Sons, Lescher & Webb, Liverpool). A non-poisonous antiseptic containing *p*-chlor-*m*-xylenol emulsified with pine and other essential oils. Also available as a catheter lubricant and skin cream.

Acrosone (Woolley, Manchester), Amphyl (Lysol Ltd., London), Lysantol (Allen & Hanburys, London), Neo-Monsol (Monsol Ltd., London), and Verpine (C. G. Fox, London), are non-poisonous, non-irritant antiseptics for use in midwifery, for wounds, and as general disinfectants.

Higher Phenolic Antiseptics.

In general, the bactericidal power of phenol and its homologues increases as the complexity of the alkyl group increases. Thus cresols have a phenol coefficient of about two, whilst that of thymol is about twenty-five. Research on the variation of the phenol coefficient with increase in the alkyl group showed the *n*-amyl derivatives to be always the most active, and the alkylcresols to be more active than the alkylphenols. It was also found that toxicity tends to decrease with rise in molecular weight, amyl-*m*-cresol, for example, with a phenol coefficient of between 200 and 300, having about half the toxicity of hexyl-resorcinol.

Abracide (A. Boake, Roberts, London) is tertiary butyl cresol, offered in the form of a lotion, ointment or prophylactic powder for the treatment of fungous diseases of the skin such as athlete's foot, etc.

Abracyl (A. Boake, Roberts, London) consists of amyl salicylate rendered germicidal with tertiary butyl cresol for the treatment of minor burns, scalds, etc.

Cresantol-3 (Monsanto Chemicals Ltd., London) is a non-poisonous antiseptic stated to consist of substituted phenols containing aryl groups. R.W. coefficient 105.

The following formulæ yield non-poisonous antiseptics, having R.W. coefficient of 3.4:—

Formula A. Cresantol-3 3 ml., ti-tree oil 3 ml., oil of lemon grass 0.05 ml., isopropyl alcohol 10 ml., triethanolamine 5 ml., ricinoleic acid 5 ml., water to 100 ml. Mix the triethanolamine with the ricinoleic acid and a little water, stirring vigorously, dissolve the Cresantol-3 and the oils in the alcohol, mix the two solutions and dilute to volume. The product has a pH of 8.8.

Formula B. Cresantol-3 3 ml., terebene 2 ml., oil of sassafras 1 ml., industrial methylated spirit 10 ml., potassium hydroxide 10% w/v 10 ml., ricinoleic acid 6 ml., water to 100 ml. Heat the potassium hydroxide solution with the ricinoleic acid, dissolve the Cresantol-3 and the oil of sassafras and terebene in the alcohol, mix the two solutions and dilute to volume. The product has a pH of 11.0.—*Pharm. J.*, ii/1936, 273.

Dimol "43" (Dimol Laboratories, London; Anglo-French Drug Co., London). Dimethyl-methoxyphenol, $C_6H_3(CH_3)_2(OCH_3)OH = 152.1$, in combination with tri- and tetra-methylphenols. R.W. coefficient 43. For use in dysentery, colitis and intestinal toxæmias generally. It is supplied in tablets: A (enteric-coated for solution in the bowel) and B (sugar-coated for solution in the stomach). Also supplied as a syrup, lavage powder, ointment and snuff.

[P1] **Amylmetacresol.** $C_6H_{11} \cdot C_6H_4(OH)CH_3 = 165.13$.

A colourless solid with a pleasant odour and taste. M.p. 24°. It is almost insoluble in water, but soluble in alcohol, ether and oils.

Amyl-*m*-cresol possesses powerful antiseptic properties (R.W. coefficient 250) and a low toxicity.

[P2] **Amyl-meta-cresol Capsules (Boots, Nottingham).** Each capsule contains 0.15 g. of amyl-*m*-cresol in olive oil. Dose.—2 to 3 thrice daily after meals. In chronic intestinal infection and colitis.

A.M.C. Antiseptic Solution (Boots, Nottingham). A concentrated oral disinfectant for use as a mouthwash or gargle containing 1% of amyl-*m*-cresol.

Kramsol (*Boots, Nottingham*). An instrument-sterilising solution containing amyl-w-cresol and formaldehyde. Highly germicidal and free from corrosive action.

Proprietary Phenolic Disinfectants.

(For trade-names of some proprietary lysols, see under *Liquor Cresolis Saponatus B.P.*, p. 465.)

The nomenclature used by manufacturers in describing their preparations includes the following:—

"Tar Acids." These are oxygenated hydrocarbons, including phenols, cresols and higher hydroxy compounds.

"Phenoloids." A vague term. The bodies so called simply consist of phenol and its higher homologues, i.e., xylenols and dimethylhydroxybenzenes. They are more bactericidal and less poisonous, and they make good emulsions with soap and water.

"Tar Oils." The neutral bodies present, i.e., insoluble in soda.

"Coke Oven Oils." Contain varying percentages of "phenoloids" with tar oils.

The disinfecting power of the higher phenols increases in proportion to their position in the homologous series, but their solubility decreases proportionately. Bodies, therefore, with the hypothetical diphenyl nucleus which have become so popular can only be used as emulsions.

For various methods used for the determination of cresol and higher phenols in lysols and disinfectants, for meta-cresol in cresol, and for the Chick Martin and Rideal-Walker methods of standardising disinfectants, see Vol. II.

[P2] **Creolin** (*Pearson's Antiseptic Co., London*). Contains 35% of the less toxic but more powerful homologues of phenol. R.W. coefficient 18-20. Used diluted 1-200 to 1-400.

[P2] **Creophen** (*Ferris, Bristol*). A coal tar product containing 25% v/v of phenols, with R.W. coefficient 5-6. Used as a general antiseptic in $\frac{1}{4}$ -1% solution.

[P2] **Cyllin Medical** (*Jeyes Sanitary Compounds, London*). A saponaceous solution of high boiling phenols with coal tar hydrocarbons in vegetable oil soap. It contains 50-55% v/v of phenols and has R.W. coefficient 22-24. For medical and surgical purposes it is used diluted 1-300. For use in contact with mucous membrane, e.g., douches, 1 in 600.

[P2] **Cyllin Capsules**, containing 1 and 3 minims, keratin-coated, have been given as an internal antiseptic in summer diarrhoea, dysentery, colitis and sprue. "Stomachic" capsules, gelatin-coated, are also available.

Lano-Cyllin Ointment contains 5% of Cyllin in a wool fat and soft paraffin base. For eczema, ringworm, hemorrhoids, etc.

[P2] **Izal Germicide** (*Newton, Chambers, Sheffield*).

A 40% emulsion of Izal oil, containing aromatic hydroxy compounds, including xylenes and related substances obtained from bituminous coal. Izal germicide is miscible with water, saline, alcohol and glycerin. R.W. coefficient 18 to 20. For general purposes dilute 1 in 600; for a mouthwash 1 drop to a tumbler of warm hypertonic saline. A 1 in 200 solution has been officially recommended for the cleansing of service and civilian respirators. [P2] **Izal Oil Capsules** contain 2 m.; for internal antiseptics and in bronchiectasis, etc.

[P2] **Jeyes Fluid** (*Jeyes Sanitary Compounds, London*). A non-irritant and non-corrosive saponaceous solution of cresols and coal tar hydrocarbons with resin and vegetable oil soap. It contains 25-30% v/v of phenols and has R.W. coefficient 6-7.

[P2] **Monsol** (*Monsol Ltd., London*). A non-caustic germicide stated to be prepared from oils obtained in the gasification of coal by the Mond power gas process. It contains 12% of the homologues of phenol, the formula being sulphonated cod-liver oil 17%, curd soap 3%, "Ol Picis (Mond)" 73%, terpinoline 2% and water 5%.

[P2] **Pacolin** (*Pearson's Antiseptic Co., London*). Disinfectant containing 22% of the homologues of phenol. Is employed diluted 1-80 for general purposes, or 3-5 drops in a tumbler of water as a mouth-wash.

CUPRUM

Cu = 63.57.

Incompatibles with Copper Salts. Alkalis and alkaline carbonates, also preparations containing tannin and iodides.

Antidotes to Copper Salts. Empty stomach by emetic (if vomiting has not occurred) or by stomach tube. Potassium ferrocyanide, 10 gr. in water, is said to be a useful antidote. Keep patient lying down and warm; apply heat to abdomen. Give white of egg and demulcent drinks freely, but avoid oils and fats. Morphine, $\frac{1}{2}$ gr. hypodermically, or tincture of opium by mouth, for pain.

Cupri Sulphas (*B.P., U.S.P. XI, Fr. Cx., P. Helv. V*).
 $\text{CuSO}_4 \cdot 5\text{H}_2\text{O} = 249.7$.

Dose.— $\frac{1}{4}$ to 2 grains (0.016 to 0.12 g.); as emetic, 5 to 10 grains (0.3 to 0.6 g.). Average dose $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.016 to 0.03 g.). *Fr. Cx.* has maximum single and daily dose 0.75 g.

Blue crystals. **Soluble** 1 in about 3 of water, 1 in 3 of glycerin; insoluble in alcohol 90%.

Uses. Given internally, copper sulphate in small doses has an astringent action and has been employed for this purpose in diarrhoea, cholera and amoebic dysentery (by colonic irrigation). In larger doses it has an emetic action, but it is not generally recommended for this purpose except in the case of phosphorus poisoning, in which it forms an insoluble phosphide and so prevents absorption.

Externally it is astringent and caustic, and has fungicidal properties. Solutions of $\frac{1}{4}$ to $\frac{1}{2}$ % have been employed locally as stimulant astringents in eye affections such as conjunctivitis and trachoma, and frequent application of a 1% solution is of value in styas after epilation of the lashes. Copper pencils, prepared by fusing 1 part of potash alum with 2 parts of copper sulphate, are useful for this purpose. 0.5 to 1% solutions have also been employed in urethritis and vaginitis, in tropical ulcer, and as an application to discharging gums in pyorrhoea alveolaris.

It has been employed both by injection and internal irrigation in actinomycosis, using a 1% solution.

ACTINOMYCOSIS. Treated by injection of 1% copper sulphate solution every few days until softening of the infiltration occurs. For small lesions a few ml. If extensive, the first injections are given under anæsthetic. Abscesses are opened and scraped and 40 to 100 ml. of $\frac{1}{2}$ to $\frac{1}{4}$ % injected.

AMŒBIC DYSENTERY. Colonic irrigation recommended with 2 to 4 litres of hot solution of copper sulphate 1 : 5000 at a temperature of 50° to 55° in the container at the rate of 100 to 200 ml. per minute. On arrival in the colon the temperature is 45° to 48°. Ten irrigations daily, or every other day, usually cured the condition.—P. Beregoff, *Canad. med. Ass. J.*, i/1935, 641.

FISTULAS, both tuberculous and osteomyelitic, have been well treated with injections of 2 to 3 ml. of 10% solution.

TRACHOMA has been well treated with subconjunctival injections of a 1% solution of copper sulphate with 4% procaine.

TROPICAL ULCER. In local treatment copper sulphate acts with such rapidity in comparison with other forms of treatment that it can be regarded as a specific. It is best used as a 1 in 150 solution, applied as a continuous bath. The first essential in the general treatment is a diet rich in vitamins.—C. E. M. Ganther, *Med. J. Aust.*, i/1938, 348.

Collyrium Cupri Sulphatis (B.P.C.). 0.25% w/v.

Guttæ Cupri Sulphatis (R.L.O.H.). 1 or 2 grains to the ounce. Suitable as a lotion for gleet.

Alibour Waters.

Solutum Cuprozincicum Forte (Fr. Cx.). *Syn.* EAU DE DALIBOUR FORTE. Copper sulphate 10 g., zinc sulphate 35 g., tincture of saffron 1 g., concentrated tincture of camphor (10% w/w) 10 g., distilled water to 1 litre.

It must be diluted for use with 5 or 6 times its volume of water, as a wet dressing in eczema.

Solutum Cuprozincicum (Fr. Cx.). *Syn.* EAU DE DALIBOUR. Copper sulphate 1 g., zinc sulphate 3.5 g., tincture of saffron 1 g., concentrated tincture of camphor 10 g., distilled water to 1 litre.

Lotio d'Alibour (L.S.H.). Copper sulphate 2, zinc sulphate 7, camphor water to 100.

Lot. Cupro-Zincica (N.I.F.). *Syn.* ALIBOUR WATER.

Zinc sulphate 12 gr., copper sulphate 8 gr., camphor water to 2 oz.

Lotie Zinci et Cupri Sulphatum (L.H.).

Zinc sulphate 6 gr., copper sulphate 4 gr., camphor water to 1 oz.

Pasta d'Alibour (Strong) (L.S.H.).

Zinc phenolsulphonate 1, copper sulphate 1, precipitated sulphur 5, diatomite 15, zinc oxide 30, lanolin to 100. The weak paste contains 0.1% of zinc phenolsulphonate, 0.5% of copper sulphate and 1% of precipitated sulphur.

Cuprum Aluminatum (P.G. VI, P. Helv. V). *Syn.* LAPIS DIVINUS, COPPER ALUM.

Potash alum powdered 16 is mixed with powdered copper sulphate 16 and potassium nitrate 16, and melted with moderate heat in a porcelain dish. Camphor 1 and potash alum 1 are then added and the mass moulded or poured on to a plate to set. It is employed as a mild caustic in ophthalmology.

A preparation known as "Brass Paste," formed by combining basic copper sulphate 86, with basic zinc sulphate 14, has been employed in cutaneous tuberculosis, especially in tuberculous conjunctivitis.

Cupri Acetas. $(\text{CH}_3\text{COO})_2\text{Cu} \cdot \text{H}_2\text{O} = 199.6$.

Dark green crystals. Applied to ulcers acts as a stimulating caustic. Soluble 1 in 15 approximately of water; only slightly in alcohol. The fatal dose *per os* is said to be 154 to 184 gr., and 154 to 308 gr. of the sulphate.

Cupri Subacetas. *Syn.* VERDIGRIS, AERUGO, COPPER OXYACETATE.

Is usually of indefinite composition, approaching $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \text{Cu}(\text{OH})_2 \cdot 5\text{H}_2\text{O} = 369.3$. Occurs in blue needles or scales, efflorescing in air and becoming green. Partly soluble in water with decomposition, insoluble in alcohol 90%; soluble in ammonium carbonate solution.

Linimentum Æruginis (Ph. Lond.).

A decoction of verdigris, vinegar and honey, employed in veterinary work.

Cupri Chloridum. *Syn.* CUPRIC CHLORIDE. $\text{CuCl}_2 \cdot 2\text{H}_2\text{O} = 170.5$.

Dose.— $\frac{1}{2}$ to 2 grains (0.016 to 0.12 g.).

Greenish very deliquescent crystals. Use similar to that of copper sulphate.

Cupri Citras (*P. Jap. V*). $\text{C}_6\text{H}_5\text{O}_7\text{Cu}_2 \cdot 2\frac{1}{2}\text{H}_2\text{O} = 360.2$.

Greenish powder slightly soluble in water. Used as an ointment for ulceration and granulation of the eye-lids.

Unguentum Cupri Citratis (*R.L.O.H.*).

Copper citrate 20 gr., yellow soft paraffin to 1 oz.

Cuprentum (*Allen & Hanburys, London*). 5% of soluble copper citrate in a lanolin base. For ophthalmic use.

Cupri Nitras (*B.P.C.*). *Syn.* CUPRIC NITRATE. $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O} = 241.6$.

Deliquescent blue powder or crystals, very soluble in water and alcohol. Used similarly to the sulphate in astringent lotions.

Cuprase (*Ducatte, Paris; Anglo-French Drug Co., London*). Colloidal solution of copper hydroxide in 5 ml. ampoules for very slow intramuscular injection for the treatment of cancer.

DEXTROSUM

B.P.

$\text{C}_6\text{H}_{12}\text{O}_6 = 180.1$.

Syn. and Prop. Name. MEDICINAL GLUCOSE (ANHYDROUS), GRAPE SUGAR, GLYCOSUM (*P. Helv. V*), SACCHARUM AMYLACEUM (*P.G. VI*), GLUCOSE OFFICINAL (*Fr. Cx.*), DEXTROSOL (*Corn Products, London*).

Dose.—Up to 6 ounces daily *per os*; intravenously, 250 to 300 ml. of a 10 to 20% solution; rectally, it is given in the form of a 5 to 10% solution. A 33 $\frac{1}{3}$ % solution has been employed intravenously in the treatment of shock following the insulin therapy of schizophrenia (sufficient being given to raise the blood sugar above hypoglycæmic levels), and a 50% solution as a sclerosing agent for varicose veins.

A white crystalline or granular powder obtained by the hydrolysis of starch. It is an equilibrium mixture of α and β dextrose. The *B.P.* requires not more than 2 $\frac{1}{2}$ % of moisture.

Dextrose monohydrate is also available, and is the form generally used for oral administration, being supplied under the name "medicinal glucose." It is the variety usually required when "glucose" *per se* is asked for. Dextrosium (*U.S.P. XI*) is the monohydrate, but the use of other hydrates is permitted, provided due allowance is made for the extra moisture.

Solid glucose, less pure, is in yellowish masses containing 10 to 20% of bodies allied to dextrin, *viz.*, amylin and gallsin.

Soluble 1 in less than 1 of water, 1 in 50 of cold alcohol 95%, 1 in 5 of boiling alcohol 90%; also soluble in glycerin.

Uses. Is given orally, intravenously or *per rectum* as a readily absorbed carbohydrate food in wasting diseases. It assists the metabolism of fats and prevents acidosis by raising the glycogen content of the liver. This action is utilised before the administration of drugs which may have a toxic action on the liver, such as cinchophen, neoarsphenamine, chloroform, etc. Before operations dextrose, in the form of barley sugar, may be taken *ad lib.* for

the prevention of post-anæsthetic acidosis, and of delayed chloroform poisoning. Dextrose is widely used in the severe nutritional disturbances of infants, especially when accompanied with diarrhoea and vomiting. Massive doses *per os* are of value in the prevention and treatment of travel-sickness (sea, air or car), and of the vomiting of pregnancy. Hypertonic solutions (25%) are injected intravenously to relieve intracranial pressure by osmosis in meningitis and hydrocephalus, also to assist drainage of the accessory nasal sinuses. Isotonic dextrose is given intravenously as a circulatory stimulant in the treatment of shock and various cardiac diseases.

Concentrated (50% or more) solutions have been used for the injection treatment of varicose veins. It is generally held that recanalisation and pulmonary embolism are more likely to occur with this than with other sclerosants.

USE IN SURGICAL SHOCK. In the treatment of surgical shock intravenous injection of dextrose has beneficial effect on the pulse and general strength, and in relief of thirst. By this means, water, the first need, is given in large amount with safety, and sugar to the extent of 2 ounces *per diem* without any demand upon the alimentary tract. Increased action of the kidneys is caused, and diluted toxic matters are removed.

The solution is also used intravenously with the addition at the time of use of 4 to 8 drops of adrenaline solution.

When a dehydrating effect is required hypertonic solutions are given intravenously or *per rectum*, since if given subcutaneously such solutions may cause œdema.

Prior to operations on children a full diet is advised and a bottle of barley sugar the day before the operation and more on the morning of the operation; in young infants, when the operation is severe and resistance low, 5% dextrose subcutaneously may be given, and in older children 10% *per rectum*.

Always before a severe operation, (1) when liver efficiency is suspect, (2) when the metabolic rate is high, (3) when patient is under-nourished or emaciated: always after a severe operation when blood transfusion is impossible: after any anæsthetic (1) when loss of blood has been heavy and blood transfusion is impracticable, (2) in case of shock, (3) when it has not been given before the anæsthetic, (4) when a rough surgeon has operated, or more than the usual amount of anæsthetic has been used, (5) when there is a history of epilepsy.—F. P. de Caux, *Brit. med. J.*, ii/1929, 1005. (10% solution is preferred by this writer, given at 100°F.)

Intramuscularly a 10% solution in saline is relatively safe for raising blood sugar and when other methods contraindicated. 20 to 40 ml. for infants; 100 ml. for older children or adults. The maximum rise in blood sugar occurs in $\frac{1}{2}$ hour.—J. Glaser, *J. Amer. med. Ass.*, ii/1928, 726.

The adult body can utilise only 0.8 g. *per kilo weight per hour*. If given too rapidly it is promptly excreted through the kidneys and wasted.—*J. Amer. med. Ass.*, ii/1929, 1327.

Intravenously for adults, 75 g. in 300 ml. of water has been advised; given during 1½ hours.—*Lancet*, ii/1929, 723. Less, it is stated, will not give the maximum therapeutic effect, and more may produce over-stimulation of the insulin-producing activity of the pancreas. Single repeated doses preferable to prolonged injection. Half dose for a child and quarter dose for infant, but same length of time for injection.—F. Titus and H. D. Lightbody, *per J. Amer. med. Ass.*, ii/1929, 947.

Although the rectal administration of dextrose is a popular measure, there is grave doubt whether absorption of the substance from the rectum does in fact take place. Animal experiments showed that following the injection of dextrose into the rectum the blood returning from this portion of the bowel failed to yield any evidence suggestive of even a slow rate of absorption. On the other hand dextrose injected into the small intestine was rapidly absorbed. Experiments on man showed that glucose administered even at the rate of 30 g. per hour by a continuous drip apparatus failed to cause any rise in the systemic blood dextrose. Even when large amounts were allowed to remain in the bowel for a considerable time, no rise in blood glucose was observed. It is concluded that absorption of dextrose from the human rectum is of no therapeutic value.—A. B. Corkill, per *Practitioner*, ii/1936, 659.

ANGINA PECTORIS. Administration of dextrose recommended to improve the coronary circulation and thus increase oxygen supply to the heart. Treatment consists in giving 50 to 100 g. of dextrose orally and 5 to 10 units of insulin subcutaneously daily for 6 to 10 days. The dose is doubled if no improvement is obtained, and is continued until improvement is definitely noted. Alternatively a 10 to 15% solution of dextrose may be given intramuscularly or a 25% solution intravenously.—R. L. Chopra, per *Prescriber*, 1939, 327.

ARTHRITIS, CHRONIC. From 20 to 60, or even 100 ml. of 10% dextrose into the painful areas of the muscle and subcutaneous tissues gives immediate relief of pain in muscular rheumatism and lumbago. Also used with success in sciatica, etc.—*Brit. med. J. Epit.*, ii/1931, 8.

DIABETES. Diabetic uræmia cured by intravenous injection of a pint of 25% dextrose solution in normal saline, repeated in 24 hours.—H. W. Fullerton and co-workers, *Lancet*, i/1932, 559.

JAUNDICE. Intravenous injection of 500 ml. of a 10% dextrose solution may be indicated two or three times a day to rehabilitated patients with abnormally functioning livers. In jaundice, intravenous injections of 5 ml. of a 10% solution of calcium chloride help to hasten coagulation of blood, prevent post-operative bleeding and neutralise the toxic bile pigments.

PNEUMONIA. Intravenous injections of 10% dextrose are most valuable when circulatory failing has commenced.

SEPTICÆMIA. Continuous giving of dextrose, up to 3 litres a day, drop by drop into the tissue of the breast, or into the saphenous vein, of great value in severe cases.—Sir W. Wheeler, *Lancet*, ii/1931, 245.

TOXÆMIA with gastric stasis well treated by intravenous injections of 10 g. (1%) sodium chloride, and 100 g. dextrose (10%), in 1000 ml. freshly distilled sterile water. Twenty minutes allowed for injection, 1, 2 or 3 litres being injected daily, supplemented by hypodermoclysis and proctoclysis.

VARICOSE VEINS. A mixture of 50% dextrose and 30% sodium chloride thought to be the ideal solution. *Dose*.—2 to 10 ml.—not more than 20 ml. at one sitting, with injections every other day.—H. M. Kern and L. W. Angle, *J. Amer. med. Ass.*, ii/1929, 601.

A 50% solution found the blandest and most efficient method of sclerosing. Inject 5 to 10 ml. and then again 3 to 4 cm. higher; repeat bi-weekly.—G. de Takats, *J. Amer. med. Ass.*, i/1929, 778.

Up to 5 ml. of 66% solution. There is a tendency for the clot to break up, and of the recorded instances of pulmonary embolism from varicose vein injections, the majority have occurred with dextrose.—W. Levi, *Lancet*, ii/1930, 16.

20,000 injections given without embolus. Massed statistics give 0.0024% mortality from that cause. Embolism probably in regions remote from the injection, as a result of inactive venous circulation. Ambulant treatment advised, wherever possible, but if rest in bed necessary, movement of limbs should be carried out frequently and patient encouraged to sit up.—F. Remenovsky, per *Brit. med. J. Epit.*, i/1934, 27.

Strong solutions of dextrose (50%) and salt (30%) have gone out of favour and are only occasionally used in allergic cases.—A. Dickson Wright, *Brit. med. J.*, i/1940, 665.

VOMITING OF PREGNANCY. Glucose intravenously 5 to 10%, 4000 ml. in 24 hours.—*Brit. med. J. Epit.*, ii/1930, 64.

Intravenous injections of 50 to 75 g. of dextrose in 200 to 300 ml. distilled water (25% solution) used. The addition to the injection of 1 unit of insulin to 5 to 10 g. of dextrose did not seem to have any clinical advantages. Vomiting

usually ceased in 12 to 24 hours.—P. Titus, *J. Amer. med. Ass.*, ii/1925, 491. W. Thalhimer gives 100 g. of dextrose intravenously in as much water as the condition of the patient indicates (1 or 2 litres), the injection taking from 3 to 5 hours, and administers *hypodermically* 1 unit of insulin for every 3 g. of dextrose. Vomiting usually ceased in 6 to 8 hours.—*Ibid.*, 493.

Ampulla Dextrosi (L.C.C.). (a) Dextrose 5%, sterilised water to 500 ml.; (b) dextrose 50%, sterilised water to 10 or 50 ml.

Enema Dextrosi (B.P.C.). *Dose.*—4 ounces (120 ml.). 10% w/v in water or peptonised milk.

Enema Dextrosi (St. M. H.). Dextrose 1 oz., sodium chloride 1 dr., water to 1 pint.

Liquor Dextrosi et Sodii Chloridi (B.P.C.). *Syn.* GLUCOSE-SALINE SOLUTION.

A sterile solution containing 5% w/v of dextrose and 0.9% of sodium chloride. Although hypertonic when first injected, the rapid absorption of the dextrose renders the resulting solution isotonic.

Modified Glucose-Saline Solution. Dextrose 250 g., acacia 50 g., magnesium sulphate 1 g., sodium bicarbonate 16.5 g., sodium chloride 30 g., potassium dihydrogen phosphate 0.9 g., potassium sulphate 1.75 g., water to 5000 ml. Dissolve the acacia in 50 ml. of water, strain, and autoclave at 110°. Allow to stand if possible for 24 hours. Filter through Gooch asbestos on a sintered glass filter, dissolve the dextrose and the salts except the sodium bicarbonate, make up to 1000 ml., sterilise, allow to stand, filter, and again sterilise. Dissolve the sodium bicarbonate in 4000 ml. of water, add the saline solution, filter, distribute into flasks, displace the air by carbon dioxide, close the flasks with rubber bungs, tied down, and again autoclave. Has been administered in amounts of up to 20 pints in 4 days without causing rigor.—E. Lloyd, *Pharm. J.*, i/1936, 399.

WOUND SHOCK. The danger of intravenous administration of glucose saline in cases of shock, when the plasma proteins have been depleted by hæmorrhage or local plasma loss, is due to the fact that the normal amount of water cannot be retained in the circulation. Hence, there is a risk of pulmonary œdema. The intravenous administration should be preceded by a transfusion of whole blood or plasma. A pint of 5% glucose should be given, mixed or alternated, with every pint of saline. The rate of administration should be slow—a drip infusion at the rate of 40 drops to the minute is suitable for the average case. If dehydration is severe the rate must be increased.—“The Treatment of Wound Shock,” M.R.C. War Memo. No. 1, H.M.S.O., 1941.

Soluté Injectable Hypertonique de Glucose (Fr. Cx.). Glucose 300 g., distilled water to 1000 ml.

Soluté Injectable Isotonique de Glucose (Fr. Cx.) is 5% isotonic solution, sterilised at 110° in neutral glass.

Cabiven (Coates & Cooper, London). A 66% solution of grape sugar for injection in varicose veins. Issued in ampoules of 5 and 10 ml.

Decrose (Boots, Nottingham). Preparation of dextrose, calcium glycerophosphate and vitamin D. For use wherever dextrose is required, and especially in expectant and nursing mothers and growing children.

Dextrose-C (British Drug Houses, London). A preparation of medicinal dextrose containing 100 i.u. of vitamin C in each 100 grains. For use in debilitated or pyrexial conditions and in the vomiting of pregnancy.

Glucodin (Glaxo Laboratories, London). 98% medicinal glucose with 4½ gr. of calcium glycerophosphate and 250 i.u. of vitamin D (calciferol) in each ounce. Especially indicated in conditions associated with ketosis in which glucose therapy is applied to patients who must subsist for long periods on a low fat diet.

Glucose B-D (Crookes Laboratories, London). Each teaspoonful contains 75 i.u. of vitamin D and 75 i.u. of vitamin B₁. *Dose.*—1 to 2 teaspoonfuls three times daily.

Glucosum Liquidum (B.P.). *Syn.* CORN SYRUP, GLUCOSUM (U.S.P. XI). Consists of a mixture of dextrose, maltose, dextrin and water, and occurs as a viscous mass containing about 20% of water. Sp. gr. about 1.6. It is prepared by the hydrolysis of starch.

Enema Glucosi Liquidii (B.P.C.). *Dose.*—4 ounces (120 ml.). 10% w/v in water or peptonised milk.

Pigmentum Glucosi (T.H.). Glucose 25, glycerin to 100. For ozaena.

Syrupus Glucosi Liquidii (B.P.). Liquid glucose 33.3% w/w with syrup. Used as a pill excipient.

Dextrin (P. Helv. V, Fr. Cx., P. Jap. V). *Syn.* BRITISH GUM. In yellowish powder or gum-like masses. Is obtained commercially by heating starch, which has been moistened with dilute nitric acid and dried, at 110° to 115°. Consists principally (there are various other dextrans formed before this) of achroodextrin which is the ultimate product of starch hydrolysis before the grape sugar stage is reached. It is soluble in water, alcohol 60%, and ether.

Dextrin-Maltose (Allen & Hanburys, London). A starch-free mixture of carbohydrates issued in six forms. No. 1 contains sodium chloride 2%, No. 2 is salt-free, No. 3 contains potassium bicarbonate 3%, No. 4 vitamin D, No. 5 sodium chloride 2%, and iron 20 p.p.m., and No. 6 vitamin C.

Lactosum (B.P., Fr. Cx., P. Helv. V, P. Dan.).

Syn. SACCHARUM LACTIS (P. Jap. V), MILK SUGAR.

$C_{12}H_{22}O_{11} \cdot H_2O = 360.2$.

Dose.—*ad lib.*

Lactose is a disaccharide, obtained by evaporating the whey of milk to a low bulk and allowing to crystallise. It occurs as a white crystalline powder, odourless and slightly sweet. It is dextro-rotatory and reduces Fehling's solution. Lactose exists in two modifications corresponding to the α and β isomerides. The milk sugar of commerce is α -lactose. β -lactose is also obtainable. It is anhydrous, more soluble than α -lactose, and passes into the latter form in solution.

Soluble 1 in 7 of water; almost insoluble in alcohol 90%, chloroform and ether.

Used in humanising cows' milk for infant feeding. Is diuretic and laxative in large doses. It is said to be a useful addition to magnesia as a laxative; it increases the solubility of the latter by combination.

A dose of $\frac{1}{2}$ to 1 oz. in the morning in a large cup of weak tea a useful laxative. Of value in flatulence and spasm of the colon.—T. C. Hunt, *Lancet*, ii/1931, 872.

Lævulosum (B.P.). *Syn.* DIABETIN, FRUCTOSE.

$C_6H_{12}O_6 = 180.1$.

A monosaccharide obtained from "invert sugar" and occurring as a whitish, crystalline, hygroscopic powder, reducing Fehling's solution. It is lævorotatory.

A stronger sweetening agent than cane sugar; it has a pleasant flavour. Specially suitable for diabetics. Since lævulose does not raise the concentration of sugar in the blood, except where there is hepatic derangement, it is employed as a test for liver efficiency (see Vol. II).

Very **soluble** in water, less soluble in alcohol 90%; insoluble in dehydrated alcohol or ether.

Sorbitol. *Syn. and Prop. Name.* d-SORBITE, SIONON (Bayer Products, London). $C_6H_8(OH)_6 = 182.2$.

d-Sorbitol, a sugar occurring in apples, pears, etc., and usually obtained from cerelose (a crystalline form of glucose) by treating with hydrogen under pressure. It crystallises with $\frac{1}{2}$ to 1 H_2O as

colourless or white, sweet crystals, which do not reduce Fehling's solution.

Soluble in water and hot alcohol.

Uses. Sorbitol is used as a substitute for glycerin, to which it is chemically and physically akin, in tooth pastes; its use has also been suggested as a glycerin substitute in pharmaceutical preparations. In diabetes it is used in a daily dose of from 30 to 80 g. as a sweetening agent in place of sucrose, since it does not produce a rise in blood sugar.

Can safely be used as a substitute for sugar in diabetes, but the probability of intestinal irritation must limit the dose. Also its price makes it a luxury which can usually be more economically provided by the use of ordinary sugars and slightly more insulin.—W. W. Payne, R. D. Lawrence and R. A. McCance, *Lancet*, ii/1933, 1258.

Up to 30 to 80 g. daily may be given to diabetics with other foods.—*Per Prescriber*, 1929, 419. Can be metabolised more easily than glucose. Quantities up to 3 ounces a day rarely produce diarrhoea.—*Brit. med. J.*, ii/1930, 105.

Manna (B.P.C., U.S.P. XI, *Fr. Cx.*, *P. Helv. V*, *P. Dan.*).

Dose.— $\frac{1}{2}$ to 4 drachms (2 to 16 g.), or more.

A saccharine exudation from *Fraxinus Ornus* (Oleaceæ). In flattish, somewhat three-edged pieces. Contains 40 to 60% of mannitol (*syn.* mannite, *P. Ital. V*, *P. Ned. V*), $C_6H_8(OH)_6$ = 182.1, a non-fermentable sugar, which does not reduce Fehling's solution, and other sugars. Has mild laxative properties.

Mel Depuratum (B.P.). *Syn.* CLARIFIED HONEY, MEL DESPUMATUM, MIEL BLANC (*Fr. Cx.*)

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 g.).

Prepared by melting honey, allowing to stand, straining off the scum rising to the surface and adjusting the sp. gr. to 1.36 by adding water.

Aqua Mellis (B.P.C.). HONEY WATER.

Oils of bergamot, lavender, clove and sandal wood, musk and saffron with triple rose water, triple orange-flower water, honey and alcohol 90%.

Oxymel (B.P.). **Dose.**— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). Acetic acid 15, distilled water 15, purified honey to 100.

Sucrosom (B.P., U.S.P. XI, *Fr. Cx.*, *P. Helv. V*, *P. Dan.*).

Syn. SACCHARUM PURIFICATUM, SACCHAROSE, SUCROSE.

$C_{12}H_{22}O_{11}$ = 342.2.

In crystals or white powder.

In addition to the sugar obtained from the juice of the sugar cane, *Saccharum officinarum* (Gramineæ), various grades of granular cane and beet sugar, both with and without the addition of "blue," are marketed. For the manufacture of syrups a sugar without the colouring matter is essential. B.P., *Fr. Cx.* and U.S.P. XI allow also beet sugar from *Beta vulgaris* var. *Rapa* (Chenopodiaceæ).

Soluble readily 2 in 1 of water, 1 in 60 of alcohol 90%.

Uses. Is used for the same purposes as dextrose, but is not so readily assimilated since it has to be broken down in the body to dextrose before it can be stored as glycogen in the liver. It has been given intravenously as strong as a 50% solution, but an

isotonic solution (920·6 grains per pint, i.e., 10·5%) would appear preferable. It is added to infants' foods made of dried milk.

RELATIVE SWEETNESS OF SUGARS. If the sweetness of sucrose is rated as 100, lævulose deserves a value of 173, dextrose 74, maltose 32, galactose 32, and lactose 16.

Solution for injection: Sucrose 500 g., citric acid 0·1 g., sodium phosphate 3·65 g., water to 1000 g. The solution is prepared aseptically and heated for one hour at 100°. It may be used in place of dextrose.—K. K. Jespersen, *Dansk Tidsskr. Farm.*, 1940, 14, 27.

Intravenous injections of 100 ml. of 50% sucrose solution are of value for reducing intracranial pressure in cases of acute brain injury, and are preferable to dextrose injections. The injections are without untoward effects.—E. V. Hahn, F. B. Ramsey and K. G. Kohlstedt, *J. Amer. med. Ass.*, 1/1937, 773.

Saccharum Ustum. Caramel is prepared by heating sucrose at 180° to 200° to form a thick black mass which is diluted with hot water to a sp. gr. of 1·4.

Liquor Sacchari Usti (B.P.C.) is a mixture of equal volumes of burnt sugar and chloroform water.

Syrupus (B.P.).

Sucrose 667, water to 1000 by weight. Sp. gr. not less than 1·32. 9 fl. oz. of syrup contain approx. 8 oz. of sucrose. *U.S.P. XI* orders sucrose 85, water *q.s.* to measure 100. Weaker strengths of syrup do not keep well. Potassium carbonate 1 grain in 12 ounces of syrup has been found to prevent crystallisation. Best temperature for producing syrup free from invert sugar is thought to be 90°. Syrupus Simplex (*Fr. Cx.*) is either "heat-prepared" (165 g. of sucrose to 100 g. of water), or "cold-prepared" (180 g. to 100 g. of water).

The Addendum (War Emergency Formula) 1917 to the *B.P.C.* 1911, included Syrup Substitute (*syn.* SYRUPUS FACTITIUS, ARTIFICIAL SYRUP) made by mixing tragacanth powder 0·7, with chloroform 0·5, adding water 90, shaking till uniformly diffused and adjusting to 100 with water.

Invert Sugar is prepared by action of dilute mineral acid on sucrose. It consists of a mixture of equal weights of dextrose and lævulose. A useful substitute for cane sugar in dyspepsia—more easily borne in gastritis.

Invert sugar forms in simple syrup on keeping—that made by cold process produces more than hot. In 18 months it may reach 6%.

Solutions of invert sugar have been used in the injection treatment of varicose veins. They are claimed to have the advantage of not causing cramp or sloughing if accidentally injected outside the vein. From 5 to 20 ml. of a solution containing from 60 to 75 g. of invert sugar in 100 ml. is given.

Invert Sugar Solution for Injection Treatment of Varicose Veins.

760 g. of sucrose is dissolved in water, 1 ml. of N/1 hydrochloric acid is added and the solution made up to a litre. After filtering, the solution is filled into 5·5 ml. ampoules which are sterilised at 120° for thirty minutes, inversion occurring simultaneously. This product has a pH of 3, but this is of no importance since the solution has no buffering action.—S. Hansen, S. A. Schon and G. Tonnesen, *Dansk Tidsskr. Farm.*, 1933, 7, 26.

Theriacal, syn. TREACLE, is the uncrystallisable residue from sugar-refining. A 50% solution in hot milk in doses of 5 to 20 ounces is used as an enema.

DIGITALIS FOLIUM

B.P., U.S.P. XI, Fr. Cx., P. Jap. V.

Syn. DIGITALIS, FOXGLOVE LEAF.

[P1] "*Digitalis*, glycosides of; other active principles of *digitalis*."[81] "*Digitalis*, glycosides and other active principles of, except substances containing less than one unit of activity (as defined in the 'British Pharmacopœia') in two grammes of the substance."[86] "*Digitalis*, glycosides of; other active principles of *digitalis*—specify proportion as the number of units of activity as defined in the 'British Pharmacopœia' contained in a specified quantity of the preparation."

The leaf of *Digitalis purpurea* (Scrophulariaceæ) rapidly dried at a temperature of 55° to 60° as soon as possible after collection. I.A. requires the powdered entire second-year leaf; adopted by Fr. Cx. and P. Belg. IV; P. Ned. V specifies drying at 55° to 60°. P. Helv. V collects when dry, and dries immediately at 40° and then at 55° to 60° for $\frac{1}{2}$ hour.

Incompatible with preparations of cinchona and with lead acetate, also with iron salts (but the blackening is preventable by citric acid) and with iodine and potassium iodide.

Cumulative Action. The average rate of elimination is 25 m. of tincture, or about 2 gr. of standardised leaf per day, but it may be substantially more or less than this. Signs of toxic action are anorexia, nausea, headache and diarrhœa (nausea may be due to cardiac failure and not to digitalis), followed by runs of extrasystoles or ventricular tachycardia. Administration should be stopped for 24 hours, and smaller doses given afterwards.

The more common symptoms of overdosage, such as anorexia, nausea, vomiting, and diarrhœa are quite generally known. Less common phenomena justify re-emphasis. Coupled beats and the development of partial or complete heart block demand immediate discontinuation of the drug.

The toxic effects of digitalis on the brain and certain nerve tissues are not sufficiently appreciated although their importance is outstanding and they have been known to result in death. Prominent among these symptoms are disturbances in vision, consisting of dimness of vision, inability to focus the eyes, difficulty in the identification of objects, the presence of scotoma and diplopia, and yellow and green vision. The last are striking symptoms and are often alarming evidence of digitalis poisoning. Prodromal symptoms frequently occur and if properly interpreted, so that the administration of the drug is discontinued, the more prominent and serious disturbances may be avoided. They consist of restlessness, increased nervous irritability, and periods of disorientation regarding time and place. If stupor supervenes, death usually ensues. It is important to realise the fact that the cerebral manifestations of digitalis intoxication may occur independently of nausea, vomiting, and so forth. Occasionally, paroxysms of tachycardia occur; they usually arise in the ventricles, and have been known to result in death.—F. A. Willius, *Proc. Mayo Clin.*, 1935, 579.

The rule as to the proper dosage of digitalis in use at the Mayo Clinic, and which in most instances works satisfactorily, is to give one-tenth of the patient's bodyweight (measured in pounds) in grains or cat units of digitalis. This usually is sufficient to digitalize the patient when administered over three or four days. Digitalis intoxication is more likely to occur in the old arteriosclerotic person than in any other type of individual.—H. L. Smith, *Proc. Mayo Clin.*, 1938, 574.

Antidotes. Empty stomach by emetic or by stomach tube, using dilute tannic acid solution. Keep patient lying down and

warm. Give stimulants, e.g., brandy, $\frac{1}{2}$ oz., or aromatic spirit of ammonia, $\frac{1}{2}$ dr., in water. Atropine, $\frac{1}{100}$ gr., hypodermically. Chloral hydrate, 20 gr., may be necessary. Chloroform inhalations. Amyl nitrite has been recommended.

Uses. Digitalis is used in medicine for three purposes: (1) as a stimulant in acute circulatory failure, (2) as a diuretic, and (3) as a cardiac tonic in chronic heart disease; of these the most important and the most widely employed is the last-mentioned.

Digitalis has a narrowing influence upon the arteries. Acting on the vagus, it pulls the reins of the heart. Acting on the heart muscle, it is a most useful whip, at the same time providing it with food by improving the circulation. Slowing the heart, it makes it regular also. This slowing gives the heart an opportunity of resting, so secondarily improving contractility, conductivity and excitability. By primary action it increases its strength, regulating its rhythm by depressing excitability and conductivity. In large doses it may increase excitability, causing extra-systoles, perhaps diminish contractility and, by causing long pauses, do harm to the circulation. All these influences vary according to dose, form in which it is given and the conditions of the heart.

The most remarkable therapeutic effect of digitalis is seen in *auricular fibrillation*; in this it is almost specific, causing a rapid diminution in the number of ventricular beats, rendering the heart's action more efficient and improving the circulation.

In *auricular flutter* it has the peculiar effect of changing the flutter to fibrillation, but when the drug is withdrawn the heart changes back, not to flutter, but to normal rhythm.

In *partial heart block* it exaggerates the condition and should in general be avoided, though by tending to quicken the beat it may be of some value in *complete heart block*.

Digitalis has practically no effect in reducing the rapid pulse of fevers, and although it has been widely employed in *pneumonia*, its routine use in this condition has been deprecated by most workers.

Apart from the foregoing, digitalis is employed with advantage in a large number of conditions in which the efficiency of the heart is impaired and there is deficient circulation.

The only cases likely to show bad effects are those with damaged auriculo-ventricular bundle, in whom heart-block may result. Raised blood pressure is no contraindication to the use of digitalis, and is often due to some secondary effect of the heart failure.

When used as a diuretic the kidneys must be capable of responding to its action, which is exerted by increasing the force of the cardiac systole and forcing more blood through the organs.

Apart from its well-established indications in which the drug may be expected to produce results of value, it is still common to find it prescribed in various states in which it can be of no real benefit and may even be harmful. Thus, the routine use of digitalis increases the mortality in lobar pneumonia, is believed to increase the post-operative death rate in thyrotoxicosis, and handicaps recovery in the peripheral circulatory failure of shock and collapse.—R. Gilchrist, *Practitioner*, ii/1939, 436.

Congestive failure provides the main indication for the administration of digitalis. Its influence removes the signs and symptoms caused by congestive failure, and if such symptoms are absent little is gained by its use. Tachycardia in itself (unless due to auricular flutter) is seldom an indication for digitalis; nor is bradycardia a contraindication. It should not, therefore, be a routine measure in hyperthyroidism, pneumonia or shock. The slowing of the pulse is not the best guide to the effectiveness or otherwise of digitalis; the improvement in the patient's symptoms and sense of well-being is often more reliable.—A. R. Gilchrist, *Edinb. med. J.*, 1939, 46, 233.

AURICULAR FIBRILLATION. 54 cases of auricular fibrillation treated with 0.1 ml. of tincture per lb. weight, with sodium bicarbonate, aromatic spirit of ammonia, and chloroform water to 3 ounces. The average dose was 13 ml.; the average pulse before use was 140 and 8 hours after it was 91. Toxic effects occurred once and vomiting twice, and the average duration of good effect was 6 days, so that small doses were needed at the end of a week. The method is a measure of urgency only.—G. J. Langley, *Brit. med. J.*, i/1927, 1043, 1162.

CONGESTIVE HEART FAILURE. Rest and digitalis the outstanding methods of treatment. *Digitalisation.*—Calculate dose in minims by multiplying body-weight in pounds by 2½, i.e., a 10-stone patient requires 350 minims. (Initially it is best to give ½ of this dose.) In urgent cases if no strophanthus or digitalis has been given previously, safest to give half the dose at once, ½ the dose after 6 hours, ¼ after a further 6 hours, and a further ¼ after 6 hours. Often not sufficient urgency to warrant more than 90 minim doses three or four times daily.—Maurice Campbell, *Practitioner*, 1931, 32.

PNEUMONIA. The infusion of digitalis helps the heart to resist depressant action which the pneumonia toxin has. 1 dr. of the infusion every 4 hours, increasing to ½ oz. every 4 hours, or 3 hours, night and day. Begin about second or third day.—E. M. Brockbank, *Brit. med. J.*, i/1930, 974.

From a study of 1000 cases of lobar pneumonia no evidence was found that the routine use of digitalis was useful. When auricular fibrillation (in about 5% of cases) is present digitalis may save life, though patients frequently recover without it, but routine digitalis therapy in lobar pneumonia is dangerous.—H. Gold and co-workers, *Amer. J. med. Sci.*, April, 1933, 509.

Digitalis does not appear advisable in pneumonia, except for patients with definite auricular fibrillation.—Sollmann, 5th Edn., 1936.

[P1-81] **Acetum Digitalis (P. Ned. IV).** Digitalis leaves 1, dilute acetic acid (6%) 9, alcohol (90%) 1. Macerate 5 days.

[P1-81] **Digitalis Pulverata (B.P. Add. I).**

Dose.—½ to 1½ grains (0.03 to 0.1 g.); single doses, 3 to 10 grains (0.2 to 0.6 g.).

Digitalis leaf reduced to powder, no part being rejected, and adjusted by admixture with exhausted leaf or with weaker leaf to contain 10 units per gramme.

For preparing the fresh infusion and the tincture, biologically standardised but unadjusted leaf is also recognised by the B.P.

The therapeutic efficiency of a number of cardiotonics has recently been determined by comparative tests on patients with heart disease. The following are arranged in order of efficiency: powdered digitalis leaf, digitaline (digitoxin), Digifoline, Digoxin, tincture of digitalis, Folinerin, ouabain and strophanthin. The three latter were shown to give results inferior to those of digitalis or its preparations.—F. Prescott, *Chem. & Drugg.*, i/1940, 251.

From a six-year study of the clinical efficacy of digitalis preparations it was concluded that there was no evidence that the glucoside preparations (Digalen, Verodigan, Nativelle's Digitaline, and Digoxin), when given by mouth, were quicker in action, more efficient, more prolonged in action or less toxic than standardised whole digitalis leaves.—W. D. Stroud and J. B. V. Veer, *J. Amer. med. Ass.*, ii/1937, 1808.

[P1-81] **Digitalis Pulverata (U.S.P. XI).**

Average Dose.—1½ gr. (0.1 g.).

Standardised dried and powdered leaf; 0.1 g. is equivalent to 1 to 1.1 *U.S.P.* digitalis units (which are identical with the international units).

Suppositories. The following formula is suggested for suppositories containing the active principles in the aqueous phase of an oil-in-water emulsion, thus facilitating absorption. 1.1 g. of powdered digitalis is infused with 9 ml. of hot water and the cooled liquid is emulsified with 15 g. of cocoa butter containing 1% of ovoid lecithin and made into 10 suppositories. The addition of 1% of Nipagin-Nipalol combination as a preservative is suggested.—H. Eschenbrenner, *Pharm. Ztg., Berl.*, 1936, 1170.

[P1-S1] *Tabellæ Digitalis Pulveratæ* (*B.P.C.*) contain 1 gr. (0.06 g.).

[P1-S1] *Extractum Digitalis Stabilisatæ* (*Fr. Cx.*). Dried leaves extracted with 70% alcohol, evaporated to soft extract.

[P1] *Infusum Digitalis Recens* (*B.P.*).

Dose.—90 to 300 minims (6 to 20 ml.); single dose, 1 to 4 oz. (30 to 120 ml.).

Prepared from the equivalent of 0.5% of international standard digitalis powder. A concentrated infusion must not be used; when *Infusum Digitalis* is prescribed the fresh infusion is to be dispensed.

This is an active preparation. In use it may well be combined with some vasodilator.

The infusion has such practical disadvantages that its use should now be abandoned.—C. Hoyle and J. W. Linnell, *Practitioner*, i/1936, 94.

[P1-S1] *Liquor Digitalis ad usum internum* (*P. Ned. V.*). *Syn.* DIGISOL.

Dose.—Maximum single 3 ml.; maximum daily 10 ml.

Similar to the solution for injection following except that, after the evaporation of the chloroform, the volume of water used to extract the residue is 88% of that of the chloroform. Finally to every 88 parts of this solution are added 12 parts of 96% alcohol.

[P1-S1] *Liquor Digitalis ad Injectionem* (*P. Ned. V.*). *Syn.* DIGISOL FOR INJECTION. *Dose.*—5 ml. maximum single and *per diem*.

Macerate one part of powdered digitalis leaves with 8 parts of water during 48 hours at a temperature not exceeding 15°, strain and filter. Shake the filtrate with an equal volume of chloroform during 48 hours, avoiding emulsification. Reserve the chloroform solution and evaporate a measured volume of the aqueous layer on the water bath to a thick extract. To this add sufficient anhydrous sodium sulphate to form a dry powder. Shake this during 24 hours with a volume of the chloroformic extract equal to that of the evaporated aqueous solution and filter. Measure the volume of the chloroform and distil off. Treat the residue with water equal in volume to that of the chloroform, using small quantities at a time; dissolve 0.8% of sterile sodium chloride in the solution and filter. Sterilise by heating on 3 consecutive days for 1 hour at 70° to 80°. *Keep in a cool place away from light.*

A lethal dose for a cat of 2 ml. per kg. body weight is required by *P. Ned. V.* The preparation is considered to be too dilute for injection when rapid digitalisation is required.

[P1] *Mist. Digital. et Caffein.* (*N.I.F.*).

Caffeine 1 gr., tincture of digitalis 7½ m., solution of strychnine hydrochloride 3 m., concentrated infusion of orange 15 m., water to ½ oz.

[P1] *Mist. Digital. c. Scill.* (*N.I.F.*).

Tincture of digitalis 5 m., tincture of squill 10 m., potassium acetate 10 gr., chloroform water to ½ oz.

[P1-S1] *Pilulæ Digitalis Compositæ* (*B.P.C.*).

Syn. GUY'S PILL, ADDISON'S PILL, BAILLIE'S PILL, PILULÆ DIGITALIS CUM SCILLA.

Dose.—1, as often as 3 times a day.

Q*

Mercurial pill 1, powdered digitalis 1, squill 1. In grains for one pill; in grammes for fifteen. Used in cardiac dropsy.

[D-P1-81] **Niemeyer's Pill.** *Syn.* HEIM'S PILL.

Dose.—1 pill thrice daily.

Powdered digitalis $\frac{1}{2}$ gr., ipecacuanha $\frac{1}{2}$ gr., powdered opium $\frac{1}{2}$ gr., extract of helenium $\frac{1}{2}$ gr.

Used in combating the fever of phthisis. When the fever is of the periodical type, one grain of quinine sulphate is added to the above formula.

The B.P.C. gives Niemeyer's Pill as a synonym for Pilulæ Digitalis Co. Whitla gives the formula—digitalis $\frac{1}{2}$ gr., quinine 1 gr., opium $\frac{1}{2}$ gr., Heim's pill being similar with ipecacuanha $\frac{1}{2}$ gr. in place of the quinine. In "Lectures on Phthisis" Niemeyer gives the formula of Heim's pill as above, with or without quinine, and says that "it has become a very common pill at my clinic."

For preparations of similar composition which are *exempt* [D] see pp. 1139 and 1140.

[P1-81] **Tabella Digitalis et Hydrargyri Composita** (*St. B. H.*). *Syn.* GUY'S PILLS (*St. G. H.*).

Powdered digitalis, mercury pill and squill, of each 1 gr.

[P1-81] **Tinctura Digitalis.** (*B.P., Fr. Cx., F.E. VIII, P. Belg. IV, and P. Ital. V.*)

Dose.—5 to 15 minims (0.3 to 1 ml.); single dose, 30 to 90 minims (2 to 6 ml.).

Frequently single doses of as much as $1\frac{1}{2}$ drachms are given. Large single doses in many cases preferable to repeated small doses.

May be prepared from unstandardised leaf, the tincture being subsequently biologically assayed, or it may be prepared from standardised leaf, using a quantity equivalent to 1000 units (80 g. of international standard powder) per litre, by percolation with alcohol 70%. *B.P. Add. I* permits also, as a further alternative, maceration for two days with alcohol 70% in place of percolation. It is required to contain 1 unit per ml.

[P1-81] **Tinctura Digitalis** (*U.S.P. XI*).

Average dose.—15 minims (1 ml.).

Powdered digitalis leaf, 1 in 10, biologically standardised and adjusted so that 1 ml. is equivalent to 1 to 1.1 U.S.P. digitalis units.

Stability of the Tincture. Experiments extending over three years indicate that the addition of glacial acetic acid and sodium acetate to a tincture prepared from the de-fatted drug yields a stable preparation.—L. W. Rowe and W. L. Scoville, *J. Amer. pharm. Ass.*, 1933, 1087.

In tropical climates such as that of India, tincture of digitalis undergoes deterioration in a short time. Tinctures become darkish in colour on dilution and are evidently considerably weaker in therapeutic efficacy. Dosage used in India far too small.—R. N. Chopra, S. C. Bose and P. De, *Indian med. Gaz.*, Mar., 1925, 97.

In cold countries the average quantity of tincture of digitalis required to cause toxic effects varies from 4 to 7 dr., but in Calcutta the smallest dose required was 9 dr. and the highest 29 dr., while the average was well over 14 dr. Due to loss of potency of tincture and increased decomposition in the alimentary tract and liver. Toxic effects with B.P. tincture in 15 m. doses thrice daily very rare in India. To obtain prompt results in grave cases 2 to 3 dr. per day for 5 days should be given.—S. C. Bose, *Indian med. Gaz.*, Apr., 1925, 154.

[P1-81] **Digitalinum (B.P.C.).** *Syn.* DIGITALINUM PURUM GERMANICUM.

Dose (by subcutaneous injection).—For a single administration $\frac{1}{2}$ to 1 grain (0.03 to 0.06 g.); for repeated administration $\frac{1}{15}$ to $\frac{1}{5}$ grain (0.004 to 0.012 g.).

A mixture of glycosides from the seeds of *Digitalis purpurea* (Scrophulariaceæ) standardised biologically to contain 80 units of activity (equivalent to 8 g. of the international standard powder) per gramme. It occurs as an odourless, yellowish-white powder with an intensely bitter taste and contains digitalinum verum, $C_{34}H_{56}O_{14}$, a definite physiologically-active glycoside, together with a large proportion of water-soluble glycosides of which little is known and the physiologically-inactive glycosides digitonin, $C_{55}H_{90}O_{29}$, and gitonin, $C_{48}H_{80}O_{28}$.

Soluble readily in water and alcohol; sparingly soluble in chloroform and ether.

Caution. When digitalin is ordered (with the relative *bold dose*) Digitalinum (B.P.C.) should be given. DIGITALINE (*Fr. Cx.*) consists almost entirely of digitoxin, and the dose is much smaller, *v. Digitoxinum*.

[P1-81] **Injectio Digitalini (B.P.C.).**

Dose (by subcutaneous injection).—For a single administration, 15 to 30 minims (1 to 2 ml.); for repeated administration, 3 to 6 minims (0.2 to 0.4 ml.). Contains per ml. 0.03 g. of digitalin, equivalent to about $2\frac{1}{2}$ units of activity.

Indications for hypodermic use.—

The hypodermic method alone is admissible (1) in grave cases where cardiac failure is imminent and immediate and certain action is required, because in such cases gastro-intestinal absorption is slow and uncertain, (2) In cases in which it is desirable to safeguard the stomach and to avoid setting up gastric intolerance or embarrassment of cardiac action by a dilated stomach, the hypodermic method must be used, *e.g.*, in typhoid with failing heart, where diuresis is essential; in vomiting in arteriosclerotics, where the stomach becomes distended on the slightest irritation.

[P1-81] **Nativelle's Crystallised Digitaline (Laboratory Nativelle, London)** is probably identical with digitoxin, *q.v.*; $\frac{1}{10}$ mg. ($\frac{1}{100}$ grain) contains one unit of activity. It is supplied in the following forms: pink granules of $\frac{1}{10}$ mg. ($\frac{1}{100}$ gr.) and white granules of $\frac{1}{2}$ mg. ($\frac{1}{200}$ gr.); 1 in 1000 solution, 5 drops correspond to $\frac{1}{10}$ mg. ($\frac{1}{100}$ gr.); ampoules for intramuscular injection, 1 ml. = $\frac{1}{2}$ mg. ($\frac{1}{200}$ gr.). *Dose.*—(1) *small dose:* $\frac{1}{10}$ mg. or 5 drops of the 1 in 1000 solution daily for the first 5 days of every 10 or 15-day period, continued indefinitely if necessary; (2) *medium dose:* 2 granules of $\frac{1}{10}$ mg. or 10 drops of the 1 in 1000 solution daily for 5 days, then cease for a week and repeat, or replace by the small dose; (3) *strong dose:* intensity of treatment depends upon the case, administration being pushed to saturation point as evinced by a pulse of 60; the patient should be examined daily and treatment stopped if signs of intoxication appear; the threshold is usually reached with 2 to 3 mg. given over a period of 10 days. The intravenous or intramuscular injections are reserved for cases of intolerance to the medicament *per os*, or for cases of urgency.

Digitalis leaf was compared with Digitaline Nativelle in a selected group of 49 patients in a series of experiments extending over periods of 24 to 54 weeks. Digitaline Nativelle is about 200 times as potent as digitalis by cat and frog methods, but 1800 times as potent when the two are compared in man (method of assay in man described). It requires from 6 to 12 cat units of digitalis leaf to produce the effects of 1 cat unit of Digitaline Nativelle, and full digitalisation is accomplished by a total of 3 cat units by the mouth, compared with 25 cat units of digitalis.—H. Gold *et al.*, *J. Pharmacol.*, 1940, 69, 177.

[P1-81] Tabellæ Digitalini et Nitroglycerini.

Digitalin $\frac{1}{10}$ gr. (0.006 g.) with glyceryl trinitrate $\frac{1}{100}$ gr. (0.0006 g.). Useful in aortic disease. Where vascular tension is high, the addition of glyceryl trinitrate prevents increase of peripheral resistance, and thus robs the digitalis of the influence on the arterioles on account of which its administration is supposed to be contraindicated.

[P1-81] Digitoxinum (B.P.C.). Syn. DIGITALINE (Fr. Cx.).

Dose.— $\frac{1}{8000}$ to $\frac{1}{800}$ grain (0.0001 to 0.001 g.). *Caution.*—0.002 g. may be a fatal dose.

Koppe took 1 mg. of digitoxin *per os* without any certain toxic effect, but a dose of 2 mg. taken four days later nearly produced a fatal result.

Digitoxin of commerce consists chiefly of the definite glycoside digitoxin, $C_{41}H_{64}O_{13}$, together with a small proportion of gitoxin, $C_{41}H_{64}O_{14}$. *P. Belg. IV* and *F. E. VIII* have formula $C_{34}H_{54}O_{11}$.

It occurs as a white microcrystalline powder with an intensely bitter taste.

Soluble about 1 in 80 of dehydrated alcohol, and 1 in 20 of chloroform. Sparingly soluble in alcohol 90%; very soluble in more dilute alcohol. In the pure condition it is stated to be insoluble in water. There is, however, physiological and chemical evidence that it is *soluble in the presence of the other glycosides*.

Solutions may be made containing $\frac{1}{80}$ gr. (0.001 g.) of digitoxin in 15 minims (1 ml.) of Petit's Liqueur. This quantity will approximate 40 drops, which may be considered a maximum dose. Suitable either *per os* or as an enema. May also be given in syrup—digitoxin 0.1, alcohol (90%) 200, distilled water 750, syrup to 2500. *Dose.*—1 to 4 drachms (4 to 15 ml.).

[P1-81] Tablets and [P1-81] Granules (Pills) of digitoxin are prepared containing $\frac{1}{100}$ gr. ($\frac{1}{2}$ milligramme) and $\frac{1}{800}$ gr. ($\frac{1}{10}$ milligramme).

[P1-81] Poudre de Digitaline au Centième (Fr. Cx.). Digitaline 1%, carmine 2.5%, with lactose.

[P1-81] Soluté de Digitaline (Fr. Cx.) contains digitaline 0.1% dissolved in alcohol (95%) 46%, glycerin 40%, and water. *Dose.*—0.3 gramme.

[P1-81] Vin de Digitale Composé (Fr. Cx.). 20 g. contains the equivalent of 0.1 g. of digitalis, and 1 g. of potassium acetate.

[P1-81] Digalen (Roche Products, Welwyn Garden City).

Stable preparations of the therapeutically active principles of digitalis leaves, pharmacologically standardised, available as oral solution, tablets, ampoules and suppositories. 1 ml. of oral solution, and each suppository, is equivalent to 0.1 g. of international standard digitalis powder (1 B.P. unit); the tablets and ampoules are each equivalent to 0.05 g. of international standard powder ($\frac{1}{2}$ B.P. unit).

The emergency intravenous dose of Digalen, for patients who have not previously received digitalis, is 1 minim per lb. weight, i.e., one-half the full therapeutic dose. If necessary give another dose of $\frac{1}{2}$ minim per lb. weight and repeat at 2-hourly intervals to a total of not more than 4 injections until improvement or signs of toxic action, then revert to oral use.—H. E. B. Pardee, *J. Amer. med. Ass.*, ii/1928, 147.

[P1-81] Digifoline (Ciba, Horsham). Total glycosides of digitalis leaf. Tablets contain $1\frac{1}{2}$ gr. *Dose.*—As a cardiac tonic, 1 tablet for 5 days in every fortnight; as a sedative, 3 tablets during 3 days, followed by interval of 10 days; astylosic dose, 4 tablets. Also given hypodermically or intravenously (1 ml. = $1\frac{1}{2}$ gr. standardised digitalis leaf).

[P1-81] **Digifortis** (*Parke, Davis, London*). Tincture of digitalis free from fat. 1.25 unit per ml. *Average dose*.—8 minims (0.5 ml.) orally two or three times a day. Also Digifortis Tablets (0.8 unit) and Capsules (0.8 unit).

[P1-81] **Digiglusin** (*Lilly, London*). A standardised preparation containing all the medicinally active glycosides of digitalis. Supplied as tablets each representing 0.1 g. of digitalis leaf or 1 cat unit, and as ampoules containing 1 ml. of the same potency.

[P1-81] **Diginutin** (*Burroughs Wellcome, London*). Preparations of the total glycosides of *Digitalis purpurea* in solution or tablets, for oral administration. The solution is equivalent in strength to the B.P. tincture, 1 ml. representing 0.1 g. of international standard digitalis. Tablets represent 5 or 10 minims of the solution.

[P1-81] **Digipuratum** (*Knoll, London; Savory & Moore, London*). Active principles of digitalis. *Dose*.—1 tablet, 1 ampoule, or 1 ml. of liquid (each corresponding to 1½ gr. of active digitalis leaves) 3 or 4 times daily.

[P1-81] **Digitalis Exclud Suppositories** (*Riddell, London*). Digitalis leaf 0.1 g., caffeine 0.09 g., theophylline 0.02 g. *Dose*.—1 to 3 daily; for continuous treatment, one daily. Course of 20, then 14 days' interval and repeat. For use in the entire field of digitalis therapy, especially chronic heart complaints. No cumulative effects.

[P1-81] **Digitalone** (*Parke, Davis, London*). A fat-free non-alcoholic solution of the active principles of digitalis; 1 ml. = 1 i.u. Prescribed in the same dosage as Tinct. Digitalis B.P.

[P1-81] **Digitol** (*Sharpe & Dohme, London*). Defatted standardised tincture of digitalis.

[P1-81] **Digiveron** (*Boehringer, Mannheim; Coates & Cooper, London*). Gitalin component of digitalis leaves. Supplied in tablets or granules of 0.0008 g. and in suppositories containing 0.0012 g. *Dose*.—½ to 1 tablet, or 1 suppository.

[P1-81] **Digitalis Lanata** leaves contain digitoxin, gitoxin, and digoxin, each glycoside existing in the leaf in combination with dextrose and an acetyl group forming respectively the complex glycosides, digilanid A, B, and C. Digilanid C is probably identical with lanadigin. The leaf of *D. lanata* is 3 to 4 times as potent as that of *D. purpurea*, and is now used as the source for the manufacture of the crystalline glycosides.

Chemical Relationships of Digitalis Glycosides. According to Prof. Stoll and co-workers, from the mixed glycosides of the leaf of *Digitalis lanata*, three complex glycosides named digilanid A, B and C respectively can be separated by shaking with immiscible solvents. Digilanid A on mild alkaline hydrolysis loses an acetyl group yielding deacetyldigilanid A. Similarly digilanids B and C yield deacetyldigilanids B and C. On further hydrolysis by means of an enzyme, a molecule of dextrose is removed from each of the deacetyldigilanids, and the products obtained are respectively digitoxin, gitoxin and digoxin. The deacetyldigilanids A and B (but not C) can be separated from the mixed glycosides of *Digitalis purpurea* leaf, thus providing a connecting link between the therapeutically active principles of the leaves of the two species.

Tinctures made from *D. lanata* (Kashmir and Austrian varieties), when administered intravenously, are twice as toxic to cats as those made from the standard *D. purpurea*. *D. lanata* (Austrian) in concentrated solution produces at least 50% more slowing of the heart-beat as compared with the standard *D. purpurea*. The Kashmir variety produces the same amount of slowing of heart-beat as the standard digitalis (B.P. '32). In dilute form (1 in 20) the Kashmir variety produces much less physiological slowing of the heart as compared

with the other two. The standard *D. purpurea* is slower in action as compared with both varieties of *D. lanata*.—R. N. Chopra, J. S. Chowhan and J. C. Gupta, *Indian J. med. Res.*, 1936, Oct., 509.

[P1-81] **Digilanid** (*Sandoz, London*). Preparations of uniform activity and composition containing the three glycosides of *Digitalis lanata* in the forms in which they occur in the leaf. It is stated to be better tolerated than other digitalis preparations and may be administered orally, intramuscularly or intravenously, the action commencing in 24 to 48 hours, 20 to 40 hours and about 10 hours respectively. Available in tablets (0.25 mg.), solution (1 ml. = 0.5 mg.) and ampoules (2 ml. and 4 ml. containing 0.4 and 0.8 mg. respectively). The adult oral dosage for general use is 1 tablet or 15 drops of solution three times daily. Parenterally, 0.8 mg. may be given once daily intravenously or 0.4 mg. twice daily intramuscularly.

[P1-81] **Digoxin** (*Burroughs Wellcome, London*). $C_{41}H_{64}O_{14}$.

Dose.—Orally, initial dose 0.001 to 0.0015 g. ($\frac{1}{100}$ to $\frac{1}{66}$ grain); maintenance dose 0.00025 g. ($\frac{1}{4000}$ gr.) twice daily. To be taken with water. Intravenous dose, 0.0005 to 0.001 g. ($\frac{1}{2000}$ to $\frac{1}{1000}$ grain).

A crystalline glycoside obtained from *D. lanata*, m.p. (with decomposition) about 265°.

Almost **insoluble** in water, sparingly soluble in chloroform and acetone, more soluble in dilute alcohol.

Uses. Is rapidly effective when given orally in auricular fibrillation, but may be given intravenously when extremely rapid effect is required. It reduces congestion in patients suffering from congestive heart failure and auricular fibrillation, and promotes diuresis when oedema is present. Orally the effect begins in 1 hour, reaching a maximum in 6 to 7 hours; intravenously the effect begins in 5 to 10 minutes and reaches a maximum in 1 to 2 hours. Available in oral solution containing 0.0005 g. per ml., in tablets of 0.00025 g., or in solution for intravenous injection containing 0.0005 g. per ml.

5 to 10 minutes after intravenous injection of 0.75 to 1.0 mg. ventricular slowing begins and is maximal in 1 to 2 hours. 1.0 mg. intravenously causes a fall in rate slightly greater than that after intravenous injection of 0.25 mg. of ouabain of 90% standard activity. Digoxin by mouth in single doses of 1.0 to 1.5 mg. causes rapid fall in ventricular rate, beginning one hour after administration and reaching full extent in 6 to 7 hours. Digoxin is absorbed and eliminated more rapidly than digitalis and causes vomiting if sufficient is given.—E. J. Wayne, per *Practitioner*, ii/1933, 314.

Since the introduction of Digoxin there is no longer much place for massive digitalisation or intravenous strophanthin in an urgent case; the former is more dangerous, the latter more likely to cause vomiting and a more difficult period of stabilisation. A dose of 1.5 mg. of Digoxin by mouth, or 1.0 mg. intravenously, is recommended in an urgent case that has not had digitalis recently, and 0.25 mg. thrice daily as an average routine dose afterwards.—M. Campbell, *Practitioner*, ii/1933, 476.

[P1-81] **Gitoxinum**. $C_{41}H_{64}O_{14}$.

A glycoside present in the leaves of *D. purpurea* and *D. lanata*, m.p. (with decomposition) 285°. Similar to Digoxin in solubilities.

[P1-81] **Cedilanid** (*Sandoz, London*). A preparation of lanatosid C, one of the three native glycosides found in *Digitalis lanata*. Available in tablets and solution for oral administration, in ampoules for intravenous injection, and in suppositories. **Dose.**—*Tablets* (0.00025 g.) 1 or 2 three times daily; *Solution*, $\frac{1}{2}$ to $\frac{1}{4}$ ml. (1 ml. = 0.001 g.) three times daily; *Ampoules*, 2 to 4 ml. (0.0004 to 0.0008 g.) intravenously daily; *Suppositories* (0.001 g.) 1 twice daily. Increases cardiac efficiency without influencing the heart rate to any marked degree and has a remarkable diuretic effect. Specially indicated in heart failure due to

myocardial insufficiency and that associated with disturbance of rhythm. It may be employed when other digitalis preparations present difficulties owing to toxic manifestations.

[P1-81] **Pandigal** (*Herts Pharmaceuticals, Welwyn Garden City*). Preparation of the glycoside, lanadigin, from *Digitalis lanata*. Supplied in the form of tablets, solutions, ampoules or suppositories for oral, intravenous or rectal administration in doses of 0.0002 to 0.0004 g.

Adonis Vernalis (*Fr. Cx., P. Austr., P. Ned. V*). Contains a hygroscopic glycoside adonidin which resembles digitalis in action. *Dose*.—In powder, 3 to 6 grains; of infusion 1 in 40, 4 drachms; of adonidin, $\frac{1}{2}$ to $\frac{1}{2}$ grain daily. Epilepsy has been treated with it combined with bromide. *Tincture*—leaves and stalks employed, 1 in 10. *Dose*.—10 to 30 minims. Adonidin is a local anæsthetic. In chronic glaucoma, iritis, and iridocyclitis 1% solution has been used; 3 drops relieve pain.

5 mg. of adonidin in 0.5% solution an efficient diuretic in cardiac anasarca. —*Per Yearb. Pharm., 1927, 218. See also ibid., 1926, 237.*

Cereus (B.P.C.), syn. NIGHT-BLOOMING CEREUS, CACTUS GRANDIFLORUS, is the fresh young shoots of *Cereus grandiflorus*. Preparations have been used as cardiac tonics free from cumulative or narcotic action, but evidence of utility is doubtful. The importation of the fresh shoots for the preparation of the small amounts of extract and tincture required is frequently inconvenient, and dried *Opuntia* flowers are sometimes used instead.

Extractum Cerei Liquidum (B.P.C.). Syn. EXTRACTUM CACTI GRANDIFLORI LIQUIDUM. *Dose*.—1 to 10 minims (0.06 to 0.6 ml.). 1 in 1.

Tincturâ Cerei (B.P.C.). Syn. TINCTURA CACTI GRANDIFLORI. *Dose*.—2 to 30 minims (0.12 to 2 ml.). 1 in 4.

Convallaria (B.P.C., P. Helv. V). Syn. LILY OF THE VALLEY FLOWERS, MUGUET (Fr. Cx.). The dried inflorescence of *C. majalis* (Liliaceæ). Two glycosides have been obtained from the plant: convallarin, a purgative (*dose*.—3 to 4 grains), and convallamarin (*dose*.— $\frac{1}{2}$ to 2 grains). A cardiac stimulant and diuretic. Its action is so feeble as to be almost of no value in medicine. It is an old remedy for dropsy.

Extractum Convallariæ Liquidum (B.P.C.). *Dose*.—5 to 10 minims (0.3 to 0.6 ml.). 1 in 1.

Tinctura Convallariæ (B.P.C.). *Dose*.—5 to 20 minims (0.3 to 1.2 ml.). 1 in 8.

Cratægus Oxyacantha (N.O. Rosaceæ). Syn. ENGLISH HAWTHORN, HAW, AUBÉPINE (Fr. Cx.).

Dose.—2 to 15 grains thrice daily. Liquid extract of the fruit, 10 to 15 minims. Contains a cyanogenetic glucoside. A cardiac tonic, in dyspnoea, hypertrophy, valvular insufficiency and heart oppression.

Pharmacologically there are considerable similarities between the actions of tincture of cratægus and tincture of digitalis. Clinically, however, tincture of cratægus has little effect in slowing the heart rate and does not promote diuresis. On the other hand it reduces blood pressure, and in ten cases of hypertension treated with one drachm of tincture of cratægus three times daily, there was a uniform lowering of the systolic and diastolic blood pressure. It is not cumulative and after cessation of the drug the blood pressure returns to its previous level.—J. W. P. Graham, *Brit. med. J.*, ii/1939, 951. Value in hypertension confirmed.—F. Bodman, *ibid.*, 1022.

Cratægus has a paralytant action on the respiratory centre when given intravenously, and is toxic to the heart. Chronic poisoning causes necrosis of the liver. The mammalian heart is at first slowed and strengthened, but later passes into auricular fibrillation and heart block.—J. D. P. Graham, *Quart. J. Pharm.*, 1940, 49.

Extrait d'Aubépine (Fluide) (Fr. Cx.). 1 in 1 liquid extract of the flowers with alcohol 45%.

Teinture d'Aubépine (Fr. Cx.). Prepared by macerating the bruised flowers 2 parts, for 10 days with alcohol 60% 5 parts, and filtering.

Tincture of hawthorn was made by macerating the dry powdered whole fruits with 70% alcohol for seven days. Assayed against standard tincture of digitalis it was found to possess about 14.5% of the potency of the standard preparation.—J. D. P. Graham, *Brit. med. J.*, ii/1939, 951.

Folinerin (Schering, London). Crystalline glycoside from the leaves of *Nerium oleander* in tablets containing 0.1 mg. *Dose.*—Two tablets three times daily. In all conditions in which digitalis would be given.

Has a digitalis action on pulse, diuresis and bodyweight. Is more quickly absorbed and has a shorter cumulative effect. Further clinical trial is suggested.—W. Schuler and H. Ott, *Munch. med. Wschr.*, 1937, 49.

Verbascum Thapsus. *Syn. MULLEIN, BOUILLON BLANC (Fr. Cx.).* The leaves are used as a substitute for digitalis. The flowers, together with those of *V. thapsiforme* are official in the *Fr. Cx.*

EMULSIONES

These are usually preparations containing oil and water in which the oil is finely dispersed in the water (oil-in-water type) or, *vice versa*, in which the water is dispersed in the oil (water-in-oil type).

The latter type is not usually employed for internal administration, but chiefly as liniments, embrocations and ointments, and the following considerations apply to the oil-in-water types only. Oil-in-water emulsions are very suitable preparations for exhibiting oily substances, particularly if they are nauseous, since, being suspended in an aqueous medium, which is generally sweetened and flavoured, they do not make contact with the papillæ of the tongue. Such preparations are, moreover, readily diluted with water and aqueous preparations. In order to make the dispersion of oil more permanent, it is necessary to employ an emulsifying agent or emulgent.

Emulgents.

The following are used for preparing emulsions for internal administration:—Acacia, decoction of chondrus (Irish moss), or yolk of egg.

Acacia is probably the best emulgent for this type of emulsion. When preparing an emulsion by hand, using a pestle and mortar, it is better to employ powdered acacia, but if using a machine (hand or power) it is preferable to use mucilage of acacia. In the former method, a primary concentrated emulsion should first be prepared and afterwards diluted. The following proportions are suitable for making primary emulsions:—

For fixed oils: oil 4, water 2, gum 1.

For volatile oils: oil 2, water 2, gum 1.

The powdered acacia should be added to the oil in the mortar, quickly diffused, the water immediately added and the emulsion prepared by light and quick trituration. In order to form an emulsion it is necessary that the acacia should hydrate with the

water and this may not happen if the powdered acacia is left in contact with the oil too long before adding the water. The primary emulsion should be diluted to volume with the vehicle, any salts or alcoholic liquids being added in a diluted condition just before the final adjustment to volume.

Even a good emulsion may, on standing, tend to separate into two layers, an upper concentrated emulsion and a lower very weak emulsion. This is known as "creaming." An emulsion in this condition is readily made homogeneous again by shaking, but creaming will reoccur on standing. In order to prevent creaming, either the continuous aqueous phase must be made more viscous by the incorporation of more acacia or, better still, tragacanth, or the globules of the oily disperse phase must be decreased in size. In a hand mortar-made emulsion, using the proportions of oil and gum stated above, it is almost impossible to prevent creaming if the amount of oil present is less than 20%. By employing a machine, however, the oil globules can be reduced to such a very fine size that creaming can be prevented. Acacia emulsions usually require a preservative such as chloroform (0.2%) or benzoic acid (0.6%).

Decoction of Chondrus. This is a cheap emulgent and can be employed to replace acacia although it does not form such a good emulsion. It is preferable to use an emulsion machine as mortar-made emulsions are usually very coarse and are prone to separate. The decoction should be freshly prepared and allowed to stand for about 18 hours before use. If a machine is used, such as a small cream machine, equal volumes of the oil and decoction should be stirred together and the mixture passed through the machine twice. A preservative such as chloroform or benzoic acid is very necessary with this type of emulsion.

Yolk of Egg. This is an excellent emulgent for oils. It possesses approximately double the emulsifying power of powdered acacia, volume for weight. The yolk of an egg of average size measures from 4 to 5 fluid drachms and suffices for the emulsification of 4 fluid ounces of fixed oil or 2 fluid ounces of volatile oil. White of egg is a much poorer emulgent than the yolk and it is usual to reject it, using the latter only.

The yolk should be triturated to a perfectly smooth consistence and the oil gradually incorporated by trituration, water being added from time to time if the emulsion thickens too much.

Emulsions prepared with yolk of egg are not so liable to separate upon the addition of alcoholic preparations, acid salts, diluted acids, glycerin, syrups or large quantities of soluble salts as are those prepared with acacia. Preservatives are necessary for this type of emulsion.

Yolk of egg may be preserved by mixing it with an equal volume of glycerin, and by this means it can be kept in a suitable condition ready for use.

When preparing an emulsion in an homogenising or emulsion machine, it may happen that the resulting emulsion is too viscous, although when made by hand in a mortar the viscosity is a suitable one. The difference is due to the much smaller globules of oil in the machine-made emulsion, and it is advisable in this case to reduce the amount of emulgent specified in the formula.

ANTAGONISMS OF EMULSIFYING AGENTS. Antagonisms sometimes occur between emulsifying agents which individually produce the same type of emulsion. Emulsifying agents may be divided into 3 groups: (1) emulsifiers with low internal and superficial viscosity (sodium oleate); (2) those with low internal and high superficial viscosity (saponin); (3) those with high internal and superficial viscosity (acacia). Members of group (1) antagonise the other groups, but groups (2) and (3) are compatible.—N. Chatterjee, per *J. Amer. pharm. Ass.*, 1937, 197.

Methyl cellulose is used for the preparation of oil-in-water emulsions. A 10% mucilage is prepared by heating the emulsifier with water and allowing to cool, or by wetting it with equivalent amount of glycerin, alcohol 90%, or oil, and then adding the water. The oil is then stirred into the mucilage. Emulsions prepared with methyl cellulose preparations are compatible with both acids and alkalis. Their mucilages are tasteless, neutral in reaction, do not ferment or grow moulds, and dry on the skin without unpleasant stickiness.

P.M.B. 333 (*Pharmaceutical Specialities (May & Baker) Ltd., London*)
A cellulose derivative colloiddally soluble in cold water, the solution becoming more viscous and less clear as the concentration of P.M.B. 333 increases. The solution has adhesive properties and can replace mucilages, agar-agar, tragacanth, acacia, etc. It is uniform, very stable, and has the power of emulsifying substances such as oils, fats, waxes, natural and artificial resins, etc.

For details of hand machines for preparing emulsions, see *Pharm. J.*, ii/1934, 307, 337.

EPHEDRA

(with EPHEDRINE)

B.P.C., Fr. Cx.

Syn. MA-HUANG.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Ephedra, alkaloids of.*"

[S3] "*Alkaloids—Ephedra, alkaloids of—in substances containing less than 1% of the alkaloids of ephedra.*"

[S6] "*Alkaloids—Ephedra, alkaloids of—specify proportion as the proportion of any one alkaloid of ephedra that the preparation would be calculated to contain on the assumption that all the alkaloids of ephedra in the preparation were that alkaloid.*"

The dried young branches of *E. sinica*, *E. equisetina*, *E. Gerardiana*, and other species of *Ephedra* (Ephedraceæ) from India, China and Spain. It contains 1 to 2% of alkaloids of which up to about 70% may be *l*-ephedrine, other alkaloids present being its stereoisomeride, *d-ψ*-ephedrine (pseudo-ephedrine), and small amounts of *l*-*N*-methylephedrine, *d*-*N*-methyl-*ψ*-ephedrine and nor-*d-ψ*-ephedrine. The *B.P.C.* requires not less than 1.25% of alkaloids.

Ephedra varieties and alkaloid content.—*Pharm. J.*, ii/1927, 118.

[P1] **Extractum Ephedræ Liquidum (B.P.C.).**

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 ml.). 1 in 1.

When dispensed in mixtures mucilage must be added.

Phedros (*Sharp & Dohme, London*). Each fl. oz. contains chloroform 2 m., liquid extract of ephedra 40 m., syrup of squill 180 m., syrup of ipecacuanha 40 m., ammonium chlorid 8 gr., and syrup of tolu. *Dose.*—2 teaspoonfuls every 2 or 3 hours.

[P1] **Ephedrina** (*B.P.C.*, *U.S.P. XI*, *Fr. Cx.*).

Syn. α -HYDROXY- β -METHYLAMINOPROPYLBENZENE, α -PHENYL- β -METHYL AMINOPROPANOL, *l*-EPHEDRINE.

$C_9H_9 \cdot CH(OH) \cdot CH(NH \cdot CH_3) \cdot CH_3 = 165.1$.

Dose.— $\frac{1}{2}$ to $1\frac{1}{2}$ grains (0.016 to 0.1 g.).

An alkaloid obtained from various species of *Ephedra*, and also prepared synthetically. The synthetic or artificial substance is laevorotatory and is stated to be identical in action with natural ephedrine (see E. C. Dodds and R. L. Noble, *Pharm. J.*, i/1938, 641). It occurs in white crystals which readily absorb moisture and carbon dioxide. As usually supplied it contains about 5% of water of crystallisation corresponding to the hemihydrate which has a m.p. of about 40°; the anhydrous crystals melt at about 38°. The hydrated crystals can be dried by storage over calcium chloride. (*N.N.R.* also gives EPHEDRINE ANHYDROUS and EPHEDRINE HEMIHYDRATE, both for use in a 1% oily solution for local application to mucous membranes.)

Volatility. Both ephedrine and pseudoephedrine are appreciably volatile at 30° and 60°C, and readily volatile at 100°C.—R. Monnet and P. Durand, per *Quart. J. Pharm.*, 1938, 764.

Soluble 1 in 20 of water, 1 in 20 of glycerin, 1 in 100 of liquid paraffin (the solution being turbid unless made with anhydrous ephedrine), and in light petroleum, ether, alcohol and fixed and volatile oils. The solution in chloroform leaves a residue of ephedrine hydrochloride on evaporation.

Dispensing Note. Ephedrine preparations should be kept in stoppered amber bottles. Aqueous solutions undergo decomposition on exposure to light and air with formation of benzal-ephedrine. Oily solutions give very unpleasant-smelling compounds, probably amines, and eventually ephedrine carbonate and ammonia.

Compatibility. Both the sulphate and hydrochloride appear to be compatible in the cold with chemicals likely to be prescribed with them, e.g., the bromides, iodides, carbonates, bicarbonates, and sodium salicylate. Reasonable precautions are needed as ephedrine is a delicate alkaloid.

Toxic effects have sometimes been observed, consisting of giddiness, headache, thirst, nausea, palpitation, insomnia, tremor, anxiety complex, and bladder irritation. Large and repeated doses should be avoided. Some patients need carefully regulated doses. Very large doses cause diaphoresis. For an adult a strong saline purge is suggested and a vasodilator if blood pressure is high, which is *not necessarily the case*.

Chronic poisoning following $\frac{1}{2}$ grain thrice daily for four months.—W. H. Higgins, *J. Amer. med. Ass.*, i/1929, 313.

10 mg. of ephedrine subcutaneously may cause gangrene and necrosis at the site of injection, but smaller doses do not. Adrenaline is said to be two and a half times as efficient as ephedrine.—J. E. Nadler, *Pharm. J.*, ii/1927, 73.

Uses. Ephedrine has a similar physiological action to adrenaline, but its action is less potent and more prolonged and owing to its greater stability it has the advantage over adrenaline of being

effective when taken by the mouth. In therapeutic doses it has a stimulant action on the heart, but large doses are depressant. Given by injection it causes a lasting rise of blood pressure, and it is employed for this purpose to combat the fall in blood pressure consequent on spinal anaesthesia. Given orally or by injection it dilates the bronchial muscles and is of great value in asthma, though it is more effective in preventing an attack than in relieving one already present. It is of value in whooping-cough by relieving the bronchial spasm, though its effect is enhanced by the concurrent use of belladonna.

It has a similar vasoconstrictive action on mucous membranes to adrenaline, but is without the irritant action of the latter. Ephedrine sprays are much employed in hay fever, coryza and laryngitis, but their continued use is liable to lead to an aggravation of the dilatation; in particular, the use of oily sprays in children is to be deprecated, owing to the danger of lung complications.

It is also given internally in nocturnal incontinence, in myasthenia gravis and in narcolepsy, and has been suggested for use intravenously in obstetric shock and collapse and orally for the relief of nerve pains in leprosy. It is sometimes used as drops (1 or 2%) or ointment for its mydriatic effect.

It was found in barbiturised dogs that ephedrine administered either orally or intravenously has no effect on the intestinal absorption of isotonic sodium chloride solution or of isotonic glucose solution. Ephedrine given orally has no effect on absorption of water from the intestine, but when the drug is given intravenously the amount of water absorption is somewhat decreased. Since ephedrine has so little effect on the absorption of such divergent substances as water, sodium chloride and glucose, it seems safe to assume that the absorption of food substances in general from the intestine is probably not materially affected by the drug. This is of importance, as ephedrine is often given over long periods of time in certain chronic ailments.—E. J. van Liere, D. Northup and C. K. Sleeth, *J. Pharmacol.*, 1937, 434.

ASTHMA. Though it has the advantage over adrenaline of effectiveness *per os* and giving longer immunity from attacks, it may cause tremor, palpitation, insomnia and sometimes inability to micturate.—Frank Coke, *Brit. med. J.*, i/1929, 954. The first dose seems to act marvellously, but subsequent doses seem to do nothing.—J. Freeman, *ibid.*

A useful prophylactic agent. Psychological effect of being able to prevent acute attack. Peptone injections prior to ephedrine of value.—A. Dingwall Fordyce, *Brit. med. J.*, i/1931, 166.

The following injection hypodermically has been found useful in severe attacks:—Ephedrine hydrochloride $\frac{1}{2}$ gr., Liq. Adrenalin. 1 in 1000 5 m., pituitary extract 0.5 ml., distilled water to 1 ml. It should be put up in air-free ampoules, as otherwise it becomes discoloured.—M. W. Geffen, *Lancet*, ii/1932, 56.

Definitely better results when combined with thyroid medication. $\frac{1}{2}$ gr. dose of ephedrine hydrochloride twice daily gave little relief, but $\frac{1}{2}$ gr. dose at night with 1 gr. of thyroid B.P. in the morning averted attacks for some months.—H. S. Russell, *Brit. med. J.*, i/1934, 1097.

COLIC. Ephedrine hydrochloride is preferable to morphia in both renal and biliary colic. In renal colic the results of $\frac{1}{2}$ to 1 gr. dose of ephedrine by mouth are spectacular—relief is almost instantaneous. In gall-stone colic there is some relief, but not to the same extent as is the case with renal colic. If ephedrine is not available, $\frac{1}{2}$ gr. atropine sulphate acts very well, i.e., it acts on the unstriated muscle fibre and relaxes the muscle.—A. J. Ambrose, *Med. Pr.*, ii/1936, 46.

ENURESIS IN CHILDREN. Ephedrine $\frac{1}{2}$ grain at bedtime for child from 10 to 12 almost specific. Bladder emptied before and 2 hours after going to sleep.—L. E. Parkhurst, *Brit. med. J.*, ii/1930, 1103.

The most useful drug at present available for treatment of enuresis in children. Give an initial dose of ephedrine hydrochloride at bedtime and increase by $\frac{1}{2}$ gr. every 4 to 7 days till enuresis is controlled; as much as 4 gr. at a dose given without unpleasant effects. Wakefulness and restlessness respond well to phenobarbitone $\frac{1}{2}$ gr. given with the ephedrine.—R. W. Brookfield, *Brit. med. J.*, ii/1935, 1119.

Ephedrine was given in 38 consecutive cases, over periods up to several months; the enuresis ceased in 10 cases and there was improvement in 14 others. The ephedrine sometimes caused restlessness and other side-effects, but these were seldom seen in older children of phlegmatic type, some of whom seemed to have an unusual tolerance to the drug. Toxic effects cease promptly when the drug is remitted. Those cases in which enuresis persists through school life, only to cease in the late teens or early twenties, are precisely the ones in which ephedrine appears to be of most value. After excluding urinary infection, half a grain of ephedrine alkaloid in tablet form is prescribed to be given at bedtime. The dose is increased by $\frac{1}{2}$ gr. every 3 to 4 nights until in some cases as much as 5 grains is being taken. The insomnia due to ephedrine may be relieved to some extent by giving $\frac{1}{2}$ to 1 gr. of phenobarbitone simultaneously.—R. W. Brookfield, *Lancet*, ii/1937, 623.

LEPROSY. *Per os* relieves nerve pains. More lasting and efficient than adrenaline injections.—E. Muir, *Indian med. Gaz.*, Apr., 1928, 198. See also R. G. Cochrane, *Lancet*, ii/1929, 551, and R. Green, *Trans. R. Soc. trop. Med.*, Jan., 1929, 376.

LOW BLOOD PRESSURE. $\frac{1}{2}$ to $\frac{1}{4}$ gr. produces very satisfactory rise in pressure and no toxic symptoms. $\frac{1}{2}$ gr. caused giddiness.—H. W. Hales, *Lancet*, ii/1928, 360.

Chronic vascular hypotension. Nine cases treated. Rise in systolic pressure, remaining up for 4 hours.—*Lancet*, ii/1928, 144.

Doses of 0.05 to 0.125 g. *per os* or subcutaneously raise systolic and diastolic blood pressure, and increase pulse rate for several hours.—T. G. Miller, *per J. Amer. med. Ass.*, ii/1925, 1159.

Low blood pressure following influenza, pneumonia, etc. The power of ephedrine to raise blood pressure appears to be decreased in arteriosclerosis, debility and hypertension.—*J. Amer. med. Ass.*, 1931, 96, 480.

Warning against use in patients with cardiac injury.—*Prescriber*, 1929, 70.

MYASTHENIA GRAVIS. Personal experience of a medical victim after influenzal pneumonia. Progress with ephedrine after none with adrenaline and thyroid.—H. Edgeworth, *J. Amer. med. Ass.*, i/1930, 1136.

Ephedrine in doses of $\frac{1}{2}$ gr. twice daily of distinct value, the disease may, however, progress during its use.—D. McAlpine, *Lancet*, i/1934, 180.

NARCOLEPSY. Symptoms successfully treated in eight cases by ephedrine hydrochloride or sulphate $\frac{1}{2}$ gr. 2 or 3 times daily.—Henry Cohen, *Lancet*, ii/1932, 335. See also A. Haddow, *ibid.*, 420.

OBSTETRIC SHOCK AND COLLAPSE. 1 gr. in 8 ml. of normal saline intravenously. Also in gynaecological cases to lessen shock of operation.—J. H. Hannon, *Brit. med. J.*, i/1929, 954.

SHOCK FROM TRAUMA OR HÆMORRHAGE. Intravenous injection of 15 mg. of value.—C. A. Johnson, *J. Amer. med. Ass.*, i/1930, 1388.

SPINAL ANÆSTHESIA. Of value in restoring arterial tension. Give 0.1 g. subcutaneously before systolic pressure drops below 100.—*J. Amer. med. Ass.*, 1927, 1136.

For dependable results (to raise blood pressure in spinal anæsthesia) ephedrine must always be given intravenously, because its action is uncertain when given intramuscularly or subcutaneously. The duration of the raised level is uncertain, 10 to 20 minutes being probably the maximum period; therefore, repeated injections are necessary.—H. Dodd, *Lancet*, i/1940, 359.

STOKES-ADAMS' DISEASE. 30 mg. of ephedrine sulphate by mouth gave instant relief from attacks and in one week the individual dose was cut down to 20 mg. Medication ceased after a fortnight and there were no attacks for a year, when they were again relieved by ephedrine.—C. S. Higley and R. M. Stechen, *per Brit. med. J. Erit.*, i/1934, 27.

In six cases of complete heart-block ephedrine orally increased the rate of ventricular beating in four, and in two other cases complicated by Stokes-Adams' seizures, ephedrine taken for 2 $\frac{1}{2}$ and 1 $\frac{1}{2}$ years respectively was entirely

successful in prevention of syncopal attacks, but seizures returned with its discontinuance. The dose recommended is the minimum quantity consistent with an acceleration. A dose of $\frac{1}{2}$ gr. at 8-hour intervals may be sufficient.—A. R. Gilchrist, *Brit. med. J.*, i/1934, 613.

WHOOPIING COUGH. Dose of $\frac{1}{2}$ grain *per os* in watery solution to children of one year and $\frac{1}{2}$ grain for those younger, night and morning, of value. Most useful during second stage. No serious toxic symptoms.—*Brit. med. J. Epit.*, i/1928, 28.

Narist. Ephedrin. (N.I.F.). Ephedrine $2\frac{1}{2}$ gr., menthol $1\frac{1}{2}$ gr., oleic acid 5 m., liquid paraffin to 1 oz.

[P1] **Nebula Adrenalinæ et Ephedrinæ Oleosa (B.P.C.).**

Adrenaline 1 in 10,000 and ephedrine 1 in 50, with menthol and eucalyptol in an oily basis.

A warning concerning the misuse of vasoconstrictor drugs (adrenaline and ephedrine) as sprays, oils or drops for nasal troubles. Continuous and indiscriminate use may be fraught with disastrous results. On repeated use the duration of the constriction becomes gradually reduced, and in the end a condition of aggravated dilatation is produced.—A. Francis, *Brit. med. J.*, i/1936, 609.

Solutions of drugs in oils should never be used as intranasal medication, in infants and children, and should be used with care in adults. Antiseptic solutions are of doubtful value in decreasing the pathogenic flora of the nose, and there is danger of producing lung lesions. Ephedrine is a chemically stable vasoconstrictor which in normal saline solution does not produce the unpleasant sensation of burning and stinging. These qualifications render it specially suitable for use in children.—C. G. Flake, *New Engl. J. Med.*, 1939, 866.

An attempt to produce antiseptic or astringent effects in the nose with any of the solutions now in use is fraught with danger, and weak solutions of ephedrine ($\frac{1}{2}$ per cent. in normal saline) are the only ones which should justifiably be used to produce vasoconstriction, since these alone neither damage ciliary action nor interfere with the flow of mucus.—*Brit. med. J.*, i/1939, 343.

[P1] **Neb. Ephedrin. Co. (N.I.F.).** Ephedrine $4\frac{1}{2}$ gr., menthol $8\frac{1}{2}$ gr., camphor $8\frac{1}{2}$ gr., oil of thyme 9 $\frac{1}{2}$ m., oleic acid 10 m., light liquid paraffin to 1 oz.

[P1] **Nebula Ephedrinæ Composita (B.P.C.).** Ephedrine 1% *w/v* with menthol, camphor and oil of thyme in light liquid paraffin.

[P1] **Unguentum Ephedrinæ (B.P.C.).** 1% in white soft paraffin.

[P1] **Ephetonin (Merck, Darmstadt; Savory & Moore, London)** is the inactive form of ephedrine synthetically prepared. 4 mg. of the synthetic are stated to be equivalent to 2 mg. of the natural alkaloid.

[P1] **Ephedrinæ Hydrochloridum (B.P., U.S.P. XI, Fr. Cx., P. Helv. V, P. Dan.).**

$C_6H_5 \cdot CH(OH) \cdot CH(NH \cdot CH_3) \cdot CH_3 \cdot HCl = 201.6$.

Dose.— $\frac{1}{2}$ to $1\frac{1}{2}$ grains (0.016 to 0.1 g.). (*Caution:* 1 grain has been known to produce slight toxic phenomena. Many people react well to $\frac{1}{10}$ grain.) *U.S.P. XI* average dose $\frac{3}{4}$ grain. *P. Dan.* max. single dose $1\frac{1}{2}$ grains; max. per day 6 grains. *P. Helv. V* gives $\frac{3}{4}$ grain and 3 grains respectively. Colourless crystals. M.p. 213° to 216° .

Soluble 1 in 5 of water, 1 in about 5 of alcohol 90%, 1 in 60 of glycerin; insoluble in ether, chloroform, olive oil and in liquid paraffin.

Ephedrine-Glucose-Gum Solution. Advocated for intravenous infusion following severe hæmorrhage.—Ephedrine hydrochloride 1 gr., dextrose 440 gr., acacia 525 gr., water to 1 pint. The ephedrine is stated to help to raise the peripheral resistance, thus raising the blood pressure more rapidly. Insulin (10 units) may be given intramuscularly at the same time.—W. Hunter, *Brit. med. J.*, ii/1936, 537.

Elixir Ephedrinæ Hydrochloridi (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

A lemon-flavoured elixir containing $\frac{1}{2}$ gr. of ephedrine hydrochloride per dr. Asthma is well treated by 1 to 2 drachms at bedtime; also gives relief in hay fever. For whooping-cough in children $\frac{1}{2}$ to 1 drachm.

[P1] Nebula Adrenalinæ et Ephedrinæ (B.P.C.).

Adrenaline 1 in 8000 and ephedrine hydrochloride 1 in 45 in an aqueous medium.

[P1] Tabellæ Ephedrinæ Hydrochloridi (B.P.C.) contain $\frac{1}{2}$ gr. (0.03 g.).

[P1] **Adrephine Inhalant (Parke, Davis, London).** Adrenaline 1 in 10,000, ephedrine hydrochloride 1%, benzocaine 1%, Chloretone 0.5% and glycerin q.s. As a spray in hay fever, rhinitis, etc. [P1] **Adrephine Ointment** contains adrenaline 1 in 5000 and ephedrine hydrochloride 2%. For application to inflamed mucous membrane.

Argotone (Rona Laboratories, London). "Natural lævorotatory Ephedrine hydrochlorate" 0.9%, Argryol (Barnes) 1, normal saline solution to 100. To be used as a spray at least two times daily or 4 to 6 drops to be instilled into each nostril 3 to 5 times a day.

[P1] **Cosome Brand Cough Syrup (Merck, Darmstadt; Savory & Moore, London).** Contains Ephetonin 0.2%, Dionin 0.04%, and syrup of thyme.

[P1] **Disco (Abbott Laboratories, London).** Tablets containing ephedrine hydrochloride $\frac{1}{2}$ gr. and phenacetin $1\frac{1}{2}$ gr. *Dose.*—2 tablets and then one tablet at intervals of 1 to 4 hours, as required. For relief of pain in dysmenorrhœa.

[P1] **Ephetonogen (Richter, London).** Ephedrine hydrochloride 0.02 g., adrenaline 0.0001 g. *Dose.*—1 ml. daily subcutaneously or intramuscularly.

[P1] **Ephetonogen Forte.** Ephedrine hydrochloride 0.03 g., adrenaline 0.00015 g., atropine 0.00002 g., in 1 ml. *Dose.*—1 ml. subcutaneously or intramuscularly.

[P1] **Ephregel (Evans, Sons, Lescher & Webb, Liverpool).** A combination of ephedrine and adrenaline as a nasal jelly for use in hay fever, rhinitis, and acute colds.

[P1] **Ephrelis (Evans, Sons, Lescher & Webb, Liverpool).** Elixir containing per dr. ephedrine hydrochloride $\frac{1}{2}$ gr., codeine phosphate $\frac{1}{16}$ gr., with squill and wild cherry. *Dose.*—2 to 4 drachms.

[P1] **Ephresol (Evans, Sons, Lescher & Webb, Liverpool).** Nasal spray containing ephedrine hydrochloride 2% and adrenaline 0.01%.

Ephretuss (Evans, Sons, Lescher & Webb, Liverpool). Syrup of ephedrine containing $\frac{1}{2}$ gr. of ephedrine per dr. *Dose.*—Under 1 year, up to 1 drachm; over 1 year, up to 2 drachms; 2 or 3 times daily.

[P1] **Gluco-Fedrin (Parke, Davis, London).** A nasal spray containing ephedrine 1%, chloretone 0.5%, and menthol 0.1% in a dextrose base. For the treatment of rhinitis, etc.

[P1] **Isedrin Plain (Lilly, London).** Aromatic aqueous solution of ephedrine 1% w/v, with gluconic acid and chlorbutol 0.5%, rendered isotonic with dextrose, for use as a nasal spray in catarrh, etc. Available also with Merthiolate (Isedrin Compound) instead of chlorbutol.

[P2] **Metaphedrin Inhalant No. 99 (Abbott Laboratories, London).** Contains ephedrine 0.95% and Metaphen (q.v.) 1 in 2500. Colds, asthma, hay fever, etc.

[P1-81-84] **Ephedrine and Nembutal (Abbott Laboratories, London).** Capsules containing Nembutal $\frac{1}{2}$ gr. and ephedrine hydrochloride $\frac{1}{2}$ gr. Asthma, hay fever, and other allergic conditions. The addition of Nembutal has antispasmodic and sedative effect.

Zephrol (Pharmaceutical Specialities (May & Baker) Ltd., London). Nasal jelly containing ephedrine hydrochloride, chlorbutol, sodium chloride and essential oils. Zephrol spray solution and cough syrup, both containing ephedrine, are also supplied.

[P1] **Ephedrinæ Sulphas** (B.P.C.). ($C_{10}H_{15}ON$)₂.H₂SO₄ = 428.3.

Dose.— $\frac{1}{4}$ to $1\frac{1}{2}$ grains (0.016 to 0.1 g.). U.S.P. XI average dose $\frac{1}{2}$ grain.

White, colourless, odourless crystals, *soluble* 1 in 2 of water, 1 in 60 of alcohol 90%, 1 in 60 of glycerin; insoluble in oils.

[P1] **Adrephine** (Parke, Davis, London). Adrenaline 0.01%, ephedrine sulphate 2% and Chloretone 0.5% in solution. Used as spray in hay fever, rhinitis, etc.

[P1] **Epinalin** (Burroughs Wellcome, London). Each ml. contains adrenaline 0.0001 g. (= 1 in 10,000) and ephedrine sulphate 0.02 g. (= 1 in 50). Nasal spray in asthma and hay fever. Also supplied in ampoules for hypodermic injection.

[P1] **Pseudo-Ephedrine**. *Syn.* *d-ψ*-EPHEDRINE.

Dose.—Children: $\frac{1}{4}$ grain (0.015 g.) for children under 7, $\frac{1}{2}$ grain (0.03 g.) for children over 7. Adults: 1 grain (0.06 g.) repeated at hourly intervals until 3 grains has been given.

Less toxic than ephedrine and much less effect on blood pressure. Is more effective in lessening frequency of attacks in asthma of children, but not so effective in relieving an attack in adults. Useful for prevention of dyspnoea in bronchitis and bronchial asthma. Especially indicated in those cases intolerant of ephedrine.

PRESSOR ACTION IN MAN was determined in 28 patients by subcutaneous injection. 1 gr. of pseudo-ephedrine caused a slight rise of blood pressure followed by a fall, while 2 gr. produced a pronounced rise approximating to that obtained with 1 gr. of ephedrine.—S. B. Dimson, *Quart. J. Pharm.*, i/1934, 23. (Report to the Therapeutic Trials Committee.)

Pseudo-ephedrine is of less value than ephedrine for controlling a fall in blood pressure during spinal anaesthesia.—J. E. Monro, *ibid.*, 32.

PSEUDO-EPHEDRINE IN ASTHMA. A report to the Therapeutic Trials Committee. *Per os* it is more efficacious than ephedrine in lessening attacks of asthma in childhood, but less efficacious in relieving actual asthmatic paroxysm in adults. Less toxic than ephedrine, but in large doses may produce the same unpleasant side-actions. Worthy of further trial in children and in adults unable to tolerate ephedrine. Neither ephedrine nor pseudo-ephedrine as effective as adrenaline injections in treatment of an asthmatic attack.—G. W. Bray and L. J. Wits, *Lancet*, i/1934, 790.

Tests of ephedrine and pseudo-ephedrine at the Hospital for Sick Children, Gt. Ormond Street, find both drugs wanting as a sure preventive of asthmatic attacks, the best medicinal treatment for children being dilute hydrochloric acid before meals, with an anti-spasmodic at bedtime.—Asthma Research Council Report, 1933, *Brit. med. J.*, ii/1933, 1135.

Useful for the minor manifestations of asthma but cannot replace ephedrine in the severe attacks.—J. B. Christopherson and M. Broadbent, *Brit. med. J.*, i/1934, 978.

Propadrinæ Hydrochloridum. *Prop. Name.* PROPADRIN HYDROCHLORIDE (Sharp & Dohme, London) (Capsules contain $\frac{1}{2}$ gr.). $C_9H_9\text{CHOH}\cdot\text{CHNH}_2\cdot\text{CH}_3\cdot\text{HCl}$ = 187.7.

Dose.— $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.024 to 0.048 g.).

Propadrine hydrochloride is the hydrochloride of *dl*-phenyl-1-amino-2-propanol-1, a base resembling ephedrine. It occurs as a white, crystalline powder, melting at 190° to 194°.

Soluble freely in water and alcohol; insoluble in ether, chloroform and benzene.

Uses. Has an action similar to that of ephedrine but somewhat

more prolonged, and is less apt to give rise to an anxiety complex. It is employed internally in the treatment of allergic manifestations. Externally, it has a vasoconstrictive action on the mucous membranes and is used by local application in rhinitis, etc., in the form of a 1% solution or as a compound nasal jelly containing 0.66% of the hydrochloride.

Amphetamina. *Syn. and Prop. Names.* ISOMYN, β -AMINO-PROPYLBENZENE, β -PHENYLISOPROPYLAMINE, BENZYL METHYL CARBINAMINE, α -METHYLPHENETHYLAMINE, α -PHENYL- β -AMINOPROPANE, RACEMIC DESOXY-NOR-EPHEDRINE, ALLODENE (*Bush, London*), BENZEDRINE (*Smith, Kline & French, Philadelphia; Menley & James, London*).

[P1] and [S1] "*Beta-aminopropylbenzene; its salts; its N-alkyl derivatives; their salts; beta-aminoisopropylbenzene; its salts; its N-alkyl derivatives; their salts.*"

[S3] "*Beta-aminopropyl benzene; its salts; its N-alkyl derivatives; their salts; beta-aminoisopropylbenzene; its salts; its N-alkyl derivatives; their salts, in appliances for inhalation in which the poison is absorbed in inert solid material.*"

[S7] "*Medicines made up ready for the internal treatment of human ailments containing beta-aminopropylbenzene; its salts; its N-alkyl derivatives; their salts; beta-aminoisopropylbenzene; its N-alkyl derivatives; their salts, must be labelled with the words "Caution. It is dangerous to take this preparation except under medical supervision" instead of the word "poison."*"

A colourless, mobile liquid with a slight odour and an acrid taste, obtained by the reduction of the oxime of phenylacetone. Amphetamine consists of a mixture of racemic desoxy-nor-ephedrine bases of the formula $C_6H_5CH_2CH \cdot NH_2 \cdot CH_3$. It readily volatilises at the ordinary temperature and boils at about 202° . On exposure to air it absorbs carbon dioxide forming a carbonate which is also readily volatile.

Slightly *soluble* in water; soluble in ether, alcohol, acids, amyl alcohol, ethyl acetate and chloroform.

Uses. It resembles ephedrine and adrenaline in properties, and is used as a volatile vasoconstrictor for use by inhalation in hay fever and for the relief of acute coryza and all catarrhal affections of the respiratory system. Inhalations should be repeated at not less than hourly intervals, since overdosing may give rise to restlessness and insomnia. Its use is contraindicated in cardiovascular disease, and in patients suffering from sinusitis it is stated to increase the severity of the symptoms.

An exhaustive list of the toxic signs and symptoms due to the inhalation of Benzedrine.—S. P. Waud, *J. Amer. med. Ass.*, i/1938, 206.

Benzedrine Inhaler (*Smith, Kline & French, Philadelphia; Menley & James, London*). An inhaler containing β -phenylisopropylamine 0.325 g., oil of lavender and menthol.

Karsodrine Inhaler (*Griffiths Hughes, Manchester*). An inhaler containing β -phenylisopropylamine 0.33 g., cineol, oil of citronella-methyl salicylate, oil of eucalyptol, menthol and eucalyptol.

[P1-31] **Amphetaminæ Sulphas.** *Prop. Name.* BENZEDRINE SULPHATE (*Smith, Kline & French, Philadelphia; Menley & James, London*).

Dose.— $\frac{1}{24}$ to $\frac{1}{2}$ grain (0.0025 to 0.01 g.).

A white odourless powder with a slightly bitter taste that is followed by numbness. It is prepared by neutralising benzedrine in alcoholic solution with sulphuric acid.

Readily **soluble** in water; slightly soluble in alcohol (90%); insoluble in ether.

Toxic Effects. It is usually well tolerated in therapeutic dosage, but minor reactions such as dryness of the mouth, insomnia, loss of appetite, tremor and palpitations are not uncommon. Overdosage may lead to collapse and syncope, and continuous administration may lead to addiction, and has been known to give rise to aplastic anæmia.

Untoward cardiovascular effects were observed following the administrations of 10 to 30 mg. of Benzedrine sulphate. Symptoms included pallor, flushing, palpitation and variations in pulse-rate and blood-pressure. In six cases the effects recorded included collapse, multiple extrasystoles, heart-block and pain in the chest radiating to the left arm.—E. W. Anderson and W. C. N. Scott, *Lancet*, ii/1936, 1461.

Symptoms of acute poisoning were brought on in one case as a result of the ingestion of 30 mg. within six hours.—H. Ulrich, *New Engl. J. Med.*, ii/1937, 696.

Benzedrine sulphate gives the best results when used in doses of 10 to 30 mg. Larger amounts often produce so much palpitation, tremor and rise in blood pressure that the concomitant psychological effects are apt to be destroyed. The drug should be given before midday if sleeplessness is to be avoided; the effect tends to remain at a maximum for about 5 hours and takes an hour or more to develop fully. The possibility of addiction needs to be guarded against, though the preponderance of disquieting somatic symptoms over the feeling of euphoria, when large doses are taken, and the sleeplessness induced will probably make addiction rare.—E. Guttman and W. Sargent, *Brit. med. J.*, i/1937, 1013.

A case of acute aplastic anæmia following the self-administration of Benzedrine sulphate by a young man of 26, previously in good health. The total amount taken was 190 mg. in nineteen days. Severe cardiovascular collapse occurred the day after the last dose was taken. Gradual recovery ensued with restoration to normal health.—I. J. Davies, *Brit. med. J.*, ii/1937, 615.

Collapse with death following continued use of Benzedrine sulphate by a student.—L. C. Smith, *J. Amer. med. Ass.*, ii/1939, 1022.

The continued use of amphetamine may result in addiction. A case reported.—S. Friedenber, *J. Amer. med. Ass.*, i/1940, 956.

Contraindications. Its use is contraindicated in elderly patients, in cardiovascular disease, especially in the presence of hypertension, and in patients with prominent anxiety symptoms.

Uses. Amphetamine sulphate has a marked stimulant effect on the central nervous system, causing a lessening of fatigue, an increase of mental activity, and a general feeling of well-being; in the higher doses it causes an appreciable rise in blood pressure and relaxes the smooth muscle of the gastro-intestinal tract. The pressor effect is enhanced by atropine, stramonium and scopolamine. It has been employed with success in the treatment of narcolepsy, in post-encephalitic parkinsonism, in sea-sickness, and in mild depressive neuroses. It is not recommended in the treatment of sleepiness and fatigue in normal individuals, and should not be used as a "pick-me-up," except under strict medical

supervision. In maximum doses it is of value for facilitating the roentgenographic study of the intestinal tract, but its general use in spastic conditions of the intestine is not recommended.

It is best to commence treatment with a dose of from 2.5 to 10 mg., and it is inadvisable to exceed 20 mg. for a single dose. In certain conditions it may be necessary to repeat the use of the drug two or three times daily. In order to avoid insomnia the drug is preferably administered during the morning.

BARBITURATE POISONING. Benzedrine sulphate is effective in preventing or counteracting the narcosis produced by the intravenous administration of sodium amytal. This action and the fact that Benzedrine sulphate causes a rapid and prolonged rise in blood pressure may be found useful in certain medical or surgical cases in which it seems desirable to overcome severe side reactions of the narcosis produced by the barbiturates, particularly respiratory embarrassment and pronounced decrease in blood pressure.—A. Myerson *et al.*, *New Engl. J. Med.*, ii/1939, 1015.

HYPOTENSION. An investigation of blood pressure in mental disorders. Benzedrine sulphate given orally causes a rise in blood pressure, commencing in 45 to 120 minutes, reaching a maximum in a further 60 minutes and returning to normal in 24 hours. All patients showed increased talkativeness and frequently there was a tendency in the direction of euphoria.—S. A. Peoples and E. Guttmann, *Lancet*, i/1936, 1107.

MORPHINE WITHDRAWAL TREATMENT. The administration of Benzedrine sulphate, 10 mg. daily, is an invaluable aid in combating the physical and mental inertia which is a common factor during convalescence from drug addiction.—H. C. Duckworth, *Brit. med. J.*, ii/1940, 628.

NARCOLEPSY. Complete relief of attacks of sleep and almost complete relief of cataplexy obtained in nine cases from use of Benzedrine 10 to 40 mg. 3 times a day. Start with 10 mg. doses to avoid untoward symptoms. Approximately three times as effective as ephedrine in preventing attacks of sleep.—M. Prinzmetal and W. Bloomberg, *J. Amer. med. Ass.*, ii/1935, 205.

Oral medication with Benzedrine sulphate appears to be the only satisfactory method of treatment. Several cases of long-continued use are reported; no deleterious effects were noted, and there was no evidence of habit formation.—H. Ulrich, *New Engl. J. Med.*, ii/1937, 696.

POST-ENCEPHALITIC PARKINSONISM. Combined treatment with Benzedrine sulphate, 10 mg. daily, and atropine sulphate, 10 to 15 drops of 0.5% solution three times daily, gave better results in the symptomatic treatment of 12 cases than the use of either medicament alone.—J. Finkelman and L. B. Shapiro, *J. Amer. med. Ass.*, ii/1937, 344.

Sixty-six out of 74 patients obtained definite subjective benefit from the use of Benzedrine (either alone or combined with the belladonna group of drugs) and 53 obtained objective benefit. Two doses of Benzedrine sulphate were given daily, the first at 8 a.m. and the second at noon, the dose varying from 40 to 60 mg. a day, the age and systolic pressure of the patient being used as determining factors in prescribing the initial dose. While it may not produce the striking relief of symptoms seen with the atropine group, it has the advantage that a constant dose seems to be adequate and that it is free from distressing side effects.—F. L. Davis and W. B. Stewart, *J. Amer. med. Ass.*, i/1938, 1890.

Benzedrine enhances the effect of stramonium, atropine and scopolamine, and is best used in conjunction with these drugs in the treatment of post-encephalitic parkinsonism. Encouraging results in 20 cases.—R. A. Matthews, *Amer. J. med. Sci.*, 1938, 195, 448.

PSYCHIATRY. The immediate effects of Benzedrine sulphate administered orally in doses of 10 to 20 mg. before breakfast and frequently repeated at noon, have been studied in 100 cases in which there were disorders of mood (chiefly depression), chronic nervous exhaustion and psychoneurosis. In about 80% of the cases of chronic exhaustion or depression, the immediate results were favourable and in some instances spectacular. When given to psychoneurotic patients, particularly those who are anxious, highly nervous and apparently stimulated, it has a less favourable immediate effect.—D. L. Wilbur, A. R. MacLean and E. V. Allen, *Proc. Mayo Clin.*, 1937, 97.

An account of a study of the effects of Benzedrine on a group of 33 patients over a period of fourteen months who were suffering from the minor forms of mental disorder. The dosage varied from 5 to 45 mg. daily *per os*. In 16 the drug had to be discontinued owing to untoward effects, and in two more because no benefit was produced. In 11 the drug appeared to be helpful, and in 5 no effect, mental or physical, was produced. Apart from transient relief in some cases, the drug is of doubtful value as an aid to psychotherapy. It would appear unwise to give Benzedrine to any subject with prominent anxiety symptoms. The initial dose should not exceed 10 mg., and the optimum dose determined carefully (divided dosage is recommended). It should be used cautiously in certain depressives, because of the possibility of intensifying the depression, with consequent suicidal risk.—E. W. Anderson, *Brit. med. J.*, ii/1938, 60.

SEA-SICKNESS. In 100 cases of sea-sickness satisfactory results were obtained from the use of Benzedrine sulphate in 39, doubtful results in 40, and failure in 21. It is not a rival to old-established methods, but is a useful ally. The effect is greater and more lasting when combined with other remedies. The effect is augmented by vagus-inhibiting drugs such as belladonna, and in the presence of concomitant sympathetic activity bromides or barbiturates prevent unpleasant restlessness and insomnia without interfering with the gastro-intestinal or circulatory effects of Benzedrine.—J. Hill, *Brit. med. J.*, ii/1937, 1109.

SPASTIC COLON. Benzedrine sulphate is not recommended in the treatment of spastic disorders of the gastrointestinal tract. Of 18 patients with a spastic irritable colon treated with Benzedrine sulphate, 3 improved, 1 showed improvement followed by relapse, 11 were unimproved, and 3 were worse.—D. H. Rosenberg *et al.*, *J. Amer. med. Ass.*, i/1938, 1994.

[P1-81] **Methedrine** (*Burroughs Wellcome, London*).

$C_6H_5 \cdot CH_2 \cdot CH(CH_3) \cdot NH(CH_3)$. = 149-23.

Dose.—2 to 4 mg. every four hours until the desired effect is obtained.

Methedrine is the dextro-rotatory form of the N-methyl derivative of amphetamine. It is issued in 2 mg. tablets for the treatment of narcolepsy and for controlling symptoms similar to those of narcolepsy in the treatment of post-encephalitic parkinsonism. It has been used as an analeptic in barbiturate poisoning and appears to be useful in increasing energy or capacity for work. It must, however, be used cautiously, particularly owing to its pressor effect and the hyper-excitability, gastro-intestinal disturbance and sleeplessness which follows its administration.

Its use is **contraindicated** in cardio-vascular disease, especially when hypertension is present.

Par-Isalol (*Coates & Cooper, London*). Tablets containing Isalol (1-phenyl-2[methyl(diethylaminoethyl)]-aminopropane-1-ol—*Gehe*), theobromine, caffeine and phenazone. For bronchial asthma, chronic bronchitis, angina pectoris, etc.

Isalol is an ephedrine substitute stated not to have the blood-pressure-raising effect of ephedrine, but to have a good action on the bronchial muscles. Of 60 cases treated (0.09 g. in tablets thrice daily during attacks and half this dose during quiescent periods) 22 were cured and 28 much relieved, with no observable effect on blood pressure or pulse rate and no toxic symptoms.—H. Handovsky and E. Kubeja, *Munch. med. Wschr.*, 1934, 326.

Phedracin (*Ciba, Horsham*). (Formerly known as CIBA 2020.) The hydrochloride of trimethoxybenzyl-dihydroimidazol; distantly related to adrenaline, ephedrine and mescaline. **Dose.**—Orally (tablets containing 0.2 g.), 0.1 to 0.4 g.; intramuscularly (1 ml. ampoules contain 0.1 g.), 0.1 to 0.2 g.; intravenously, 0.1 g. To combat the fall of blood pressure in spinal anaesthesia and for the treatment of post-operative shock; also in cases, *e.g.*, asthma, where patients are refractory to or intolerant of ephedrine.

In laboratory animals it was found to produce prolonged elevation of the blood pressure. In man it appears to act predominantly on the smooth muscle of the blood vessels and skin, producing a rise in blood pressure, pallor, and goose-skin.

its action on the bronchial musculature renders it of some value in asthma, but it appears to be inferior to ephedrine, though it may be useful as an alternative when ephedrine is contraindicated or inactive. It has been found helpful in controlling the blood pressure during spinal anæsthesia, and in the treatment of operative shock.—F. A. Jones and C. Wilson, *Lancet*, i/1938, 195.

Euphorbia (B.P.C.). *Syn.* AUSTRALIAN SNAKE WEED, CAT'S HAIR, EUPHORBIA PILULIFERA. The dried entire plant, *E. hirta* (Euphorbiaceæ).

For asthma, bronchial affections, paroxysmal dyspnoea, laryngeal spasm, whooping cough, angina pectoris, coryza and hay fever.

Euphorbia Extract (Aqueous). *Dose.*— $\frac{1}{2}$ to $1\frac{1}{2}$ grains. **Tincture.** *Dose.*—10 to 30 minims. 1 in 5 of alcohol 60%.

Extractum Euphorbiæ Liquidum (B.P.C.).

Dose.—2 to 5 minims (0.12 to 0.3 ml.). 1 in 1. The *N.F. VI* dose for a liquid extract of the same strength is 30 minims.

[P1] **Mist. Euphorb. Co. (N.I.F.).** Potassium iodide $7\frac{1}{2}$ gr., sodium bromide $7\frac{1}{2}$ gr., liquid extract of euphorbia 10 m., solution of glyceryl trinitrate 1 m., ethereal tincture of lobelia $7\frac{1}{2}$ m., water to $\frac{1}{2}$ oz.

Euphorbia Peplus (Euphorbiaceæ). *Syn.* PETTY SPURGE, DEVIL'S MILK. The entire plant. Indigenous to the British Isles.

In cases of dyspnoea, whether of pulmonary or pneumogastric origin. Modifies secretion in asthma and suppresses attacks. The fresh plant has an acrid juice which, when dried, imparts its virtues both to water and alcohol. **Decoction.**—45 grains to the pint. *Dose.*—1 teacupful (diluted if preferred) 3 or 4 times daily, preferably between meals. **Extract.** *Dose.*— $7\frac{1}{2}$ to 30 grains. **Tincture** (1 in 5 with 45% alcohol). *Dose.*—30 to 60 minims during the day.

Euphorbium (B.P.C., Fr. Cx.). Dried latex obtained by incision from the stem of *Euphorbia resinifera* (Euphorbiaceæ).

It occurs in dull yellowish-brown tears, brittle, odourless, and with an acrid taste. The powder is sternutatory. It is used as a vesicant in veterinary practice.

Costus. *Syn.* KUNTH, KUTH OR KOOT ROOT. The root of *Saussurea Lappa* (Compositæ). In powder it is used for preserving furs, etc., from moth. The oil is used as a basis for perfumes: the powder for sachets.

A Liquid Extract 1 = 1 made by percolation with 90% alcohol to exhaustion and concentrating. Used for the treatment of asthma: $\frac{1}{2}$ to 2 drachms stated to stop paroxysms. It may be taken as such in a little water (to cut short a paroxysm), or in the form of a mixture, taken 3 to 4 times daily, containing potassium iodide or potassium bromide 5 to 10 gr., tincture of belladonna 3 to 5 m., borax 2 gr., liquid extract of *S. lappa* $\frac{1}{2}$ to 2 dr., spirit of chloroform 10 m., water 1 oz., for continued administration. Has no cumulative action. Is not claimed to produce a permanent cure.—R. N. Chopra, *Indian med. Gaz.*, Apr., 1928, 189; *Indian J. med. Res.*, 1929, 351.

ERGOTA

B.P.

Syn. SECALE CORNUTUM (U.S.P. XI, Fr. Cx., P. Ital. V, P. Helv. V, P. Belg. IV), ESPOLÓN DE CENTENO, CORNEZUELO DE CENTENO (F.E. VIII).

[P1] "Alkaloids, the following; their salts, simple or complex:—Ergot, alkaloids of."

"Ergot (the sclerotia of any species of *Claviceps*); extracts of ergot; tinctures of ergot."

[S1] "Alkaloids, the following; their salts, simple or complex:—Ergot, alkaloids of."

"Ergot; extracts of ergot; tinctures of ergot."

[88] "*Alkaloids—Ergot, alkaloids of—specify proportion as the proportion of any one alkaloid of ergot that the preparation would be calculated to contain on the assumption that all the alkaloids of ergot in the preparation were that alkaloid.*"

Dose.—The B.P. requires *Ergota Præparata* (*vide infra*) to be dispensed when *Ergota* is prescribed. *Fr. Cx.*, maximum single dose 15 grains; maximum during 24 hours 70 grains approximately.

The sclerotium of the fungus *Claviceps purpurea* (Pyrenomyces) on *Secale cereale* (Gramineæ). It contains not less than 0.05% of ergot alkaloids calculated as ergotoxine.

Storage. Ergot should be kept entire and not powdered. If powdered the fat should be removed immediately, otherwise the alkaloid content decreases.

Antidotes. Empty stomach by emetic or by stomach tube, using dilute solution of tannic acid. Keep patient lying down and warm. Give purgative dose of castor oil or magnesium sulphate. Medicinal charcoal has been recommended. Stimulants, *e.g.*, brandy, $\frac{1}{2}$ oz., or aromatic spirit of ammonia, $\frac{1}{2}$ dr., in water. Nitroglycerin sometimes used.

Uses. Ergot stimulates plain muscle throughout the body, but its use is confined almost entirely to obstetrics, owing to its action in exciting uterine contractions, and it is especially employed after delivery to check post-partum hæmorrhage. It is also used as an emmenagogue.

Because of its success in uterine hæmorrhage it has been widely employed in various other internal hæmorrhages, but its use in such conditions is irrational, and in the treatment of cerebral and pulmonary hæmorrhages its administration may actually be harmful.

ENURESIS IN CHILDREN. Ext. Ergot. Liq. 5 minims for a child of 5 years, with $2\frac{1}{2}$ minims Ext. Glyc. Liq. and a drop of peppermint, effectual in a fortnight. Worth trying.—A. Patton, *Brit. med. J.*, ii/1930, 981.

[P1-81] ***Ergota Præparata* (B.P.).**

Dose.—5 to 15 gr. (0.3 to 1 g.); it may be given in a cachet or capsule.

Powdered and defatted ergot adjusted to contain 0.1% of ergot alkaloids calculated as ergotoxine. Probably the best ergot preparation for giving *per os*.

P. Helv. V requires the defatted powder to be used in dispensing and for preparing galenicals (unless the contrary is specified), the dose being reduced by 30%.

[P1-81] ***Erbolin* (Glaxo Laboratories, London).** A stable physiologically standardised preparation of powdered, defatted ergot in capsules, each containing the equivalent of 0.5 mg. ($\frac{1}{200}$ grain) of ergotoxine.

[P1-81] ***Extractum Ergotæ* (B.P.C.).**

Dose.—1 to 3 grains (0.06 to 0.2 g.).

A soft extract containing when freshly prepared 0.5% of alkaloids; 3 gr. contain about $\frac{3}{8}$ gr. of total alkaloids. The extract is much more stable than the liquid extract, its alkaloidal content

being practically unaltered after two years' storage under ordinary conditions.

[P1-S1] **Extractum Secalis Cornuti** (*P. Ital. V, F.E. VIII, P. Belg. IV*). *Syn.* EXTRACTUM CLAVICIPIS (*Fr. Cx.*), ERGOTINA BONJEAN, ERGOTIN.

Dose.—2 to 8 grains (0.12 to 0.5 g.).

An aqueous extractive precipitated by alcohol and evaporated.

[P1-S1] **Extractum Ergotæ Liquidum** (*B.P.*).

Dose.—10 to 20 minims (0.6 to 1.2 ml.).

Prepared from defatted ergot by percolation with a 1% solution of tartaric acid in alcohol 50%, and adjusted to contain not less than 0.06% *w/v* of total ergot alkaloids, calculated as ergotoxine, when freshly prepared. It loses activity on keeping, and the *B.P.* permits a decrease in alkaloidal content to 0.04%.

The extract contains the water-insoluble alkaloids such as ergotoxine in addition to the water-soluble ergometrine, and there is now a demand for ergot preparations containing less ergotoxine, but standardised on their ergometrine content. In consequence, the *B.P.* 1914 liquid extract is again in favour, and this preparation gives the results required when made from a high potency ergot of Spanish or Portuguese origin.

[P1-S1] **Extractum Ergotæ Liquidum** (*B.P.* 1914).

Dose.—10 to 30 minims (0.6 to 1.8 ml.).

Prepared by macerating crushed ergot 10, with water 50, for 12 hours. Strain, repeat the macerations with water 25, again strain, mix the liquids and evaporate to 7 parts. When cold, add alcohol 3.75 parts, set aside and finally filter.

[P1-S1] **Fluidextractum Ergotæ** (*U.S.P. XI*). *Average dose.*—30. minims (2 ml.).

The potency per millilitre is equivalent to not less than 0.5 mg. of ergotoxine ethanesulphonate. It is prepared by extracting defatted ergot with a menstruum consisting of 2 volumes of hydrochloric acid and 98 volumes of diluted alcohol (48.4 to 49.5% *v/v*) or by extracting ergot with the same menstruum and, after cooling to -14° , removing the congealed fat by filtration. One ml. represents 1 g. of ergot; the liquid extract must not be diluted and it must conform in potency to the above standard when assayed biologically, using single comb White Leghorn cockerels.

[P1-S1] **Ergodex** (*British Drug Houses, London*). *Dose.*—10 to 30 minims (0.6 to 2 ml.). A stable liquid preparation containing the whole alkaloidal content of ergot, including the alkaloid ergometrine, and suitable for oral use.

[P1-S1] **Infusum Ergotæ Recens** (*B.P.C.*).

Dose.—1 to 2 ounces (30 to 60 ml.). 1 in 20.

The fresh infusion should be dispensed when Infusum Ergotæ is ordered.

[P1-S1] **Mist. Ergotæ** (*N.I.F.*). Liquid extract of ergot (*B.P.* 1914) 15 m., chloroform water to $\frac{1}{2}$ oz.

[P1-S1] **Mistura Ergotæ Alkalina** (*St. M.H.*). Liquid extract of ergot 20 m., iron and ammonium citrate 15 gr., weak tincture of ginger 20 m., chloroform water to 1 oz.

[P1-S1] **Mistura Bromidi cum Ergota** (*C.H.W.*). Potassium bromide 10 gr., liquid extract of ergot 5 m., cinnamon water to 1 oz.

[P1-S1] **Mistura Ergotæ cum Ferro** (*C.H.W.*). Liquid extract of ergot 15 m., solution of ferric chloride 10 m., spirit of chloroform 10 m., infusion of calumba to 1 oz.

[P1-S1] **Mistura Ergotæ cum Strychnina** (*R.F.H.*). Liquid extract of ergot 30 m., quinine sulphate 3 gr., solution of strychnine hydrochloride 3 m., dilute phosphoric acid 20 m., chloroform water to 1 oz.

[P1-81] *Tinctura Ergotæ Ammoniata* (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.). 1 in 4 with 10% of dilute solution of ammonia.

A sample contained 0.02% of alkaloids.—*Pharm. J.*, i/1936, 342.

[P1-81] *Ergometrina* (B.P. Add. I). *Syn.* ERGONOVINE (N.N.R.), ERGOTOCIN, ERGOBASINE, ERGOSTETRINE. $C_{18}H_{23}O_2N_3 = 325.2$.

Dose.— $\frac{1}{320}$ to $\frac{1}{60}$ grain (0.0005 to 0.001 g.); by intramuscular injection, $\frac{1}{320}$ to $\frac{1}{160}$ grain (0.00025 to 0.0005 g.); by intravenous injection, $\frac{1}{640}$ to $\frac{1}{320}$ grain (0.000125 to 0.00025 g.).

In colourless, hygroscopic crystals becoming coloured on exposure to air. Two forms occur; one has m.p. 162° to 164° (decomp.), and the other, obtained from acetone, has m.p. 212° . The low m.p. form is less stable than that with the higher m.p.

For method of extraction, see Vol. II.

Soluble readily in alcohol and acetone, sparingly soluble in benzene and chloroform, moderately soluble in water. The aqueous solution has a blue fluorescence and becomes brown on exposure owing to oxidation. Ergometrine differs from other ergot alkaloids in being soluble in water, and almost insoluble in chloroform.

The low m.p. form tends to pass into the high m.p. form on keeping, and the latter can also be obtained readily by crystallisation in the presence of a crystal of the high m.p. variety. The more stable form is less soluble, but both have the same specific rotation.—R. L. Grant and S. Smith, *Nature, Lond.*, i/1936, 154.

Stable solutions may be prepared by addition of ascorbic acid, 10 mg. per ml.—A. Solomon and R. W. Spanhoff, *Quart. J. Pharm.*, 1938, 652.

Pharmacology. Ergometrine differs from other ergot alkaloids by the absence of the paralysing effect on augmentor sympathetic actions, and by a much weaker activity in the production of gangrene. Its specific action is to initiate a long persistent rhythm of powerful contractions in a uterus normally quiescent, as in the puerperium. If the uterus already exhibits a vigorous spontaneous rhythm, ergometrine does not enhance it. It is more readily absorbed than ergotoxine, but anæsthetised animals differ from the human patient in showing no regularity of response to oral doses of ergometrine which produced immediate effects when given intravenously.

Uses. Clinically, it is remarkable for its rapidity of action, which distinguishes it from the ergotoxine-ergotamine group. By mouth, using average doses, an effect is usually seen in 5 to 8 minutes, by intramuscular injection in from 3 to $4\frac{1}{2}$ minutes, and by intravenous injection in about 1 minute. The onset of action is abrupt and there is a well-marked uterine spasm lasting for about half an hour, after which strong isolated contractions occur at regular intervals and continue for 2 to 3 hours or more. When powerful action is required in the shortest possible time, larger doses should be employed, such as, by mouth, 1 mg.; intramuscularly, 0.5 mg.; intravenously, 0.125 mg., though these doses have been increased to as much as 1.5 mg., 0.75 mg., and 0.15 mg. respectively, without symptoms of intolerance. It is freer from

unpleasant side-effects (depression, headache, and nausea) than the ergotoxine-ergotamine group, and from dangerous gangrene-producing properties.

The greatest clinical value of ergometrine is in the treatment of post-partum hæmorrhage; it may be safely administered at the beginning of the third stage if necessary. It has also been found of value in the control of hæmorrhage following Cæsarean section. Many workers favour its use in the puerperal period for the promotion of involution and the prevention and control of sepsis, but its use in this connection has not been universally accepted. Varying results have also been obtained in the treatment of incomplete and inevitable abortion. It may be used as a palliative measure in certain cases of menorrhagia and metrorrhagia.

[P1-81] **Ergometrine Acid Tartrate.**

$C_{19}H_{23}O_2N_3, C_4H_6O_4 = 475.4$. Colourless crystals, soluble in water.

[P1-81] **Basergin** (*Sandoz, London*). A stable preparation of ergobasine (ergometrine) tartrate. Supplied in tablets containing 0.00025 g., solution, 1 ml. = 0.00025 g., and ampoules, 1 ml. = 0.0002 g. *Dose*.—1 tablet or 15 to 30 drops of solution one to three times daily, or $\frac{1}{4}$ to 1 ml. subcutaneously, intramuscularly, or intravenously, following the third stage of labour.

[P1-81] **Ergometrine Hydrochloride.** White crystals, soluble in water, m.p. 245° to 246° (decomp.).

[P1-81] **Ergotrate** (*Lilly, London*). Ergometrine maleate in tablets containing 0.2 mg. ($\frac{325}{1000}$ gr.).

[P1-81] **Ergotrate H.** Ergometrine hydracrylate in ampoules containing 0.2 mg. ($\frac{325}{1000}$ gr.) for intravenous injection.

[P1-81] **Ergotamine.** $C_{33}H_{35}N_5O_8 = 581.6$.

Colourless crystals darkening on exposure to light.

Soluble in alcohol 90%, chloroform and acetone, sparingly soluble in ether.

Its pharmacological action is similar to that of ergotoxine but it has a greater sympathicolytic effect. It is available commercially only as the tartrate in the proprietary article Femergin, *q.v.*

Some discussion has taken place between Prof. Stoll and Drs. Smith and Timmis as to the occurrence of ergotamine in ergot of rye, the English workers maintaining that ergotamine is not a normal constituent (*vide Lancet*, ii/1930, 652, 873, 994, 1148).

[P1-81] **Ergotamine Tartrate** is official in *P. Belg. IV* with formula $(C_{33}H_{35}O_8N_5)_2, C_4H_6O_6, 2CH_3OH$.

Dose.—0.001 g. two to four times daily; subcutaneously or intramuscularly, 0.00025 g.

Toxic Effects. Its continued use may give rise to symptoms of ergotism, and cases of gangrene have been reported.

Gangrene of the feet, necessitating amputation of the legs, following hypodermic injections of ergotamine tartrate in a fisherman suffering from toxæmia with jaundice of unknown origin, the injections being given for pruritus. 19 ml. was injected within a week. Oral use is less likely to produce toxic effects.—W. M. Yater and J. A. Cobill, *J. Amer. med. Ass.*, i/1936, 1635.

Report of a case of gangrene and death in a middle-aged woman following injections (four of 0.25 mg.) of ergotamine tartrate for pruritus.—S. E. Gould *et al.*, *J. Amer. med. Ass.*, i/1936, 1635.

A case of impending gangrene of both feet, due to arterial spasm following the administration of ergotamine tartrate, was almost immediately relieved by the intravenous and oral administration of papaverine hydrochloride. Initially $\frac{1}{4}$ gr. was given intravenously in 1 ml. of normal saline, 6 hours later the same dose was given orally, and after a further 4 hours the intravenous dose was repeated. The pain was completely relieved within 12 hours.—S. Perlow and L. Bloch, *J. Amer. med. Ass.*, ii/1937, 27.

Contraindications. It should not be administered to pregnant women or during labour, neither is its use advisable in puerperal sepsis, severe toxæmia, arteriosclerosis and other vascular diseases.

Uses. Ergotamine tartrate is characterised by two main actions, namely, a powerful and prolonged action on the uterus, and paralysis of the sympathetic nerve endings. It is of value as a uterine hæmostatic and is indicated in obstetric and gynaecological hæmorrhages whenever prolonged action is desired. It has been widely employed in the treatment of migraine for the abortion of attacks, and has been advocated in Graves' disease and certain psychotic conditions.

GRAVES' DISEASE. Ergotamine tartrate injections, 1 mg. intramuscularly, gave improvement, but not in severe cases. Or subcutaneously $\frac{1}{16}$ grain each morning, repeated in the evening if tolerated. Suspend for a week or two after 20 to 25 days.—*Per Prescriber*, 1929, 391.

MIGRAINE treated by ergotamine tartrate, 2 mg. daily by mouth, with additional 2 mg. when an attack is threatened.—*Per Prescriber*, 1929, 33.

Given in 45 cases (6 men and 39 women) it caused abrupt termination of headache in 40. Speed of pharmacological effect varies with route of administration, e.g., intravenously, relief in 15 to 30 minutes; subcutaneously, 1 to 2 hours; *per os*, 2 to 3 hours. Recommended single dosage 0.5 mg. subcutaneously or 1 mg. *per os*. Only give half subcutaneous dose at first trial. Injection can be repeated after 2 or 3 hours. For prompt sustained effect 0.25 mg. intravenously and at the same time the same amount subcutaneously.—W. G. Lennox, *New Engl. J. Med.*, 1934, 210, 1061.

Among the most recent and promising forms of treatment is the intramuscular injection of ergotamine tartrate 0.5 ml. The benefit as to headache is frequently almost dramatic, though it may cause vomiting or uterine colic. The usual effect is to bring promptly to a close an attack which would otherwise disable the patient for hours, or even days.—M. Critchley, *Brit. med. J.*, ii/1935, 795.

Intravenous or subcutaneous injections of 0.5 mg. of ergotamine tartrate gave relief in migrainous headaches in over 90% of patients, even in those which had proved resistant to other forms of treatment.—W. G. Lennox *et al.*, *Amer. J. med. Sci.*, ii/1936, 57.

Not only is ergotamine of little account in stopping non-migrainous headaches, but it may actually initiate a headache.—W. J. Lennox and co-workers, *per J. Amer. med. Ass.*, ii/1936, 906.

In five years' experience no serious complications have occurred in the treatment of 189 patients with migraine headache. Contraindications to the use of ergotamine tartrate are septic states, especially when associated with intravascular foci and obliterative vascular disease, especially when coronary. Treatment should be continued with caution in the presence of marked arteriosclerosis, hepatic or renal disease, vitamin C deficiency, and hypersensitivity to the drug. When correctly administered in the absence of contraindications, ergotamine tartrate may be considered a safe and extremely valuable means of aborting or terminating migraine headaches.—T. J. C. von Storch, *J. Amer. med. Ass.*, ii/1938, 293.

[P1-S1] **Femergin** (*Sandoz, London*). GYNERGEN in U.S.A. Tablets contain 0.001 g. of ergotamine tartrate. Also supplied in solution for oral use and ampoules for injection.

[P1-S1] **Neo-Femergin** (*Sandoz, London*). A preparation combining the persistent action of ergotamine with the rapid action of ergobasine (ergometrine). Supplied in tablets containing 0.000125 g. ergobasine tartrate and 0.00025 g.

ergotamine tartrate; also in solution and ampoules containing similar proportions. *Dose*.—1 tablet or 15 to 30 drops of solution three times daily, or $\frac{1}{2}$ to 1 ml. subcutaneously or intramuscularly after expulsion of the placenta. Should not be given before or during labour.

[P1-81] **Ergotinina**. *Syn.* ERGOTININE CRYSTALLISÉE (*Fr. Cx.*).

$C_{21}H_{21}O_4N_2 = 609.7$.

Dose.— $\frac{1}{100}$ to $\frac{1}{50}$ grain (0.0003 to 0.001 g.). *Fr. Cx.* has the latter as *max. single dose*, and 0.002 g. as *max. daily dose*.

An alkaloid in minute colourless needles, soluble in 200 of alcohol 95%, less in ether, very soluble in chloroform, insoluble in water.

This alkaloid has been proved to be inert.

[P1-81] **Ergotoxina** (*B.P.C.*).

Dose.— $\frac{1}{100}$ to $\frac{1}{50}$ grain.

A white amorphous powder darkening on exposure to light and air.

Soluble in alcohol, acetone, chloroform and ethyl acetate, also in benzene, from which it crystallises with 2 molecules of solvent; almost insoluble in water.

Uses. Ergotoxine causes contraction of plain muscle, particularly of the uterus. It is usually employed by injection in the form of the soluble salt ergotoxine ethanesulphonate, and may be employed in this manner to control hæmorrhage and counteract uterine atony and subinvolution after parturition in Cæsarean section. It should not be used during labour.

The degree of uterine spasm and its duration after permissible dosage is not so great as has sometimes been supposed. Repeated investigations have shown that, in the puerperal uterus at least, spasm does not last longer than about an hour and a half after 0.5 mg. of ergotoxine or ergotamine intramuscularly. —Chassar Moir, *Proc. R. Soc. Med.*, 1935, 1661.

[P1-81] **Ergot Aseptic Ampoules** (*Parke, Davis, London*). Preparation of ergot preserved with Chloretone; for intramuscular injection. *Dose*.—1 ml.

[P1-81] **Ernutin** (*Burroughs Wellcome, London*). A solution physiologically standardised for hypodermic use, containing ergotoxine, Tyramine and Ergamine (*v. infra*) in two forms: (*a*) for oral use, *dose*.—30 to 60 minims, to be given after labour is completed, every 3 hours until contraction effected, and (*b*) for hypodermic use, *dose*.—5 to 10 minims, after expulsion of the placenta.

[P1-81] **Ergotoxinæ Æthanosulphonas** (*B.P.*). Probable formula $C_{28}H_{41}N_2O_6 \cdot C_2H_5 \cdot SO_2 \cdot OH = 737.5$.

Dose.— $\frac{1}{100}$ to $\frac{1}{50}$ grain (0.0005 to 0.001 g.) by subcutaneous or intramuscular injection.

Colourless, odourless, acicular crystals containing about 83.6% of ergotoxine.

Soluble in alcohol 90%; readily soluble in methyl alcohol, sparingly soluble in water.

[P1-81] **Ergothane** (*Evans, Sons, Lescher & Webb, Liverpool*). Ampoules of ergotoxine ethanesulphonate solution containing 0.0005 g. per ml. *Dose*.—0.5 to 1 ml. (0.25 to 0.5 mg.) intramuscularly or subcutaneously, repeated in 24 hours if necessary.

[P1-81] **Ergotoxinæ Phosphas** (*B.P.C.*).

Dose.— $\frac{1}{100}$ to $\frac{1}{50}$ grain (0.0005 to 0.001 g.) by subcutaneous or intramuscular injection.

Colourless crystals darkening on exposure to air and light.

Soluble 1 in 18 of boiling alcohol 90%, less soluble in cold alcohol, sparingly soluble in water.

Other Ergot Alkaloids.

In addition to the above alkaloids, other constituents have from time to time been reported.

[P1-S1] **Sensibamine** was obtained in 1932. It is a molecular compound of two alkaloids, ergotamine and ergotaminine. It is less stable than ergoclavine, and, on solution in alcohol, ergotaminine crystallises out.

[P1-S1] **Ergoclavine** was obtained by W. Küssner (*Arch. Pharm., Berl.*, 1934, 503) in hygroscopic crystals, resembling sensibilamine but differing from it in being recrystallisable from acetone or alcohol. It is stated to constitute 16 to 20% of the total alkaloids of Spanish and Russian ergots. Ergoclavine consists of an equimolecular compound of two alkaloids, which are probably ergosine and ergosinine.

Ergoclavine and Sensibamine are pharmacologically identical with ergotoxine and therefore also with ergotamine.—A. Vartiainen, *J. Pharmacol.*, 1935, 54, 259.

[P1-S1] **Ergometrine**. $C_{11}H_{15}O_4N_3$. Obtained by S. Smith and G. M. Timmis (*Nature, Lond.*, ii/1934, 259). Has no physiological action, and bears the same relationship to ergometrine as ergotaminine to ergotamine, or as ergotinine to ergotoxine. It can be converted to ergometrine by treatment with acid.

[P1-S1] **Ergosine** and [P1-S1] **Ergosinine** are isomeric alkaloids, probably $C_{11}H_{15}O_4N_3$, which have been obtained also by Smith and Timmis (*Nature, Lond.*, i/1936, 111, 1075). The latter is sparingly soluble in water and methyl alcohol but can be recrystallised from aqueous acetone.

A new phenolic alkaloid, which does not give the blue colour with *p*-dimethylaminobenzaldehyde, has been isolated in extremely small yield. It contains one nitrogen atom, the probable formula being $C_{11}H_{15}O_4N$, and the name suggested is **Ergomonamine**.—G. W. Holden and G. R. Driver, *Quart. J. Pharm.*, 1936, 230.

Histamine. *Syn. and Prop. Name.* AMINOETHYLGLYOXALINE, 4- β -IMINAZOLYLETHYLAMINE, ERGAMINE (*Burroughs Wellcome, London*).

A base present in ergot, usually prepared synthetically from protein decomposition products. It is used therapeutically as the acid phosphate.

Pharmacology. It has intense action on plain muscle. The plain muscle fibre of the uterus in particular is stimulated to contraction by minute doses. Injected subcutaneously it causes fall of blood pressure, and in other than minimal doses it produces a violent and intense erythema all over the body, headache, conjunctivitis, paræsthesias, vomiting, tenesmus, bronchial spasm and unconsciousness.

Histamine in Relation to Blood Pressure.

Histamine is, no doubt, liberated from the tissues in response to injury. Intravenously in cats a dose of 1 to 2 mg. per kilo causes respiratory disease, due to contraction of bronchiolar muscles, and rise of blood pressure, due to contraction of muscles of arterioles. Profound fall of blood pressure follows within 4 or 5 minutes. It has a powerful dilating effect on the smallest vessels. The hypothesis of "Histamine Shock" is that the circulation is brought to a precariously low point by depletion of the central vessels, much rich corpuscular blood remaining locked in the minute vessels and much of its fluid part finding its way into extravascular tissue spaces. Similar effects in man with small intravenous or subcutaneous doses. Larger doses subcutaneously (6 to 8 mg.) cause fall of blood pressure, respiratory distress, contraction of stomach, and occasionally collapse.—"The Blood Vessels of the Human Skin and their Responses," Thomas Lewis (1927), 108-109 (H. K. Lewis).

Histaminæ Phosphas Acidus (*B.P. Add. I*). *Syn.* HISTAMINÆ PHOSPHAS (*U.S.P. XI*). $C_5H_9N_3 \cdot 2H_3PO_4 = 307.2$.

Dose.— $\frac{1}{150}$ to $\frac{1}{80}$ grain (0.0005 to 0.001 g.) by subcutaneous injection.

In colourless, odourless, prismatic crystals. **Soluble** 1 in $4\frac{1}{2}$ of water, slightly in alcohol.

Uses. Is administered hypodermically, by inunction, and by ionisation in the treatment of rheumatism, being especially useful in chronic cases with vasomotor disturbances. Is also useful in chronic rheumatoid arthritis, in osteoarthritis and related conditions, and in pruritus associated with urticaria, and has been employed with success in Ménière's disease and in headache associated with vasodilatation. Its stimulating action on the production of gastric juice is used in the differential diagnosis of pernicious and secondary anæmias by means of the fractional test meal; in the achlorhydria of pernicious anæmia 0.5 to 1 ml. of 1 in 1000 solution does not induce secretion of hydrochloric acid. The 1 in 1000 solution has also been used in the diagnosis of circulatory disturbances such as Raynaud's disease. In normal patients, when the solution is pricked into the skin, a red spot followed by a weal should appear in about $2\frac{1}{2}$ minutes. In Raynaud's disease and allied affections this reaction is delayed.

ASTHMA. With suitable technique and individualised dosage, histamine treatment may produce permanent and satisfactory results in bronchial asthma and urticaria. Begin in severe cases with 0.00001 mg. and in milder cases with 0.0001 mg. The first injection is given intracutaneously, and when it causes no noticeable reaction, give the same dose subcutaneously the following day, later injections given at intervals of two days. Doses gradually increased up to a maximum of 0.01 mg.—A. Dzsineh, *Klin. Wschr.*, ii/1935, 1612.

CHEYNE-STOKES' RESPIRATION. Normal breathing resumed and continued for about 6 hours after small dose of histamine subcutaneously. Slight headache, feeling of warmth, and occasional reddening of skin of arms and neck—symptoms pass off in an hour. Following two further injections next day Cheyne-Stokes' respiration ceased altogether.—F. Kisch, *Klin. Wschr.*, 1930, 1819, per *Prescriber*, 1930, 655.

HEADACHE. Of 85 patients suffering from a type of severe vascular headache associated with evidence of vasodilatation, 65 obtained definite permanent relief for periods of from 2 weeks to 18 months, following subcutaneous injection of 0.05 mg. of histamine twice daily on two consecutive days, increasing on the third day to 0.066 mg. twice daily, and then 0.1 mg. twice daily for two or three weeks.—B. T. Horton *et al.*, *Proc. Mayo Clin.*, 1939, 257.

MÉNIERE'S DISEASE. Eleven patients, all of whom were in the acute or subacute stages of the disease and were either partially or totally incapacitated, all responded to histamine intravenously in a spectacular manner. 1.9 mg. of histamine acid phosphate was given in 250 ml. of normal saline, the time taken to administer the solution being one and a half hours. In some cases the injection was repeated on two or three successive days. No ill effects resulted from the injections.—C. H. Shelden and B. T. Horton, *Proc. Mayo Clin.*, i/1940, 17.

POST-OPERATIVE COLLAPSE. After the intravenous injection of 0.005 mg. of histamine most persons show a brief fall of the systolic blood pressure, whereas those subject to post-operative circulation disturbances react to such an injection with a fall of blood pressure followed by an often considerable rise. In these latter patients the subcutaneous injection of 0.5 to 1 mg. of histamine twice a day for 8 to 10 days before an operation has been found a valuable prophylactic measure to combat the tendency to post-operative collapse.—S. Rusznayk and co-workers, *Dtsch. med. Wschr.*, 1935, 1111.

RHEUMATISM. Histamine given subcutaneously in the form of a solution of strength of 1 mg. of histamine acid phosphate in 1 ml. of saline, with 0.5% of phenol. Initial dose 0.1 mg., increased daily by 0.05 mg. till definite improvement observed. Satisfactory dose usually between 0.1 and 0.5 mg., which is

repeated 2 or 3 times weekly and further increased if response diminishes. Sensitivity varies: women usually more sensitive than men (but does not affect menstruation). With long intervals between doses (e.g., a week) some increased sensitivity observed. Of benefit in all types of rheumatism, but in particular the type characterised by co-existence of impaired grip, the result of periarticular arthritis in the hand with vasomotor disturbances (e.g., cold and cyanotic fingers). Cases with gross heart disease or high blood pressure unsuitable. Patients lie down for 15 to 30 minutes after injection to diminish liability to headache and giddiness.—B. Shanson and C. G. Eastwood, *Lancet*, i/1934, 1226. See also F. S. Mackenna, *ibid.*, 1228, Bissett, *ibid.*, 1366, and Woodmansey and Bissett, *ibid.*, ii/1933, 1018, and references under Electrotherapy in Vol. II.

A useful treatment for the common complaint of morning stiffness (in chronic rheumatism) is to inject hypodermically 0.1 ml. of histamine acid phosphate in saline. The effect is to cause "unlocking" of the stiff joints and to increase the power of the hand grips. If found to suit, the dose may be increased gradually, and later, if improvement is maintained, the intervals between injections may be lengthened.—Whitla, 8th Edn., 1938.

Liquor Histamine Phosphatis (U.S.P. XI).

Average dose.—5 minims (0.3 ml.) by parenteral injection. A 0.1% solution of histamine acid phosphate in distilled water.

Amino-Glaucosan (*Saccharin Corporation, London*). 10% solution of histamine hydrochloride used in the form of eye drops as a miotic in acute glaucoma.

Imadyl (*Roche Products, Welwyn Garden City*). Histamine preparations in various forms—2% ointment for ionisation (may also be used by massage), also tablets containing 0.05 g. (1 tablet to 1 litre for immersion or 1 in 5000 solution for moistening anode pad); ampoules for injection, 1 mg. in 1 ml. (doses increasing from 0.1 to 0.5 mg.).

Thio-Histamine (*British Drug Houses, London*). An organic sulphur compound administered by intramuscular injection for the removal of fibrotic lesions resulting from previous inflammation. Also useful in acne rosacea and vulgaris, seborrhoeic and other forms of dermatitis, and in thrombo-angitis obliterans. It is similar to Contramine (*q.v.*) in therapeutic effects, but is quicker in action. A course of treatment consists of the injection on three successive days of 0.001 g., 0.002 g., and 0.003 g., no further injections being made for 6 to 8 weeks. The solution may also be applied locally around the lesion twice daily until signs of inflammation occur.

Histaminase is an enzyme, which specifically inactivates histamine. It is a compound of physiologic albuminoid substance obtained from the intestinal mucous membrane as a loose white powder, which is stable and dissolves in water to a slightly opalescent fluid. Since it has been shown that there is a release of a so-called H-substance in the blood during allergic shock, which is probably histamine, patients with various allergic cutaneous disorders were treated with histaminase. It was administered either intramuscularly or orally as enterically coated tablets containing five units, the unit being the amount necessary to inactivate 1 mg. of histamine during 24 hours incubation at 37° in a phosphate buffer solution at pH 7. Out of a total of 35 patients treated there was a partial or complete improvement in all but 9. Dosage has to be worked out for each individual case, but it is recorded that no untoward reactions were noted after patients had taken as much as 150 histamine-detoxifying units daily for four or five days. Patients receiving intramuscular injections had very much better results than those receiving the enzyme in tablet form, although the first four injections elicited symptoms comparable to those following protein shock therapy.—Goldberg, *J. Amer. med. Ass.*, ii/1940, 429.

Histidine Hydrochloride.

Dose.—3 grains (0.2 g.), in 4% aqueous solution, given daily for about 3 weeks by subcutaneous or intramuscular injection. The monohydrochloride of the base *L*-histidine,

which is the amino-acid corresponding to histamine.

The 4% solution is administered by injection in the treatment of peptic ulcer, and it is claimed that symptomatic improvement occurs after 4 or 5 injections. The theoretical basis of the treatment rests on the work of Aron and Weiss (*Pr. méd.*, 1933, 93, 1880), who showed that peptic ulcer could be produced in dogs by preventing duodenal digestion by surgical means. They suggested that ulcer formation was connected with a deficiency of amino-acids and that this deficiency was corrected by the injection of histidine. These experiments were subjected to serious criticism by H. C. Barry and H. W. Florey (*Lancet*, ii/1936, 728) who, as a result of further experiments on cats and pigs, were unable to substantiate the suggestion of Aron and Weiss. In general, it may be said that the extremely favourable results reported by early investigators have not been borne out by more recent experimental and clinical research, but that the drug may be found of value in selected cases as an adjunct to the diet-alkali régime.

Disappointing relapses are known, and there will probably be general agreement that histidine is not a specific remedy for peptic ulcer, in the sense that it does not counteract the cause. If this is so, it must seem unwise to relax attention to dietetic and general measures while carrying out injection treatment. The longest case-histories hitherto reported are less than two years, and the word "cure" is therefore inappropriate to any of them. The time has not yet come for accepting an entirely new theory of ulcer causation and for abandoning the ordinary rules of diet and management.—*Lancet*, i/1936, 95.

Results obtained in 40 patients do not warrant routine injections of histidine in all ulcer patients. The expense involved, the 24 consecutive intramuscular injections, the mild reactions experienced by an appreciable number of patients, the high percentage of recurrences within 6 months after treatment, and the fact that approximately the same percentage of patients respond favourably to the diet-alkali regimen without histidine injections—these speak against the routine use of histidine in ulcer therapy. Histidine produced remission of ulcer symptoms in 55% of the patients treated; it did not prolong the symptom-free interval nor did it prevent recurrences; 85% of the patients who developed remissions have returned with ulcer symptoms within 6 months after treatment. However, histidine may be used as "extra artillery" in patients not responding to the diet-alkali-antispasmodic management. About 50% of the latter patients may thereby become symptom-free and an additional 20% moderately improved.—D. J. Sandweiss, *J. Amer. med. Ass.*, i/1936, 1459.

Comparison of a series of 41 cases treated with histidine hydrochloride with 40 controls treated with the usual diet-alkali ulcer regimen showed that symptomatic and radiologic response of the patients in the histidine series was not quite as good as that in the diet-alkali series, in either the initial or the sustained effects. The clinical improvement appears to be symptomatic and transient. Chronicity and rhythmicity is a characteristic feature of peptic ulcer. Histidine appears to have no effect other than to alter the rhythm slightly. It showed no constant effect on the hydrochloric acid secretion. The therapeutic indications for histidine in the treatment of peptic ulcer are necessarily limited. The extravagant claims that have been made for this substance are unwarranted.—D. A. Kirby (for Council on Pharmacy and Chemistry of the A.M.A.), *J. Amer. med. Ass.*, i/1936, 1472.

The treatment should be reserved for simple uncomplicated cases, for cases of stoma-ulcer, and in patients in whom other methods have failed. It should be regarded at present as an adjunct to simple diet-alkali treatment; it is most useful as an ambulatory method, but adequate after-treatment should be enforced on the usual lines.—E. Bulmer, *Lancet*, ii/1936, 734.

There can be no great objection to the use of histidine in addition to the usual treatment by rest and dieting, but its use as a substitute for the proper treatment is quite unjustifiable, as although an occasional patient may be saved trouble in this way, the majority will be placed in a fool's paradise, in which the ulcer, although temporarily latent, becomes progressively less amenable to treatment.—A. F. Hurst, *Practitioner*, ii/1936, 415.

Histidine not only lacks specificity but is no more beneficial than the injection of sterile water in the therapy of peptic ulcer.—R. Upham and H. Barowsky, *J. Amer. med. Ass.*, ii/1937, 422.

Injections of distilled water produced similar results to histidine. Remissions produced by histidine may be explained as psychic effects, added confidence in "something new" instead of the same "diet and powders." The symptom-free interval is longest after diet-alkali treatment. The short duration of remission and the high percentage of recurrences after parenteral therapy probably result because of more rapid increase in diet. In the present state of our knowledge all we can hope to accomplish by any form of ulcer therapy is to relieve symptoms, to delay relapses and to prevent complications. The parenteral method is not indicated in the routine treatment of peptic ulcer. It may be used only in those patients not responding to the diet-alkali régime, and only in association with, but not in place of, the usual planned diet. Unable to corroborate the experimental work of Aron and Weiss.—D. J. Sandweiss, *J. Amer. med. Ass.*, i/1937, 700.

Laurostidin (*Roche Products, Welwyn Garden City*) and **Stellidin** (*Pharmaceutical Specialities (May & Baker) Ltd., London*) are sterile 4% solutions of *l*-histidine hydrochloride in 5 ml. ampoules for intramuscular or subcutaneous injection. The former is also issued in tablets containing 0.2 g.

Tyramina. *Syn. and Prop. Name.* *p*-HYDROXYPHENYLETHYLAMINE, TYRAMINE (*Burroughs Wellcome, London*).
 $\text{OH} \cdot \text{C}_6\text{H}_4 \cdot \text{CH}_2\text{CH}_2\text{NH}_2 = 137.1$.

Dose.— $\frac{1}{4}$ to $\frac{3}{8}$ grain (0.02 to 0.04 g.) by hypodermic injection of the acid phosphate.

An organic base present in aqueous extracts of ergot but obtained synthetically. Has a weak but prolonged adrenaline action but no local vasoconstrictor effect. It has practically no effect on the uterus. Has been used to raise blood pressure in collapse.

ERYTHRITYLIS TETRANITRAS

Syn. ERYTHROL TETRANITRATE, NITRO-ERYTHRIT, ERYTHRO-TETRANITRAL, ERYTHROL NITRATE.

[P1] "*Erythrityl tetranitrate.*"

Dose.— $\frac{1}{4}$ to 1 grain (0.015 to 0.06 g.), increased to 3 grains or more in tablet form *vide infra*. When erythrityl, or erythrol, tetranitrate is prescribed, twice the prescribed amount of diluted erythrityl tetranitrate must be dispensed.

In colourless and slightly tar-like smelling crystals, m.p. 61°, formed by dissolving erythrol (a sugar obtained from various lichens, e.g., *Rocella tinctoria*, *R. fuciformis*, etc.), in fuming nitric acid, and precipitating by sulphuric acid. The crystals are explosive unless mixed with an inert diluent.

Soluble in water about 1 in 20,000, about 1 in 60 of absolute alcohol.

Uses. As a vasodilator. Its slight solubility as against that of glyceryl trinitrate (1 in 800) renders its action in reducing blood pressure slower and more prolonged. It is employed in angina pectoris, chronic Bright's disease, nephritis, aneurism, arteriosclerosis, Raynaud's disease, dyspnoea, headache and nervous

affections accompanied by high blood pressure. It is often effective in the paroxysms of asthma, especially if followed by a hot drink, and in relieving the spasms of lead colic. For angina, to avert paroxysms, even half a drachm a day has been taken. Præcordial pains are promptly relieved by one tablet 3 times a day.

Daily use of the tablets, beginning with $\frac{1}{2}$ grain thrice daily and gradually increasing, will ward off attacks. Cumulative effect or tolerance has not been observed. Erythrityl tetranitrate produces little effect until half an hour after its administration, and the maximum effect is produced at the end of an hour; the arterial tension gradually increases again, but it does not return to its previous condition until about 10 hours after the dose has been taken.

PRURITUS. Of 21 cases of generalised pruritus, complete relief was obtained in 10 and moderate relief in 7 by the use of erythrityl tetranitrate by mouth in doses of 0.03 g. and glyceryl trinitrate in tablets containing 0.0006 g. Effect possibly associated with dilatation of the cutaneous vessels. Of no value in localised pruritus.—Prinzmetal, *Arch. Derm. Syph., N.Y.*, 1934, 843.

[P1] **Erythritylis Tetranitras Dilutus** (B.P., U.S.P. XI). *Syn.* ERYTHRITYL TETRANITRATE (50%), ERYTHROL TETRANITRATE (50%).

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.) representing $\frac{1}{2}$ to 1 grain (0.015 to 0.06 g.) of pure erythrityl tetranitrate. U.S.P. average dose (of dilution) $\frac{1}{2}$ grain (0.03 g.).

A mixture of approximately equal weights of erythrityl tetranitrate and lactose, the latter being added in order to minimise the risk of explosion.

[P1] **Tabellæ Erythritylis Tetranitratis Diluti** (B.P.C.).

Contain 1 gr. (0.06 g.) in chocolate basis.

[P1] **Mannitylis Hexanitratis.** *Syn.* HEXANITRIN, NITROMANNITE, MANNITOL NITRATE. $\text{CH}_2\cdot\text{ONO}_2\cdot(\text{CH}\cdot\text{ONO}_2)_4\text{CH}_2\cdot\text{ONO}_2=452.1$.

Dose.— $\frac{1}{2}$ to 1 grain (0.016 to 0.06 g.) increased.

The nitrate of the hexahydric alcohol, mannite, $\text{C}_6\text{H}_8\cdot(\text{OH})_6=182.1$. In light acicular crystals, m.p. 113° , practically insoluble in water. Is used similarly to erythrityl tetranitrate but is more explosive and requires extra care. In angina and asthma its action is not so powerful, but probably more prolonged.

EUONYMUS

B.P.C., *Fr. Cx.*

The dried root-bark of *Euonymus atropurpureus* (Celastraceæ), the wahoo or spindle-tree.

Uses. Possesses tonic, hydragogue cathartic, diuretic and anti-periodic properties.

Elixir Euonymi et Pulsatillæ (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.).

Tincture of euonymus 12.5, tincture of pulsatilla 12.5, simple elixir to 100.

R*

Extractum Euonymi (B.P.C.). *Syn.* EUONYMIN.

Dose.—1 to 2 grains (0.06 to 0.12 g.). $\frac{1}{4}$ to 1 grain cholagogue, 1 to 4 grains cathartic.

A brown alcoholic extractive containing calcium phosphate to keep it as powder. In commerce chlorophyll is sometimes added. *Fr. Cx.* has Euonymine Brune, *max. single dose*, $1\frac{1}{2}$ grains. 1 grain, combined with 4 grains of iridin, is a successful purge.

Extractum Euonymi Liquidum.

1 = 1, made with alcohol (90%) 4, water 1. *Dose.*—10 to 60 minims (0.6 to 4 ml.).

Liquor Euonymini et Iridini (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.).

Contains the equivalent of about 3.5% w/v of extract of euonymus and 2% w/v of extract of iris.

Liquor Euonymini et Pepsini (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.).

Contains 1 gr. of extract of euonymus and 2 gr. of pepsin in 1 dr.

[P] Pilula Euonymini.

Euonymin 2 gr., extract of hyoscyamus $\frac{1}{2}$ gr., for 1 pill; taken at bedtime. A cholagogue stimulant, producing no depression or headache; requires to be followed by a saline aperient in the morning.

Tinctura Euonymi (B.P.C.).

Dose.—10 to 40 minims (0.6 to 2.6 ml.). 1 in 5 of alcohol 45%.

Iridis Rhizoma (B.P.C., P. Helv. V). *Syn.* ORRIS ROOT. The rhizome of *Iris germanica*, *I. pallida* and *I. florentina* (Iridaceæ). Contains "concrete oil of orris" or "butter of orris" (0.1 to 0.2%), used in perfumery, and irone, $C_{15}H_{20}O$, an oil with pungent odour, violet-like in very high dilution. Irone for use in perfumery is prepared synthetically from citral.

Iris (B.P.C.), syn. BLUE FLAG, is the dried rhizome and roots of *I. versicolor*, and contains a cathartic resinoid.

Extractum Iridis (B.P.C.). *Syn.* IRIDIN.

Dose.—1 to 3 grains (0.06 to 0.2 g.) in pills, often with extract of hyoscyamus or euonymus. A dry extract prepared with alcohol 70%, and mixed with calcium phosphate to reduce caking.

EXTRACTUM FELLIS BOVINI**B.P.*****Syn.* FEL BOVINUM PURIFICATUM.**

Dose.—5 to 15 grains (0.3 to 1 g.) in enteric-coated capsules or pills.

A dark yellowish-green, bitter-sweet mass.

Soluble in water and alcohol 90%, insoluble in ether.

Manufactured by evaporating 20 of fresh ox bile to 5, mixing with 10 of alcohol 90%, separating the precipitate and evaporating the clear fluid to thick extract consistence. It is composed of bile salts, cholesterolin, lecithin and bile pigments.

Uses. Bile plays an important part in the digestion, especially of the fatty acids, and is a powerful stimulant to the secretory activity of the liver. Ox bile has been usefully employed in a variety of conditions in which there is a diminution of bile in the

intestinal tract, *e.g.*, in catarrhal cholangitis and sluggish liver. By stimulating intestinal peristalsis it is also valuable in chronic constipation and for the removal of impacted feces. For this latter purpose and for the treatment of paralytic ileus it has been employed in the form of an enema consisting of a 5% *w/v* solution of the extract in 5% soft soap solution, in doses of 5 to 20 ounces, or a 25% solution of fresh ox bile in hot water in doses of 1 to 4 ounces.

ACUTE ILEUS. Human bile used successfully in 9 out of 13 cases. Freshly secreted human bile from a cholecystectomy preferable, but can be kept in an ice-chest for a week. Give 2 oz. of bile in 4 oz. of saline per rectum and repeat every 4 hours until definite improvement is seen and bowels have been opened, reverting to bile if vomiting returns. Causes no discomfort and no difficulty in retention. Only water, orange juice, and glucose allowed until ileus is overcome. Both ox bile and vomited human bile have also been used, but both cause acute pain and are not so effective as fresh human bile.—*R. St. Leger Brockman, Lancet*, ii/1927, 320.

Acute intestinal obstruction. The action of human bile often dramatic.—*Lancet*, i/1929, 442.

Extractum Fellis Bovis (U.S.P. XI). *Average Dose.*—6 grains (0.4 g.). A dry extract adjusted with starch so that 1 g. represents 8 g. of ox bile.

Extractum Bilis Bovis Depuratum (Fr. Cx.). Shake 1000 g. of filtered ox bile with 1000 g. of alcohol (90%), and allow to stand 2 days. Filter, wash the residue with 200 g. of alcohol (70%), mix the filtrate and washings and evaporate below 50° to a firm extract.

Fel Bovinum Exsiccatum. *Dose.*—5 to 10 grains in cachets.

Fel Bovis (U.S.P. XI) is the fresh bile of the ox.

Sodii Tauroglycocholas (B.P.C.). *Syn.* BILE SALTS.

Dose.—2 to 6 grains (0.12 to 0.4 g.), preferably in capsules.

A yellowish-brown hygroscopic powder consisting chiefly of sodium taurocholate, $C_{26}H_{44}O_7NSNa$, and sodium glycocholate, $C_{26}H_{42}O_6NNa$. *Soluble* 2 in 1 of water, and in alcohol, insoluble in ether. It is prepared by extracting pig or ox bile with dehydrated alcohol, decolorising, and precipitating with ether. Is cholagogue, and assists pancreatic digestion. A 1% solution in water containing oil of eucalyptus 5%, is used for pediculosis.

The total salts of ox bile consist of a mixture of the sodium salts of taurocholic acid and glycocholic acid with small proportions of the sodium salts of tauro- and glyco-deoxycholic acids and tauro- and glyco-choleic acids. Taurocholic acid is a compound of cholic acid with the base taurine $CH_3(NH_2) \cdot CH_2SO_3H$, whilst glycocholic acid is a compound of cholic acid and glycine $CH_3(NH_2) \cdot COOH$. Similar compounds are formed by these bases with deoxycholic acid and choleic acid. The latter is a compound of deoxycholic acid and stearic or palmitic acid.—*N. Evers and W. Smith, Quart. J. Pharm.*, 1940, 213.

Sodii Desoxycholas. $C_{24}H_{39}O_4Na = 414.3$. Obtained from the tauroglycocholate by alkaline hydrolysis and crystallisation from glacial acetic acid of the separated bile acids. A white soluble powder, very irritating when inhaled. Bile salts appear to possess a solvent action on pneumococci, also on amœbæ and spirochætes. The addition of quinine enhances the action.

SPRAY SOLUTION. Sodium desoxycholate 4, quinine hydrochloride 0.5, glycerin 25, water to 100. For septic throats.

TABLETS. Contain sodium desoxycholate 1 gr., quinine ethyl carbonate $\frac{1}{2}$ gr., peppermint oil $\frac{1}{10}$ m., ammoniated glycyrrhizin 2 gr. Also made with acriflavine 1 in 1000. For infected throats.

Sodii Glycocholas. $C_{26}H_{42}O_6NNa = 487.3$.

Dose.—2 to 6 grains (0.12 to 0.4 g.).

A similar salt prepared from the lead salt precipitated from a tauroglycocholate solution by lead acetate. *Soluble* 1 in 2 of water and 1 in 3 of alcohol 90%. Appears to be a useful chologogue for congestion of the liver, gall-stones, constipation and melancholia.

These salts produce slight fall of blood pressure, the taurocholate more than the glycocholate.

CHOLECYSTITIS. Sodium glycocholate 3 gr. with hexamine 7 gr. in cachets, 1 night and morning.—W. Bain, *Lancet*, i/1929, 495.

MIGRAINE. Good results in 22 patients following use of bile salts, capsules of sodium glycocholate being given in doses of 2 to 20 gr. *t.d.s.*, investigations showing that many cases of migraine are caused through errors of the biliary mechanism.—T. C. Hunt, *Lancet*, ii/1933, 279.

Sodii Taurocholas. $C_{26}H_{44}O_7NSNa = 537.4$.

Dose.—2 to 6 grains (0.12 to 0.4 g.), in pill, keratin-coated to prevent solution until it reaches the bowels.

A whitish powder, separated from the filtrate of the precipitation of tauroglycocholate with lead acetate. *Soluble* about 2 in 1 of water. It has been recommended for gouty obesity and dyspepsia.

Lotio Sodii Taurocholatæ (B.V.H.). Sodium taurocholate 1½ dr., oil of eucalyptus 1 oz., water to 20 oz. For pediculosis. The taurocholate emulsifies the oil and assists penetration of the louse's egg.

Dehydrocholic Acid. *Prop. Name.* DECHOLIN (*Riedel-de Haen, Berlin; Endocrines-Spicer, Watford*) (0.25 g. tablets).

$C_{24}H_{34}O_5 = 402.5$.

Dose.—4 to 8 grains (0.25 to 0.5 g.).

Dehydrocholic acid is an oxidation product of cholic acid derived from the natural bile acids. It exists as an odourless, crystalline powder with a bitter taste. M.p. 233° to 235°.

Slightly *soluble* in alcohol and glacial acetic acid.

Uses. A potent chologogue for use in functional hepatic insufficiency and for the prevention and treatment of migraine associated with faulty hepatic functioning. It is also of value for outlining the bile ducts at operation and to avert some of the post-operative complications; in cholecystography it accelerates the appearance of the gall-bladder shadow and hastens removal of the residual dye from the bile tract.

Sodium Dehydrocholate. *Prop. Names.* DECHOLIN SODIUM (*Riedel-de Haen, Berlin; Endocrines-Spicer, Watford*) (Ampoules contain 10 ml. of 20% solution), SUPRACHOL (*Richter, London*) (Ampoules contain 10 ml. of 5 or 20% solution; tablets 4 gr.).

Dose.—5 to 10 ml. of a 20% solution.

Sodium dehydrocholate is a colourless, crystalline powder with a bitter taste.

Soluble in water and alcohol; the aqueous solution is neutral to litmus.

Uses. This is employed for similar purposes to the above where more prompt action is required. It is administered intravenously,

one injection being given on each of three successive days, the first of 5 to 10 ml., and the second and third of 10 ml. each. It may also be employed to determine the rate of circulation of the blood. 10 ml. of the 20% solution is injected quickly intravenously. The time taken from the injection to the appearance of a bitter taste in the mouth is taken as that of the complete circuit. The normal circulation time is 10 to 17 seconds; in heart failure it is 23 to 40 seconds. To distinguish between right and left ventricular failure, 5 m. of ether may be injected to record the arm-to-lung time; this figure (normal 4 to 8 seconds) subtracted from the sodium dehydrocholate reading gives the pulmonary circulation time (normal $4\frac{1}{2}$ to 10 seconds).

While sodium dehydrocholate has some diuretic effect it becomes a satisfactory diuretic in most cases only when combined with Salyrgan. The effective dosage of Salyrgan seems to be considerably lower when used in this combination, the maximum output following administration of 1 ml. or less of Salyrgan with simultaneous intravenous injection of 10 ml. of 20% sodium dehydrocholate. Sodium dehydrocholate intravenously is contraindicated in mechanical obstruction of the bile passages, acute hepatitis and acute yellow atrophy.—F. A. Weigand, *J. Amer. med. Ass.*, ii/1935, 2034.

EXPERIMENTALLY INDUCED JAUNDICE. As the result of the observation that attacks of severe jaundice confer complete relief from rheumatic symptoms in patients suffering from chronic atrophic arthritis and primary fibrositis, H. E. Thompson and B. L. Wyatt induced a condition of "therapeutic jaundice" in ten patients by means of intravenous injections of bilirubin and bile salts. A solution containing 10 mg. per kilo of bilirubin with 40 mg. per kilo of sodium dehydrocholate was employed, and the number of daily injections necessary to induce severe jaundice varied from seven to eleven. The first observable icterus in the eyes was noted after the first to fourth injection, and as a rule the icterus became progressively more marked with each succeeding injection. General reactions were of short duration and never appeared dangerous, and the observable jaundice disappeared in from 14 to 23 days after the last injection. Analgesia was noted after one to seven injections, the shortest period being twelve days; five of the ten patients have had no return of pain up to the present, the longest elapsed interval being a period of 5½ months.—Report of Fourth Ann. Meeting of the American Rheumatism Association, *J. Amer. med. Ass.*, ii/1937, 1482; P. S. Hench, *ibid.*, 1481.

SOME PROPRIETARY BILE SALT PREPARATIONS

Bilisalin (Endocrines-Spicer, Watford). Tablets contain bile salts 4 gr., and hepatic substance 2 gr. *Dose.*—One tablet 4 times daily for 3 days, double dose for 3 days, treble dose for 3 days, and continue until free bile appears in stool. In hepatic insufficiency, gall-stones, mucous colitis, etc.

Cholalic (Allen & Hanburys, London). An elixir of bile salts. Each drachm contains 1 gr. each of sodium taurocholate and sodium glycocholate. *Dose.*—1 to 3 teaspoonfuls. Constipation associated with hepatic deficiency.

Deagalol (Riedel-de Haen, Berlin; Endocrines-Spicer, Watford). Desoxycholic acid and menthol in $1\frac{1}{2}$ gr. tablets for diseases of the liver and biliary tract. *Dose.*—1 or 2 tablets thrice daily.

Desibyl Capsules (Parke, Davis, London). Desiccated bile in capsules each equivalent to about 2 to 5 ml. of fresh bile. Advocated as a cholagogue and choleric, and for use in the treatment of anorexia, intestinal indigestion and constipation. It is also advocated in steatorrhea for promoting intestinal absorption of fatty acids and fat-soluble vitamins. *Dose.*—2 or 3 capsules three times daily after meals. The capsules should be taken on a full stomach.

Felagol (Richter, London). Tablets containing sodium cholate 2 gr., hexamine salicylate $2\frac{1}{2}$ gr., benzyl succinate $\frac{1}{2}$ gr., lactic ferments $\frac{1}{2}$ gr., oil of peppermint $\frac{1}{2}$ gr. *Dose.*—2 tablets thrice daily.

Felamine (Sandoz, London). Hexamine glycocholate in tablets containing 5 gr. (0.3 g.). Cholagogue and biliary antiseptic. In catarrhal jaundice, constipation and enteritis and in the after-treatment of typhoid fever and for gall-stones.

Glandulax (*Richter, London*). Tablets of biliary salt, pancreas, duodenum, digestive ferments, pectin and aloin. *Dose*.—2 to 3 daily.

Glanfel Tablets (*Armour, London*). Enteric-coated tablets of 1 and 3 gr. consisting chiefly of sodium glycocholate and sodium taurocholate in the proportions existing in fresh bile. *Dose*.—One tablet one to three times daily. In indigestion, constipation, colitis, etc.

Lactobyl (*Continental Laboratories, London*). Tablets containing biliary salts, intestinal glands, hyperactivated charcoal, lactic ferments and extract of laminaria.

Oleoformine (*Corbière, Paris; Anglo-French Drug Co., London*). Combination of cholic acid, sodium oleate and hexamine in gluten-coated tablets. *Dose*.—3 to 4 tablets twice daily in acute cases; 2 tablets twice daily in chronic cases.

Opobyl (*Bengué, London*). Contains hepatic and biliary extracts, extracts of boldo and combretum, podophyllin and euonymin. For hepatic and biliary insufficiency.

Pancrobilin (*Reed & Carnrick, New Jersey; Coates & Cooper, London*). Pills (or liquid) containing pancreatic enzymes and bile salts. [P1-81] **Compound pills** contain in addition $\frac{3}{16}$ gr. of strychnine, $\frac{1}{16}$ gr. of belladonna and $\frac{1}{2}$ gr. of aloin.

Procholon Tablets (*Squibb, New York; Savory & Moore, London*). Dehydrocholic acid tablets. *Dose*.—1 or 2 tablets two or three times daily. Hepatic insufficiency, cholecystitis, chronic constipation, etc.

Sal-Cholate (*Lilly, London*). Tablets containing sodium glyco- and taurocholate $\frac{1}{2}$ gr., sodium salicylate $1\frac{1}{2}$ gr., phenolphthalein $\frac{1}{8}$ gr., extract of cascara sagrada $\frac{1}{2}$ gr. *Dose*.—1 or 2 at bedtime or 1 after each meal.

Salvacid (*Coates & Cooper, London*). "Glycocholacetate, Thuryon" (ox bile derivatives combined with the antispasmodic principle of sage) 0.20 g., parathyroid extract 0.0001 g., sodium bicarbonate 0.05 g., calcium carbonate 0.05 g.

Veracolate (*W. R. Warner, London*). Tablets containing sodium glycocholate $\frac{1}{2}$ gr., sodium taurocholate $\frac{1}{2}$ gr., extract of cascara 1 gr., phenolphthalein $\frac{1}{8}$ gr., oleoresin of capsicum $\frac{1}{16}$ gr.

Boldo (*B.P.C., Fr. Cx.*).

Dose.—1 to 3 grains in cachet or capsule. The dried leaves of *Peumus Boldo* (*Monimiaceæ*) from Chili and Bolivia. They resemble those of Sweet Gale (*Myrica Gale*), but are more aromatic. In dyspepsia, liver affections, rheumatism, and as a diuretic for atony of the bladder.

Tinctura Boldo (*B.P.C.*). 1 in 10 of 60% alcohol.

Dose.—10 to 30 minims (0.6 to 2 ml.).

Boldine Houdé (*Laboratoires Houdé, Paris; Wilcox, Jozseau, London*). Granules containing 1 mg. of the alkaloid boldine. *Dose*.—3 to 6 granules daily. In hepatic disorders.

FERRUM

Fe = 55.84.

Ferrum (*B.P.*). Consists of iron wire of 0.1 mm. diameter. *U.S.P. XI* requires it to be in form of fine bright wire, filings, or powder. *Fr. Cx.* includes filings (*Limaille de Fer*).

Extractum Ferri Pomatum (*P.G. VI, P. Ital. V, P. Jap. V*) is prepared by digesting iron filings in juice of sour apples, and contains 5% of iron.

Tinctura Ferri Pomata (*P.G. VI*). *Dose*.—15 to 30 minims (1 to 2 ml.). Ferrated extract of apples 1 part, cinnamon water (*P.G. VI*, containing 10% of alcohol) 9 parts.

Liquor Ferri Acetatis.

Dose.—5 to 15 minims (0.3 to 1 ml.).

Prepared by dissolving freshly precipitated ferric hydroxide in acetic acid and diluting with glycerin and water.

Pneumonia has been treated with full doses every 6 hours until crisis past.

Solutio Ferri Subacetatis (*P. Helv. V*) is a similar preparation adjusted to contain 5% of Fe.

Liquor Ferri et Ammonii Acetatis.

Average dose.—4 drachms (15 ml.).

Tincture of ferric chloride 4, dilute acetic acid 6, solution of ammonium acetate 50, aromatic elixir 12, glycerin 12, water to 100. To be freshly made. Useful in anæmia and particularly in chronic parenchymatous nephritis. It acts as a diuretic and diaphoretic.

Mist. Ferri Acet. (N.I.F.).

Strong solution of ammonium acetate 10 m., solution of ferric chloride 10 m., glycerin 10 m., water to $\frac{1}{2}$ oz.

Mistura Ferri Acetatis (W.H.). *Syn.* BASHAM'S MIXTURE.

Solution of ferric chloride 15 m., solution of ammonium acetate 2 dr., dilute acetic acid 15 m., glycerin 15 m., water to $\frac{1}{2}$ oz. For chronic parenchymatous nephritis.

Ferrum Redactum (*B.P., U.S.P. XI, Fr. Cx.*). *Syn.* QUEVENNE'S IRON.

Dose.—1 to 10 grains (0.06 to 0.6 g.). *U.S.P. XI* average dose 8 grains.

Fine powdered iron containing at least 80% (*U.S.P.* and *Fr. Cx.* 90%) of metallic iron, prepared by reducing ferric oxide with hydrogen.

P. Dan. and *P. Helv. V* include both Ferrum reductum and Ferrum pulveratum.

Incompatible with tannin and metallic salts.

Pills of reduced iron require $\frac{1}{2}$ to $\frac{1}{2}$ grain of compound tragacanth powder to bind them.

Trochisci Ferri Redacti (*B.P.C.*) contain 1 grain.

Vinum Ferri (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.).

Sherry-type wine in which iron has been immersed until the liquid contains 0.125 to 0.300% w/v of Fe.

Vinum Ferri (*P. Jap. V*). Iron and ammonium citrate 2%, in a white wine.

Ferri Carbonas Saccharatus (*B.P., P. Helv. V*).

Dose.—10 to 30 grains (0.6 to 2 g.).

Ferrous oxycarbonate, $\alpha\text{FeCO}_3, \gamma\text{Fe}(\text{OH})_2$, partially oxidised and mixed with liquid glucose, the mixture containing not less than 50% of ferrous iron calculated as FeCO_3 .

Incompatible with tannin-containing drugs, also with acids and acid salts.

Uses. For anæmia and chlorosis of young women. Ferrous salts are used in preference in anæmia as they are more readily ionised and less readily hydrolysed than ferric salts, and remain longer in the circulation than such complex salts as iron and ammonium citrate. Another point in favour of ferrous salts is that much smaller doses can be given. Large doses of iron lead to various complications, indigestion, cramps, etc.; they also change the bacterial flora and interfere with the absorption of such essential substances as minerals and vitamins.

Mistura Ferri Composita (B.P.C.). *Syn.* GRIFFITH'S MIXTURE.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains ferrous carbonate equivalent to about 3 gr. of ferrous sulphate per oz.

Pilula Ferri Carbonatis (B.P.). *Syn.* BLAUD'S PILL, PILULA FERRI, IRON PILL, MASSA FERRI CARBONATIS (U.S.P. XI).

Dose.—5 to 30 grains (0.3 to 2 g.). U.S.P. XI average dose 4 grains.

Each 5 grains contain about $\frac{1}{2}$ grain of iron.

ANÆMIA. Massive iron therapy—up to 60 gr. of Blaud's pill daily—the most effective treatment of secondary anæmia. Ferrous better than ferric salts.—*Lancet*, ii/1931, 531.

In the treatment of MICROCYTIC HYPOCHROMIC ANÆMIAS it is usually a waste of time, material, and money to give less than 45 gr. of Blaud's pill or 60 gr. of iron and ammonium citrate daily in the early stages.—J. F. Wilkinson, *Practitioner*, ii/1933, 418.

In SPLENIC ANÆMIA, whether it is believed that operation is indicated or not, treatment with effective doses of iron—iron and ammonium citrate 90 gr. daily, Blaud's pill 45 gr. daily, ferrous sulphate, chloride or carbonate in tablet form, 9 gr. daily—should be tried for at least 6 to 8 weeks before iron therapy is held to have failed.—L. S. P. Davidson, *Lancet*, ii/1934, 596.

In the treatment of HELMINTHIC ANÆMIA, iron in large doses (Blaud's pills 3 to 4 *t.d.s.* and iron and ammonium citrate 1 $\frac{1}{2}$ to 2 grammes *t.d.s.*) combined with a well balanced diet (fats and proteins) proved most effective. Iron was found more effective in ankylostoma anæmia than in that due to intestinal bilharziasis. Liver therapy proved ineffective.—M. Salah, *per Trop. Dis. Bull.*, 1936, 33, 151.

COMBINED DEGENERATION OF THE CORD successfully treated by Blaud's pill 150 gr. daily, in capsules. Liver treatment may be necessary in addition.—W. Sargent, *Lancet*, i/1932, 232.

Excretion by Normal Subjects. Two men and two women, who were in iron balance on diets containing 7 to 9 mg. per day, were each given approximately 1000 mg. of iron daily for 36 to 46 days. The iron was taken by the men in the form of iron and ammonium citrate, and by the women in the form of capsules containing 1 g. of saccharated iron carbonate. Determinations of the iron excreted were made, and after discontinuing the administration and allowing time for unabsorbed iron in the gut to be excreted, net absorptions of 1.5 to 5 g. of iron were registered. Immediately afterwards the subjects were again found to be in iron equilibrium in spite of the large amounts absorbed, and it is concluded that the body has little or no capacity for excreting iron. Changes in the hæmoglobin levels were comparatively slight. In two there was no change, in one it rose about 10% and fell very slowly, and in the fourth it rose during administration but fell immediately the iron was discontinued, in spite of the large amount absorbed.—E. M. Widdowson and R. A. McCance, *Biochem. J.*, 1937, 2029.

It is suggested that the capacity of the bowel to excrete iron has been exaggerated, particularly its capacity to regulate the amount of iron which it excretes. There are, indeed, indications that in man and certain animals the bowel excretes practically no iron. If this is the case, the amount of iron in the body must be regulated by controlled absorption.—R. A. McCance and E. M. Widdowson, *Lancet*, ii/1937, 680.

Pilulæ Ferri Carbonatis (U.S.P. XI). *Syn.* CHALYBEATE PILLS, FERRUGINOUS PILLS. *Average dose.*—3 pills.

Each pill contains about 1 gr. of FeCO_3 .

Pilulæ Ferri Carbonatis Compositæ (B.P.C.). *Syn.* BLAUD'S PILL WITH ALOIN AND CASCARA.

Dose.—1 to 3 pills.

Contain 5 gr. of pill of iron carbonate with $\frac{1}{10}$ gr. of aloin and $\frac{1}{2}$ gr. of dry extract of cascara sagrada.

Pil. Ferri et Casc. (N.I.F.).

Pill of iron carbonate 4 gr., dry extract of cascara sagrada $\frac{1}{2}$ gr.

[P1-81] *Pilulæ Ferri Carbonatis cum Arseno et Strychnina* (B.P.C.).
Syn. BLAUD'S PILL WITH ARSENIC AND STRYCHNINE.

Dose.—1 or 2 pills.

Contain 5 gr. of pill of iron carbonate with $\frac{1}{10}$ gr. of arsenic trioxide and $\frac{1}{10}$ gr. of strychnine hydrochloride.

[P1-81] *Pilulæ Ferri Carbonatis et Arseni* (B.P.C.). *Syn.* BLAUD'S PILL WITH ARSENIC.

Dose.—1 pill.

Contain 5 gr. of pill of iron carbonate and $\frac{1}{10}$ gr. of arsenic trioxide.

Pilulæ Ferri Carbonatis Saccharati (B.P.C.).

Dose.—1 to 3 pills.

Contain 3 gr. of saccharated iron carbonate per pill, equivalent to about 10 gr. of Blaud's pill.

Tabellæ Ferri Carbonatis (B.P.C.).

Dose.—1 to 6 tablets.

Contain the equivalent of 5 gr. of Blaud's pill.

Tabellæ Ferri Carbonatis et Aloini (B.P.C.). *Syn.* BLAUD'S TABLETS WITH ALOIN.

Dose.—1 to 6 tablets.

Contain the equivalent of 5 gr. of Blaud's pill and $\frac{1}{10}$ gr. of aloin.

Ferri Citras. *Syn.* FERRUM CITRICUM OXYDATUM (P. *Jap.* V).

Dose.—5 to 15 grains (0.3 to 1 g.).

Contains ferric citrate corresponding to not less than 16% of Fe. Garnet-red soluble scales with slight ferruginous taste.

Ferri et Ammonii Citras (B.P. *Add. I*, U.S.P. XI, *Fr. Cx.*).

Dose.—20 to 40 grains (1.3 to 2.6 g.). 40 grains contains about 8 grains of iron. B.P. '32 gave max. dose 15 grains. U.S.P. XI average dose 30 grains. Contains 20.5 to 22.5% (B.P.) or 16.5 to 18.5% (U.S.P. XI) of metallic iron. Dark red scales soluble in about half their weight of water. Is also available in granules.

In debility and anæmia. Especially preferred in lingering cases of gastric catarrh after alkalis have ceased to benefit and the stomach is not ready for an acid tonic. Also with sodium salicylate in subacute rheumatism of children.

In ANÆMIA OF CHILDREN had no appreciable effect.—N. K. Gibbs, *Lancet*, ii/1929, 550.

Simple achlorhydric anæmia treated by iron and ammonium citrate. 90 gr. daily increased to 120 gr.—D. C. Hare, *Brit. med. J.*, ii/1931, 889.

CHLOROSIS in young persons well treated by iron. Chronic microcytic anæmia in mid-life treated by iron and ammonium citrate, 60 to 120 gr. daily for 4 to 5 months.—L. J. Witts, *Lancet*, i/1931, 146.

Anæmia is prevalent among nearly half the women of the poorest classes in Aberdeen, and appears to be mainly due to increased demands for iron as a result of frequent pregnancies, or of excessive blood loss during menstruation and/or parturition. The anæmia can be rapidly cured with marked improvement of general health by administration of iron salts. It is suggested that a glass of milk and a pennyworth of iron and ammonium citrate, without any other change in the diet of pregnant women of the poorest classes, would produce remarkably beneficial results to mother and infant.—L. S. P. Davidson and co-workers, *Brit. med. J.*, i/1933, 689.

The administration of iron in therapeutic doses to pregnant women converted the fall in hæmoglobin, which was then in progress, into a rise. After the administration of iron had been discontinued the hæmoglobin fell once more and at about the same rate as if iron had not been administered.—E. M. Widdowson, *Lancet*, ii/1939, 640.

Mist. Ferri et Ammon. Cit. (N.I.F.). Iron and ammonium citrate 20 gr., ammonium carbonate 1 gr., chloroform water to $\frac{1}{2}$ oz.

[P1] *Mist. Ferri Cit. c. Arsen.* (N.I.F.). Iron and ammonium citrate 12 $\frac{1}{2}$ gr. arsenical solution 3 m., chloroform water to $\frac{1}{2}$ oz.

Vinum Ferri Citratis (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.). Contains about 1 gr. of iron and ammonium citrate per drachm of orange wine.

Cupriferrum (*Squibb, New York; Savory & Moore, London*). Capsules contain 85 mg. of iron (as iron ammonium citrate) and 0.5 mg. of copper as copper gluconate. *Dose.*—6 to 12 capsules daily. Nutritional anæmia.

Elixir Hæmotone (*Duncan, Flockhart, Edinburgh*). Contains in each fl. dr. $7\frac{1}{2}$ gr. of iron and ammonium citrate, with copper $\frac{1}{10}$ gr., glycerophosphates and glucose. *Dose.*—1 to 4 teaspoonfuls three times daily.

Iberin (*Abbott Laboratories, London*). Capsules containing iron and ammonium citrate (B.P.) 5 gr.; vitamin B₁ 22 i.u.; vitamin B₂ 20 Sherman units; liver concentrate 4 gr. (1 part equals 20 parts of fresh liver). For secondary anæmia.

Ferri et Ammonii Citras Viridis (B.P.C.). *Syn.* FERRI ET AMMONII CITRATES VIRIDES (U.S.P. XI).

Dose.—5 to 10 grains (0.3 to 0.6 g.). Hypodermically $\frac{1}{2}$ grain in 4% w/v solution, but for this purpose it must be neutralised with ammonia to give no red colour with either methyl red or phenol red.

U.S.P. XI average dose, by parenteral injection, 1 grain.

Green deliquescent scales prepared as for iron and ammonium citrate but using more acid and sufficient ammonia to give a green colour. Contains 14 to 16% of Fe. *Soluble* 2 in 1 of water.

Injectio Ferri (B.P.).

Dose.—15 to 30 minims (1 to 2 ml.). 30 m. contains the equivalent of about $\frac{1}{10}$ gr. of iron.

Contains a double citrate of iron and ammonium.

Iron injections are a poor substitute for oral administration, and their use is seldom justified.

The injection tested in 10 cases. It was found to be of very low therapeutic efficiency owing to the small proportion of iron, and also painful, but this could be corrected by adding 3% of procaine hydrochloride. Double the maximum official dose can be given, but would have to be given twice daily for 6 weeks to equal the effect of large oral doses. Except in rare instances the administration of iron by the parenteral route should be avoided.—G. N. Burger and L. J. Witts, *Proc. R. Soc. Med.*, 1934, 27, 447.

Iron given by injection is quite inert; the popular and expensive ampoules of such solutions may have some effect on the mind, but they have none on the blood. When 30 gr. of iron and ammonium citrate is given thrice daily, the hæmoglobin generally increases by about 1% a day. It is unsafe to give much larger doses; 40 gr. 4 times a day for 3 weeks may cause acute iron encephalopathy.—A. F. Hurst, *Pharm. J.*, ii/1934, 675.

[P1-81] Injectio Ferri et Arseni (B.P.C.).

Dose.—8 to 15 minims (0.5 to 1 ml.) intramuscularly. Contains the same proportion of iron as Injectio Ferri together with $\frac{1}{50}$ gr. of arsenic trioxide per 15 m.

[P1-81] Ferarin (*Squire, London*). Solution of green iron and ammonium citrate with arsenic for intramuscular injection.

[P1-81] Ferri et Ammonii Citro-Arsenis (B.P.C.). *Syn.* SOLUBLE IRON ARSENITE.

Dose.— $\frac{1}{40}$ to $\frac{1}{2}$ grain (0.0015 to 0.03 g.); maximum daily dose 1 grain (0.06 g.).

A double salt of ferrous arsenite and ammonium citrate in greenish deliquescent scales containing about 14% of Fe and 1.4% of As₂O₃. May be administered by injection.

Ferri et Ammonii Tartras.

Dose.—5 to 15 grains (0.3 to 1 g.). In garnet-red soluble scales containing not less than 13% of Fe.

Ferri et Mangani Citras (B.P.C.).

Dose.—3 to 15 grains (0.2 to 1 g.).

In reddish scales, freely soluble in water, containing not less than 14% of Fe and not less than 7% of Mn. Useful in chlorosis, combining the action of the two elements.

Ferri et Potassii Tartras (B.P.C.). *Syn.* FERRUM TARTARATUM, FERRI-KALIUM TARTARICUM (*P. Jap. V*).

Dose.—5 to 10 grains (0.3 to 0.6 g.).

Reddish-brown scales soluble in water about 1 in 1; very sparingly soluble in alcohol 90%. Contains not less than 20% of Fe.

Menorrhagia of young females is well treated by this tartrate.

Ferri Iodidum (B.P.C.). *Syn.* FERROUS IODIDE. $\text{FeI}_2 = 309.7$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

Crystalline grey or brown hygroscopic masses readily soluble in water. Mostly prescribed as SYRUPUS FERRI IODIDI.

Liquor Ferri Iodidi (B.P.C.). *Syn.* LIQUOR PRO SYRUPO FERRI IODIDI.

Dose.—2 to 8 minims (0.12 to 0.5 ml.).

Contains about 53.5% *w/v* of FeI_2 , and when mixed with 7 volumes of syrup forms Syrupus Ferri Iodidi.

Syrupus Ferri Iodidi (B.P., P. Ned. V). *Syn.* SIRUPUS FERROSI IODIDI CONCENTRATUS *I.A.*

Dose.— $\frac{1}{4}$ to 2 drachms (2 to 8 ml.).

Contains 5% *w/w* of FeI_2 ; 2 drachms contains about $7\frac{1}{2}$ gr. of ferrous iodide equivalent to about $1\frac{1}{2}$ gr. of iron.

P. Belg. IV and F.E. VIII have this strength as concentrated syrups, which diluted 10 times provide dilute syrups containing 0.5% of ferrous iodide. *Fr. Cx. and P. Ital. V* have the same dilute syrup only.

Incompatible with alkalis such as sal volatile.

ACTION OF LIGHT. The action of light in restoring the green colour in a decomposed sample is due to conversion of the sucrose to invert sugar, the levulose of which has a complex reducing effect resulting in the re-formation of ferrous iodide. When the inversion is completed by sufficiently long exposure to light, enough levulose is present to preserve the ferrous iodide permanently. Immersion of a discoloured syrup in boiling water for an hour is as effective as exposure to sunlight in restoring the green colour.—*H. V. Arny, A. Taub and W. C. Mende, per Pharm. J., ii/1936, 251.*

Addition of lactic acid does not prevent rapid development of the brown colour on exposure to light, but both citric and tartaric acids are satisfactory preservatives.—*A. Jermstad and B. Fretheim, Pharm. Zentr., 1939, 80, 545.*

Syrupus Ferri Iodidi (U.S.P. XT).

Average dose.—15 minims (1 ml.).

Approximately the same composition and strength as *B.P.* syrup, except that it contains 50% more hypophosphorous acid. *U.S.P. XI Supp. II* allows the substitution of citric acid for the hypophosphorous acid in the formula to retard discoloration.

Ferrum Iodatam Saccharatum (P. Jap. V). A preparation made by triturating lactose and reduced iron with freshly prepared solution of ferrous iodide. It contains 20% of Fe I_2 .

Syrupus Ferri Bromidi (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.).

Contains about $4\frac{1}{2}$ gr. of ferrous bromide in 1 dr.

Syrupus Ferri Bromidi cum Quinina (B.P.C.).*Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).Contains about $\frac{1}{10}$ gr. of quinine dihydrobromide and 4 gr. of ferrous bromide in 1 dr.**[P1] Syrupus Ferri Bromidi cum Quinina et Strychnina (B.P.C.).***Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).Similar to the preceding, containing also $\frac{1}{10}$ gr. of strychnine per dr.**[P2] Ferri Oxalas (Fr. Cx.).** $\text{Fe}(\text{COO})_2 \cdot 2\text{H}_2\text{O} = 179.9$. *Syn.* FERROUS OXALATE, PROTOXALATE OF IRON, FERROSUM OXALICUM (P. Belg. IV).*Dose.*—1 to 5 grains (0.06 to 0.3 g.).

Yellow crystalline powder, insoluble in water but soluble in dilute acids. Has been given in anæmia and as a nerve tonic.

Ferri Oxidum Calcinatum. *Syn.* FERRI SESQUIOXIDUM. Obtained by roasting precipitated oxide of iron, and usually contains about 94% of Fe_2O_3 . Impure forms are Armenian bole, ochre, Venetian red, jewellers' rouge, etc.**Ferri Oxidum Præcipitatum Fuscum (B.P.C.).** *Syn.* FERRI PEROXIDUM.*Dose.*—5 to 15 grains (0.3 to 1 g.). A brown powder containing 80 to 90% of Fe_2O_3 .**[P1-81-83] Emplastrum Ferri (B.P.C.).** *Syn.* EMPLASTRUM ROBORANS, STRENGTHENING PLASTER. Contains 9% of brown precipitated ferric oxide in Burgundy pitch and plaster of lead.

The name "Strengthening Plaster" is usually applied to a spread plaster which is not prepared with iron oxide, and has, therefore, an entirely different composition.

Ferri Oxidum Præcipitatum Rubrum (B.P.C.). *Syn.* FERRI CARB., FERRI SUBCARB.*Dose.*—5 to 15 grains (0.3 to 1 g.).

Obtained by precipitating ferrous sulphate solution with sodium carbonate and washing and drying the precipitate. A dull brownish-red powder.

Ferrum Oxydatum Saccharatum (P. Austr., P.G. VI, P. Helv. V, P. Dan.).*Dose.*—10 to 40 grains (0.6 to 2.5 g.).

Dilute ferric chloride solution (P.G. VI—10% of Fe) 30 g. with water 150. Then add with stirring a solution of sodium carbonate 26 in water 150 (towards the end of the precipitation before each fresh addition of the alkali wait for the re-solution of the precipitate). Wash to free from chloride, collect on cloth, press slightly, mix in porcelain dish with powdered sugar 50 and so much sodium hydroxide solution (sp. gr. 1.17) as is required to dissolve on a water-bath (not more than 5 to be used), evaporate, dry, and mix with sugar q.s. to make 100.

A reddish-brown powder containing 2.8 to 3% of Fe.

Ferri Peptonas. A compound of iron and peptone with addition of sodium citrate to render it soluble. Usually administered as the solution in the treatment of anæmia, neurasthenia and chlorosis.**Liquor Ferri Peptonatis (B.P.C.).** *Syn.* SOLUTION OF PEPTONISED IRON.*Dose.*—1 to 4 drachms (4 to 16 ml.).

Contains 0.65% w/v of iron and 4% w/v of peptone.

Liquor Ferri Peptonatis cum Mangano (B.P.C.). *Syn.* SOLUTION OF PEPTONISED IRON WITH MANGANESE.

Dose.—1 to 4 drachms (4 to 16 ml.).

Similar to the above, but containing also $\frac{1}{2}$ gr. of manganese chloride per drachm.

Liquor Ferri Albuminati (P.G. VI, P. Helv. V).

Dose.—1 to 4 drachms (4 to 16 ml.).

A solution containing a compound of iron and egg albumen adjusted to contain about 0.4% of Fe. *P. Ned. V* contains 0.25% of Fe_2O_3 .

Fer Ascoli (Allen & Hanburys, London). An organic compound of iron with nuclein in tablet form. Used in treatment of anæmia.

Ferratin (Boehringer, Mannheim; Coates & Cooper, London). Sodium ferroalbuminate, containing 6% of iron. Tablets contain 4 grains. *Dose.*—2 tablets 3 or 4 times daily.

[P1] **Ferroarsine (Parke, Davis, London).** Solution of iron peptonate and manganese with arsenic peptonate $\frac{1}{8}$ gr. and strychnine sulphate $\frac{1}{16}$ gr. *Dose.*—1 to 2 fluid drachms (4 to 8 ml.) thrice daily.

Ferri Perchloridum (B.P.C., P. Helv. V). *Syn.* FERRI SESQUICHLORIDUM, FERRUM SESQUICHLORATUM (*P. Jap. V*).

$\text{FeCl}_3 \cdot 6\text{H}_2\text{O} = 270.3$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.), or more.

Deliquescent yellow masses made by evaporating the strong solution and crystallising.

Incompatible with infusions, etc., containing tannin, with the alkalis, alkaline carbonates, iodides, salicylates and mucilage of acacia. With potassium iodide in presence of potassium citrate a potassium ferricitrate is formed, and hence it is compatible.

Soluble in water, alcohol, ether and glycerin.

Uses. Internally as hæmatinic, externally as astringent and styptic.

BRONCHITIS. The irritating dry cough may be relieved by applying a mixture of 120 gr. of ferric chloride in 2 oz. of glycerin, on cotton wool, wound round a bent probe, which is passed just to the side of the middle line as near the back of the tongue as possible into each vallecule in turn.—E. P. Poulton and F. A. Knott, *Practitioner*, 1/1936, 30.

Garg. Ferri Perchlor. (N.I.F.). Solution of ferric chloride 2 dr., potassium chlorate 2 dr., glycerin $\frac{1}{2}$ oz., water to 8 oz. Dilute with 1 or 2 parts of water.

Glycerinum Ferri Perchloridi (B.P.C.). *Syn.* PIGMENTUM FERRI PERCHLORIDI. Solution of ferric chloride 1, glycerin 1. For use as a paint. Glycerin and chloroform water cover its metallic astringent taste.

Gossypium Stypticum. *Syn.* GOSSYPIUM FERRI PERCHLORIDI.

Saturate absorbent wool 85 with water 100 containing ferric chloride 15, and dry. Lintum Stypticum is made similarly.

Liquor Ferri Dialysatus (B.P.C.).

Dose.—10 to 30 minims (0.6 to 2 ml.).

A colloidal solution of ferric hydroxide containing the equivalent of 3 to 4% of Fe.

A well-tolerated, non-astringent hæmatinic. It is prescribed undiluted or mixed with 2 parts of glycerin.

Dialysed iron is useful as an antidote to arsenic—much superior to the moist peroxide; 1 ounce doses should be given repeatedly, preceded by a dose of common salt or sodium bicarbonate.

Colliron (Evans, Sons, Lescher & Webb, Liverpool). 10% solution of colloidal iron.

Idozan (Coates & Cooper, London). 5% solution of colloidal iron.

Dose.—1 drachm, increased to $\frac{1}{2}$ ounce, thrice daily.

Ovoferrin (*A. C. Barnes, Philadelphia; Fassett & Johnson, London*). Colloidal iron tonic (1 dr. = 1 gr. of colloidal iron). *Dose*.—One tablespoonful in water or milk.

Liquor Ferri Oxychloridi (B.P.C.). *Syn.* SOLUBLE PEROXIDE OF IRON.

Dose.—10 to 30 minims (0.6 to 2 ml.).

Contains the equivalent of about 3% *w/v* of Fe.

Liquor Ferri Perchloridi (B.P.).

Dose.—5 to 15 minims (0.3 to 1 ml.).

Contains about 15% of FeCl₃, equivalent to about 5% of Fe.

A solution of the same strength may be obtained by diluting 1 volume of Liq. Ferri Perchlor. Fort. with water to 4 volumes.

The use of iron salts applied as a lotion, compress or wet dressing should be discouraged in all vesicular, bulbous and exudative dermatoses. Two cases of permanent pigmentation following the application of 5% ferric chloride solution for the treatment of ivy poisoning.—E. F. Traub and J. S. Tennen, *J. Amer. med. Ass.*, i/1936, 1711.

ERYSIPELAS. Liq. Ferri Perchlor. 20 or 25 m. thrice daily acts almost as a specific. Collodion locally helps.

TINEA CIRCINATA. An intractable case quickly cured, after failure of iodine, salicylic acid and chrysarobin.—J. H. Boulton, *Brit. med. J.*, ii/1932, 180.

Liquor Ferri Chloridi (U.S.P. XI).

Average dose.—1½ minims (0.1 ml.).

A solution containing 10 to 11% *w/w* of iron, and from 3 to 5% *w/w* of HCl, and therefore approximately double the strength of Liquor Ferri Perchloridi (B.P.). Liquor Ferri Perchloridi Fortis (B.P.C.) diluted with an equal volume of water would give a solution of approximately the same iron content.

Liquor Ferri Sesquichlorati (P.G. VI) contains 10% of Fe approx. FERRUM SESQUICHLORATUM SOLUTUM (*P. Helv. V*) is similar.

Liquor Ferri Perchloridi Fortis (B.P.C.). Contains 20% Fe. Has sp. gr. about 1.43. It is four times the strength of Liquor Ferri Perchloridi.

[P1] **Mist. Arsen. Ferri et Strych. (N.I.F.)**. Solution of strychnine hydrochloride 3 m., arsenical solution 3 m., solution of ferric chloride 10 m., dilute hydrochloric acid 1 m., syrup ½ dr., water to ½ oz.

[P1] **Mist. Ferri et Strych. (N.I.F.)**. Solution of strychnine hydrochloride 3 m., solution of ferric chloride 10 m., dilute hydrochloric acid 1 m., chloroform water to ½ oz.

Mist. Ferri Perchlor. (N.I.F.). Solution of ferric chloride 10 m., glycerin 20 m., water to ½ oz.

Mistura Ferri Salina (U.C.H.).

Potassium citrate 22 gr., solution of ferric chloride 24 m., chloroform water to 1 oz. The styptic taste of iron is masked in this mixture, as a double decomposition occurs between the iron and the potash salt.

Nebula Ferri Perchloridi (T.H.). Ferric chloride 5 gr., glycerin 15 m., water to 1 oz.

Pigmentum Ferri Perchloridi (T.H.) contains 1 to 2 dr. of ferric chloride per oz. of water.

Tinctura Ferri Perchloridi (B.P.C.).

Dose.—5 to 15 minims (0.3 to 1 ml.).

A 25% dilution of strong solution of ferric chloride with diluted alcohol. Is the same strength as Liquor Ferri Perchloridi.

Owing to the fact that ferric chloride does not remove any of the acid of the gastric juice (as when reduced iron or Bland's pills are

given), this is preferred by many. Thread-worms are killed by rectal injection of 1 dr. of the tincture in 10 oz. of water.

CUTANEOUS ERYSIPELAS. An old effective remedy is local application of strong solution of ferric chloride, also internal use of tincture of ferric chloride.

Tinctura Ferri Chloridi (U.S.P. XI).

Average dose.—10 minims (0.6 ml.).

Solution of ferric chloride (U.S.P.) 35 ml. diluted with sufficient alcohol to produce 100 ml.

Ferri Phosphas (B.P.C.).

Dose.—5 to 10 grains (0.3 to 0.6 g.).

A slate-blue amorphous powder consisting of hydrated ferrous phosphate, ferric phosphate and some hydrated iron oxide, containing not less than 47% of ferrous salts calculated as $\text{Fe}_2(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Liquor Ferri Phosphatis (B.P.C.).

Dose.—4 to 8 minims (0.5 to 2 ml.).

One volume mixed with seven volumes of syrup forms Syrupus Ferri Phosphatis.

Liquor Ferri Phosphatis Compositus (B.P.C.).

Dose.—8 to 30 minims (0.5 to 2 ml.).

One volume mixed with seven volumes of syrup forms a compound syrup similar to Syrupus Ferri Phosphatis Compositus.

[P1] **Pilulæ Ferri Phosphatis cum Quinina et Strychnina (B.P.C.).** *Syn.* PILULÆ TRIUM PHOSPHATUM, EASTON'S PILLS.

Dose.—1 or 2 pills. Contain saccharated iron phosphate, quinine and strychnine equivalent to $\frac{1}{2}$ dr. of Syrupus Ferri Phosphatis cum Quinina et Strychnina.

Also made twice this strength. Either may be combined with arsenic trioxide, $\frac{1}{10}$ grain (0.001 g.).

Syrupus Ferri Phosphatis (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). Contains 1 gr. of anhydrous ferrous phosphate per drachm. Is best prepared, as required, from Liquor Ferri Phosphatis.

Syrupus Ferri Phosphatis Compositus (B.P.).

Syn. CHEMICAL FOOD, PARRISH'S SYRUP, PARRISH'S FOOD.

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Contains iron equivalent to 0.9% w/v of $\text{Fe}_2(\text{PO}_4)_2$, and calcium equivalent to 1.4% w/v of $\text{Ca}_3(\text{PO}_4)_2$. 2 dr. contains about $1\frac{1}{2}$ gr. of anhydrous ferrous phosphate equivalent to about $\frac{1}{2}$ gr. of iron.

Syrupus Ferri cum Mangano (Gt. Orn. H.). (*Dose* for 1-year-old child.)

Copper sulphate $\frac{3}{16}$ gr., manganese chloride $\frac{1}{8}$ gr., compound syrup of ferrous phosphate to 1 dr.

[P1] **Syrupus Ferri Phosphatis cum Quinina et Strychnina (B.P.).** *Syn.* EASTON'S SYRUP, SYRUPUS TRIUM PHOSPHATUM.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains iron equivalent to 1.8% w/v of $\text{Fe}_2(\text{PO}_4)_2$, 1.09% w/v of anhydrous quinine, and 0.0246% w/v of strychnine. 1 dr. represents 1 gr. of anhydrous ferrous phosphate, $\frac{1}{8}$ gr. of quinine sulphate and $\frac{1}{16}$ gr. of strychnine hydrochloride. It contains only about half the strychnine content of the B.P. 1914 syrup.

A widely-used tonic preparation.

The following formula for Easton's Syrup is suggested to replace the existing official preparation. Iron 8.6 g., phosphoric acid 35 ml., strychnine hydrochloride

0.3 g., quinine hydrochloride 13.3 ml., dilute hydrochloric acid 50 ml., syrup 660 ml., glycerin 140 ml., distilled water to 1000 ml. Dilute the phosphoric acid with 70 ml. of water, add it to the iron in a flask of suitable size, and heat on a water bath until the iron is dissolved. Add a solution of the strychnine and quinine hydrochlorides in the dilute hydrochloric acid, and filter into the syrup and glycerin previously mixed. Pass sufficient distilled water through the filter to produce the required volume.—W. T. Wing, *Quart. J. Pharm.*, 1939, 562.

Liquores pro Syrupo Eastonii. It is not possible to prepare solutions so that 1 part of the solution containing the iron and 1 part of that containing the alkaloids, when diluted with 6 parts of syrup, will yield an Easton's Syrup identical with that of the *B.P.* By using Liquor Ferri Phosphatis (*see above*) in conjunction with Liquor Quininae et Strychninae a very close approximation is obtained.

The Committee on Pharmacy and Pharmacognosy of the Pharmacopœia Commission (*Report* 13) have recommended the inclusion in the *B.P.* of a formula for Easton's Syrup, which provides for two concentrated liquors which can be stored and diluted with syrup at the time of dispensing. The solutions are prepared as follows:—dilute 40 ml. of phosphoric acid with 40 ml. of water and add to it 8.6 g. of iron; heat on a water-bath until the iron is dissolved, filter and pass sufficient water through the filter to produce 125 ml. Triturate strychnine hydrochloride 0.3 g., and quinine sulphate 14.8 g., with a mixture of glycerin 75 ml. and dilute hypophosphorous acid 22.5 ml.; stir until solution is complete, filter and pass sufficient water through the filter to produce 125 ml. To produce Easton's Syrup mix equal quantities of the two solutions and add three times the volume of the mixed solutions of syrup.

A purely phosphatic preparation of quinine and iron cannot be made as a single solution at any considerable concentration much higher than that of the official syrup, and there seem to be only two alternatives; either a single solution four times the strength of the official syrup, necessitating the use of ferrous chloride in place of ferrous acid phosphate, with consequent alteration of the official formula, or retention of the present formula and employing two solutions, each eight times the strength of the official syrup in their respective ingredients, for mixing in equal parts. These solutions are already formulated in the *B.P.C.*—A. J. Jones, *Quart. J. Pharm.*, 1938, 496.

[P1-81] **Liquor Quininae et Strychninae (B.P.C.).** A syrup differing from Syrupus Ferri Phosphatis cum Quinina et Strychnina (*B.P.*) only in the presence of 0.75% *v/v* of hypophosphorous acid may be made by mixing 1 oz. of this solution, 1 oz. of solution of ferrous phosphate, $\frac{1}{2}$ oz. of glycerin, and 1 oz. of distilled water with sufficient syrup to produce 8 oz.

[P1] **Syrupus Triplex (B.P.C.).**

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Equal parts of Easton's Syrup, Parrish's Syrup and compound syrup of hypophosphites.

[P1] **Tabellæ Ferri Phosphatis cum Quinina et Strychnina (B.P.C.).** *Syn.* EASTON'S TABLETS, TABELLÆ TRIUM PHOSPHATUM. *Dose.*—1 tablet. Each tablet is approximately equivalent to 1 dr. of Easton's syrup. Tablets are also made equivalent to $\frac{1}{2}$ dr.

[P1] **Tabellæ Phosphatum et Hypophosphitum Compositæ** (B.P.C.), *syn.* TRIPLE SYRUP TABLETS, *dose*.—1 tablet, are approximately equivalent to 1 dr. of triple syrup.

Ferrodic (Allen & Hanburys, London). Chocolate-flavoured granules containing ferrous phosphate and glucose. 1 dr. = 10 gr. of Bland's pill or 4 dr. of Syrup. Ferri Phosph. Co. *Dose*.— $\frac{1}{2}$ to 2 teaspoonfuls thrice daily after meals.

Ferri Phosphas Saccharatus (B.P.C.).

Dose.—5 to 10 grains (0.3 to 0.6 g.).

A slate-blue powder containing hydrated ferrous phosphate with ferric phosphate and iron oxide, the ferrous iron content being not less than 60%, calculated as $\text{Fe}_2(\text{PO}_4)_3 \cdot 8\text{H}_2\text{O}$ = 501.7.

Ferri Pyrophosphas, $\text{Fe}_2(\text{P}_2\text{O}_7)_2$, may be obtained as a white insoluble powder by interaction of ferric sulphate and sodium pyrophosphate. When Ferri Pyrophosphas is prescribed Ferri Pyrophosphas Solubilis is always required.

Ferri Pyrophosphas Solubilis (B.P.C.). *Syn.* FERRI PHOSPHAS SOLUBILIS, SODIO-CITRO-FERRIC PYROPHOSPHATE, FERRUM PYROPHOSPHORICUM CUM AMMONIO CITRICO (P. Helv. V).

Dose.—2 to 8 grains (0.12 to 0.5 g.).

Green soluble scales containing not less than 10% of Fe. P. Helv. V requires 15.5 to 17% of Fe. Darkens on exposure to light.

Ferri Subchloridi Citratum (B.P. Add. I). CITRATED FERROUS CHLORIDE.

Dose.—3 to 5 grains (0.2 to 0.3 g.). FeCl_2 = 126.7.

A buff-coloured powder with astringent, acid, metallic taste. Contains not less than 68% of ferrous iron calculated as FeCl_2 , together with citric acid in an amount equal to one-tenth the proportion of ferrous chloride. It is prepared by dissolving iron in hydrochloric acid, assaying, adding the requisite amount of citric acid, evaporating and drying at 80°.

Soluble 1 in 1 of water almost entirely.

Uses. A convenient method of administering ferrous iron, since the aqueous solution does not readily become oxidised.

Metallic iron, colloidal ferric preparations, and the scale preparations, in which the iron is in a complex form and not readily ionised, all require to be given in large doses to produce effects. The soluble ferrous salts are the most active. The average effective dose of ferric chloride must be higher than 400 mg. of iron a day, equivalent to Liq. Ferri Perchlor. 40 minims t.d.s. Ferric chloride is less potent than ferrous chloride or ferrous sulphate, but is effective if given in sufficient amounts. It is possible that iron is not absorbed in the ferric valency, and that ferric salts are reduced to the ferrous state in the alimentary tract before absorption. If minimum effective doses of ferrous iron are prescribed, between 50 and 100% of the dose ingested may be utilised for hæmoglobin formation. Reticulocyte crises and repair of anæmia may be observed with a daily dosage as low as 22 mg. of ferrous iron by mouth. There now seems no doubt that the effective dosage of preparations of iron is directly proportional to the ease with which they yield free ferrous ions.—L. J. Witts, *Lancet*, i/1936, 1.

Copper and Manganese as Adjuncts to Iron. In anæmia, experiments show that while pure uncontaminated iron is ineffective, the addition of small amounts of copper, germanium, nickel, arsenic or manganese make it effective—the results being essentially the same with all the supplementary elements.

Treatment of 150 cases of anæmia with (1) copper, (2) manganese, (3) copper and manganese, (4) various combinations of copper, manganese and iron, led to the belief that the best treatment was adequate doses of iron in suitable form without any further adjuncts.—J. F. Wilkinson, *Brit. med. J.*, ii/1932, 367.

Syr. Ferri Subchloridi (N.I.F.). *Syn.* SYRUP OF FERROUS CHLORIDE. Reduced iron 24 gr. is placed in a loosely-covered 6 oz. bottle with dilute hydrochloric acid 1 oz., and shaken occasionally until effervescence ceases. The solution is filtered and diluted with syrup to 6 oz. Each fluid drachm contains about $\frac{1}{2}$ gr. of iron. It should be stored away from sunlight or in brown bottles.

Endomin Tablets (*Reed & Carrick, New Jersey; Coates & Cooper, London*). A proprietary containing iron 8 mg., copper 0.6 mg., manganese 0.4 mg., zinc 0.3 mg., nickel 0.03 mg., cobalt 0.03 mg. and sodium germanate 0.05 mg. *Dose*.—1 to 3 tablets thrice daily. For use in anæmia in conjunction with a palatable easily-digested diet, rich in vitamins.

Ferosan (*Boots, Nottingham*). Capsules each containing 3 gr. of ferrous chloride for the treatment of hypochromic anæmias. *Dose*.—1 or 2 capsules three times a day, reduced to 1 capsule daily or discontinued entirely when the blood count is restored to normal.

Ferro-Constans (*Richter, London*) and **Ferronyl** (*Napp, London*) are tablets of ferrous chloride 0.05 g.

Ferri Sulphas (*B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.*). *Syn.* FERROUS SULPHATE. $\text{FeSO}_4 \cdot 7\text{H}_2\text{O} = 278.0$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

In clear, pale, bluish-green crystals containing about $\frac{1}{2}$ of their weight of iron.

A saturated solution with some crystals of the salt in excess keeps better than a weak solution; in the latter oxidation soon takes place.

Soluble 1 in $1\frac{1}{2}$ of water and 1 in 4 of glycerin; insoluble in alcohol 90%

Is administered in the treatment of chlorosis in young females in 4-grain doses. May give results in 6 weeks.—Prof. J. A. Gunn, *Lancet*, i/1931, 146.

9 gr. of ferrous sulphate, containing 180 mg. of metallic iron, is certainly as efficacious (from the point of view of hæmoglobin increase) as 90 gr. of iron and ammonium citrate containing 1215 mg. of iron, and the same remark probably applies to similar doses of ferrous carbonate and ferrous chloride.—L. S. P. Davidson and H. W. Fullerton, *Edinb. med. J.*, 1938, 210.

ANÆMIA IN INFANCY. All infants of low birth weight should receive iron therapy from the second month. Iron therapy should also be used prophylactically for some weeks following infections, and in all cases where the infant appears to be pale, fatigued, and not thriving. The following prescription is both palatable and efficient: ferrous sulphate $1\frac{1}{2}$ gr., dilute hypophosphorous acid $\frac{1}{2}$ m., dextrose 15 gr., chloroform water to 1 dr. Three times daily at the end of a feed.—L. S. P. Davidson and H. W. Fullerton, *Edinb. med. J.*, 1938, 193.

The following mixture was found of value in the treatment of nutritional anæmia in young children: ferrous sulphate $1\frac{1}{2}$ gr., dilute hypophosphorous acid $\frac{1}{2}$ m., dextrose 15 gr., chloroform water to 1 dr. The mixture is prepared as follows: dissolve the dextrose in some of the chloroform water, add the dilute hypophosphorous acid, dissolve the ferrous sulphate in some chloroform water and add to the dextrose solution, and make up to volume with chloroform water. The mixture will keep stable at room temperature for over two months. The mixture was given in one or two drachm doses three times daily, the full dose being reached in 3 to 5 days, and given in this way it was always well tolerated. Treatment of 26 babies, varying in age from 6 months to 3 years produced an average daily rise in hæmoglobin content of almost 1% over the first 3 to 5 weeks of treatment.—H. M. M. Mackay and L. E. Jacob, *Lancet*, ii/1937, 570.

Mist. Ferri Aperiens (*N.I.F.*). *Syn.* MIST. MAG. C. FERRO. Ferrous sulphate 3 gr., magnesium sulphate 30 gr., dilute sulphuric acid 5 m., copper sulphate $\frac{1}{2}$ gr., peppermint water to $\frac{1}{2}$ oz.

Mistura Ferri Aperiens (*U.C.H.*).

Magnesium sulphate 30 gr., ferrous sulphate 2 gr., dilute sulphuric acid 2 m., peppermint water to 1 oz.

Ferrofax (*Crookes Laboratories, London*). Ferrous iron with vitamin B in capsules or powder. 5 minim capsules each contain ferrous iron 0.1 g., vitamin B₁ 16.2 units, vitamin B₂ 3.2 units, and traces of manganese, copper and cobalt. Treatment of nutritional anæmia. *Dose*.—One capsule three times daily.

Neo-Ferrum (*Crookes Laboratories, London*). A colloidal iron concentrate equivalent to 10% Fe, 9% alcohol, sugar, and flavouring. One teaspoonful = 54 gr. of Bland's pill. *Dose*.— $\frac{1}{2}$ to 1 teaspoonful 3 times daily, increasing to 2 teaspoonfuls three times daily.

Ferri Sulphas Exsiccatus (*B.P., P. Helv. V, P. Dan., P. Jap. V*).

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.).

Ferrous sulphate dried at 40°; it contains not less than 80% of FeSO_4 .

Pilula Ferri Sulphatis contains 3 or 5 grains of exsiccated ferrous sulphate with syrup *q.s.* Dissolving slowly, these pills do not derange the stomach. If made with lanolin or kaolin ointment as excipient they will not crack.

[P1-81] **Pil. Ferri et Aloin.** (*N.I.F.*). Exsiccated ferrous sulphate $1\frac{1}{2}$ gr., potassium bicarbonate 1 gr., dry extract of *nux vomica* $\frac{1}{2}$ gr., dry extract of belladonna $\frac{1}{2}$ gr., aloin $\frac{1}{2}$ gr.

[P1-81] **Pilulæ Ferri et Arseni** (*B.P.C.*). *Syn.* PILULÆ FERRI ARSENICALES. *Dose.*—1 pill.

Contain 3 gr. of exsiccated ferrous sulphate and $\frac{5}{16}$ gr. of arsenic trioxide.

[P1-81] **Pilulæ Ferri Arsenicales cum Strychnina** are the same with $\frac{5}{16}$ gr. of strychnine hydrochloride per pill.

Ferræmia (*Wilcox, Jozseau, London*). Chocolate-coated tablets containing exsiccated ferrous sulphate $2\frac{1}{2}$ gr., dried yeast 2 gr., copper sulphate $1\frac{1}{16}$ gr., manganese hypophosphite $\frac{3}{16}$ gr. *Dose.*—One or two tablets three times daily. Anæmia and debilitated conditions.

Fersolate Tablets (*Glaxo Laboratories, London*). Exsiccated ferrous sulphate 3 gr. (equivalent to 1 gr. of ferrous iron), and $1\frac{1}{16}$ gr. each of copper and manganese. *Dose.*—Three 3-grain tablets daily. In secondary anæmia.

Hemochromin (*G. W. Carnrick, Newark, N.J.; Brooks & Warburton, London*). Tablets containing in each exsiccated ferrous sulphate equivalent to 2 gr. of crystalline ferrous sulphate, and $2\frac{1}{2}$ gr. of extract of liver (representing $\frac{1}{2}$ to 1 ounce of fresh liver). For iron deficiency anæmias and general debility. *Dose.*—Two tablets three times a day.

Liquor Ferri Persulphatis (*B.P.C.*). A solution containing ferric sulphate equivalent to 14 to 15% of Fe.

Liquor Ferri Tersulfatis (*U.S.P. XI*).

A solution of ferric sulphate containing 9.5 to 10.5% *w/w* of iron. Sp. gr. about 1.43 at 25°.

Liquor Ferri Subsulphatis. *Syn.* MONSEL'S SOLUTION.

Dose.—3 to 6 minims (0.2 to 0.4 ml.).

A solution of basic ferric sulphate. When evaporated and scaled forms **Monsel's Salt or Ferric Subsulphate**, $\text{Fe}_2\text{O}(\text{SO}_4)_2$, *dose*— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.).

A spray of 20 grains to the ounce checks hæmoptysis, and internally is not irritating although astringent.

[P1-81] **Unguentum Ferri Persulphatis** (*General Hosp., Notts.*). Ferric sulphate 10 gr., almond oil $\frac{1}{2}$ dr., conium ointment to 1 oz.

The name persulphate may be taken to mean normal ferric sulphate, $\text{Fe}_2(\text{SO}_4)_3$, as contained in **Liquor Ferri Tersulfatis** (*U.S.P. XI*).

FILIX MAS

B.P., Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.

Syn. ASPIDIUM (*U.S.P. XI*), MALE FERN.

Dose.—1 to 3 drachms (4 to 12 g.).

The dried rhizome and leaf-bases of *Dryopteris Filix-mas*, collected late in the autumn, divested of the roots and dead portions, and not older than one year from the date of collection.

Dangers of filix mas. Moderate doses almost invariably produce bilirubinemia and large doses jaundice. There is risk of chronic cirrhosis of the liver developing.

About 100 cases of serious impairment of vision have been reported following administration of filix mas, mostly in South Germany and Switzerland.

Antidotes. Give purgative dose of magnesium or sodium sulphate. Demulcent drinks, but avoid oils and fats. Stimulants. Keep patient warm.

Extractum Filicis (B.P.). *Syn.* EXTRACTUM FILICIS LIQUIDUM, LIQUID EXTRACT OF MALE FERN, OLEORESINA ASPIDIUM (U.S.P. XI).

Dose.—45 to 90 minims (3 to 6 ml.). *U.S.P. XI* average dose, once a day, 1 drachm (caution). Larger doses, up to 2 or 3 drachms, are sometimes given.

Prepared by ether extraction—the yield being about 9 to 10%—and adjustment with olive oil to contain 25% of filicin, the anhydride of filicic acid, stated to be inactive as a vermifuge.

Note.—It should be well stirred before use.

Prescribing Note. The taste of this preparation is very unpleasant. It is best prescribed in a capsule or, if in a draught, it may be emulsified with an equal weight of acacia or tincture of quillaia, and flavoured with an essential oil such as cinnamon.

Uses. For all varieties of tapeworm and *ankylostomum duodenale*. Male fern retains its supremacy as the best of all remedies for tapeworm and it is the method of choice for patients treated for the first time. (The liquid extract must be freshly prepared, as it deteriorates on keeping.) On the first evening a full dose of castor oil should be given, and for the next two days a light diet of milk, gruel, soup, etc. On the fourth morning the patient is given no food, but a full dose of magnesium sulphate to ensure purgation; two hours later from 60 to 90 m. of freshly prepared liquid extract of male fern is given in a single dose. If purgation does not follow within four or five hours, a further dose of two drachms of concentrated solution of magnesium sulphate is given, followed by a glass of hot water. Treatment by male fern in children is often ineffective, since the unpleasant flavour of the drug cannot be tolerated.

Two preliminary doses of sodium sulphate at 5 and 8 p.m. on the previous day and a water enema in the morning. Then an emulsion of extract of filix mas and infusion of senna with acacia through a duodenal tube. Dose of extract 6 ml. for adult to 2 ml. for child of 5½.—*Brit. med. J. Epit.*, ii/1929, 62.

When all other methods fail, the following is often successful: Pumpkin seed 8 g., kousso 4 g., pomegranate 4 g., made into an infusion, to which is added kamala 4 g., oleoresin of aspidium 4 g., glycerin 15 ml., mucilage of acacia 15 ml., water to 240 ml. Give in two draughts 2 hours apart, after usual preliminary treatment. Severe gastro-enteric irritation with vertigo and prostration may result, but it usually gets the worm. Or give by duodenal tube into an empty stomach the morning after a day's preparation with milk diet and a cathartic, half a dose of a senna infusion (5 in 100), and 15 minutes later 2 g. of oleoresin of aspidium and 4 g. of extract of pomegranate seed mixed with the other half of the senna infusion. Remove tube promptly. Whole worm expelled in ½ to 2 hours. No treatment of any kind for tapeworm should be repeated at a less interval than three months.—*J. Amer. med. Ass.*, ii/1928, 585

Hausius Filicis (W.H.). Extract of male fern 1 dr., syrup of ginger 30 m., mucilage of acacia 2 dr., peppermint water to 1 oz.

Hausius Filicis Maris (L.H.). Liquid extract of male fern 1 dr., syrup of ginger 1 dr., tincture of quillaia $\frac{1}{2}$ dr., peppermint water to 1 oz.

Mistura Filicis (Gt. Osm. H.). (Dose for children 2 years old and upwards). Extract of male fern $\frac{1}{2}$ dr., spirit of cinnamon 4 m., syrup 2 dr., mucilage of acacia 1 dr., chloroform water to $\frac{1}{2}$ oz.

Filicin. *Syn.* FILICIC ACID.

May be extracted on the lines of the chemical assay of the liquid extract. It is a combination of various acid bodies and is soluble in ether and slightly soluble in alcohol.

An investigation on flatworms and tapeworms showed it to be an excellent helminthicide: the ingested filicin reaches the intestine, impregnates the tænia, passes into the blood and then into the bile and returns to the intestines, where it again acts on the parasites—this cycle being repeated many times. The drug is given in pills or capsules (in oil solution) in 12-grain doses for adults, and to children $\frac{1}{2}$ grain for each year of age. There are no toxic effects if given in suitable doses. Tænia are stated to be expelled in a few hours. Combined with calomel both an anthelmintic and purgative action is obtained.—*Brit. med. J. Epit.*, i/1927, 20.

Aspidinofilicinum Oleo Solutum (P.G. VI). *Syn.* ASPIDINOLFILIZINÖL. A 10% solution in a neutral vegetable oil.

Filmaron-Oil 10% (Boehringer, Mannheim; Coates & Cooper, London). *Dose.*—8.5 to 20 g. per os; children 3 to 7 g. As an enema (following a wash-out enema) in oxyuriasis, 10 g. in an equal quantity of oil.

Kamala (B.P.C., P. Jap. V). *Syn.* GLANDULÆ ROTTLERÆ.

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 g.).

The hairs and glands obtained from the fruits of *Mallotus philippinensis* (Euphorbiaceæ). Contains rottlerin and resins. Used as an anthelmintic against tapeworm, being administered in honey, gruel or mucilaginous suspension. Its administration should be preceded by the administration of sodium bicarbonate for 48 hours.

Mucuna (B.P.C.). *Syn.* COWHAGE, COWITCH.

Dose.—10 to 60 grains (0.6 to 4 g.). The hairs covering the fruit of *Mucuna pruriens* (Leguminosæ). Mixed with honey or treacle, it can be used as a tænicide.

FORMALDEHYDUM (LIQUOR)

B.P., U.S.P. XI, P. Belg. IV, Fr. Cx., P. Jap. V, P. Helv. V, F.E. VIII., P. Ital. V.

Syn. FORMALIN, FORMOL.

The synonym formalin may be used only in Gt. Britain and Northern Ireland. In other countries this name is registered as a trade-mark.

[P2] "Formaldehyde."

[83] "Formaldehyde—in substances containing less than 5%, weight in weight, of formaldehyde (H·CHO); photographic glazing or hardening solutions."

Dose.—1 minim, internally, well diluted.

An aqueous solution containing 37 to 41% w/v of formaldehyde, H·CHO = 30.02. Is prepared by the catalytic oxidation of

methyl alcohol. Some methyl alcohol is stated to be left in the product in order to prevent polymerisation. Sp. gr. 1.080 to 1.095. *P. Jap.* has also Aqua Formalinata 1 in 35 of the 35% preparation.

Caution. According to the B.P.C. a 1% solution of formalin and a 1% solution of formaldehyde both mean 1% of the pharmacopœial 40% solution. If it is desired to indicate the strength of actual formaldehyde, error is avoided by using the chemical formula, *e.g.*, 1% of $\text{H}\cdot\text{CHO}$.

Antidotes. Empty stomach by emetic. Give repeated 1 dr. doses of aromatic spirit of ammonia, or $\frac{1}{2}$ dr. dilute solution of ammonia in $\frac{1}{2}$ pint water. Demulcent drinks.

Poisoning of a boy, aged 7, treated by washing out the stomach and then giving a quantity of very dilute ammonia, as an attempt to produce hexamine with the formaldehyde. An uneventful recovery was made.—*Brit. med. J.*, ii/1927, 687.

Uses. Formaldehyde is a powerful antiseptic and disinfectant with relatively high penetrating power. Solutions or vapour produce marked irritation of all mucous membranes, and its application to the broken skin is very painful. In spite of its irritant action, however, it has been usefully employed in a wide variety of conditions.

Thus, a 1 or 2% paint has been used for diphtheria, tonsillitis and ozœna, and a 2% glycerin paint has been employed with benefit in angina follicularis. Tubercular laryngitis has been treated with a 1% solution, gradually increasing to 10%, two or three times a week, and for aphthous ulceration of the mouth a 10% suspension in collodion is said to be a useful application; both of these treatments should be preceded by a local anæsthetic.

In purulent ophthalmia and trachoma an eye-wash of 1 in 1000 to 1 in 500 is stated to give good results, though it may be found extremely painful.

Various skin diseases have also been treated by local applications of formaldehyde in different forms. For dry eczema a moist application such as 1 of formaldehyde (40%) in a starch and water jelly 99, is employed, and for weeping eczema a formaldehyde dusting powder is used. Ringworm may be cured by means of a paint, care being taken to see that the solution does not run on to the unaffected skin; one application is usually sufficient. Daily application of a 10% suspension in collodion causes warts and corns to shrivel up and fall off, and sweating of the feet may be usefully treated by application of 1 part of formaldehyde in 3 of glycerin or in 5 to 10 parts of alcohol, but this method should not be employed too frequently or over too long a period.

In addition to these local applications, formaldehyde vapour has been advocated for the treatment of phthisis (*see* Muthu's Inhalants, p. 537), but it should be borne in mind that prolonged inhalation may cause irritation of the respiratory tract.

For preserving and embalming animal tissues and museum specimens dilute about 10 times—for hardening about 25 times, but for preservative purposes a far weaker solution is sufficient.

For room disinfection and utensils 1 or 2% formalin as spray (coloured fabrics are not injured), or burn formalin disinfecting tablets, *q.v.* As a wash, up to 10% solution may be used. For furniture 1% would be suitable. Or simply *evaporate a pint of formalin per 1000 cu. ft. in an open vessel over a bunsen or spirit lamp.*

Sterilisation of Hypodermic Needles. The following solution is suggested for keeping hypodermic needles sterile without danger of corrosion: borax 1.5 g., solution of formaldehyde 2.5 g., liquefied phenol 0.4 g., water to 100 g.—H. Haenel, *Dtsch. med. Wschr.*, 1936, 1477.

Fumigators are made for room disinfection. They are arranged to be lit at the bottom of the container whilst the fumigator stands on a tray with a little water. Formaldehyde is volatilised into the room and continues to be evolved for $\frac{1}{2}$ hour. Windows, etc., to be pasted down in the usual way where complete disinfection is required, and clothing, etc., left exposed to the vapour for 3 or 4 hours.

Formalin Disinfecting Tablets are prepared from paraformaldehyde (*vide infra*) for use in a vaporiser or with a night-light—20 to 25 tablets per 1000 cubic feet, the latter number ensuring thorough disinfection. Walls and furniture should first be sprayed with water.

They are also prepared of strength 0.1, 0.25 and 0.5 g.

TERMINAL DISINFECTION during common epidemics "a procedure erroneously founded, almost always useless, and whose practical results bear no adequate relation to the labour and cost involved." Fumigation described by Dr. Andrew Balfour as "undoubtedly a process of camouflage." "Current" disinfection, *i.e.*, sterilisation of articles soiled by patient's excreta, and prompt disposal of excreta themselves, of more value.—Prof. Chagas, *Lancet*, i/1928, 922.

Collutorium Formaldehydi (R.D.H.). Solution of formaldehyde 18 m., oil of peppermint 5 m., alcohol (90%) 90 m., peppermint water to 1 oz. Use half a teaspoonful to a tumblerful of water. *N.I.F.* has solution of formaldehyde 60 m., water to 8 oz. Use 1 oz. in $\frac{1}{2}$ pint of warm water. **Garg. Formaldehyd. (N.I.F.)** is identical with the latter.

Garg. Antiseptic. (N.I.F.). Solution of formaldehyde 16 m., boric acid 100 gr., glycerin 80 m., water to 8 oz. To be diluted with three parts of cold water.

Gargarisma Formaldehydi (B.P.C.). Solution of formaldehyde 0.2% *v/v*.

[P2] **Liquor Formaldehydi Saponatus (B.P.C.)** contains 20% *w/v* of formaldehyde solution.

[P2] **Formalinsäpa, Terpinoform (P. Svec. X).**

Terpineol 5, alcoh. (90%) 20, soft soap 40, formaldehyde solution 35. A pleasant, fragrant antiseptic preparation.

[P2] **Morestin's Fluid.**

Dose.—1 to 4 ml. injected drop by drop into the not completely evacuated sac in the treatment of hydrocele.

A mixture of formalin, glycerin and alcohol equal parts.

In the treatment of hydrocele it is generally not painful. After a few hours the scrotum swells, becomes heavy and oedematous and some liquid reforms, but this is reabsorbed. Iodine has been used in children (congenital hydrocele), but is dangerous.—St. George B. Delisle Gray, *Brit. med. J.*, i/1930, 649, 726 (correction).

[P1] **Nebula Formaldehydi.** MUTHU'S INHALANTS.

Inhalant "A."—Chloroform 1 dr., menthol 10 gr., pumilio pine oil 10 m., alcohol (90%) to 1 oz., with 2½% of formaldehyde (in the form of gas). **"B."**—Guaiacol 1 dr., chloroform 1 dr., menthol 15 gr., pumilio pine oil 15 m., alcohol (90%) to 1 oz. with 5% formaldehyde. **"C."**—Guaiacol 2 dr., chloroform 2 dr., menthol 15 gr., pumilio pine oil 15 m., terebene 1 dr., alcohol (90%) to 1 oz. **"D."**—Guaiacol 2 dr., iodine 1 dr., terebene 1 dr., pumilio pine oil 15 m., chloroform 2 dr., alcohol to 1 oz.

Dose.—About 10 drops of one of the above sprinkled on the inhaler every $\frac{1}{2}$ to 1 hour, and used by continuous inhalation.

These inhalations are used progressively. After reaching "C," "D" is used as an alternate solution or for night use.

[P2] **Cromessol** (*Cromessol Co., Glasgow*). An antiseptic containing formalin and essential oils.

Formadermine (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Methylene diguaiacol (a condensation product of guaiacol and formaldehyde). Supplied in the form of powder as an antiseptic and deodorant for indolent ulcers, burns, skin affections, etc. Also as a 5% toilet powder for superficial conditions.

Formosyl (*Martindale, London*). A liquid formaldehyde potash soap. It is highly antiseptic, relatively non-poisonous, and miscible with water and alcohol in all proportions. Action of soap with the antiseptic power of formalin. A 2% solution is sufficient for general purposes and is better freshly prepared. For hand disinfection 1 to 2% is suitable. The stock bottles should be kept well corked. Available also as flavoured mouth-wash, gargle, tooth paste, etc.

Paraformaldehydum (*B.P.C.*). *Syn.* PARAFORM, PARAFORMIC ALDEHYDE, TRI-OXY-METHYLENE (*Fr. Cx.*), FORMALDEHYDUM POLYMERISATUM (*P. Belg. IV, U.S.P. XI, F.E. VIII*). $(\text{H}\cdot\text{CHO})_x = 90\cdot05$.

A white amorphous powder or friable mass, odourless at ordinary temperatures, but having a pungent odour when warmed, owing to evolution of formaldehyde. Is prepared by evaporating aqueous formaldehyde solution; the polymer $(\text{H}\cdot\text{CHO})_x$ throws out, and on drying changes to paraformaldehyde.

Catheters may be maintained aseptic by wrapping in lint impregnated with 20% of paraformaldehyde. A 25% solution in collodion has been employed as an application to warts.

Paraform Collodion, 25% strength, applied 3 times a day to warts is efficacious.

DENTAL USE. Paraformaldehyde, for the induction of painless dentine drilling, is mixed with Harvard Cement in the proportion of 1 to 20, and then made into a fairly firm mass with the fluid. If left in the cavity from 1 to 3 months, the cavity may be shaped without any pain to the patient. In addition, the slow emanation of formaldehyde gas over a lengthy period most probably arrests the process of decay. The cement should not be placed closer than half way to the nearest point of the pulp.

Pasta Formaldehydi (*R.D.H.*). Powder thymol 1 dr., and add paraform 3 gr., glycerin 10 m., zinc oxide 2 dr.

Tabellæ Formaldehydi (*B.P.C.*). *Syn.* FORMALDEHYDE AND MENTHOL TABLETS, FORMAMINT TABLETS.

Note. The general use of the names "Formalin" and "Formamint" for tablets of formaldehyde is limited to Gt. Britain and Northern Ireland.

Dose.—1 or 2 tablets. Contain about $\frac{1}{4}$ gr. of paraformaldehyde and $\frac{1}{15}$ gr. of menthol.

Formaldigen (*Hewlett, London*). Brand of formaldehyde lozenges.

Formitrol Pastilles (*Wander, London*). Brand of formaldehyde pastilles.

Acetaldehydum. *Syn.* ALDEHYDUM ABSOLUTUM. $\text{CH}_3\cdot\text{CHO} = 44\cdot03$. A colourless mobile liquid, irritating when inhaled. Sp. gr. 0.80; b.p. 21°. Becomes acid on keeping exposed to air—oxidation to acetic acid. Polymerises with rapidity in presence of sulphuric acid at atmospheric temperature into paraldehyde (*vide infra*), but if temperature be below 0° crystalline metaldehyde is formed.

Acetaldehydum Dilutum. Contains 15% *v/v* in alcohol, is neutral to test paper, and has an ethereal suffocating odour, producing spasm of the glottis when respired. Diluted 1 in 1000 with water at 140°F. has been used as inhalation in catarrh and ozena.

Paraldehyde (*B.P.*, *U.S.P. XI*, *Fr. Cx.*, *P. Ital. V*, *F.E. VIII*, *P. Helv. V*). (C_2H_4O)₃ = 132.1.

Dose.—30 to 120 minims (2 to 8 ml.), or more, in diluted syrup or almond mixture, repeated if needed in $\frac{1}{2}$ an hour. *U.S.P. XI* average dose 30 minims.

A colourless liquid, crystallising below 11°; sp. gr. 0.998. May be obtained by treating aldehyde with sulphuric acid.

It has been stated (*R. Hutchison, Brit. med. J.*, i/1930, 718) that paraldehyde may be oxidised by atmospheric oxygen, forming glacial acetic acid, but this does not occur under normal conditions of storage.

Decomposition on Storage. Samples which are free from preservative deteriorate markedly on storage even when protected from light, particularly if stored in incompletely filled containers. The main changes taking place are the formation of peroxidised compounds and an increase in acidity. While some samples show an increased aldehyde content on standing, this is unusual; there is generally a decrease due to polymerisation. Experiments on a freshly distilled sample showed that an amber-glass bottle was better than one of white glass, possibly due to differences in the composition of the glass, since no difference was noted in 2 samples, both in white glass bottles, one stored in the dark and one in the light. It is recommended that the Pharmacopœia should sanction the addition of a preservative.—*J. S. Toal, Quart. J. Pharm.*, 1937, 439.

Soluble 1 in 10 of water, and miscible with alcohol, ether, chloroform and oils.

If prescribed in greater proportion than will form a solution, it may be suspended with Pulv. Tragacanth. Co.

Antidotes. Empty stomach by emetic or stomach tube. Keep patient warm and awake, but do not walk him about. Ammonia inhalations. Strong coffee, with 5% dextrose, by rectum. Strychnine, $\frac{1}{4}$ gr., hypodermically. Oxygen, or oxygen with 7% carbon dioxide, and artificial respiration if necessary.

Recovery after taking 2 oz. of paraldehyde. Stomach washed out with weak sodium bicarbonate solution; strychnine, Coramine and pituitrin administered; 1 pint of saline given intravenously; oxygen with carbon dioxide inhalations; 3 oz. of black coffee by rectum.—*W. More, Brit. med. J.*, i/1934, 428.

Paraldehyde 9 dr.—the customary drachm per stone weight—in 5 oz. of olive oil *per rectum* for dental operation. Error in copying by a third party, stating 9 oz., caused death.—*Lancet*, i/1929, 247.

PARALDEHYDE HABIT. 18 cases observed in 8 years. If a nightly dose of 2 dr. is continued for several weeks there is loss of appetite, gastro-intestinal irritation and flatulence; the patient becomes irritable, morose and suspicious, and may be mentally confused and agitated, with muscular weakness and tremor of hands. Tolerance is established and increased dose demanded (max. single dose of $\frac{1}{2}$ ounce often known to be exceeded). The final picture is one of mental and physical deterioration. Paraldehydism always superimposed on other forms of addiction, most commonly alcoholism. Alcohol and paraldehyde tend to reinforce one another in action.—*A. E. Carver, per Lancet*, i/1934, 408.

Contraindications. Paraldehyde is contraindicated in the presence of gastric or intestinal disorder owing to its irritant effect on the mucous membrane, and in bronchitis and pulmonary affections since its pungent and disagreeable odour is likely to excite cough. It may sometimes give rise to a rash and small doses may cause a condition of excitement. Administration over prolonged periods should be avoided owing to the possibility of addiction.

Uses. Paraldehyde has a hypnotic action similar to that of chloral hydrate, but has a less depressant action on the heart. In moderate doses it produces a sleep resembling natural sleep and unaccompanied by any marked change in circulation, respiration or sensibility. In large doses it produces a comatose condition.

It is a valuable hypnotic for the relief of insomnia without pain, its effects being exerted within 15 to 30 minutes and lasting for two to three hours. It is most frequently used in mental conditions, e.g., for soothing maniacal patients and for inducing sleep in melancholia, and it is one of the best hypnotics for use in delirium tremens.

In spasmodic asthma it relieves the spasm by dilating the bronchioles, and it has been employed in tetanus by intravenous injection, 5 ml. being injected once or twice daily, increasing to 15 ml., and alternated with saline injections.

Paraldehyde *per rectum* is regarded as the safest of the basal hypnotics, especially for children, the dose being calculated on the basis of 1 dr. per stone bodyweight administered in 10% dilution in normal saline and given thirty minutes before operation; it is more likely to give rise to excitement, however, than other basal hypnotics. It is also employed by rectal injection, in association with other drugs, for the production of analgesia in childbirth.

In the treatment of the *status epilepticus*, paraldehyde by rectum in a dose of 6 dr., the dose to be repeated if necessary, is a valuable remedy.—E. Bramwell, *Practitioner*, ii/1933, 333.

RECTAL ANÆSTHESIA. Rectal paraldehyde as preliminary to tonsillectomy in children is of value. 1 dr. in 1½ oz. of saline, neither warmed nor cooled, per stone weight, an hour before operation.—M. Sourasky, *Brit. med. J.*, ii/1930, 993.

Valuable as a basal hypnotic, *per rectum*, 1 dr. per stone, given slowly 1½ hours before operation in 10 times its quantity of normal saline. Atropine as usual, and morphine to adults. Specially useful for children.—I. W. Magill, *Lancet*, i/1931, 353. Easy to work with on the upper air passages.—C. H. Thomas, *ibid.*, 354.

The evening before operation give an enema or a sedative. The following morning, 1½ hours before operation, give 1½ gr. of atropine hypodermically and immediately afterwards 8 dr. of paraldehyde (less if patient under 8 stone) in 12 oz. of saline, freshly mixed and thoroughly shaken. The paraldehyde must be fresh. The patient remains comfortable for 24 hours following operation, and distressing recollections are absent.—J. Duke Stewart, *Brit. med. J.*, ii/1932, 1139.

LABOUR. While there can be no doubt that in some selected cases, the use of paraldehyde, given in oil *per rectum* during the first stage of labour, may be a valuable means of relieving pain, the general opinion of those who have used it as a routine method in this investigation is that it is unsuitable for general use by midwives.—Report of an Investigation by the College of Obstetricians and Gynecologists at the request of the National Birthday Trust Fund, per *Lancet*, i/1936, 283.

Experience in 611 cases shows that the combination of paraldehyde and benzyl alcohol closely approaches the ideal for obtaining analgesia and amnesia during labour with safety for mother and child; it is accompanied with fewer undesirable reactions than any other existing method for relieving labour pains. Of particular importance in the technique is the thorough cleansing of the lower part of the bowel and rectum with a soapsuds enema, followed by irrigation with physiologic solution of sodium chloride until the return is absolutely clear. The dose of paraldehyde is 1.2 ml. to each 10 pounds of the weight of the woman at the beginning of labour. The dose of benzyl alcohol is always 1.5 ml. The mixture of paraldehyde and benzyl alcohol is instilled by gravity into the rectum by means of a funnel and a large catheter, which is inserted to a distance of

about 4 inches. As the solution disappears it is followed by not more than 30 ml. of physiologic solution of sodium chloride to wash out the catheter and distribute the drug. The mixture is given as soon as the patient complains of pain. The dose may be repeated if necessary after 1½ hours. As labour progresses the effect of each successive injection is more lasting, the intervals between repetitions becoming three, four or five hours. If the patient is awake half an hour after the initial instillation ½ gr. morphine is given subcutaneously. When several doses of the mixture are given the rectum should be irrigated with physiologic sodium chloride solution before each alternate instillation. A glass of orange juice or water should be given before each instillation and catheterisation is performed every 8 hours to relieve bladder distension. It is important that the rectal injection is repeated when the patient begins to awaken and not after she has become restless. Complete relief from the memory of pain was accomplished in 89.7% of cases, partial relief in 2.6% and no relief in 7.7%. Patients sleep for 6 to 12 hours after labour and awaken refreshed.—H. F. Kane and G. B. Roth, *J. Amer. med. Ass.*, ii/1936, 1710.
See also *Gwathmey's Method*, p. 150.

Elixir Paraldehydi.

Dose.—1 to 3 drachms (4 to 12 ml.).

Paraldehyde 240, glycerin 240, alcohol (90%) 480, oil of cinnamon 4, oil of bitter orange 8, saccharin 1.

Enema Paraldehydi (B.P.C.).

Dose.—1 drachm (4 ml.) per stone body weight with 5% w/v dextrose in normal saline.

Mistura Paraldehydi.

Paraldehyde 2 dr., essential oil of almond (s.A.P.) 3 m., syrup 1 oz., liquid extract of liquorice 2 dr., water to 4 oz. This covers the nauseous taste to some extent and forms four doses of ½ drachm or two doses of 1 drachm.

Mistura Paraldehydi et Potassii Iodidi.

Dose.—1 drachm (4 ml.).

Paraldehyde 1.25, potassium iodide 0.92, liquid extract of liquorice 6.25, water to 100.

In broncho-pneumonia and capillary bronchitis of infants it is valuable. The constituents of the mixture are incompatible, free iodine being formed but not sufficient to harm. In severe cases the secretions dry up remarkably.

Metaldehyde. A polymer of acetaldehyde occurring as a white crystalline solid, burning readily and subliming at 100°.

Meta (Napp, London). Compressed metaldehyde for use as a solid fuel, burning with a non-luminous carbon-free flame.

Poisoning in a boy of 16 through taking 5 g. of metaldehyde. Treatment consisted in giving large doses of alkalis and controlling the convulsions with chloral hydrate and potassium bromide.—*Lancet*, ii/1927, 670.

Two cases of poisoning in children after eating the tablets in mistake for sweets—acute poisoning of the central nervous system. Treatment: gastric lavage and purge.—*Brit. med. J.*, i/1929, 120.

Death of a young woman student after eating nearly an ounce.—*Lancet*, ii/1933, 194.

Poisoning in a child of 20 months—recovery.—A. French, *Brit. med. J.*, ii/1935, 974.

Fatal case of poisoning in a child of 2½ after swallowing one tablet. The public should be warned of Meta's dangerous qualities, and the State should introduce measures for a safer distribution.—D. R. Lewis *et al.*, *Brit. med. J.*, i/1939, 1283.

Meta Poisoning Treatment. (1) Immediate wash-outs of stomach with large quantities of sodium bicarbonate solution; repeat frequently and perform slowly for first time, (2) high colon wash-outs of bowels with alkaline solutions, (3) purgatives after washing-out—Glauber's salts or castor oil, (4) large quantities of charcoal (preferably wood), (5) caffeine, and, if necessary, strophanthin intravenously, (6) no narcotics if possible—sodium barbitone if cramps intensive, (7) calcium gluconate intravenously and 30 to 40% dextrose repeatedly intravenously.

GELATINUM

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Dan.

Nearly colourless transparent sheets or shreds made by extracting animal tissues, bones, etc., with boiling water.

Skin Gelatin is the best. It is more pliable, possesses more "fibre," and is suitable for gelatin capsule-making. Bone gelatins made from osseine (acidulated bone) are brittle and hence unsuited. *U.S.P. XI* requires gelatin for capsule-making to contain not more than 0.15% of SO_2 .

Dose.—*Ad libitum per os*, and injected.

Uses. Gelatin taken *per os* is easy of digestion, the cleavage products being largely absorbed, and it has been widely employed as a nutrient. It lacks, however, two important amino-acids, tryptophane and tyrosine. It is first converted by pepsin into proteoses and peptones. Trypsin of the pancreatic juice then splits these into amino-acids. Hypodermically the 1 to 2% solution has been used to check bleeding from the lungs and kidneys and to relieve aortic aneurism. 100 ml. or more of 2% solution may be injected into the gluteal region. These injections may be followed by pain, fever, local swellings and nettle rash. Other hæmostatics may be combined with it. It has been given orally to arrest hæmorrhage of the stomach in ulcer and cancer, and of the intestines in typhoid and dysentery. Oozing hæmorrhage from mucous surfaces due to snake bite is also well treated by large quantities given orally. Solutions of gelatin for injection must be sterilised with great care, since tetanus spores are liable to be present.

On theoretical grounds its use was suggested as a source of amino-acetic acid (glycine, *q.v.*) in the treatment of myasthenia gravis, but in clinical trial it was found to be unsatisfactory.

Gelatina Soluta Sterilisata (*P. Helv. V*) is approx. 9% in normal saline. The warm solution is mixed with the white of an egg, heated in an autoclave until a temperature of 120° is reached (should not occupy more than 30 minutes), then allowed to cool to normal pressure and filtered. It is distributed into sterile tubes which are sealed and steamed for half an hour on three consecutive days. The tubes are then incubated for a week at 37° , and any contaminated are rejected.

Liquor Gelatinæ Sterilisatus (*P. Jap. V*) is similar, but strength of sodium chloride is 0.5%.

Soluté Injectable de Gélatine (*Fr. Cx.*).

Gelatin 10 g., sodium chloride 8 g., distilled water to 1000 ml. Neutralise to bromo-thymol blue accurately by adding drop by drop N/10 sodium hydroxide. Sterilise for 15 minutes at 115° in an autoclave.

Formalised Gelatin. This has been used with success as a substitute for collodions. Gelatin solution 10% in water is stored in wide-mouth test-tubes holding 3 oz. each. The tubes are plugged with cotton wool and sterilised, at 100° for 15 minutes, on three successive days. When required for use, melt in a water-bath and add 1 dr. of formalin solution diluted 10 times, *i.e.*, 4% strength of formaldehyde approx.—the final product will then contain a little over 1% of formaldehyde, or fully 2½% of commercial formalin solution.

The wound is dressed with a thick roll or pad of sterilised gauze, with a piece of stiff gauze above extending beyond the wound. The formalised gelatin is applied with a swab on the top of the stiff gauze beyond the limit of the wound—this holds the dressing in place without bandage.

Capsulæ.

Capsules are made with a gelatin base and varying quantities of glycerin according to the degree of flexibility required. They are used for a variety of medicaments and are particularly suitable for nauseating oils. Soft gelatin capsules may be used for both liquid and solid medicaments, but it is unusual to put liquids into the hard type of gelatin capsule. Soft capsules are obtainable in various sizes having capacities of 3, 5, 10, 15, 20, 30, 60 and 90 minims. Hard capsules are obtainable in sizes which will hold 3, 4, 5, 6, 8, 10, 15, 25 gr. of sodium bicarbonate. A special form of soft gelatin capsule, made and filled by machinery, is known as a "perle." Soft capsules are to be preferred to the hard variety because they are more easily swallowed. Aqueous liquids tend to soften the capsule and should not, therefore, be prescribed in such containers. If it is necessary to include them, they should either be evaporated to low bulk and mixed with almond oil or they should be emulsified in almond oil using a little wool fat or white wax as emulgent. Liquids such as creosote and various volatile oils may cause discomfort in the stomach if dispensed undiluted in capsules. They should be mixed with four times their volume of almond oil and then capsuled.

Glutoid (Enteric) Capsules.

These may be hard or soft gelatin capsules and are intended to pass unchanged through the stomach and dissolve in the intestines. For this purpose they should be filled and sealed in the usual manner, then immersed for 5 minutes in solution of formaldehyde diluted with three times its volume of water and afterwards dried. Variable results may be obtained owing to variation in the composition of the capsule base. The action of the formaldehyde on the gelatin varies with the time of immersion and the amount of gelatin present. Moreover, the hardening effect of formalising increases on keeping and they should, therefore, be freshly prepared. The finished capsules may be tested in the following manner: they should not dissolve in an aqueous solution of glycerin of pepsin and hydrochloric acid when immersed for two hours at 37°, but should dissolve in an alkaline pancreatin solution at the same temperature. Glutoid capsules are useful for (a) drugs which may be inactivated in the stomach such as pancreatin or ox bile; (b) drugs which are more efficacious if they reach the intestines in a concentrated form, such as anthelmintics, intestinal disinfectants, and drugs like emetine and emetine bismuth iodide.

Slipules (Martindale, London), and Pulvules (Lilly, London) are hard gelatin capsules of the "slipover" variety.

Lamellæ.

Ophthalmic lamellæ or discs are prepared with gelatin, glycerin and water. The discs are $\frac{1}{8}$ inch (3.175 mm.) in diameter. Directions for making them are given in the B.P.

Pastilli.

Pastilles consist of a basis of gelatin with varying quantities of glycerin. The medicament is dissolved or suspended in the melted mass, which is then moulded in oil-lubricated moulds.

The B.P.C. recommends **Glycogelatin** as a basis for pastilles. This has gelatin 20, glycerin 40, sucrose 5, citric acid 2, sodium benzoate 0.2, oil of lemon 0.1, solution of bordeaux B 1, triple orange-flower water 6.25. The gelatin is softened in water, the glycerin added and the mass evaporated down to 85. The other ingredients are then incorporated. This basis gives a soft pastille which quickly dissolves in the mouth. As the medicament is intended to have a prolonged local action, the basis should be firm enough to ensure that the pastilles dissolve very slowly. The usual commercial medicated pastille contains a higher proportion of gelatin and dissolves slowly in the mouth. They are moulded in dry starch moulds and then thoroughly dried in trays for several weeks.

Glyco-gelatin (T.H.). Gelatin 1 oz., glycerin 2½ oz. (by weight), orange-flower water 2½ oz.; soak the gelatin in the water, then heat until dissolved, add the glycerin and, when nearly cold, carmine solution q.s. Is a softer basis than that of the B.P.C.

Gelatinum Glycerinatum (U.S.P. XI). Soak gelatin 1, for 1 hour, in boiled and cooled water to cover it. Drain and add glycerin 1 (by weight), heat to dissolve, strain and evaporate to 2.

Ichthyocolla (B.P.C., P. Belg. IV, F.E. VIII, P. Ital. V). *Syn.* ISINGLASS, COLLE DE POISSON (*Fr. Cx.*).

The swimming bladder of certain species of the sturgeon and hake, dried and sliced into thin pieces. About 3 drachms to the pint of warm water forms a jelly. Is used for refining wine. Isinglass plasters on muslin or on silk (court plaster) are prepared with a 1 in 6 or 1 in 8 solution.

Sinclair's Glue. For applying extension in fractures instead of plaster. Melt on water-bath when required and apply with the hand, using a bandage if necessary.

Very good glue or gelatin 50, water 100, glycerin 4 or 6, thymol or menthol 0.15%. The smaller amount of glycerin is for summer or tropical use and the larger amount for winter. The blistering occasionally reported is due to the excessive pull exerted by the gauze. If patient complains of a tickling or burning sensation, the dressing must be removed, or in any case every 10 to 14 days.

When extra traction is needed, or for very tender skins, the following formula is occasionally used:—Isinglass 50, gelatin 50, water 200, tannic acid 12, glycerin 8 or more, thymol or menthol 0.15%.

Previous formulæ containing calcium chloride are no longer used.—W. A. Knight, *Pharm. J.*, i/1935, 7.

Pectin. A complex carbohydrate contained in many fruits and vegetables, and particularly in apples, beets, and the peel from citrus fruits. It has a sweetish glutinous taste, and reduces Fehling's solution. When boiled with sugar in acid media it forms a jelly, and is extensively used in the manufacture of jams and jellies for setting purposes.

Powdered pectin is obtainable commercially in a highly refined form and standardised to a definite "setting power." The standard strength usually employed is "100-Grade," 1 lb. of which will set 100 lb. of sugar in solution to a jelly of standard strength and firmness containing 65% of sugar. For medicinal and toilet purposes a pectin of about "190-Grade" is employed (pure pectin is approximately "200-Grade").

Pectin-sugar-acid gels can be obtained with 0.125% of pectin, but jams usually contain 0.5 to 1%. For 1% pectin the lower limit for sugar content is 50%, and the higher 75%. Less than 66% sugar grows moulds and yeasts. Gooseberry juice, apple and lemon are used commercially as additions where the fruit is not rich, e.g., strawberry, cherry, raspberry, blackberry, rhubarb.—S. Back, *Pharm. J.*, ii/1931, 44.

A powder consisting of pectin 10 g., tragacanth 12 g., acacia 16 g., gelatin 7.8 g. is a good emulsifying agent. 18 g. of the powder triturated with 100 g. of water, allowed to stand for 30 minutes and then 400 g. of boiling water gradually added will emulsify 400 g. of cod-liver oil, added in 5 separate portions with vigorous shaking.—W. Brandrup, per *Chem. & Drugg.*, ii/1934, 778.

Formulæ for preparing non-greasy ointments with pectin as base.—A. Mosig, *Pharm. Zentralh.*, 1937, 78, 1.

Uses. Apart from its commercial uses pectin has been employed for various therapeutic purposes. Internally, it may be used in the treatment of diarrhoea and probably forms the basis of the "raw apple" treatment of infantile enteritis. Its mode of action is uncertain, but it is thought to act by the adsorption of toxins. It is also stated to reduce the clotting-time of the blood, and has

been employed as a hæmostatic for external and internal hæmorrhage, being given either orally, or by subcutaneous or intramuscular injection, or in the form of a compress.

DIARRHŒA. The following preparation was designed to provide a product which could be administered to infants suffering from diarrhœa; dextrin and maltose 175 g., acid-free pectin 6 g., agar-agar finely ground 8 g. The substances are mixed dry, water or milk boiled with the mixed powders for 5 minutes and the product poured into 8 custard cups to form a day's feeding on a three-hour schedule.—M. Winters and C. A. Tompkins, *Amer. J. Dis. Child.*, 1936, 52, 259.

The following preparation was successfully employed in the treatment of diarrhœa in infants and the new-born: pectin 6.3%, agar 4.3%, dextrimaltose 89.4%. For nurslings 1 cup of the powder is cooked for 10 minutes in a double boiler with 24 ounces of milk, and the desired amount poured into feeding bottles while still hot, being rewarmed and shaken when required for use. The usual feeding schedule is continued. For children from 6 months to 2 years of age 8 ounces of the powder is cooked for 10 minutes with 16 ounces of milk. In a series of 23 cases of enteritis in the new-born complete recovery occurred in all.—P. J. Howard and C. A. Tompkins, *J. Amer. med. Ass.*, i/1940, 2355.

HÆMOSTATIC. Of 96 cases mostly tonsillectomy treated with a pectin preparation, 95 clearly demonstrated its hæmostatic properties.—T. Langner, *Ned. Tijdschr. Geneeskunde*, 1937, 81, 188.

A valuable hæmostatic in tonsillectomy. It is applied on a small swab, which is placed on the tonsil cavity and allowed to remain there for 3 or 4 minutes.—D. Guthrie, *Lancet*, ii/1938, 751.

Aplona (Coates & Cooper, London). Preparation of apple pectin for the treatment of diarrhœa.

Arhemapectyl (Bengue, London). A colloidal isotonic solution of pectin for use in hæmorrhage. Is non-toxic by ingestion up to 80 ml. 1% solution, and has no contraindications. Supplied in ampoules.

Nipectin (Lilly, London). A preparation of pectin with 0.15% of nickel for the treatment of diarrhœa and enteritis. The presence of the nickel is stated to increase the solubility and bactericidal activity.

Apple Powder. The feeding of apple pulp (the "raw apple" treatment) was found to be an effective therapeutic measure in the treatment of infantile diarrhœa. The use of the pulp was later replaced by apple powder, which is more conveniently administered. The powder is prepared from the cored and peeled apple, and although a proportion of the vitamin A and C content is destroyed in the preparation of the powder, it is stated that the pectin content is actually increased. It has been mainly employed in the treatment of diarrhœa in infants, but is also claimed to have a definite field of usefulness in the treatment of gastrointestinal diseases in the adult. Since it is probable, however, that the value of apple pulp or powder lies mainly in the pectin content, the use of pectin itself would seem to be a more rational procedure and is, in fact, becoming increasingly preferred.

DIARRHŒA, INFANTILE. Raw apple treatment, consisting of giving 1 to 4 tablespoonfuls of apple pulp every hour or two for 48 hours and nothing else to eat or drink, successful in 88% of cases.—T. L. Birnberg, per *Brit. med. J.*, i/1933, 624.

Fresh prepared apple powder better, 30 to 50 g. daily, soaked in warm water; diarrhœa completely arrested within 18 hours. Not suitable for children under 9 months.—P. Freud, *Brit. med. J. Epit.*, ii/1934, 67.

130 cases of acute enteritis in children from 4 months old treated with the raw apple diet with only 1 death.—J. Giblin and M. Lischner, *Arch. Pediat.*, 1935, 355.

23 cases of diarrhœa in patients varying from a few days to 8 years old treated with uniformly good results by raw apple treatment.—M. P. Borowsky, *Amer. J. Dis. Child.*, 1936, 51, 1487.

The advantages of the powder over the apple pulp are: (1) the powder represents a product of high and uniform potency; (2) the æsthetic difficulties of taste and colour are overcome; (3) co-operation of parents is more easily obtained; (4) the bulk of the apple pulp makes dosage difficult; (5) the pulverised cellulose threads of the powder make a smoother stool; (6) the powder can be added easily to milk formulæ and will produce no curdling; (7) it represents a product of uniform price available at all times of the year; (8) it keeps well, is light and compact; (9) it is not rejected when given to children who are vomiting. In children it may be given in the form of 10% apple-powder water.—I. A. Manville *et al.*, *Canad. med. Ass. J.*, i/1937, 252.

Ivax (Boots, Nottingham). An extract of apples, containing Ext. Malorum (10 in 1) 46.5, sucrose 28.0, water to 100.0, for the treatment of diarrhoea in infants and children, colitis, dysentery, etc. Each fluid ounce represents 4 oz. of fresh apples. *Dose*.—Infants up to 1 year of age, 2 to 3 fl. oz. daily. For older children, $\frac{1}{2}$ to 1 fl. oz. every two hours.

GELSEMIUM

B.P.C.

Syn. GELSEMI RADIX.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Gelsemium, alkaloids of.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Gelsemium, alkaloids of, except substances containing less than 0.1% of the alkaloids of gelsemium.*"

[S6] "*Alkaloids—Gelsemium, alkaloids of—specify proportion as the proportion of any one alkaloid of gelsemium that the preparation would be calculated to contain on the assumption that all the alkaloids of gelsemium in the preparation were that alkaloid.*"

Dose.— $\frac{1}{2}$ to 1 grain (0.015 to 0.06 g.).

The dried rhizome and roots of "yellow jasmine," *Gelsemium sempervirens* (Loganiaceæ), imported from the United States. Must be distinguished from the yellow jasmine cultivated here, which is a species of *Jasminum*. The drug contains the alkaloid gelsemine and an amorphous mixture of alkaloids called gelseminine. The latter has the greater physiological activity.

Antidotes. Empty stomach by emetic or by stomach tube, using dilute solution of tannic acid. Keep patient warm; give brandy, $\frac{1}{2}$ oz., or aromatic spirit of ammonia, $\frac{1}{2}$ dr., in water. Artificial respiration and oxygen with 7% carbon dioxide inhalations if necessary.

Accidental death from an overdose in the case of a woman suffering from neurasthenia.—*Pharm. J.*, i/1927, 558.

Even small doses sometimes cause delayed symptoms of toxicity. The warning signs are ptosis, double vision, dilated pupils, weakness and depression. A drachm of fluid extract has caused death and a dose of 30 minims is dangerous.—Sollman, 5th Edn., 1936.

Uses. Febrifuge, antispasmodic and analgesic. In acute and rheumatic neuralgia, toothache, uterine and ovarian pain and chorea. It is a powerful paralyzant and respiratory poison. Large doses contract the pupil and cause giddiness and diplopia.

[P1-81] Extractum Gelsemii (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.). A soft extract.

[P1-81] Extractum Gelsemii Liquidum. By percolation with a mixture of alcohol 4 and water 1. Strength 1 = 1. *Average dose.*— $\frac{1}{2}$ minim.

Dysmenorrhœa is well treated by 3 minim doses with 5 minims of tincture of belladonna thrice daily.

For examination nervousness a small dose thrice daily is a tonic.

[P1] Mistura Gelsemii (R.L.O.H.). Sodium salicylate 10 gr., sodium bicarbonate 10 gr., potassium bromide 10 gr., tincture of gelsemium 10 m., chloroform water to 1 oz. For neuralgia and generally as a sedative.

[P1-81] Tinctura Gelsemii (B.P.C.).

Dose.—5 to 15 minims (0.3 to 1 ml.). 1 in 10.

Uses. For neuralgia of face and jaws associated with carious teeth—15 m. every 6 hours may give relief. Is often given with ammonium or potassium bromide. In rheumatoid arthritis it is given with cimicifuga *g.v.* Disordered vision may follow even moderate doses.

INFLUENZA has been treated by the following:—Tincture of gelsemium 12 m., tincture of belladonna 5 m., potassium citrate 10 gr., syrup of orange 1 dr., chloroform water to 1 oz. *Dose.*—1 ounce every 4 hours. Afterwards $\frac{1}{2}$ oz. until temperature falls to normal. Headache and backache vanish, with general improvement.

[P1-81] Gelsemina (B.P.C.). $C_{20}H_{23}O_2N_2 = 322.2$.

Dose.— $\frac{1}{100}$ to $\frac{3}{80}$ grain (0.0005 to 0.002 g.) in pills.

Minute white crystals, m.p. 178°, with a bitterish taste, sparingly soluble in water, easily in alcohol, ether and acids. It forms crystalline salts, and has mydriatic properties, but it is now used only for trigeminal neuralgia.

[P1-81] Gelseminæ Hydrochloridum. $C_{20}H_{23}O_2N_2.HCl = 358.7$.

Dose.— $\frac{1}{100}$ to $\frac{3}{80}$ grain (0.0005 to 0.002 g.).

In white, granular crystals, freely soluble in water.

GENTIANA

(with CALUMBA, QUASSIA, etc.)

B.P., U.S.P. XI, Fr. Cx., P. Helv. V, P. Dan.

Dose.—10 to 30 grains (0.6 to 2 g.).

The dried rhizome and roots of *Gentiana lutea* (Gentianaceæ). Ryutan (*P. Jap. V*) is obtained from *G. scabra*.

Uses. Gentian is a bitter tonic and is used to improve the appetite and to stimulate gastric secretion. It should be given from half to one hour before meals, since its administration with or after food is ineffective.

It is usually given with alkalis in conditions of hyposecretion, in chronic gastritis and atonic dyspepsia, in convalescence and in the dyspepsia of children.

Extractum Gentianæ (B.P.).

Dose.—2 to 8 grains (0.12 to 0.5 g.). A soft aqueous extract used as a pill excipient. *Fr. Cx.* has a soft extract prepared with alcohol 60%.

Infusum Gentianæ Compositum Concentratum (B.P.).*Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Gentian about 1 in 10 with dried bitter orange peel and lemon peel in alcohol 25%.

Infusum Gentianæ Compositum Recens (B.P.).*Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Gentian 1 in 80 with dried bitter orange peel and lemon peel.

Mistura Gentianæ Acida (B.P.C.).*Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains 12 m. of dilute nitro-hydrochloric acid with syrup of orange, compound infusion of gentian and chloroform water to 1 oz.

*Mist. Gent. Acid. (N.I.F.).*Dilute hydrochloric acid 10 m., concentrated compound infusion of gentian 15 m., chloroform water to $\frac{1}{2}$ oz.**Mistura Gentianæ Alkalina (B.P.C.).** *Syn.* MISTURA GENTIANÆ CUM SODA.*Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains 15 gr. of sodium bicarbonate and 5 gr. of ammonium carbonate with syrup of orange and compound infusion of gentian to 1 oz.

Mist. Sod. c. Gent. (N.I.F.). *Syn.* MIST. GENT. ALK.Sodium bicarbonate 10 gr., concentrated compound infusion of gentian 15 m., water to $\frac{1}{2}$ oz.*Tinctura Amara (P.G. VI).* Gentian 3, centaury root 3, orange peel 2, orange berries 1, zedoary root 1, diluted alcohol (67 to 69% v/v) to 50.**Tinctura Gentianæ Composita (B.P.).***Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). Gentian 1 in 10 with dried bitter orange peel and cardamom in alcohol 45%.*Tinctura Gentianæ Composita (U.S.P. XI).**Average dose.*—60 minims (4 ml.).Similar in composition to *Tinct. Gent. Co. B.P.*, but contains also about 10% of glycerin.*Azadirachta.* *Syn.* NIM or NEEM, MARGOSA. The bark of *Azadirachta indica* (Meliaceæ), indigenous to India. Used as a bitter instead of gentian or quassia.*Calamus (B.P.C.).* *Syn.* SWEET FLAG ROOT. *Dose.*— $\frac{1}{2}$ to 1 drachm (1 to 4 g.). The dried rhizome of *Acorus Calamus* (Araceæ). Aromatic bitter and carminative. *Tinctura Calami.* *Dose.*— $\frac{1}{2}$ to 1 drachm. 1 in 5. *Infusum Calami.* *Dose.*— $\frac{1}{2}$ to 1 ounce. 1 in 10.*Calumba (B.P., P. Helv. V, P. Dan., P. Jap. V).* *Syn.* RADIX FRASERI, COLOMBO (*Fr. Cx.*).The dried root, sliced, of *Jateorhiza palmata* (Menispermaceæ). Bitter tonic for simple debility and indigestion. Contains no tannin and can be given with salts of iron.False calumba root is from *Coscinium fenestratum*.*Infusum Calumbæ Concentratum (B.P.).* *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). About 1 in 2 $\frac{1}{2}$.*Infusum Calumbæ Recens (B.P.).* *Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 20.

Tinctura Calumbæ (B.P.). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).
1 in 10 of alcohol 60%. *Fr. Cx.* has 1 of drug to 5 of alcohol 60%.

Cascarilla (B.P.C., P. Dan.). The dried bark of *Croton Eluteria* (Euphorbiaceæ). Contains 1.5 to 2% of volatile oil, also the bitter principle cascarillin. Aromatic tonic.

Infusum Cascarillæ Concentratum (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). About 1 in 2 $\frac{1}{2}$.

Infusum Cascarillæ Recens (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 20.

[P1] **Mistura Cascarillæ Composita (St. T. H.).** Camphorated tincture of opium 15 m., vinegar of squill 20 m., emulsion of chloroform 10 m., infusion of cascarilla to 1 oz.

Tinctura Cascarillæ (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 5.

Chirata (B.P.C.). The dried plant, *Swertia Chirata* (Gentianaceæ).

Dose.—5 to 30 grains (0.3 to 2 g.).

A bitter tonic given in indigestion for anorexia and torpid liver with constipation.

Infusum Chiratæ Recens (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 20.

Infusum Chiratæ Concentratum (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 2 $\frac{1}{2}$.

Tinctura Chiratæ (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 10.

Cimicifuga (B.P.C.). *Syn.* BLACK SNAKEROOT, BLACK COHOSH, *ACTÆÆ RACEMOSÆ RADIX.*

Dose.—8 to 15 grains (0.5 to 1 g.).

The dried rhizome and roots of *Cimicifuga racemosa* (Ranunculaceæ).

Uses. *Cimicifuga* is a bitter tonic and has mild expectorant, anti-spasmodic and emmenagogue actions. It has been used internally in bronchitis, chronic rheumatism, lumbago, sciatica, chorea, dysmenorrhœa and amenorrhœa, usually in the form of the liquid extract or the tincture.

Extractum Cimicifugæ Liquidum (B.P. '98). *Dose.*—5 to 30 minims (0.3 to 2 ml.). 1 in 1.

Tinctura Cimicifugæ (B.P.C.). *Syn.* TINCTURA ACTÆÆ RACEMOSÆ.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 10.

In rheumatoid arthritis 15 minims of tincture with 5 minims of tincture of gelsemium thrice a day is often useful.

Cimicifugin. *Dose.*—1 to 6 grains in pill. Is the resinous body obtained by pouring a strong tincture into water.

Otosedan (formerly known as *Otosclerol*) (Coates & Cooper, London). A preparation containing cimicifugin, bromides, and combined phosphorus. For deafness. *Dose.*—1 tablet thrice daily after meals, increased if necessary.

Condurango (B.P.C., Fr. Cx., P. Jap. V, P.G. VI, P. Ital. V, P. Belg. IV, P. Helv. V, P. Dan.).

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 g.) in powder.

The stem bark of *Marsdenia Condurango* (Asclepiadaceæ) from Ecuador. Is bitter and acrid. A stomachic and stimulant in dyspepsia.

Extractum Condurango Liquidum (P.G. VI) is made 1 in 1 with alcohol 1 and water 3.

Vinum Condurango (P.G. VI). *Dose*.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). Liquid extract 10, aromatic tincture 1, sucrose 9, sherry 80. (*Tinctura Aromatica* (P.G. VI) is cinnamon 5, ginger 2, galanga 1, clove 1, cardamom 1, alcohol 69% v/v 50). *P. Jap. V* has a similar wine, but uses tincture of orange for aromatic tincture.

Galanga (B.P.C., *Fr. Cx.*, *P. Helv. V*, *P. Dan.*). *Syn.* LESSER GALANGAL, EAST INDIAN ROOT, CHINA ROOT.

Dose.— $\frac{1}{2}$ to $\frac{1}{2}$ drachm (1 to 2 g.).

The dried rhizome of *Alpinia officinarum* (Zingiberaceæ). Aromatic and carminative. Has been used as decoction (1 in 20).

Inula. *Syn.* ELECCAMPANE. The dried rhizome and roots of *Inula Helenium* (Compositæ). Antiseptic; given internally in bronchitis as *Extractum Inulæ Liquidum*, 1 = 1, *dose*.—10 to 60 minims.

Lupulus (B.P.C.). *Syn.* HOPS, HOUBLON (*Fr. Cx.*), HUMULUS, STROBILI LUPULI.

The dried strobiles of the hop plant, *Humulus Lupulus* (Cannabaceæ). An aromatic bitter, formerly believed to possess sedative properties. The use of pillows stuffed with hops is reputed to induce sleep.

Extractum Lupuli (B.P.C.).

Dose.—5 to 15 grains (0.3 to 1 g.). A soft extract. A liquid extract, 1 in 1, *dose*.—5 to 15 minims, is also available.

Infusum Lupuli Concentratum (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

About 1 in 2 $\frac{1}{2}$. This preparation diluted with 7 volumes of water may be dispensed when *Infusum Lupuli* is prescribed.

Tinctura Lupuli (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 5.

Lupulinum (B.P.C., *P. Helv. V*).

Dose.—2 to 5 grains (0.12 to 0.3 g.) in pills, capsules or cachets.

A yellow powder, becoming brownish with age, consisting of the glandular trichomes from the strobiles of the hop plant.

Menyanthes Trifoliata (*Fr. Cx.*, *P. Dan.*). *Syn.* TRIFOLIA FIBRINA, BOG-BEAN LEAF, BUCKBEAN. Bitter tonic, emmenagogue, antiscorbutic, vermifuge and febrifuge; large doses are purgative and emetic; contains menyanthin, a glucoside. Infusion 1 in 20. *Dose*.—2 to 6 ounces, taken hot, early in the morning daily, useful for functional amenorrhœa. Liquid extract with liquorice 1 in 2. *Dose*.— $\frac{1}{2}$ ounce.

Quassia (B.P., *Fr. Cx.*, *P. Helv. V*). *Syn.* JAMAICA QUASSIA.

Dose.—2 to 8 grains (0.12 to 0.5 g.).

Stem-wood of *Picræna excelsa* (Simarubaceæ). Contains picrasmin. Is free from tannin, hence compatible with iron preparations. *Surinam Quassia* (not now in use) is the wood of *Q. amara*, a branching shrub, whereas *P. excelsa* is about 100 feet high.

Uses. Quassia is mainly employed in medicine as a non-astringent bitter stomachic to stimulate appetite. A 1 in 20 infusion administered by rectal injection may be used in the treatment of threadworms; gelatin suppositories containing $\frac{1}{4}$ to $\frac{1}{2}$ gr. of the extract, and inserted on several successive nights, have also been employed for this purpose. Infusions have also been used as lotions for pediculosis.

Concentrated infusions or extracts are widely used, in conjunction with soft soap, as horticultural insecticides.

Anti-smoking Gum. Quassia made up in form of a chewing gum has been used as a substitute for smoking for the use of patients suffering from tobacco amblyopia who feel the loss of their tobacco. If alcoholic complication is absent 1 in 20 is strong enough.

Enema Quassiae (B.P.C.).

Dose.—20 ounces (600 ml.) of the fresh infusion.

Extractum Quassiae (B.P.C.).

Dose.—3 to 5 grains (0.2 to 0.3 g.). A soft extract.

Infusum Quassiae Concentratum (B.P.).

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.). 1 in 12 $\frac{1}{2}$, extracted with cold water, and alcohol added.

Infusum Quassiae Recens (B.P.).

Dose.— $\frac{1}{4}$ to 1 ounce (15 to 30 ml.). 1%. Prepared with cold water.

[P2] **Lotio Quassiae.** Concentrated quassia infusion 1 oz., spirit of rosemary 1 $\frac{1}{2}$ dr., sassafras oil 30 m., alcohol 2 dr., liquefied phenol 2 dr., water to 6 oz. Shake before use. For nits in children's hair.

Tinctura Quassiae (B.P.). *Dose.*— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.). 1% in alcohol 45%.

Quassinum (Fr. Cx.) *Syn.* PICRASMIN. A dry alcoholic extract in white odourless intensely bitter crystals. *Fr. Cx.* gives max. single dose, and *F.E. VIII* average dose, $\frac{1}{16}$ grain.

[P1-S1] **Quebracha (B.P.C.).** *Syn.* QUEBRACHO, ASPIDOSPERMA, QUEBRACHO-BLANCO.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Quebracho, alkaloids of, other than the alkaloids of red quebracho.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Quebracho, alkaloids of.*"

[S6] "*Alkaloids—Quebracho, alkaloids of, other than the alkaloids of red quebracho—specify proportion as the proportion of any one alkaloid of quebracho that the preparation would be calculated to contain on the assumption that all the alkaloids of quebracho in the preparation were that alkaloid.*"

The dried bark of *Aspidosperma Quebracho* from Argentina. Tonic, febrifuge and antispasmodic. [P1-S1] Tincture of quebracho, 1 in 5, of alcohol 60%, *dose.*—1 drachm. [P1-S1] Liquid extract, 1=1, *dose.*—10 minims.

Serpentaria (B.P., U.S.P. XI).

Dose.— $\frac{3}{4}$ to 1 $\frac{1}{2}$ grains (0.05 to 0.1 g.). *U.S.P. XI* average dose 15 grains.

The dried rhizome and roots of *Aristolochia reticulata* (Texan Serpentry) (Aristolochiaceæ). A bitter tonic.

Infusum Serpentariae Concentratum (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.).

1 in 2 $\frac{1}{2}$. When Infusum Serpentariae is prescribed this preparation diluted with 7 times its volume of water may be dispensed.

Tinctura Serpentariae (B.P.C.). *Dose.*— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.). 1 in 5.

Aristolochia (B.P.C.). *Syn.* INDIAN BIRTHWORT, SAPSUN. The dried stem and root of *Aristolochia indica* (Aristolochiaceæ). A bitter used in the East for the same purpose as serpentary. Is administered as **Tinctura Aristolochiae**, 1 in 5, *dose.*— $\frac{1}{4}$ to 1 drachm.

GLYCERINUM

B.P., U.S.P. XI, Fr. Cx.

Dose.—1 to 2 drachms (4 to 8 ml.); by rectal injection, $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). U.S.P. XI average dose 60 minims.

Intravenously, 1 drachm (4 ml.) has been given with equal amount of tap water (*v. postea*).

Manufactured by decomposing fats with alkali or superheated steam. Sp. gr. 1.260 to 1.265. *Miscible* with water and alcohol 90%; but immiscible with ether or chloroform.

P. Ned. V permits 11.7 to 13.6% of water (sp. gr. 1.230 to 1.235). *Fr. Cx.* about 3% (sp. gr. 1.255); *P. Dan.* 12 to 15% (sp. gr. 1.225 to 1.235); *P. Helv. V* 12 to 16%. The latter includes also Glycerinum concentratum containing at least 98% of $\text{C}_3\text{H}_8\text{O}_3$. U.S.P. XI requires not less than 95%.

CRYSTALLISATION of glycerin occurs occasionally in the cold weather. The crystals do not melt again until temperature is about 20°.

Uses. Internally, glycerin is demulcent and laxative, and is widely employed as a sweetening agent in mixtures and as an ingredient in cough linctuses. Externally, it has little effect on the intact skin, but has a potent hygroscopic action when brought into contact with broken skin or mucous membranes. It is used as an emollient in many skin preparations and is of value in the prevention and treatment of chapped hands and chilblains, and it may be employed for its dehydrating effect in boils, carbuncles, and other inflammatory conditions, and as a wound dressing. Used in the form of tampons it has also proved of value, by promoting the flow of lymph, in the treatment of female gonorrhœa, and in leucorrhœa and chronic inflammation of the ovary, and intra-uterine injections of glycerin have been advocated in the treatment of puerperal sepsis and post-partum hæmorrhage. Given in the form of suppositories or by rectal injection, it is extensively employed in constipation, its irritant action on the mucous membrane causing prompt evacuation of the lower bowel.

It is a valuable preservative, especially in solutions of digestive ferments and other gland secretions, and is used for this purpose in extracts and in "aqueous" or non-alcoholic tinctures.

BOILS AND CARBUNCLES, and all kinds of wounds and sores, effectually treated; covered by gutta-percha tissue or oiled cambric. Also good in eczema. Absence of bleaching and maceration of the skin.—D. Kyle, *Brit. med. J.*, i/1931, 76.

CELLULITIS. Glycerin in combination with Liq. Hyd. Perchlor. excellent for all kinds.—H. A. Morton-Whitby, *Brit. med. J.*, i/1931, 206.

TUBERCULOUS PERITONITIS treated by glycerin 1 pint intraperitoneally—in desperate cases beneficial but toxic.—A. MacLennan. Probably diluted just as good.—D. Kyle, *Brit. med. J.*, i/1931, 76.

Tuberculous abscess cavities injected with glycerin after evacuation of contents and cauterising with iodised phenol.—H. A. Morton-Whitby, *Brit. med. J.*, i/1931, 206.

VARICOSE VEINS. Intravenous injections of 5 to 10 ml. of 50% glycerin and water initially, and 6 days later one or two injections of a 75% mixture. All cases successful.—F. Maignon, per *Prescriber*, 1932, 34.

WOUNDS as arriving in Casualty Dept. at a London hospital treated with a mixture of glycerin 1, liquid glucose 6 and water 3—left on 3 days, then a dry dressing with boric acid powder. Also effective in bromidrosis and in ozæna.

—T. H. C. Benians, *Brit. med. J.*, i/1931, 285.

The addition of about 25% of glycerin to a wet dressing avoids the bleaching and maceration of the skin: the surface of the wound is kept moist, the discharge is not pent up under a scab and the wound is thus encouraged to heal from the bottom. Even when the dressing has to be applied for weeks or months the skin remains normal.—D. Kyle, *Practitioner*, ii/1933, 318.

Glycerin in Labour.

LYMPHAGOGUE ACTION of a 10% solution of tincture of iodine in glycerin. The iodine helps to stimulate uterine contraction.—H. J. Phillips, *Lancet*, ii/1925, 1229, 1307; *Proc. R. Soc. Med.*, Feb., 1926, 26.

In obstetrics glycerin is useful, (a) where puerperal sepsis is a possibility, and (b) mild sapræmia or definite septicæmia.—C. Elliott, *Lancet*, i/1929, 1057.

Glycerin in midwifery advocated. It is powerfully hygroscopic, inhibits bacterial growth, particularly the cocci and coli groups, the causal organisms of puerperal sepsis, reduces œdema, and encourages healing of lacerated tissues. Soothing to hæmorrhoids. Used as routine at every confinement. — R. Mackinnon, *Brit. med. J.*, ii/1930, 980.

Glycerin and acriflavin (1 in 500) for torn perineum.—P. G. Preston, *Brit. med. J.*, i/1931, 294.

Glauramine (q.v.) in glycerin 1 in 60 suggested in midwifery, especially when frequent examinations needed and in prolonged or difficult labour. No irritation.—F. H. Lacey, *Brit. med. J.*, i/1931, 36.

Intravaginal glycerin of great value in sapræmia—given twice daily for two days and then once daily till temperature drops, with elevation of the head of the bed a quarter of an hour after the glycerin has been given, and local heat. Also effective for septic tears of the perineum after labour, and after prolapse operations on the vagina (from the fifth day onwards). Intra-uterine injections of hot glycerin give good results in post-partum hæmorrhage. In salpingitis and gonorrhœal cervicitis vaginal glycerins are of assistance and preferable to hot douches.—W. McKim and H. McCullagh, *Brit. med. J.*, i/1939, 111.

PUERPERAL SEPSIS. Glycerin irrigation (up to 200 ml. once or thrice daily into the uterine cavity or cervical canal) the most effective remedy at our disposal, but should be used at an early stage. Pyrexia as a sign for puerperal sepsis an entirely unreliable guide—it rarely develops at the outset; pulse rate of more importance. Drainage by glycerin started as soon as temperature rises to 99° or pulse rate to 90. It is not normal for a woman to suffer from after-pains for the first few days after the puerperium, and pain is invariably due to interference with free drainage. Profuse lochial discharge another indication for early treatment.—A. R. Hobbs, *Brit. med. J.*, ii/1931, 746.

Enema Glycerini (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 ounces (15 to 60 ml.). 20 to 50% v/v in water or mucilage of starch. Undiluted, 1 to 4 drachms (4 to 16 ml.).

Glycerinum Aluminis et Acidi Tannici.

Potassium alum (free from iron), in powder, 1, glycerin 6. Heat to dissolve and add tannic acid 1. An astringent throat pigment. Diluted 1 in 20 as a vaginal injection.

Glycerinum Boracis cum Potassii Chlorate (R.D.H.).

Potassium chlorate 20 gr., borax 10 gr., tragacanth 4 gr., glycerin 1 dr., chloroform water 1 oz.

Glycerinum cum Aqua Rosæ.

Glycerin 2, rose water 3. An agreeable emollient for the skin.

Glycerin Jelly, for toilet use.

Gelatin 140 gr., rose water 6 oz.; soak a few minutes and heat in a water-bath to dissolve; add, when cool but still fluid, white of egg $\frac{1}{2}$ oz. Heat to coagulate completely, and add glycerin 6 oz., salicylic acid 12 gr. Mix well, filter through a hot-water funnel, and bottle while warm.

Non-greasy hand-creams may be made from tragacanth 2, glycerin 5, borax 1.25, tincture of benzoin 2.5, alcohol 4, distilled witch-hazel 3, perfume *q.s.*, water 81.75. Wet the tragacanth with the alcohol and add rapidly two-thirds of the water with continuous shaking; strain through muslin; add the tincture of benzoin mixed with the selected perfume. Dissolve the borax in the remainder of the water, add the glycerin and extract of witch-hazel, and mix the two solutions.—*Pharm. J.*, 1/1939, 556.

Lubricant Glycerin Jelly is somewhat softer than the latter. For toilet use and lubrication of stomach tubes.

Glycero-alcohol. *Syn.* PETIT'S LIQUOR.

Dose.—5 to 60 minims (0.3 to 4 ml.).

Glycerin 333, distilled water 146, alcohol 95% 580. Is used as a solvent of alkaloids and active principles. It has sp. gr. about 1.

Suppositorium Glycerini (B.P.). Gelatin 14, glycerin (by weight) 70, water *q.s.* to 100, suitably combined. Pour into moulds of 15, 30, 60 or 120 minims or other capacities as required. Contains 70% by weight of glycerin. This basis may be used for gelatin pessaries.

Suppositorium Glycerini Saponatum (B.P.C.) contains 90% *w/w* of glycerin.

Suppositoria Glycerini (U.S.P. XI).

Dissolve 8 g. of sodium stearate in 92 g. of glycerin heated at 95°, add 5 g. of water and pour into moulds to produce 30 suppositories.

Glycerin Tampons consist of gauze and wool swabs soaked in medicated glycerin.

Hollow Suppositories, composed of oil of theobroma, may be filled with 20, 45, or 90 grains of glycerin; they are prompt in action.

Unguentum Glycerini Compositum (St. T. H.).

Glycerin 3 dr., strong solution of lead subacetate 20 m., wool fat 3 dr., lavender oil 1 m., yellow soft paraffin to 1 oz.

Glycols.

The glycols are dihydric alcohols with a general formula $\text{HO} \cdot \text{R}_1 \cdot \text{R}_2 \cdot \text{OH}$, where R_1 and R_2 represent any alkyl groups either similar or dissimilar. In ethylene glycol, $\text{HO} \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{OH}$, for example, they are similar, whereas in α -iso-amylene glycol, $\text{HO} \cdot \text{CH}_2 \cdot \text{CH}[\text{CH} \cdot (\text{CH}_3)_2] \cdot \text{OH}$, they are dissimilar. By condensing together two molecules of glycol, either similar or dissimilar, a compound is obtained which, whilst being a dihydric alcohol, is also an ether, such as diethylene glycol, $\text{HO} \cdot \text{C}_2\text{H}_4 \cdot \text{O} \cdot \text{C}_2\text{H}_4 \cdot \text{OH}$. In addition to this "internal ether," condensation ethers may be formed by replacing either or both of the hydrogen atoms of the hydroxyl groups. In this way ethyleneglycol-monoethylether, $\text{C}_2\text{H}_5\text{O} \cdot \text{CH}_2 \cdot \text{CH}_2\text{OH}$, is obtained.

Very few glycols, with the exception of propylene glycol, are used in pharmaceutical preparations, but large quantities are used in the cosmetic and other industries, and glycols as a class show a toxicity which, although seemingly negligible in some members, may nevertheless prove detrimental to health in the long run, owing to the cumulative effect of the toxic principle. The nature of this principle is unknown and may be due either to the presence of a cyclic ether in the product before ingestion, or to its formation

actually in the body. Whichever glycol is used in a preparation, care should be taken to determine its toxicity prior to use.

Ethylene Glycol. *Syn.* GLYCOL. $\text{CH}_2\text{OH}\cdot\text{CH}_2\text{OH} = 62.07$.

Ethylene glycol is a colourless, odourless, syrupy liquid with a sweet taste. Its properties are intermediate between those of alcohol and glycerin. M.p. -17.4° , b.p. about 197° .

Miscible with water and alcohol; soluble 1 in about 200 of ether.

Ethylene glycol is used as a solvent, particularly for preparing flavouring essences; it is a good solvent for terpeneless oils. It is also used as an "anti-freeze," and as an ingredient in dynamite. Ethylene glycol is non-inflammable and non-corrosive to metals.

As a solvent or vehicle for medicinal products it is comparatively innocuous. It is said that even 140 ml. would be needed to cause toxic symptoms in man, and the fatal dose would be more than $\frac{1}{2}$ lb.—P. J. Hanzlik and co-workers, *J. Pharmacol.*, Apr., 1931, 406. W. F. von Oettingen and E. A. Jirouch, *ibid.*, Aug., 1931, 371, draw, however, other conclusions and say subcutaneously likely to cause irritation and large doses may cause severe gastro-enteritis.

Ethylene and propylene glycols are both more effective preservatives for solutions of tannic acid than either alcohol or glycerin. In 10% concentration they are effective in preserving syrup and suspensions of tragacanth, and a 30% concentration is a satisfactory preservative for solutions of gelatin.—J. Rae, *Pharm. J.*, i/1938, 517.

Propylene Glycol. $\text{CH}_3\cdot\text{CHOH}\cdot\text{CH}_2\text{OH} = 76.09$.

Propylene glycol is a clear, colourless, odourless, hygroscopic liquid obtained by the hydrolysis of propylene chloride. It is less viscous than glycerin and should be stored in well-closed containers.

Miscible with water, alcohol and chloroform; soluble 1 in 10 of ether; immiscible with fixed oils.

This is the least toxic of the glycols, and may safely be employed as a vehicle or solvent in medicinal preparations.

Toxicity. The M.L.D. of propylene glycol (1:2-propanediol) intramuscularly and subcutaneously for rats is 15.7 and 23.1 g. per kg. respectively as compared with 7.6 and 15.1 g. per kg. respectively for glycerin. The acutely fatal oral dose for rabbits is 20 g. per kg. Daily doses of up to 8 ml. per kg. for 50 days produce no cumulative effects. Its subcutaneous injection into human subjects causes a marked burning sensation which passes off in 5 to 10 minutes. It should be a useful solvent for certain substances but should not be given undiluted by subcutaneous injection.—H. A. Braun and G. F. Cartland, *J. Amer. pharm. Ass.*, 1936, 746.

With the exception of propylene glycol, the use of glycols in food and drug preparations should be avoided.—H. O. Calvery, per *J. Amer. pharm. Ass.*, 1939, 6.

Although very large doses of the propylene and dipropylene glycols act as central nervous depressants, these glycols are devoid of demonstrable toxicity when administered in smaller though still large doses for prolonged periods. With doses of a glycol which might conceivably be ingested by man, the propylene and dipropylene glycols showed no evidence of toxicity. Only propylene glycol is suitable at present for internal or systemic use with food and medicinal products without demonstrable hazards to health.—P. J. Hanzlik *et al.*, *J. Pharmacol.*, 1939, 67, 101.

Has no demonstrable effects on the basal metabolic rate in human subjects (50 ml. in a 50% aqueous solution *per os*) and on the respiratory quotient in rats. This is further evidence in support of its non-injuriousness as a vehicle or solvent, if not desirability as an alcohol substitute in dietary and medicinal products.—P. J. Hanzlik, *J. Pharmacol.*, 1939, 67, 114.

Further confirmation that this is the least toxic and injurious of the glycols thus far investigated.—W. Van Winkle and N. K. Kennedy, *J. Pharmacol.*, 1940, 69, 140.

α -Propyleneglycol Monostearate. *Syn.* MONOLENE. A wax-like solid containing traces of the distearate and having a m.p. of 33° to 34° when fresh, rising to 37° on storage. Suggested for use as a suppository basis, and stated to favour the absorption of water soluble medicaments.—J. C. Bird, *J. Amer. pharm. Ass.*, 1937, 475.

Diethylene Glycol. $(\text{CH}_2\text{OH}\cdot\text{CH}_2)_2\text{O} = 106\cdot12$.

Diethylene glycol, or β , β' -dihydroxydiethyl ether, is a colourless, hygroscopic, odourless, oily liquid, with a sweet taste, made by heating ethylene oxide and glycol. B.p. 245°. Soluble in water, alcohol and ether; insoluble in benzene and carbon tetrachloride.

Diethylene glycol is used for many technical purposes. Mixed with 60% of water, it freezes at -18°, and with 50% at -28°, and is thus used as an "anti-freeze." It is not used medicinally owing to its toxicity. (For references to toxicity see Vol. II, 21st Edn.)

Ethyleneglycol Monoethylether. *Syn. and Prop. Name.* MONOETHYL ETHYLENEGLYCOL, CELLOSOLVE (*Carbide and Carbon Chemicals, New York*). $\text{C}_2\text{H}_5\text{O}\cdot\text{CH}_2\cdot\text{CH}_2\text{OH} = 90\cdot12$.

Ethyleneglycol monoethyl ether is a colourless, odourless liquid. B.p. 135°; flash point 44°. Miscible with water and organic solvents. It dissolves many oils, resins, waxes, etc.

Used as a solvent for cellulose nitrate, etc., and in varnish removers and dye baths. It is also used in cosmetic creams.

Diethyleneglycol Monoethylether. *Syn. and Prop. Name.* MONOETHYL DIETHYLENEGLYCOL, CARBITOL (*Carbide and Carbon Chemicals, New York*). $\text{C}_2\text{H}_5\text{O}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{O}\cdot\text{CH}_2\cdot\text{CH}_2\text{OH} = 134\cdot17$.

Diethyleneglycol monoethyl ether is a colourless, hygroscopic liquid. B.p. 200°. Miscible with water and organic solvents.

It is used as a solvent for cellulose nitrate and resins, and also in cosmetic creams.

GLYCYRRHIZA

B.P., U.S.P. XI, Fr. Cx., P. Helv. V, P. Dan.

Dose.—15 to 60 grains (1 to 4 g.).

The root and subterranean stem of *G. glabra* and other species (Leguminosæ). Both the peeled and unpeeled drug is included in the *B.P.*, the latter being admitted only when expressly named, *e.g.*, for preparing the extracts. Is demulcent and expectorant.

Elixir Glycyrrhizæ (*U.S.P. XI*).

Fluid extract of glycyrrhiza 12·5%, in aromatic elixir.

Liquor Pectoralis (*P. Dan.*). *Syn.* ELIXIR PECTORALE, KING OF DENMARK'S CHEST MIXTURE. *Dose.*—1 drachm. Extract of liquorice 1, fennel water 3, anisated liquid ammonia 1.

P. Svec. X has extract of liquorice 200, fennel water 600, ammonia solution 9% 35, anise oil 2, alcohol 90% 163. [*P1*] **Liquor Pectoralis Benzoicus** (*P. Svec. X*). Tinctura Opii Benzoica 1, Liquor Pectoralis 3.

Extractum Glycyrrhizæ (*B.P.*).

Dose.—10 to 30 grains (0·6 to 2 g.).

The evaporated chloroform water percolate. Used in lozenges and pastilles.

Extractum Glycyrrhizæ (*U.S.P. XI*). This is the commercial extract in powder or in rolls or masses. **Extractum Glycyrrhizæ Purum** (*U.S.P. XI*) is an aqueous extract of the rhizome and roots, of pilular consistence.

Extractum Glycyrrhizæ Liquidum (*B.P.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

1 in 1, by percolation with chloroform water, evaporation, and addition of 25% of alcohol 90%. Is a useful flavouring agent, especially for ammonium chloride, alkaline iodides, cascara, magnesium sulphate, quinine sulphate, ipecacuanha and aloes, but is incompatible with acids.

Extractum Glycyrrhizæ (*Fr. Cx.*). *Syn.* EXTRAIT DE RÉGLISSE.

Made by double maceration with very dilute ammonia and evaporation to a soft extract.

Fluidextractum Glycyrrhizæ (*U.S.P. XI*).

Average dose.—30 minims (2 ml.). Prepared by maceration and percolation with boiling water, followed by evaporation after the addition of ammonia and then finally adding alcohol and sufficient water.

Pulvis Glycyrrhizæ Compositus (*B.P.*). *Syn.* PULVIS PECTORALIS (*Kurellæ*).

Dose.—1 to 2 drachms (4 to 8 g.) mixed with water or milk, taken early in the morning.

Senna and liquorice of each 2, fennel and sublimed sulphur of each 1, sucrose 6½. Mix. For constipation and hepatic disease, it is pleasant to take, and effectual without catharsis. *U.S.P. XI* (*Pulvis Sennæ Compositus*) uses oil of fennel, which makes it less granular, and 3% of the sugar may be replaced by starch.

Poudre de Réglisse Composée (*Fr. Cx.*). *Syn.* PULVIS LIQUIRITIZÆ COMPOSITUS. Contains liquorice 1½, senna (washed with alcohol and powdered) 1½, fennel 1, sublimed sulphur 1, sucrose 5. *P. Jap. V* is similar.

Pulvis Sennæ Compositus (*U.S.P. XI*). *Syn.* PULVIS GLYCYRRHIZÆ COMPOSITUS (*U.S.P. X*).

Average dose.—60 grains (4 g.).

Senna 18, liquorice 23·6, washed sulphur 8, oil of fennel 0·4, sucrose 50.

Trochisci Glycyrrhizæ (*B.P.C.*), *syn.* BROMPTON COUGH LOZENGES, contain 3 grains of extract of liquorice and ½ minim of oil of anise. These lozenges are brown in colour. Lozenges which are black usually contain charcoal.

Pastilles de Réglisse. Liquorice pastilles, much used in France.

Glycyrrhizinum Ammoniatum. *Dose.*—½ to 5 grains. Glycyrrhizin is contained in the root as the ammonium salt. Readily soluble garnet coloured shining scales. It possesses a persistent sweet taste. A grain will flavour 6 ounces of water. It may, perhaps, be considered as the ammonium salt of glycyrrhizinic acid which, according to Tschirch, has the formula $C_{41}H_{41}O_{23}(COOH)_2$.

In addition to the extracts, dried "liquorice juice," or "Spanish liquorice" (*Succus Liquiritizæ, P. Helv. V*) is sold, that bearing the stamp of Solazzi being most prized. Pontefract cakes of liquorice and "pipe liquorice" are useful in allaying tickling coughs.

Abrus (*B.P.C.*). *Syn.* JEQUIRITY, JUMBLE BEADS, PRAYER BEADS.

The seeds of *Abrus precatorius* (*Leguminosæ*), a tropical climbing plant. Contains abrin, a mixture of two poisonous proteins. Infusum Abri 8% has been used, diluted, for granular eyelids.

Instillation of 5% infusion of crushed seeds for relief of pannus.—Lieut.-Col. H. Kirkpatrick, *Lancet*, i/1921, 1304.

Abri Radix, *syn.* INDIAN LIQUORICE, is the root of *Abrus precatorius* (*Leguminosæ*). It has poisonous properties and should not be used as a sweetening agent.

Althæa (*B.P.C., U.S.P. XI, P. Dan.*). *Syn.* MARSHMALLOW, GUIMAUVE (*Fr. Cx.*).

The dried peeled root of *A. officinalis* (*Malvaceæ*), collected from plants not less than two years old. Contains a fatty oil and

25 to 35% of mucilage. Used as a demulcent in bronchitis. The powdered root is a useful absorbent in pill-making. The leaves (*Althææ Folium P. Helv. V*) were formerly used for preparing a soothing ointment.

Marshmallow Pastilles. *Syn.* PASTILLES DE GUIMAUVE.

Boil incised marshmallow root 100 in water 400, strain off the liquor. Evaporate to about 80 and mix with tragacanth 10 and sugar 1000, adding orange-flower water 10 or more if necessary to make a mass for cutting into pastilles weighing 20 grains (1.2 g.). This basis may be medicated with throat remedies similar to those used in glyco-gelatin pastilles.

Species Pectorales (P.G. VI). Coarsely cut marshmallow root 8, liquorice root 3, orris root 1, tussilago farfara (coltsfoot) leaves 4, verbascum flowers 2, anise 2.

Syrupus Althææ (B.P.C.). *Syn.* SYRUP OF MARSHMALLOW.

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). 1 in 25.

Cetraria (B.P.C., P. Helv. V, P. Dan.). *Syn.* LICHEN D'ISLANDE (*Fr. Cx.*).

Iceland moss is the dried lichen, *C. islandica* (Parmeliaceæ.) Contains the carbohydrate, lichenin, and its isomeride iso-lichenin. Has demulcent properties, and is used in Northern Europe as a food.

Usually administered as *Decoctum Cetrariæ*, dose—1 to 4 fl. ounces (30 to 120 ml.), 1 in 20; also as lozenges, the bitterness (due to cetraric acid) being removed by prolonged soaking in water.

Marrubium (B.P.C.). *Syn.* HOREHOUND.

Dose.— $\frac{1}{2}$ to $\frac{1}{2}$ drachm (1 to 2 g.). The dried leaves and flowering tops of *M. vulgare* (Labiatae). Expectorant, laxative in large doses.

Infusum Marrubii Concentratum (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 2 $\frac{1}{2}$. This preparation diluted with 7 volumes of water may be dispensed when Infusum Marrubii is prescribed.

Syrupus Marrubii (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). About 1 in 2. Prepared by dissolving sucrose in an aqueous decoction of the drug.

Symphytum (B.P.C.). *Syn.* COMFREY ROOT.

The dried rhizome and root of *Symphytum officinale* (Boraginaceæ). Contains 0.6 to 0.8% of allantoin, and has been applied to wounds and ulcers in form of a decoction (1 in 20), or as a poultice prepared from the fresh root. The liquid extract (1 in 4 by extracting the drug in coarse powder with water, and preserving with 20% of 90% alcohol) has been given internally for gastric ulcer in doses of 2 to 4 drachms.

"An ancient remedy and its modern utilities. The *Symphytum officinale* and its contained allantoin." By C. J. Macalister. Together with an account of the chemical constitution of allantoin. By A. W. Titherley (*John Bale, Sons & Danielsson*, 1936).

Allantoinum (B.P.C.). $C_4H_8O_3N_4 = 158.1$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.).

A diuretic of glyoxylic acid, occurring to the extent of about 0.8% in comfrey. It is prepared synthetically by the oxidation of uric acid. Occurs in colourless crystals. M.p. about 235°.

Soluble 1 in about 200 of water, almost insoluble in alcohol 90%, and ether.

A cell proliferant. Has been applied locally to indolent ulcers and sluggish wounds and abscesses.

The activity of allantoin has been stated to be due to the formation of urea.—per *J. Amer. med. Ass.*, ii/1938, 758.

Tussilaginis Flos (*B.P.C.*, *Fr. Cx.*). *Syn.* COLTSFOOT FLOWER, FARFARÆ FLORES. The dried flowering shoots of *Tussilago Farfara* (*Compositæ*). Demulcent, relieves irritable cough.

Extractum Tussilaginis Liquidum (*B.P.C.*). *Syn.* LIQUID EXTRACT OF COLTSFOOT.

Dose.—10 to 30 minims (0.6 to 2 ml.). 1 in 1.

Syrupus Tussilaginis (*B.P.C.*). *Syn.* SYRUP OF COLTSFOOT.

Liquid extract of coltsfoot 25% *v/v* in syrup.

Tussilaginis Folium (*B.P.C.*). *Syn.* FARFARÆ FOLIA.

The dried leaves of *Tussilago Farfara*. Has been administered for its demulcent properties in the form of a decoction (1 in 20, *dose.*—2 ounces).

GOSSYPHII CORTEX

B.P.C.

Syn. GOSSYPHII RADICIS CORTEX.

The root bark of *Gossypium herbaceum* (*Malvaceæ*) and other cultivated species.

Uses. Has been used as an emmenagogue and abortifacient. May relieve dysmenorrhœa.

Decoctum Gossypii Corticis (*B.P.C.*). *Dose.*— $\frac{1}{2}$ to 2 ounces (15 to 60 ml.). 1 in 5.

Extractum Gossypii Corticis Liquidum (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 1.

Tinctura Gossypii Corticis (*B.P.C.*). 1 in 4.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Lactagol (*Lactagol, London; Pearson, Mitcham*) is an extract of cotton seed. *Dose.*—1 teaspoonful 4 or 5 times daily given in milk.

Used to increase the flow of milk and the nitrogenous constituents of same. *Edestine*. Stated to be the active principle, so far as galactagogue action is concerned, of cotton seed freed from fat, etc. Is also obtainable from linseed by precipitation with water from a 4% saline extractive.

Aletris (*B.P.C.*). *Syn.* STAR GRASS, AGUE ROOT, COLIC ROOT. (*Dioscorea* is also called colic root).

The dried rhizome and roots of *A. farinosa* (*Liliaceæ*). Used as a so-called uterine tonic.

Elixir Aletridis (*B.P.C.*). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

A flavoured preparation containing 25% *v/v* of liquid extract of aletris.

Extractum Aletridis Liquidum (*B.P.C.*). *Dose.*—5 to 15 minims (0.3 to 1 ml.). 1 in 1.

Caulophyllum (*B.P.C.*). *Syn.* BLUE COHOSH, PAPOOSE OR SQUAW ROOT. *Dose.*—5 to 30 grains (0.3 to 2 g.).

The rhizome and roots of *C. thalictroides* (*Berberidaceæ*).

Diuretic and emmenagogue.

Extractum Caulophylli Liquidum (B.P.C.). Dose.—10 to 30 minims (0.6 to 2 ml.). 1 in 1.

Liquor Caulophylli et Pulsatillæ (B.P.C.). Dose.—1 to 2 drachms (4 to 8 ml.).

Contains 25% v/v of liquid extract of caulophyllum and 5% v/v of liquid extract of pulsatilla.

Liquor Caulophylli et Pulsatillæ Compositus (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains liquid extracts of caulophyllum 15%, pulsatilla 5%, aletris 10%, and black haw 20% (all by volume). A sedative in dysmenorrhœa and uterine disorders.

Caulophyllin, dose.—1 to 4 grains (0.06 to 0.25 g.), is the resinoid obtained by precipitating a concentrated alcoholic tincture. Has diuretic, diaphoretic, anthelmintic, antispasmodic and emmenagogue properties.

Helonias. FALSE UNICORN ROOT. The dried rhizome and root of *Chamoelirium luteum*. Is used in colic and in atony of the generative organs; also employed as an abortifacient.

"Helonias Compound." Aloes 9 oz., helonias 14 oz., tansy 14 oz., oil of pennyroyal 1½ oz., oil of cassia 1 drachm, cayenne ½ oz., myrrh 8½ oz. in 1 gallon of 17% alcohol. Dose.—1 drachm in a cup of hot water, sweetened, twice daily. For promoting menstruation.

Piscidia (B.P.C.). Syn. JAMAICA DOGWOOD. The root bark of *P. Erythrina* (Leguminosæ). Useful in neuralgia, toothache, bronchitis, pertussis, insomnia, and dysmenorrhœa.

Extractum Piscidiæ Liquidum (B.P.C.). Dose.—½ to 2 drachms (2 to 8 ml.). 1 in 1. A dry alcoholic extract, dose—2 to 5 grains, is also prepared.

Pulsatilla (B.P.C., Fr. Cx.). Syn. PASQUE FLOWER. The dried herb, *Anemone Pulsatilla* (Ranunculacæ). Contains a crystalline vesicant substance, anemone camphor. Fr. Cx. specifies fresh flowering plant. Used in dysmenorrhœa and amenorrhœa.

Extractum Pulsatillæ Liquidum (B.P.C.). Dose.—2 to 5 minims (0.12 to 0.3 ml.). 1 in 1.

Tinctura Pulsatillæ (B.P.C.). Dose.—5 to 30 minims (0.3 to 2 ml.). 1 in 10.

Dysmenorrhœa may be relieved by the following mixture: Tinct. Pulsatilla 4 dr., Spt. Chlorof. 2 dr., chloroform water to 6 oz. 2 dr. to be taken as soon as menstrual (or premenstrual) pain begins and every three hours while pain continues.

Senecio. RAGWORT. *Senecio Jacobæa* and *S. aureus* (Compositæ) are emmenagogues, and have been employed in amenorrhœa and dysmenorrhœa. Liquid Extract, 1 = 1 of herb. Dose.—20 to 60 minims. *Senecio cineraria* (*Cineraria maritima*) has been employed in the form of a tincture, 3 to 4 drops to an eye-bath of water, in the treatment of cataract. The fresh juice has also been used as eye-drops for the same purpose.

Viburnum (B.P.C., Fr. Cx., P. Helv. V). Syn. BLACK HAW.
Dose.—½ to 1 drachm (1 to 2 g.).

The dried root bark of *V. prunifolium* (Caprifoliacæ). Anti-spasmodic, diuretic and nervine sedative. Used in dysmenorrhœa and in threatened abortion for its supposed sedative effect on the uterus.

Elixir Viburni (B.P.C.). Syn. ELIXIR VIBURNI PRUNIFOLII.

Dose.—½ to 2 drachms (2 to 8 ml.). Liquid extract of black haw 1 in 8 with compound tincture of cardamom and aromatic elixir.

Elixir Viburni et Hydrastis (B.P.C.). Syn. ELIXIR VIBURNI COMPOSITUM.

Dose.—½ to 1 drachm (2 to 4 ml.).

Contains liquid extract of black haw 30 m. and extract of hydrastis about 1 gr. in 1 dr.

Extractum Viburni (B.P.C.). Dose.—3 to 8 grains (0.2 to 0.5 g.). A soft extract.

Extractum Viburni Liquidum (B.P.C., Fr. Cx.). Dose.—1 to 2 drachms (4 to 8 ml.). 1 in 1.

GOSSYPIUM

AND OTHER ALLIED DRESSINGS.

For descriptions of medicated surgical dressings, see under individual medicaments (also Index).

By rule 10 of the Poisons Rules, 1935, the provisions of the Pharmacy and Poisons Act, 1933 and of the Poisons Rules, 1935, which apply solely to substances included in the First Schedule to the Poisons Rules do not apply to surgical dressings.

Gossypium Absorbens (B.P.C.). *Syn.* ABSORBENT COTTON WOOL, GOSSYPIUM DEPURATUM (*P. Helv. V, Fr. Cx.*), GOSSYPIUM PURIFICATUM (*U.S.P. XI*). The prepared epidermal trichomes of the seeds of various species of *Gossypium* (Malvaceæ). The filaments each consist of a single cell 2 to 4 cm. long forming a flattened tubular band. It is required to be not more neppy than a standard sample, and to comply with a test for absorbency. *U.S.P. XI* requires absorbent cotton to comply with tests for sterility. Cotton wool is soluble in an ammoniacal solution of copper oxide.

Curatio Normalis XIII (B.P.C. Supp.). *Syn.* STANDARD DRESSING No. 13, SMALL PLAIN WOUND DRESSING.

The dressing consists of a pad sewn to an open-weave bandage measuring 2 inches by 2½ yards. The pad, which measures 4 inches by 3 inches, is composed of about 100 gr. of absorbent cotton wool enclosed in absorbent gauze. The gauze, which is 4 inches long, is either woven tubular 6¾ inches in circumference, or woven single width 8 inches wide.

Curatio Normalis XIV (B.P.C. Supp.). *Syn.* STANDARD DRESSING No. 14, MEDIUM PLAIN WOUND DRESSING.

This dressing is similar to Standard Dressing No. 13, but the pad measures 6 inches by 4 inches, and is composed of about 200 gr. of absorbent cotton wool enclosed in absorbent gauze 6 inches long, and either woven tubular 9 inches in circumference, or woven single width 10 inches wide. The open-weave bandage measures 2½ inches by 3 yards.

Curatio Normalis XV (B.P.C. Supp.). *Syn.* STANDARD DRESSING No. 15, LARGE PLAIN WOUND DRESSING.

This dressing is similar to Standard Dressing No. 13, but the pad measures 8 inches by 6 inches, and is composed of about 400 gr. of absorbent cotton wool enclosed in absorbent gauze 8 inches long, and either woven tubular 13 inches in circumference, or woven single width 14 inches wide. The open-weave bandage measures 3 inches by 4 yards.

Bandages are made termed black cloth, buttercloth, calico, "cataract" (of special form for bandaging after the operation), crêpe, crêpe (Velpeau), crinoline (for silicating and plaster of Paris), domette, elastic circular stocking (stockinette), elastic (india-rubber webbing), flannel, gauze, muslin (for plaster of Paris), open wove (absorbent), plaster of Paris, selvedge (white and grey) and triangular splint.

Ligamentum Crispi (B.P.C.). *Syn.* CRÊPE BANDAGE. A characteristic fabric of plain weave in which the warp threads are of cotton and wool, and the weft threads are entirely of cotton. When fully extended the length is not less than twice the unstretched length, and after being stretched for 1 minute it returns to not more than two-thirds the fully-extended length.

Ligamentum Domettæ (B.P.C.). DOMETTE BANDAGE. A union fabric of plain weave in which the warp yarns are of cotton and the weft yarns of wool.

Ligamentum Lanulæ (B.P.C.). FLANNEL BANDAGE. A raised fabric of plain weave made entirely of wool.

Ligamentum Linæ (B.P.C.). BLEACHED CALICO BANDAGE. A bleached cotton cloth of plain weave.

Ligamentum Linæ Crudum (B.P.C.). UNBLEACHED CALICO BANDAGE. An unbleached cotton cloth of plain weave.

Ligamentum Sindonis (B.P.C.). MUSLIN BANDAGE. A cotton cloth of plain weave known as butter cloth material.

Ligamentum Textum Apertum (B.P.C.). OPEN-WOVE BANDAGE. *Syn.* WHITE OPEN-WOVE BANDAGE. Cotton cloth of plain weave.

Battista (B.P.C.). BATTISTE. A bleached cotton fabric proofed on both surfaces with a rubber solution rendering it impervious to water and forming a non-adhesive surface. It is heat vulcanised and not cold cured.

Billroth's Cambric. Cotton fabric treated by a special process. It takes the place of gutta-percha tissue and oiled silk, being sterilisable.

Carbasus Absorbens (B.P.C.). ABSORBENT GAUZE. *Syn.* UN-MEDICATED GAUZE. Cotton cloth of plain weave containing per inch not less than 19 threads in the warp and not less than 15 in the weft. It complies with a test for absorbency.

Carbasus Absorbens in Tænia (B.P.C.). ABSORBENT RIBBON GAUZE. A material similar to the preceding but containing per inch not less than 30 threads in the warp and not less than 35 in the weft.

The following medicated ribbon gauzes are made in $\frac{1}{4}$, $\frac{1}{2}$, 1 and 2-inch widths, in 12 yard lengths:—Alembroth, aluminium acetate, boric acid, iodoform, [P1] mercury and zinc cyanide, [P2] mercuric chloride, [P2] phenol.

Tulle Gras (Lumière, Paris; Anglo-French Drug Co., London). Surgical dressing consisting of wide-mesh gauze impregnated with soft paraffin and 1% balsam of Peru, and sterilised.

For the treatment of burns on the face and hands the Ministry of Health recommends (1941) the use in the Emergency Medical Services of Tulle Gras (not tannic acid). Similar emergency treatment is also recommended for serious burns in other parts of the body (prior to coagulation treatment).—*Pharm. J.*, i/1941, 77.

Nonad Tulle (Allen & Hanburys, London), Jelonet (Smith & Nephew, Hull) and Optrex Tulle (Optrex Ltd., London C. F. Thackray, Leeds) are similar preparations.

A dressing similar to Tulle Gras may be prepared in the following way. Curtain net, with a mesh of 2 mm. is cut into pieces 9 cm. square. These are

placed in a metal box slightly larger in size. The box is then filled with the following mixture: soft paraffin 96 g., balsam of Peru 2 g., halibut oil 2 g., sufficient to impregnate and cover the material completely after sterilisation.—A. H. McIndoe, *Proc. R. Soc. Med.*, 1940, 34, 62.

Cellulosum Ligni (B.P.C.). CELLULOSE WADDING. *Syn.* TILLMAN'S DRESSING. Is prepared from high-grade bleached sulphite pulp and complies with a test for absorbency.

Charta Oleata (B.P.C.). OILED PAPER.

White paper rendered waterproof by treatment with a drying oil.

Jaconettum (B.P.C.). JACONET. A bleached cotton fabric, proofed on one side with a rubber solution rendering it impervious to water and forming a non-adhesive surface. It is heat vulcanised and not cold cured. Pink jaconet, coloured with a suitable dye, is also available.

Lana (B.P.C.). *Syn.* ANIMAL WOOL, LAMB'S WOOL. Wool is the fleece of the sheep prepared by cleansing to remove grease and other foreign substances. It consists of solid cylindrical hairs soluble in 4.5% aqueous sodium hydroxide, insoluble in ammoniacal copper oxide solution which stains it blue.

Linteum Absorbens (B.P.C.). ABSORBENT LINT. *Syn.* LINT, COTTON LINT, UNMEDICATED LINT, LINTEUM CARPTUM. A cotton cloth of plain weave from the warp yarns of which a nap has been raised. It complies with a test for absorbency.

Lint is also obtainable medicated with iodoform 10%, and with ferric chloride 10% (styptic lint).

Sponges, Carbolised, have fallen into disuse but some surgeons still prefer them to cotton swabs. They are available thin and flat and can be kept in 1 in 20 phenol solution.

Sponge is the cleaned skeleton of a marine animal, *Spongia officinalis*.

Spongio-Piline. Thick felt with waterproof india-rubber backing for applying warm moist dressings.

Impermeable Piline. One-third the thickness of spongio-piline of felt, and instead of the waterproof india-rubber backing of the former, there is an antiseptic material, not affected by heat or strong spirit. For applying liniments in rheumatism, and where warmth is desired simultaneously.

Stupa (B.P.C.). TOW. *Syn.* UNMEDICATED TOW.

Jute fibre of good average quality in cheese rolls.

Tela Carbasi et Gossypii (B.P.C.). GAUZE AND COTTON TISSUE. *Syn.* ABSORBENT GAUZE TISSUE.

Consists of a thick layer of absorbent cotton wool enclosed in tubular absorbent gauze. It is also prepared medicated with boric acid, trinitrophenol, iodoform, [P2] mercuric iodide, [P1] mercury and zinc cyanide, [P2] phenol or thymol.

Eye Pads are ready cut, round or oval, consisting of a layer of wool between two sheets of gauze.

Tela Carbasi et Ligni (B.P.C.). CELLULOSE TISSUE. *Syn.* GAUZE AND CELLULOSE WADDING TISSUE.

Consists of a thick layer of cellulose wadding enclosed in tubular absorbent gauze.

Dental Dressings.

For dental use are prepared:—

Aseptic Dental Napkins.

Absorbent Dental Rolls. As a substitute for the napkin or rubber dam. For covering the mouths of the salivary ducts, a section may be placed on either side of a tooth, or the entire roll may be bent round the outside of the arch or under the tongue. No. 1, diameter $\frac{3}{8}$ inch; No. 2, $\frac{1}{2}$ inch; No. 3, $\frac{3}{4}$ inch; No. 4, $\frac{1}{2}$ inch; in $1\frac{1}{2}$ or 6 inch lengths.

Non-absorbent Dental Rolls. To replace the rubber dam. In crown and bridge work. May be used in connection with the saliva ejector.

Sterilised Absorbent Pledgets for wiping out cavities.

Aseptic Absorbent Points are prepared for drying pulp canals.

Sterilised Bibulous Paper, in sheets, 3 inches by 10 inches.

Carbonised Cotton for filling pulp canals, and for treatment of exposed pulps.

Sphagnum. *Syn.* TURF MOSS, BOG MOSS. The dried moss, numerous varieties of which are indigenous to Gt. Britain. Is used as an absorbent dressing and for other purposes where absorbency is required. It has the advantage that the absorbed liquid does not merely wet the surface but is absorbed into the cells of the moss which therefore does not feel wet. The plant in its dry condition will absorb upwards of 20 times its weight of water or discharge. For taking up urinary discharge in bladder, kidney and dropsical affections the material is pre-eminently suitable. The dressing is also useful as a bedding for insane persons.

Cavendish Moss Sheets (*Martindale, London*) are sheets of compressed sphagnum, 24 by 15 inches by $\frac{1}{4}$ inch approximately in thickness. Gauze-covered moss, loose moss dressings, moss pillows and [P2] sublimated moss (0.25% of mercuric chloride) are also available.

Laminaria Digitata. *Syn.* SEA TANGLE. From this seaweed "laminaria tents" are made for gynecological and surgical use. Placed in contact with moisture they swell to three times their original size in dry state. The laminaria is sterilised by drying after immersion in acetone, chloroform or alcohol 90% under pressure at 133°, or by placing in saturated solution of iodoform in ether or in sublimate solution.

Stipes Laminariæ (*P. Helv. V*) is from *L. hyperborea* and consists of the pseudo petiole. *P. Dan.* admits both *L. digitata* and *L. hyperborea*.

HAMAMELIS

Hamamelidis Cortex (*B.P.C.*), *syn.* WITCH HAZEL BARK, is the bark of *Hamamelis virginiana* (*Hamamelidaceæ*), and contains about 6% of tannin. It is imported from the United States.

Uses. A local astringent and hæmostatic.

Tinctura Hamamelidis (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 10 of alcôhol 45%.

$\frac{1}{2}$ drachm of the tincture in 1 ounce of cold water may be given as a retention enema for bleeding piles every day.

A lotion of 1 or 2 dr. with water to 1 oz. is a useful application to bruises and small wounds.

Hamamelis (*B.P., P. Helv. V, Fr. Cx.*). *Syn.* HAMAMELIDIS FOLIA, WITCH HAZEL LEAVES.

Consists of the dried leaves of *Hamamelis virginiana*.

Uses. Employed in the form of a liquid extract as a local application to sprains, bruises, superficial wounds and epistaxis; also as a gargle in sore throat and hoarseness, and in the form of suppositories for internal hæmorrhoids and ointment for external hæmorrhoids.

Extractum Hamamelidis (B.P.C.). *Syn.* HAMAMELIN, HAMAMELIDIN. *Dose.*—1 to 5 grains (0.06 to 0.3 g.) in pill.

A dry alcoholic extract from the leaf. It may be brown or green in colour according to the leaf from which it is prepared and the temperature of evaporation.

It was suggested (H. Berry, *Pharm. J.*, ii/1936, 247) that alcohol 45% should be used in the preparation of dry extract of hamamelis, since such an extract has the advantages of being readily soluble in glycerin and of not varying in colour whilst retaining the full tannin content of the drug. An extract prepared on these lines has been recommended for inclusion in the *B.P.* by the Pharmacy and Pharmacognosy Committee of the Pharmacopœia Commission (*Report* 13).

A suppository of 1 to 3 grains with cacao butter is useful for piles.

Extractum Hamamelidis Liquidum (B.P.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

A 1 in 1 preparation of the dried leaves made with 45% alcohol.

Liquor Hamamelidis (B.P.C.). *Syn.* DISTILLED WITCH HAZEL. *Dose.*— $\frac{1}{2}$ to 3 drachms (2 to 12 ml.). 1 in 1, prepared by distillation from the fresh leaves or twigs. Used externally for piles, and by rectal injection for internal piles, to check epistaxis and bleeding from tooth sockets, also for application to bruises.

For piles, 5 minims of a mixture of equal parts of the liquor and glycerin containing 10% of phenol, have been injected into the piles hypodermically.

Pasta Hamamelidis (B.P.C.). *Syn.* WITCH HAZEL CREAM.

A non-greasy stearate cream containing about 50% *w/w* of solution of hamamelis. Useful basis for medicated creams.

Cremor Hamamelidis (L.H.). Solution of hamamelis 60 m., yellow soft paraffin 120 gr., wool fat to 1 oz.

Hazel Foam (Martindale, London). A soothing, non-greasy ointment basis. May be medicated with all forms of antiseptics and skin applications, *e.g.*, ichthammol 3%; ichthammol 3 to 10% with resorcin 5%; salicylic acid 1%; cade oil 5%; phenol 1 to 2½%; solution of coal tar 10%.

Suppositorium Hamamelini et Zinci Oxidi (B.P.C.) contains 3 gr. of extract of hamamelis and 10 gr. of zinc oxide with oil of theobroma to 30 gr.

[D-P1-81] **Compound Hamamelis Suppository.** Hamamelin 1 gr., or caine 5 gr., cocaine hydrochloride $\frac{1}{2}$ gr., extract of opium $\frac{1}{2}$ gr., extract of belladonna $\frac{1}{2}$ gr., oil of theobroma to 60 gr. For internal hæmorrhoids.

[P1-81] **Suppositorium Hamamelini, Conii et Eucainæ.**

Hamamelin 5 gr., extract of conium 4 gr., benzamine $\frac{1}{2}$ gr. in glycerin suppository mass to 30 gr. Rub down the drugs first with a very little warm water. In painful hæmorrhoids.

[D-P1-81] **Suppositorium Hamamelini et Hydrargyri Compositum.**

Mercurial ointment 1 gr., hamamelin 2 gr., extract of ergot 1 gr., extract of belladonna $\frac{1}{2}$ gr., morphine sulphate $\frac{1}{2}$ gr., tragacanth *q.s.*, oil of theobroma to 15 gr.

The mercury to act on prostatic hypersemia often present with piles, hamamelin on the mucous membrane, ergot on the muscular walls of blood vessels, belladonna the same and sedative, morphine analgesic and vasoconstrictor. The theobroma oil as local mechanical lubricant and the tragacanth for consistency.
